To this article of *clock*-work we ſhall ſubjoin a brief account of two curious contrivances; the one for giving motion to the parts of a *clock* by making it to deſcend along an inclined plane, is the invention of Mr. Maurice Wheeler; and the *clock* itſelf may be ſeen in Don Saltero's coffee-houſe at Chelſea. D E (ſee *Tab. Horology*, *fig.* 5.) is the inclined plane on which the *clock* A B C deſcends: this conſiſts externally of a hoop about an inch broad, and two ſides or plates ſtanding out beyond the hoop about one-eighth of an inch all round, with indented edges, that the *clock* may not ſlide, but turn round whilſt it moves down. One of theſe plates is inſcribed with the twenty-four hours, which paſs ſucceſſively under the index L P, *fig.* 6. which is always in a poſition perpendicular to the horizon, and ſhews the hour on the top of the machine: for this reaſon the lower part of the index, or H L is heavieſt, that it may preponderate the other H P, and always keep it pendulous, with its point to the vertical hour, as the movement goes on. Inſtead of this index, an image may be fixed for ornament on the axis *g*, which with an erected finger performs the office of an index. In order to deſcribe the internal part or mechaniſm of this *clock*, let L E T Q be the external circumference of the hoop, and *f*, *f*, the frame plate, on which is placed the train of wheel work, 1, 2, 3, 4, which is much the ſame as in other *clocks*, and is governed by a balance and regulator, as in them. But there is no need of a ſpring and fuſee in this *clock*; their effects being otherwiſe anſwered, as we ſhall ſee. In this machine the great wheel 1 is placed in the center, or upon the axis of the movement, and the other wheels and parts towards one ſide, which would therefore prove a biaſs to the body of the *clock*, and cauſe it to move, even on an horizontal plane, for ſome ſhort diſtance; this makes it neceſſary to fix a thin plate of lead at C, on the oppoſite part of the hoop, to reſtore the equilibrium of the movement. This being done, the machine will abide at reſt in any poſition on the horizontal plane H H; but if that plane be changed into the inclined plane D E, it will touch it in the point D; but it cannot reſt there, becauſe the center of gravity at M acting in the direction M I, and the point T having nothing to ſupport it, muſt continually deſcend, and carry the body down the plane. But now if any weight P be fixed on the other ſide of the machine, ſuch as ſhall remove the center of gravity from M to the point V in the line L D which paſſes through the point D, it will then reſt upon the inclined plane, as in the caſe of the *rolling* CYLINDER. If this weight P be ſuppoſed not fixed, but ſuſpended at the end of an arm, or vectis, which arm or lever is at the ſame time faſtened to a central wheel 1, moving on the axis M of the machine, which wheel by its teeth ſhall communicate with the train of wheels, &c. on the other ſide, and the power of the weight be juſt equal to the friction or reſiſtance of the train, it will remain motionleſs as it did before when it was fixed. And, conſequently, the *clock* alſo will be at reſt on the inclined plane. But, ſuppoſing the power of the weight P to be ſuperior to the reſiſtance of the train, it will then put it into motion, and of courſe the *clock* likewiſe; which will then commence a motion down the plane; while the weight P, its vectis P M, and the wheel 1, all conſtantly retain the ſame poſition which they have at firſt, when the *clock* begins to move. Hence it is eaſy to underſtand, that the weight P may have ſuch an intrinſic gravity, as ſhall cauſe it to act upon the train with any required force, ſo as to produce a motion in the machine of any required velocity; ſuch, for inſtance, as ſhall carry it once round in twenty-four hours: then, if the diameters of the plates A B C be four inches, it will deſcribe the length of their circumference, viz. 12,56 inches in one natural day; and, therefore, if the plane be of a ſufficient breadth, ſuch a *clock* may go ſeveral days, and would furniſh a perpetual motion, if the plane were infinitely extended.

Let S D be drawn through M perpendicular to the inclined plane in the point D; alſo let L D be perpendicular to the horizontal line H H, paſſing through D; then is the angle H D E = L D S = D M T; whence it follows that the greater the angle of the plane's elevation is, the greater will be the arch D T, and, conſequently, the further will the common center of gravity be removed from M; therefore the power of P will be augmented, and of courſe the motion of the whole machine accelerated. Thus it appears, that by duly adjuſting the intrinſic weight of P, at firſt to produce a motion ſhewing the mean time as near as poſſible, the time may be afterwards corrected, or the *clock* made to go faſter or ſlower by raiſing or depreſſing the plane, by means of the ſcrew at S. The angle to which the plane is firſt raiſed is about ten degrees. The marquis of Worceſter is alſo ſaid to have contrived a watch that moved on a declivity. See farther Phil. Tranſ. abr. vol. i. p. 468, &c. or N° 161.

The other contrivance is that of M. de Gennes for making a *clock* aſcend on an inclined plane. To this end let A B D (*fig.* 7.) be the machine on the inclined plane E D E, and let it be kept at reſt upon it, or in equilibrio by the weight P at the end of the lever P M. The circular area C F is one end of a ſpring barrel in the middle of the movement, in which is included a ſpring as in a common watch. To this end of the barrel the arm or lever P M is fixed upon the center M; and thus, when the clock is wound up, the ſpring moves the barrel, and therefore the lever and weight P in the ſituation P M. In doing this, the center of gravity is conſtantly removed farther from the center of the machine, and therefore, it muſt determine the *clock* to move upwards, which it will continue to do as long as the ſpring is unbending itſelf; and thus the weight and its lever P M will preſerve the ſituation they firſt have, and do the office of a chain and fuſee. Phil. Tranſ. N° 140. or Abridg. vol. i. p. 467.

By means of the following table clocks and watches may be ſo regulated as to meaſure true equal time.

Days.	H.	M.	S.
1	0	3	56
2	0	7	52
3	0	11	48
4	0	15	44
5	0	19	39
6	0	23	35
7	0	27	31
8	0	31	27
9	0	35	23
10	0	39	19
11	0	43	15
12	0	47	11
13	0	51	7
14	0	55	3
15	0	58	58
16	1	2	54
17	1	6	50
18	1	10	46
19	1	14	42
20	1	18	38
21	1	22	34
22	1	26	30
23	1	30	26
24	1	34	22
25	1	38	17
26	1	43	13
27	1	46	9
28	1	50	5
29	1	54	1
30	1	57	57

The ſtars make 366 revolutions from any point of the compaſs to the ſame point again in 365 days and one minute: and therefore, they gain a 365th of a revolution every 24 hours of mean ſolar time, near enough for regulating any clock or watch.

This acceleration is at the rate of 3 min. 55 ſec. 53 thirds, 59 fourths in 24 hours; or, in the neareſt round numbers, 3 minutes, 56 ſeconds, by which quantity of time, every ſtar comes round ſooner than it did on the day before.

Therefore, if you mark the preciſe moment ſhown by a clock or watch when any ſtar vaniſhes behind a chimney, or any other object, as ſeen through a ſmall hole in a thin plate of metal, fixed in a window-ſhutter; and do this for ſeveral nights ſucceſſively (as ſuppoſe twenty) if, at the end of that time, the ſtar vaniſhes as much ſooner than it did the firſt night, by the clock, as anſwers to the time denoted in the table for ſo many days, the clock goes true: otherwiſe not. If the difference between the clock and ſtar be leſs than the table ſhews, the clock goes too faſt; if greater, it goes too ſlow; and muſt be regulated accordingly, by letting down or raiſing up the ball of the pendulum, by little and little, by turning the ſcrew-nut under the ball, till you find it keeps true equal time.

Thus, ſuppoſing the ſtar ſhould diſappear behind a chimney, any night when it is XII. by the clock; and that, on the 20th night afterward, the ſame ſtar ſhould diſappear when the time is 41 minutes 22 ſeconds paſt X. by the clock; which being ſubtracted from 12 hours, 0 min. 0 ſec. leaves remaining 1 hour, 18 minutes, 38 ſeconds for the time the ſtar is then faſter than the *clock*: look in the table, and againſt 20, in the left hand column, you will find the acceleration of the ſtar to be 1 hour, 18 min. 38 ſec. agreeing exactly with what the difference ought to be between the *clock* and ſtar: which ſhews that the *clock* meaſures true equal time, and agrees with the mean ſolar time, as it ought to do.

To add chimes to a piece of CLOCK-*work*. See CHIMES.

CLOCK, *Balance of a*. See BALANCE.

CLOCK-*makers, Company of*. See COMPANY.

CLOCK-*makers compaſſes*. See COMPASSES.

CLOERE, a priſon or dungeon; it is conjectured from Britiſh original; the dungeon or inner priſon of Wallingford caſtle, temp. H. 2. was called *Cloere-brien*, i. e. *carcer Brieni*, &c.

CLOISTER, CLAUSTRUM, an habitation ſurrounded with walls, and inhabited by canons, or religious.

In a more general ſenſe *cloiſter* is uſed for a monaſtery of religious of either ſex.

In a more reſtrained ſenſe *cloiſter* is uſed for the principal part of a regular monaſtery, conſiſting of a ſquare built around; ordinarily, between the church, the chapter-houſe, and the refectory; and over which is the dormitory. See DORMITORY, &c.

The *cloiſters* ſerved for ſeveral purpoſes in the ancient monaſteries. Petrus Bleſenſis obſerves, that it was here the monks held their lectures; the lecture of morality at the north-ſide, next the church; the ſchool on the weſt, and the chapter on the eaſt; ſpiritual meditation, &c. being reſerved for the church.

Du Cange concludes, that all theſe different exerciſes were performed in the cloiſter itſelf; but by miſtake. The church, the chapter-houſe, and the ſchool, were not parts of the *cloiſter*, but buildings adjoining to it.

Lanfranc obſerves, that the proper uſe of the *cloiſter* was for the monks to meet in, and converſe together, at certain hours of the day.

The form of the *cloiſter* was ſquare; and it had its name *clauſtrum* from *claudo, I ſhut or cloſe*, as being incloſed on its four ſides with buildings.

Hence, in architecture, a building is ſaid to be in form of a *cloiſter*, when there are buildings in each of the four ſides of the court.

CLOISTERED *monks*. See MONK.

CLONARIUM, in *Botany*, that ſmall pedicle which ſupports every ſeparate flower, or fruit in a cluſter, as every grape in a bunch, every berry in a corymbus of ivy, &c.

CLOSE, in *Heraldry*. When any bird, addicted to flight, is drawn in a coat of arms, in a ſtanding poſture; with its wings cloſe down about it, and not either flying or diſplayed, they blazon it by the word *cloſe*.

In which ſenſe *cloſe* ſtands oppoſed to VOLANT.

Cloſe is not applied to the peacock, dunghill-cock, &c. becauſe that is their ordinary poſture.

The term *cloſe* is likewiſe uſed for the barnacles, or bits of a bridle, when not extended, as they are uſually borne.

It is alſo applied to the bearing a helmet, with the vizor down: a barnacle *cloſe*, helmet, *cloſe*, &c.

CLOSE, in *Muſic*. See CADENCE.

CLOSE, *Breach of*, in *Law*, a ſpecies of treſpaſs, denoting every unwarrantable entry on another's ſoil, which the law ſuppoſes to be *incloſed*, either by a viſible fence, or an inviſible boundary.

CLOSE *Rolls*, and CLOSE *Writs*, in *Law*; charters, or letters of the king, containing grants of lands, &c. ſealed with his great ſeal, and directed to particular perſons, and for particular purpoſes, not being proper for the public inſpection, are *cloſed* up and ſealed on the outſide, and are therefore called *writs cloſe*, *literæ clauſæ*, and they are recorded in the *cloſe rolls*. See LETTERS, and PATENT.

CLOSE *field*. See FIELD.

CLOSE *fights*, aboard a ſhip, are bulk-heads put up fore and aft in the ſhip, for the men to ſtand behind in a cloſe engagement, and fire on the enemy; or, if the ſhips be boarded, to ſcour the decks.

CLOSE *fire*. See FIRE, and REVERBERATION.

CLOSE-*hauled*, in *Sea Language*, denotes the arrangement or trim of a ſhip's ſails when ſhe endeavours to proceed in the neareſt direction poſſible to that point of the compaſs from which the wind blows. The keel of larger ſhips makes an angle of about ſix points with the line of the wind; but ſloops and ſmaller veſſels ſail almoſt a point nearer. All veſſels, when *cloſe-hauled*, make nearly a point of lee-way, and this angle increaſes with the increaſe of wind and ſea. The ſails, in this diſpoſition of them, are all extended ſideways on the ſhip; and the term *cloſe-hauled* is then applied to it, becauſe her tacks are drawn cloſe down to her windward ſide, the ſheets hauled cloſe aft, and all the bow-lines are drawn to their utmoſt extenſion, in order to keep the ſails ſteady.

CLOSE *quarters*, in *Sea Language*, denote ſtrong beams of wood extended along a merchant-ſhip in ſeveral places: as they are a place of retreat, when the ſhip is boarded by an adverſary, they are fitted with ſmall loop-holes, through which the ſhip's crew may fire ſmall arms to defend themſelves and annoy the enemy. They are likewiſe furniſhed with powder-cheſts, filled with powder, old nails, &c. which may be fired upon the boarders.

CLOSE *Pound*. See POUND.

CLOSET, in *Heraldry*, ſignifies the half of a BAR.

CLOSET, *Clerk of the*. See CLERK.

CLOSH, in our old cuſtoms, an unlawful game, forbidden by ſtat. 14 Edw. IV. c. 3. & 33 Hen. VIII. c. 9. It is ſaid to have been the ſame with our *nine-pins*, and is called *cloſh-coyls*, by the 33^d Hen. VIII.

CLOT-*bird*, in *Zoology*, a name by which the common OENANTHE is called in many parts of England.

CLOTH, in *Commerce*, in its general ſenſe, includes all kinds of ſtuffs woven or manufactured on the loom, whether their threads be of wool, hemp, or flax.

CLOTH is more peculiarly applied to a web, or tiſſue of woollen threads, interwoven; whereof ſome called the *warp*, are extended lengthwiſe, from one end of the piece to the other; the reſt, called the *woof*, are diſpoſed acroſs the firſt, or breadthwiſe of the piece.

Cloths are woven on the looms as well as linens, druggets, ſerges, camblets, &c. They are of various qualities, fine, coarſe, ſtrong, &c. ſome are made of wool, and this of different colours; the wool being dyed and dreſſed, is firſt ſpun, then wove: others are wrought white, deſtined to be dyed in ſcarlet, black, blue, green, yellow, &c. Their breadths and lengths are various, according to the places where they are manufactured.

The goodneſs of CLOTH conſiſts, 1°, In the wool's being fine, and being well dreſſed. 2°, In its being ſpun equably; always obſerving, however, that the thread of the warp be finer, and better twiſted, than that of the woof. 3°, In the *cloth*'s being well wrought and beaten on the loom, ſo as to be every where equally cloſe and compact. 4°, In the wool's not being finer and better at one end of the piece than in the reſt. 5°, In the liſts being ſufficiently ſtrong, and of the ſame length with the ſtuff; and that they conſiſt of good matter, as wool, hair, or oſtrich feathers, or the hair of Daniſh dogs;

which laſt is the beſt. 6°, In the *cloth*'s being well cleared of the knots, and other imperfections. 7°, In its being well ſcoured with good fullers-earth, then fulled with the beſt white ſoap, and waſhed out in clear water. See Fulling. 8°, In the hair or knap's being well drawn out with the TEAZLE, or thiſtle, on the pole, without being too much opened. 9°, In its being ſhorn cloſe; yet without laying the ground or thread bare. See Sheering. 10°, In its being well dyed. 11°, In its not being ſtretched, or pulled farther than is neceſſary to ſet it ſquare, and bring it to its juſt length and breadth. See Tenter. 12°, In its only being preſſed cold; hot-preſſing being hurtful to *cloth*.

Manufacturing of white Cloths *for dying*. The beſt wools for the purpoſe are thoſe of England and Spain; eſpecially thoſe of Lincolnſhire, and Segovia.

To uſe them to the beſt advantage; when taken out of the bales, they muſt be ſcoured, by putting them in a liquor ſomewhat more than lukewarm, compoſed of three parts of fair water, and one of urine. After the wool has continued long enough in the liquor to diſſolve and looſen the greaſe, it is taken out, drained, and waſhed in a running water: it is known to be well ſcoured, when it feels dry to the touch, and has no ſmell but the natural ſmell of the ſheep.

In this ſtate it is hung out to dry in the ſhade; the heat of the ſun being apt to make it harſh, and untractable. When dry, it is beat with rods on hurdles of wood, or on ropes, to clear out the duſt and groſſer filth: the more it is thus beat and cleaned, the more ſoft it becomes, and the better it ſpins. After beating, it is well picked, to clear the reſt of the filth, that had eſcaped the rods.

It is now in a ſtate to be oiled, and carded on large iron cards, placed aſlope. The beſt oil for the purpoſe is oil of olives; one fifth of which, at leaſt, ſhould be uſed for the wool deſtined for the woof, and a ninth for that of the warp.

It is now given out to the ſpinners; who firſt card it on the knee, with ſmall fine cards; then ſpin it on the wheel: obſerving to make the thread of the warp ſmaller, by one-third, than that of the woof, and much cloſer twiſted: in order to this, the latter muſt be ſpun with the band, or ſtring open, and the former with it croſſed.

The thread being thus ſpun, reeled, and made into ſkeins; that deſtined for the woof is wound on ſpools, i. e. on little tubes, or pieces of paper, or ruſhes, ſo diſpoſed as that they may be eaſily put in the eye of the ſhuttle. That for the warp is wound on a kind of rochets, or large wooden bobbins, to diſpoſe it for warping.

When warped, it is ſtiffened with ſize; whereof, that made of ſhreds of parchment is the beſt; and, courſe yarn, uſed in kerſeys, is ſtiffened by ſteeping it for a few hours in chalk-water; and, when dry, is given to the weavers, who mount it on the loom.

The warp being on the loom, the weavers, who are two to each loom, one on each ſide, tread at the ſame time, alternately, on the ſame treadle; i. e. now on the right ſtep, and now on the left, which raiſes and lowers the threads of the warp equally; between which they throw, tranſverſly, the ſhuttle from the one to the other. And each time that the ſhuttle is thrown, and ſo a thread of the woof inſerted within the warp, they ſtrike it conjointly with the ſame frame wherein is faſtened the comb, or reed, between whoſe teeth the threads of the warp are paſſed; repeating the ſtroke as often as is neceſſary; in ſome *cloths* no leſs than twelve or thirteen times, viz. ſix with the warp open, and ſeven ſhut.

It may be obſerved, that the more the threads of the woof are ſtruck againſt each other, the cloſer the *cloth* is: and hence it becomes enabled to ſuſtain the violence of the fulling-mill, as well as of the teazing, or fulling-thiſtle, without fretting, or opening. The weavers having continued their work till the whole warp is filled with woof, the *cloth* is finiſhed: it is taken off the loom by unrolling it from the beam whereon it had been rolled in proportion as it was woven; and is now given to be cleared of the knots, ends of thread, ſtraws, and other filth; which is done with little iron nippers: and this operation is called *burling*.

In this condition it is carried to the fullery, to be ſcoured with urine, or a kind of potters clay well cleaned and ſteeped in water, put along with the *cloth* in the trough, wherein it is fulled. See Fulling.

The *cloth* being again cleared from the earth, or urine, by waſhing it in water, is returned to the former hands, to have the leſſer filth, ſmall ſtraws, and almoſt imperceptible knots, taken off as before: It is likewiſe fine-drawn. See Fine-*drawing*. Then it is returned to the fuller, to be beat and fulled with hot water, wherein five or ſix pounds of ſoap have been diſſolved. The ſoap moſt eſteemed is the white, eſpecially that of Genoa. After fulling an hour and a half, it is taken out to be ſmoothed, i. e. to be pulled by the liſts lengthways, to to take out the wrinkles and creaſes occaſioned by the force of the mallets, or peſtles, falling on the *cloth*, when in the troughs: which is often done by racking or tentering the *cloth*. See Tenter.

The ſmoothing is repeated every two hours, till the fulling be finiſhed, and the *cloth* brought to its proper breadth: after which, it is waſhed in clear water, to purge it of the ſoap, and given, all wet, to the carders, to raiſe the hair, or knap, on the right ſide, with the thiſtle, or weed; wherewith they give it two rubs, or courſes; the firſt againſt the grain, the ſecond with the grain: which operation is called ROUGHING it.

The *cloth* being dried after this operation, the cloth-worker takes it, and gives it its firſt cut, or SHEERING. This done, the carders reſume it, and after wetting it, give as many more rubs, or courſes, with the teazle, as the quality of the ſtuff requires: always obſerving to begin againſt the hair, and to end with it; and to begin with a ſmoother thiſtle, proceeding ſtill to a ſharper, and ſharper, as far as the ſixth degree.

After this, the *cloth* being dried, is returned to the cloth-worker, who ſheers it a ſecond time, and returns it to the carder; who wetting it again, gives it as many courſes as he thinks fit, dries it, and gives it back again to the cloth-worker; who after ſheering it the third and laſt time, returns it to the carders, who repeat their operation as before, till the hair, or knap, be well ranged on the ſurface of the *cloth*, from one end of the piece to the other.

It muſt be obſerved, that it is indiſpenſably neceſſary the *cloth* be wet, while in the carders hands; in order to which, it is ſprinkled from time to time with water.

The knap being finiſhed, and the *cloth* dried, the cloth-worker gives it as many cuts as he thinks requiſite for the perfection of the ſtuff. It muſt alſo be obſerved, that all the ſheerings muſt be on the right ſide, except the two laſt, which muſt be on the other; and that the *cloth* cannot be too dry for ſheering.

The *cloth* thus woven, ſcoured, knapped, and ſhorn, and ſometimes *cottened*, or FRIZED, is ſent to the dyer.

When dyed, it is waſhed in fair water, and the cloth-worker takes it again, wet as it is, lays the hair, or knap, with a bruſh on the table, and hangs it on the tenters; where it is ſtretched both in length and breadth, enough to ſmooth it, ſet it ſquare, and bring it to its proper dimenſions, without ſtraining it too much; obſerving to bruſh it afreſh, the way of the hair, while yet a little moiſt on the tenter.

When quite dry, the *cloth* is taken off from the tenter, and bruſhed again on the table, to finiſh the laying of the knap: it is then folded, and laid cold under a preſs, to make it perfectly ſmooth and even, and to give it a little gloſs.

The gloſs is given by laying a leaf of vellum, or cap-paper, in each plait of the piece; and over the whole a ſquare plank of wood: on which, by means of a lever, the ſcrew of a preſs is brought down, with the degree of force judged neceſſary, with regard to the quality of the *cloth*. In France, none but ſcarlets, greens, blues, &c. receive this laſt preparation; blacks being judged better without it.

Laſtly, the *cloth* being taken out of the preſs, and the papers removed, it is in a condition for ſale, or uſe. See the whole proceſs of manufacturing ſheep's wool into *cloth*, deſcribed by Sir W. Petty, in Birch's Hiſt. of the Royal Society, vol. i. p. 55, &c.

For the manufacture of mixt Cloths, or thoſe wherein the wools are firſt dyed, then mixed, ſpun, and woven of the colours intended; the proceſs, except in what relates to the colour, is moſtly the ſame with that juſt ſpoken of.

The method of adjuſting the mixture, is by firſt making a felt, or flock, of the colours of the intended *cloth*, as a ſpecimen: the wool of each colour is weighed, and when the ſpecimen is to the manufacturer's mind, he mixes, for uſe, a quantity in the ſame proportion; eſtimating each grain of the ſpecimen at twenty pounds weight of the ſame wool in the *cloth* to be made.

Thus, if he would mix three colours, v. gr. coffee-colour, feuille-mort, and pale-blue, the firſt to be the prevailing-colour, he weighs a quantity of each; for inſtance, 70 grains of the firſt, 25 of the ſecond, and 20 of the third: then multiplies each by 20 pounds of wool: and thus gains 1400 pounds for the coffee wool; 500 pounds for the feuille-mort, and 400 for the pale-blue.

The wools of the ſpecimen, thus weighed, are mixed, oiled, carded, moiſtened with clear water, rubbed with black ſoap, and in this ſtate wrought a long time in the hands; till they be reduced into a piece of felt like that uſed by hatters.

It is then rinſed in water, to purge out the oil and ſoap; and when dry, the hair, or knap, is carded out with the teazle; then ſhorn carefully, till the ground appear, and the ſeveral colours be diſcoverable.

Laſtly, wetting it a little, and preſſing it, he examines it well; and if he be not contented with it, makes another felt; if he be, he proceeds to mix his wools: when mixed, it is beat on hurdles, cleaned, oiled, carded, ſpun, woven, &c. as in white *cloth*.

For the laws relating to the woollen manufactory, ſee ſtat. 3 and 4 Edw. III. cap. 2. 3 and 4 Edw. IV. cap. 6. 17 Edw. IV. cap. 1. 5 and 6 Edw. VI. cap. 6. 4 and 5 Ph. and M. cap. 5. 29 Eliz. cap. 20. 1 Jac. I. cap. 8. 7 Jac. I. cap. 7. 21 Jac. I. cap. 18. 12 Car. II. cap. 27. 1 Anne. 7 Anne, cap. 13. 10 Anne, cap. 16. 1 Geo. I. cap. 15. 11. CLOUD, in *Phyſiology*, a collection of condenſed vapour, ſuſpended in the atmoſphere.

A *cloud* is a congeries of watery particles, or veſiculæ raiſed from the waters, or watery parts of the earth, by the ſolar, or ſubterraneous, or electrical fire; which at their firſt riſe from our globe, are too minute, and too much ſeparated by their mutual repulſion, to be perceived; but as they mount, meeting with a greater degree of cold, loſing their electricity, or by any other proceſs which nature employs for this purpoſe, are condenſed and rendered opaque, by the reunion of their parts; ſo as to reflect light, and become viſible. For the manner wherein vapours are raiſed into *clouds.* See Evaporation.

Theſe vapours, however raiſed, being ſpecifically lighter than air, mount in it, till having reached ſuch a region of the atmoſphere as is of the ſame ſpecific gravity with themſelves, they will be ſuſpended; till the watery veſicles, which were at firſt too thin to be perceived, being now condenſed by the cold of the ſuperior regions; and conſequently the parts ſet cloſer together; their denſity is firſt augmented ſo as to render them opaque enough to reflect the ſun's light, and become viſible; and their ſpecific gravity increaſed, ſo as to make them deſcend: in the former ſtate they are called *clouds*; and in the latter, when they arrive at us, rain.

Clouds, beſide their uſe when they deſcend in ſhowers, are of ſervice, while ſuſpended in the atmoſphere; as they help to mitigate the exceſſive heat of the torrid zone, and ſcreen it from the beams of the ſun, eſpecially when in his zenith.

From the obſervable motions of the *clouds* it appears, that there are different currents in the air at the ſame time, and in the ſame quarter, under one another. Phil. Tranſ. N° 458. p. 537.

Clouds, *Magellanic.* See Magellanic *clouds.*

CLOUDBERRY. See Chamæmorus.

CLOVE-*Tree*, Caryophyllus, in *Botany*, a genus of the *polyandria monogynia* claſs. Its characters are theſe: it hath a double empalement; the flower is of one leaf, cut into four obtuſe parts, upon which the germen is ſituated: the fruit hath another empalement, which is ſmall, and ſlightly divided into four parts, which are permanent. The flower hath four blunt petals, and hath many ſtamina. The germen is ſituated under the flower, which afterwards becomes a ſoft berry with two cells, each containing a kidney-ſhaped ſeed. There are five ſpecies.

The fruit is ſomewhat in form of a nail; whence the term *clove*, from the French *clou*, nail.

The *clove-tree* was anciently very common in the Molucco iſlands; where all the European nations, who traffic in ſpices to the Indies, furniſhed themſelves with what quantity of *cloves* they required. At preſent there are ſcarce any found but in the iſland of Ternate: the Dutch, in order to render themſelves maſters of that merchandize, having dug up the *clove-trees* of the Moluccos, and tranſplanted them to Ternate; ſo that there are none now to be had but through their hands.

The tree is very large; its bark reſembles that of the olive-tree, and its leaves thoſe of the laurel: its fruit falling, takes root, and thus it multiplies itſelf without any culture. It is ſaid, it will not allow any other herb, or tree, to grow near it; its exceſſive heat drawing to it all the humidity of the ſoil.

When the *clove* firſt begins to appear, it is of a greeniſh-white colour; as it ripens, it grows brown. Nor is there any preparation neceſſary in order to render it ſuch as it comes to us, but to dry it in the ſun; whatever ſome authors talk of firſt ſteeping it in ſea-water, to preſerve it from worms.

In the inſide of a *clove* are found a ſtyle and ſtamina, with their apices; and towards the larger end, there ſhoot out from the four angles, four little points like a ſtar; in the middle of which is a round ball, of a lighter colour than the reſt, compoſed of four ſmall ſcales or leaves, which ſeem to be the unexpanded petals of the flower.

Cloves muſt be choſen dry, brittle, harſh to the touch, well grown, of a duſky-reddiſh colour, a rough aromatic taſte, an agreeable ſmell, and, if poſſible, with the ſhank on.

This ſpice acquires weight by imbibing water, which it will do at ſome conſiderable diſtance. The Dutch, who trade in *cloves*, make a conſiderable advantage by knowing this ſecret. They ſell them always by weight; and when a bag of *cloves* is ordered, they hang it ſeveral hours before they ſend it in, at about two feet diſtance over a veſſel of water. They carefully watch the time when the *cloves* have imbibed the proper quantity, that the fraud may paſs undiſcovered. This will add many pounds to the weight, which the unwary purchaſer pays for on the ſpot. This is often practiſed in the ſpice iſlands, and ſometimes in Europe: but the degree of moiſture muſt be more carefully watched in the former place; for there a bag of *cloves* will in one night's time attract ſo much water, that it may be preſſed out of them by ſqueezing them with the hand.

Cloves are the hotteſt and moſt acrid of aromatic ſubſtances, and their properties are, to warm and dry, to correct a fetid breath, to ſharpen the ſight, diſſipate films in the eyes, fortify the ſtomach and liver, and ſtop vomiting. They are uſed in apoplexies, palſies, lethargies, and other diſeaſes of the brain.

Such of the fruit as eſcape the gatherers, grow and ſwell on the tree, and become full of a gum; theſe are ſometimes uſed in medicine, and are called *mother of cloves.*

There is alſo an oil drawn from *cloves* by diſtillation, moderately pungent; which, when new, is of a pale-yellow colour, but reddens as it grows old: it is uſed in medicine as a ſovereign remedy for the tooth-ach, and in compoſitions with the ſame view as the fruit. It is alſo much uſed among the perfumers.

No plant, nor any part of any plant contains ſo large a proportion of eſſential oil as *cloves*; and this oil is heavier than water. From ſixteen ounces of *cloves* Neumann obtained, by diſtillation, two ounces and two drams; and Hoffman obtained from the ſame quantity an ounce and a half. The pungency of *cloves* is owing to a combination of reſin with eſſential oil.

The oil of *cloves* met with in the ſhops, and obtained from the Dutch, is highly acrimonious; but this is not the genuine diſtilled oil of *cloves*. It probably derives its acrimony and high colour from a mixture of the reſinous part of the *clove*. Dr. Lewis, in his Mat. Med. obſerves, that the common oil, as being the moſt pungent, is beſt adapted for external purpoſes, and the genuine oil for thoſe of an internal aromatic.

The natives call the *clove-tree chamque*, the Perſians and Arabs *karumfel*, and the Turks *kalafour*. They make ſeveral preparations both of the flowers, and the fruit. See Antophyllus.

Clove-Cinnamon. See Cinnamon.

Clove-Water, is prepared of brandy, and cloves bruiſed therein and diſtilled.

Clove, in *Commerce*, is uſed for the two and thirtieth part of a weigh of cheeſe, i. e. eight pounds. 9 Hen. VI. cap. 8. See Weigh.

Clove-*july-flowers*, a ſpecies of caryophyllus, greatly recommended as cordials, and given in diſorders of the head, palpitations of the heart, and in nervous complaints of all kinds. See Pink.

Clove-*tongue*, a name uſed by ſome Engliſh writers, for the common black hellebore, the root of which is uſed in medicine.

CLOVER-*graſs.* See Trefoil.

CLOUGH, or *draught*, in *Commerce*, an allowance of two pounds in every hundred weight for the turn of the ſcale; that the commodity may hold out weight when ſold out by retail.

CLOUT-NAILS. See Nail.

CLOUTS, in *Gunnery*, are thin plates of iron nailed on that part of the axle-tree of a gun-carriage, which comes through the nave, and through which the linſpin goes.

CLOWN's *wound-wort*, in *Botany.* See Iron-*wort.*

CLOYED. The ſeamen, when any thing is got into the touch-hole of a great gun, ſo that they cannot with a priming-iron make way for the powder to be put in to prime it, ſay *the touch-hole is cloyed:* wherefore when guns are nailed, &c. they ſay they are *cloyed.*

CLUB-*antennæ*, in *Natural Hiſtory*, a name given by naturaliſts to ſuch of the horns or *antennæ* of butterflies as repreſent a *club*, being larger at the extremities than at the origin.

CLUNY, or Clugni, a celebrated abbey of Benedictine monks, in a city of that name in France; being the head, or chief of a congregation denominated from them.

It is ſituated in the Maſonnois, in the province of Burgundy, on the river Rhone; and was founded by William duke of Berry and Aquitain; or, as others ſay, by the abbot Berno, ſupported by that duke, in the year 910: but owed its diſtinguiſhed reputation to Odo, who was created abbot of *Cluny* in 927.

This order of monks was brought into England by William earl of Warren, ſon-in-law to William the Conqueror, who built a houſe for them at Lewes in Suſſex, about the year 1077. There were twenty-ſeven priories and cells of this order in England, which were governed by foreigners, aſterwards made denizens.

CLUE *of a ſail*, &c. See Clew.

CLUPEA, in the *Artedian Ichthyology*, the name of a fiſh, the characters of which are theſe: it is one of the order of the *malacopterygii*, or ſoft-finned kind: and in the Linnæan ſyſtem of the *abdominales*, under which are claſſed eleven different ſpecies. The branchioſtege membrane contains on each ſide eight bones. The belly is very acute, or, as it were, ſerrated, from the ſingular ſituation of the ſcales; and the back-fin is placed ſomewhat nearer to the ſnout than to the tail.

There are four ſpecies of this genus, enumerated by Artedi; of which the firſt is our common *herring*, the ſecond, the *ſprat*, the third, the *ſhad*, and the fourth, the *anchovy*. See *Tab. of Fiſhes*, N° 39.

CLUSIA, in *Botany*, the balſam-tree, a genus of the *polygamia monoecia* claſs. Its characters are theſe: the flower hath five large roundiſh concave ſpreading petals: in the bottom is ſituated a globular nectarium, including the germen, which is pervious at the top. It hath a great number of ſingle ſtamina: the oblong oval germen is terminated by a plain ſtar-like ſtigma, with ſix obtuſe indentures, which afterward becomes an oval capſule, with ſix furrows and ſix cells, opening with ſix valves, which ſpread in form of a ſtar, including many angular ſeeds fixed to a column, ſurrounded with pulp. There are two ſpecies, natives of the ſouthern parts of America.

CLUSTER-*polype*. See Polype.

CLUTIA, in *Botany*, a genus of the *dioecia gynandria* claſs, and deriving its name from *Clute*, a curious botaniſt. Its characters are theſe. It is male and female in different plants, the male flowers have five heart-ſhaped petals, which are ſhorter than the empalement, and ſpread open. They have five exterior nectariums, which are ſituated in a circle at the bottom of the petals, and five interior, which are ſituated within the other: they have five ſtamina ſituated in the middle of the ſtyle. The female flowers have petals like thoſe of the male; theſe have five double exterior nectariums, but no interior: they have a roundiſh germen which afterward becomes a globular capſule, with ſix furrows and three cells, each containing a ſingle ſeed. There are four ſpecies.

CLYDON, from κλυζω, *I cauſe to fluctuate*; in *Medical Writers*, is uſed for the fluctuation of food taken into the ſtomach, ariſing from the laxity or weakneſs of its fibres, and of the abdominal muſcles.

CLYMENUM, in *Botany*, the name of a genus of plants, the characters of which are in all reſpects the ſame with thoſe of the lathyrus; only in this plant there grow but two leaves on each rib, whereas on the *clymenum* there are ſeveral pairs; the rib finally terminating in a clavicle or tendril. Tournefort enumerates three ſpecies. Inſt. p. 396.

CLYPEOLE, in *Botany*, treacle muſtard; a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the flower hath four oblong entire petals, placed in form of a croſs, and ſix ſtamina; two of which ſtanding oppoſite, are ſhorter than the other. In the center is ſituated a roundiſh compreſſed germen, which afterwards becomes an orbicular pod, compreſſed, erect, and indented at the top, with a longitudinal fiſſure, opening in two cells, containing round compreſſed ſeeds. There are four ſpecies, natives of the ſouthern parts of Europe.

CLYPEUS, or Clypeum, *Buckler*; a piece of defenſive armour, which the ancients uſed to carry upon the arm, to ſecure them from the blows of their enemies.

The figure of it was either round, oval, or ſexangular: in the middle was a boſs of iron, or of ſome other metal, with a ſharp point. See Shield.

CLYSSUS, a chemical production, conſiſting of the moſt efficacious principles of any body, extracted, purified, and then remixed.

A *clyſſus* is when the ſeveral ſpecies, or ingredients of a body, are prepared and purified ſeparately, and then combined again. Thus, ſalt, ſulphur, oil, ſpirit, and mercury, reaſſembled into one body, by long digeſtion, &c. make a *clyſſus*.

Clyssus *of Antimony*, denotes the vapours reſulting from the detonation of nitre with *antimony*.

Clyssus *of Nitre*, ſignifies the vapours ariſing from the detonation of *nitre* with charcoal.

Clyssus *of Sulphur*, denotes an acid liquor obtained by the detonation of *ſulphur* with nitre, and is ſimilar to that of antimony. Particular virtues were formerly aſcribed to theſe liquors, of which they are now found to be deſtitute.

The rapidity and violence with which NITRE detonates in certain circumſtances, may occaſion a violent exploſion, and the rupture of the veſſels. To prevent ſuch accidents, and the diſagreeable conſequences of them, the inflammable matter ſhould not be very intimately mixed with the nitre, the DETONATION of which is proportionably ſtronger and quicker as the mixture is more exact and entire; a ſmall quantity only of the mixture ſhould be detonated at a time, and no addition ſhould be made till the detonation of the firſt ſmall quantity be altogether finiſhed.

There is alſo a *clyſſus* of vitriol, which is a ſpirit drawn by diſtillation from vitriol diſſolved in vinegar. This is uſed by phyſicians in various diſeaſes, and to extract the tinctures of ſeveral vegetables.

Clyssus is alſo uſed among ſome authors for a kind of *ſapa*, or extract, made with eight parts of the juice of a plant, and one of ſugar, ſeethed together into the conſiſtence of honey.

CLYSTER, in *Medicine*, a liquid remedy, or injection, introduced into the inteſtines by the fundament; in order to refreſh them, looſen the belly, moiſten and ſoften the fæces, diſſipate wind, &c.

The word comes from κλυζω, *lavo, abluo, I waſh.*

Clyſters are ſometimes made of bran-water and milk, but more uſually of decoctions of certain herbs; to which are added honey, brown ſugar, and ſometimes lenitive electary, and other drugs. *Clyſters* are emollient, carminative, lenitive, aſtringent, laxative, anodyne, uterine, antifebrific, nouriſhing, &c.

In Holland, England, and Germany, *clyſters* are given by means of a pipe of ivory faſtened to a bladder, the patient being made to lie on one ſide, and to retain the liquor as long as he is able. The French, and ſome other nations, uſe a ſort of ſyringe, holding a pint, or more, for this purpoſe; and this is evidently the better method, as, by this means, liquors are not only more quickly, but more forcibly thrown into the inteſtines, and are made to paſs farther than by the Engliſh method. Some alſo uſe a leather pipe of half an ell long, which is faſtened to the ſyringe, and to the pipe introduced into the anus, and by this means the patient can give himſelf the *clyſter*.

Great care muſt be taken in adminiſtring *clyſters*, that the liquor be neither too hot nor too cold, but only tepid, or moderately warm, both extremes being capable of doing great injury to the bowels.

Clyſters are properly uſed, 1. Where a coſtive ſtate is to be removed, and the body rendered ſoluble. 2. For alleviating the pains ariſing from the colic, ſtone, dyſentery, violent hæmorrhoids, and other diſorders of the abdomen. 3. For making revulſions from the head in apoplexies, lethargies, deliriums, and other diſorders of that part. 4. In difficult labours, whether the fœtus be dead or alive, eſpecially if the mother be coſtive, as alſo for expelling the ſecundines, when they adhere too firmly to the womb, or remain longer behind than they ought. 5. *Clyſters* are able to nouriſh perſons, who, from their power of deglutition being impaired, muſt otherwiſe periſh of hunger; and for this purpoſe nouriſhing liquors muſt be uſed, ſuch as broths, and the like, to which a little wine may be added, if the nature of the caſe will allow it.

A very remarkable *clyſter*, which ſeems to have been invented by the Engliſh, and, from us, propagated to other nations, is the ſmoak of tobacco. When all other *clyſters* have proved ineffectual for rendering the body ſoluble, in the iliac paſſion, and ſome other caſes, the end has ſometimes been obtained by injecting a large quantity of the ſmoak of tobacco, by means of a proper inſtrument. There are ſeveral kinds of inſtruments invented for this purpoſe, and deſcribed by Bartholine, Valentini, and others. The general method of making them is this: a box is provided, capable of holding about half an ounce of tobacco; this has two pipes, the one made of ivory, to be introduced into the anus, the other reſembles the mouth-piece of ſome muſical inſtruments, and, by means of blowing into this, the ſmoak of the lighted tobacco in the box is driven forcibly up the anus:

this is to be continued till the patient find a ſtrong ſtimulus to go to ſtool, and if once doing it does not produce the effect, it is to be repeated till it ſucceeds. This is of prodigious ſervice in obſtinate incarcerated hernias of the ſcrotum. And Heiſter obſerves, that he always found it ſucceed ſo well, as never to reduce him to a neceſſity of having recourſe to the knife. When tobacco alone will not anſwer the purpoſe, other more ſtimulating ingredients may be added to it in the box; and this acrid ſmoak ſo contracts the diameters of the inteſtines, that the prolapſed ones are much more eaſily drawn back into the abdomen, than they otherwiſe could be. See FUMIGATOR.

Clyſters of the liquid kind are prepared of different ingredients, according to the intentions propoſed to be anſwered, and as, in practice, thoſe intentions are principally four, to alter and change, to evacuate, to corroborate, and to mitigate pain; ſo *clyſters* are accordingly contrived to ſoften the indurated fæces, to correct the acrid, acid, and ſaline recrements, to evacuate the contents of the large inteſtines, and to corroborate the weak and languid fibres of the inteſtines in general, and ſo ſtrengthen their periſtaltic motion; or laſtly, to mitigate the ſpaſms of their contracted coats, and relax their conſtricted fibres.

When *clyſters* are intended to lubricate and ſoften the dry and indurated fæces, or to obtund acrid, ſaline, corroſive, and acid humours, in the large inteſtines, they are to be prepared with the emollient ingredients, ſuch as broths, milk, decoctions of emollient herbs, as marſhmallows, and the like, with manna, oil, and the like aſſiſtances; and, as all theſe ingredients have a power of relaxing ſpaſms, as well as of ſoftening the fæces, *clyſters* of this kind are extremely beneficial in all ſpaſmodic diſorders, fevers, pains, and caſes where the patient is coſtive, whether it be from ſpaſms of the inteſtines, or from induration of the fæces.

When the intention is at once to evacuate the inteſtines, and to carry off ſtagnant humours, then ſalts, added to the decoctions, admirably anſwer the end. Glauber's ſalt, Epſom ſalt, and ſal gem, are all uſeful for theſe purpoſes: in ſome caſes alſo ſal ammoniac; and experience ſhews, that half an ounce of one of theſe ſalts, in a *clyſter*, will do more toward evacuating the contents of the bowels, than four ounces of any of the common purging electaries. Corroborating *clyſters* are to be prepared of the four greater hot ſeeds, bay and juniper-berries, the carminative oils, &c. and in violent diſorders of the head, ſuch as apoplexies, palſies, lethargies, and the like, rue, marjoram, thyme, roſemary, and lavender flowers, are conveniently added to *clyſters*: as are mugwort, pennyroyal, feverfew, and the like. When there is any diſorder of the womb, or ſuppreſſion of the menſes, the clyſters of the ſedative kind are principally to be compoſed of oil, or the like fatty ingredients, and ſuch as conſiſt purely of oil alone, are found often to do wonders, in allaying the moſt violent pains.

CLYSTERS, *Nouriſhing*, are thoſe applied with deſign to nouriſh perſons who cannot take in any aliment at the mouth. Hildanus tells us, that Aubery, a phyſician, fed a woman of quality ſix weeks with *clyſters* compoſed of capons fleſh, and other fowls, boiled to a pulp, with yolks of eggs, applied twice a day. It is difficult, however, to conceive how *clyſters* ſhould nouriſh; and the caſe is briſkly controverted in the Memoirs of the French Royal Academy, between M. Littre, who maintains the negative, and M. Lemery.

The arguments uſed by the firſt, are, that the materials of the *clyſter*, for want of the ordinary paſſage, want the preparation neceſſary to be converted into nouriſhment; and beſide that, are out of the road for getting into the blood: for in the firſt of the large inteſtines, called the *cæcum*, is a valve called *valvula Baubini*, to oppoſe the paſſage of any food into the ſmall inteſtines: and there are no lacteal veins in the large inteſtines, but abundance in the ſmall ones. But the lacteals are the only canals that can carry the chyle into its receptacle, and the chyle is the only ſubſtance that can nouriſh.

To this, M. Lemery objects, that very great anatomiſts have found lacteals in the large inteſtines, though but in ſmall numbers: but though there were none, adds he, the meſeraic veins are indiſputably diſtributed to theſe inteſtines; and may eaſily be ſuppoſed to pump up the moſt ſubtil part of a broth, and carry it into the blood. M. Merry has paſſed a liquor immediately from the large inteſtines into theſe veins: beſides, the animal machine is ſo porous throughout, that nature ſeems to have intended an extraordinary way of conveying fluids into the blood, to be ready on extraordinary occaſions.

This notion will appear inconteſtible, if M. Morin's theory of the paſſage of the urine be admitted.

Herodotus ſays, the Egyptians were the firſt who invented *clyſters*; or rather, who applied them to uſe. Galen and Pliny add, that they took the hint from a bird of their country, called *ibis*, which they frequently obſerved to make this kind of injection with its beak, and afterwards to diſcharge itſelf ſeveral times Others ſay, that the *ciconia*, or ſtork, firſt taught men the application of *clyſters*.

CLYSTERS, *Uterine*, are injections into the uterus, or womb.

CLYSTERS, *Catholicon for*. See CATHOLICON.

CNEMODACTYLÆUS, in *Anatomy*, a muſcle, otherwiſe called *extenſor tertii internodii digitorum*. See EXTENSOR *tertii internodii*, &c.

CNEORUM, in *Botany*, *widow-wail*; a genus of the *triandria monogynia* claſs. Its characters are theſe: the flower hath three narrow oblong petals, and three ſtamina which are ſhorter than the petals. In the center is ſituated an obtuſe three-cornered germen, which afterward becomes a globular dry berry with three lobes, having three cells, each containing one round ſeed. We have but one ſpecies.

CNICUS, in *Botany*, *Bleſſed Thiſtle*; a genus of the *ſyngeneſia polygamia æqualis* claſs. Its characters are theſe: the empalement of the flower is ſcaly; the flower is compoſed of ſeveral hermaphrodite florets, which are uniform; theſe are funnel-ſhaped, and cut at the top into five equal ſegments, having five ſhort hairy ſtamina. In the centre is ſituated a ſhort germen crowned with down, which afterward becomes a ſingle ſeed crowned with down, and ſhut up in the empalement. There are four ſpecies.

The firſt ſort is the *carduus*, which is uſed in medicine; This is an annual plant, which periſhes ſoon after the ſeeds are ripe. It grows naturally in Spain, and in the iſlands of the Archipelago, but is cultivated in gardens in England to ſupply the market. This plant is ſo well known as to require no deſcription. See *Tab. of Botany*, *Claſs* 12.

COA, in *Natural Hiſtory*, the name given by Plumier to a genus of plants, called by Linnæus HIPPOCRATEA.

COACERVATUM *vacuum*. See VACUUM.

COACH, a vehicle for commodious travelling, ſuſpended on leathers, and moved on wheels.

In England, and throughout Europe, the *coaches* are drawn by horſes, except in Spain, where they uſe mules. In a part of the Eaſt, eſpecially the dominions of the great Mogul, their *coaches* are drawn by oxen. In Denmark they ſometimes yoke rein-deer in their *coaches*; though this is rather for curioſity than uſe.

The *coachman* is ordinarily placed on a ſeat raiſed before the body of the *coach*. But the Spaniſh policy has diſplaced him in that country by a royal ordonnance; on occaſion of the duke d'Olivares, who found that a very important ſecret whereon he had conferred in his *coach*, had been overheard, and revealed by his coachman: ſince that time, the place of the Spaniſh coachman is the ſame with that of the French ſtage-coachman, and our poſtillion, viz. on the firſt horſe on the left.

The invention of *coaches* is owing to the French: yet they are not of any great antiquity even in France; ſcarce reaching earlier than the reign of Francis I.

Their uſe, at their firſt riſe, was only for the country: and authors obſerve, as a thing very ſingular, that there were at firſt no more than two *coaches* in Paris; the one that of the queen, and the other that of Diana, natural daughter of Henry II. The firſt courtier who had one, was Jean de Laval de Bois Dauphin, whoſe enormous bulk diſabled him from travelling on horſeback.

Coaches were firſt introduced into England in 1580, by Fitz-Allen, earl of Arundel, and they were in general uſe by the nobility and gentry at London about the year 1605. Anderſon's Hiſt. Com. vol. i. p. 421, 469.

Coaches have had the fate of all other inventions to be brought by ſteps and degrees to their perfection; at preſent they ſeem to want nothing, either with regard to eaſe, or magnificence.

Louis XIV. of France made ſeveral ſumptuary laws for reſtraining the exceſſive richneſs of *coaches*, prohibiting the uſe of gold, ſilver, &c. therein; but they have had the fate to be neglected.

Coaches may be divided into two kinds; thoſe that have iron bows, or necks, and thoſe that have not; both the one and the other hath two principal parts, the body, and the train, or carriage. See CRANE-*neck*, and PERCH.

The *body* is that part where the paſſengers are diſpoſed; and the *carriage* is that which ſuſtains the body, and to which the wheels are faſtened, that give motion to the whole machine.

Coaches are diſtinguiſhed, with regard to their ſtructure, into *coaches*, properly ſo called, *chariots*, *calaſhes*, and *berlins*. With regard to the circumſtances of their uſe, &c. we diſtinguiſh *ſtage-coaches*, *hackney-coaches*, &c.

Chariot, or *Half*-COACH, is a kind of *coach* that has only a ſeat behind; with a ſtool, at moſt, before. When theſe are very gay, richly garniſhed, and have five glaſſes, they are called CALASHES.

Hackney-COACHES, thoſe expoſed to hire, in the ſtreets of London, and ſome other great cities, at rates fixed by authority.

Theſe firſt began to ply in the ſtreets of London, or rather waited at inns, in 1625, and were only twenty in number: but they were ſo much increaſed in 1635, that king Charles iſſued an order of council for reſtraining them. In 1637 he allowed fifty *hackney-coachmen*, each of whom might keep twelve horſes. In 1652 their number was limited to two hundred, and in 1654 extended to three hundred. In 1661 four hundred were licenſed at 5 l. annually for each. In 1694 ſeven hundred were allowed, and taxed by the 5 and 6 W. and M. at 4 l. per annum. each.

Thoſe in London are under the direction of commiſſioners, who take cognizance of all cauſes and diſputes ariſing thereupon.

By 9 Anne, cap. 23. eight hundred hackney-*coaches* were allowed in London and Weſtminſter; but by 8 Geo. III. cap. 24. the number is increaſed to one thouſand; which are to be licenſed by commiſſioners, and pay a duty of 5 *s.* a week for each licence to the crown: and if any perſon drive a hackney-*coach* without licence, he ſhall forfeit 5 *l.* And coachmen uſing abuſive language, or demanding more than their fare, are liable to a penalty not exceeding 20 *s.*

The ſtat. 1 Geo. I. cap. 57. ordains, that where coachmen refuſe to go at, or exact more for their hire than is limited by the act, they ſhall forfeit not exceeding 3 *l.* nor under 10 *s.* and the commiſſioners have power to determine it. The fare of hackney coachmen in London, or within ten miles thereof, is 12 *s.* 6 *d.* per day, allowing twelve hours to the day; and by the hour, not above 1 *s.* 6 *d.* for the firſt, and 1 *s.* for every hour after; and none are obliged to pay above 1 *s.* for the uſe of any hackney *coach* for any diſtance, not mentioned in the act, which is not above one mile and four furlongs; nor above 1 *s.* 6 *d.* for any diſtance not exceeding two miles. Coachmen are to have numbers on their *coaches*, on tin plates, or ſhall forfeit 5 *l.* and refuſing any perſon to take the number of their *coaches*, or giving a wrong number, incurs the forfeiture of a ſum not exceeding 40 *s.* None but licenſed *coaches* ſhall ply at funerals for hire, under the penalty of 5 *l.* Drivers of hackney *coaches* are to give way to perſons of quality, and gentlemen's *coaches*, on the penalty of 10 *s.* By 8 Geo. III. cap. 28. every hackney-*coach* is to be provided with cheque-ſtrings; and every coachman plying without them, incurs a penalty of 5 *s.* On Sundays there were formerly only a hundred and ſeventy-five *coaches* to ply, which were to be appointed by the commiſſioners; but their number is now unlimited.

COACHES, *ſtage*, are thoſe appointed for the conveyance of travellers from one city or town to another; and theſe, as well as other coaches, chaiſes, &c. with four wheels, pay an annual tax of 5 *l.*

COACH, in *Sea Language*, denotes a chamber or apartment near the ſtern, in a ſhip of war.

COADJUTOR, *Fellow-Helper*, is properly uſed for a prelate joined to another, to aſſiſt him in the diſcharge of the functions of his prelature; and even, in virtue thereof, to ſucceed him.

The *coadjutor* has the ſame privileges with the biſhop himſelf. *Coadjutors* were formerly appointed by kings, for archbiſhops and biſhops grown old, or abſent, and not able to ſuperintend their dioceſes. But the right of appointing *coadjutors*, in Romiſh countries, is now reſerved to the pope alone.

Coadjutors are alſo called biſhops *in partibus infidelium*; becauſe it is neceſſary the *coadjutor* of a biſhop ſhould be a biſhop himſelf; without which, he cannot diſcharge the office.

The uſe of *coadjutors* in the church, is borrowed from the Roman empire. Symmachus ſpeaks of aſſiſtants, or *coadjutors*, given to magiſtrates; and calls them *adjutores publici officii*.

The popes, formerly, made a ſhameful abuſe of the *coadjutories*: ſome they granted to children, and young people, with this clauſe, *donec ingreſſus fuerit: till they were capable of entering upon the adminiſtration of the office.* Others they granted to perſons not in orders, with this clauſe, *donec acceſſerit*: and others to perſons at a great diſtance, with this clauſe, *cùm regreſſus*: but the council of Trent tied down the pope's hands, by adding abundance of reſtrictions on the article of *coadjutors*.

In nunneries they have *coadjutrixes*; who are religious, nominated to ſucceed the ABBESS, under pretence of aiding her in the diſcharge of her office.

COADUNATÆ, in *Botany*, an order of plants in the *fragmenta methodi naturalis* of Linnæus.

COAGMENTATION, is uſed, among *Chemiſts*, for the act of melting down a matter, by caſting in certain powders, and afterwards reducing the whole into a concrete, or ſolid.

COAGULABLE *lymph of the blood.* See LYMPH.

COAGULATION, in *Chemiſtry*, denotes certain operations, in which fluid bodies become ſolid; as, for example, the CHRYSTALLIZATION *of ſalts*. In a general ſenſe, it ſignifies the condenſing, or thickening of a fluid matter, without its loſing any of the ſenſible parts which occaſioned its fluidity; as we frequently ſee in blood, milk, &c.

We diſtinguiſh between that kind of thickening which is effected by the evaporation of the fluid parts of a body, as in clay, which condenſes in the ſun, properly called *hardening*; and that effected without any loſs of its ſubſtance, called *coagulating*. Thus, we ſay, that cold *coagulates* blood, &c.

There is one general term, viz. *concretion*, which includes *coagulation*, condenſation, and hardening.

By injecting an acid into the vein of an animal, the blood coagulates; which ſtops its circulation, and brings immediate death. Several poiſons have their effect by inducing a *coagulation*.

COAGULATION is performed by ſix different agents in the general operations in chemiſtry, and by each of theſe in ſeveral ways.

1. It is performed with water, by congealing, cryſtallizing, and precipitating; as in the *mercurius vitæ*, and ſome other ſuch preparations.

2. With oil, which, by the force of fire, unites to itſelf ſulphur, ſalts, and metals.

3. With alcohol, upon the ſpirit of ſal ammoniac, the white of eggs, the ſerum of the blood, &c.

4. With acid and alkali, growing ſolid together, as in the *tartarum vitriolatum*.

5. With fixed alkali, as in milk. And, 6. With acid ſalts, as in milk, ſerum, and whites of eggs.

COAGULUM, the *coagulum* of the Latins, the ϖιτυα, and the ταμισος of the Greeks, are the ſame with what in Engliſh we call rennet. See RENNET.

COAGULUM, in *Chemiſtry*, denote curdled concretions formed by the mixture of two liquors; ſuch as the precipitate of ſilver in the formation of LUNA *cornea*, &c.

COAGULUM *aluminoſum*, *alum-curd*, a form of medicine, preſcribed long ſince by Riverius, and now taken into the London diſpenſatory. It is ordered to be made by putting whites of eggs into a pewter or earthen veſſel, and ſtirring them about with a large lump of alum till they are coagulated.

COAK denotes a ſort of foſſil *coals* that have undergone a ſimilar operation to that of charring; whereby they are deprived of their phlegm, acid, and the greateſt part of their oil; and are therefore uſed in furnaces for ſmelting iron ore, and for drying malt.

COAL, a black, ſulphureous, inflammable matter, dug out of the earth; ſerving in many countries as the common fuel.

This we ſometimes call *pit-coal*, *foſſil-coal*, *earth-coal*, and *natural coal*, to diſtinguiſh it from an artificial fuel made in imitation hereof, by half burning the branches and roots of trees; properly called *charcoal*, and *ſmallcoal*: in places, whither *coal* is brought by ſea, it is called *ſea-coal*. *Coal* is one of the claſs of opake inflammable foſſils, and is diſtinguiſhed from the reſt by being of a gloſſy hue, ſoft, friable, not fuſible, but eaſily inflammable, and leaving, after burning, a large reſiduum of whitiſh aſhes. We have three ſpecies of this foſſil in common uſe for our fuel in different parts of the kingdom. 1. A hard duſky black coal. This is in common uſe with us, under the name of *Scotch coal* (though that name is not reſtrained to this ſpecies alone, but the following is indiſcriminately known among the dealers by the ſame appellation): this is uſually of a rough and duſty ſurface, and is leſs gloſſy, when freſh broken, than any other coal. It burns briſkly, and turns wholly to aſhes, not leaving any cinders. There is a vaſt deal of this dug about Lymington in Hampſhire, whence it is often called by the dealers *Lymington coal*. 2. A hard gloſſy coal. This is ſometimes ſold in London with the former, under the name of *Scotch coal*, but it is more determinately known in many parts of the kingdom by the name of *Welch coal*. It is diſtinguiſhed from the others by its great hardneſs, and gloſſy black, where freſh broken, and is much eſteemed for burning with leſs ſmoak than any other kind; and in ſome parts of this kingdom, and generally in Wales, they uſe it to make malt. 3. The third is our common *coal*, too well known to need any deſcription, but diſtinguiſhed from all the others by its ſhattery friable ſtructure, and its great gloſs when freſh broken. It is common in moſt countries of Europe; though the Engliſh *coal* is of moſt repute, even in foreign countries;

notwithſtanding ſome pretend that of the Foſſe in Auvergne not to be inferior to it.

The common *pit-coal* contains a large quantity of ſal ammoniac. The mouths of our ſubterranean fires in the *coal* countries all afford it, and it is even found in brick-kilns, where nothing but *coal* is burnt with the clay. It may appear ſtrange indeed to ſome, that this black ſubſtance ſhould yield ſo white and fine a ſalt; but chemiſts know, that all volatile ſalts whatever may be freed from their fœtor and intenſe colour, by tranſmuting them into a ſal ammoniac, by the mediation of an acid, as the ſpirit of ſalt, vitriol, or alum; after ſublimation with which, they become white, ſweet, and pure. The reaſon of this change is, that though the ſalts always carry over ſome of the fœtid oil with them in a ſtate of volatility, yet being thus in a manner fixed, the fœtid oil muſt by force of fire riſe firſt, leaving the ſubſequent ſal ammoniac without ſmell: though it is ſtill a doubt, whether the ſalt be the better or the worſe for this labour. Phil. Tranſ. N° 130.

The goodneſs of *coal* is found by its being as free as poſſible from ſulphur, in its heating iron well, and in its burning a long time in the ſmith's forge. The Engliſh *coal* has this property peculiar to it, that it never lights ſo perfectly, as when water is thrown on it.

The commerce of *coal* is very conſiderable in England; great quantities are exported to France, &c. by way of Rouen. The meaſure whereby it is ſold is the chaldron, containing thirty-ſix buſhels.

In the Memoirs of the French Royal Academy, we have an account of two experiments on the common *pit-coal*, made by M. Des Landes while in England, and which he thinks have eſcaped the Engliſh philoſophers.

1ſt, Pounding ſome *coal*, and putting half an ounce of it in a phial of water, the mixture became quite black: but leaving it expoſed to the air in a window, during a cold winter night, in the morning it was found frozen, and turned to a reddiſh colour. The reaſon of the change muſt be, that the froſt had diſengaged the ſulphurs of the *coal*; though one would little expect ſuch an effect from it.

2dly, From an infuſion of cinders in brandy, mixed with iron filings, ariſes a black tincture, which brightens in proportion as it is heated; when arrived at the heat of boiling, the colour becomes perfectly fine and ſoft, and gives a dye to cloth, which no workman can imitate.

The ſtrata, or veins of *coals* in *coal-pits*, are numerous, and their order, quality, &c. are very different in different places. In thoſe at Dudley in Staffordſhire, the ſtrata, below the turf, are two or three clays, a grey ſtone, and a hard grey rock; then they are expreſſed in the Philoſophical Tranſactions, to be, 1. *coal*, called *bench-coal*; 2. *ſlipper-coal*, leſs black, and ſhining than the former; 3. *ſpin-coal*, more black and ſhining; 4. *ſtone-coal*, much like *canal-coal.*

Theſe ſtrata have between each of them a bat, or bed, of a peculiar ſort of matter, about the thickneſs of a crown piece. Below theſe are divers metalline ſtrata; as a black ſubſtance, called the *dun-row bat*; a grey iron ore, called the *dun-row iron-ſtone*; a bluiſh bat, called *white-row*; a blackiſh iron ore, called *white-row grains*, or *iron-ſtone*; a grey iron ore, called *mid-row grains*; a black foſſil ſubſtance, called the *gublin-bat*; a black iron ore, called *gublin iron-ſtone*; a dark grey iron ore, called *rubble iron-ſtone*; and laſtly, the *table-bat.*

Then, 5. comes a coarſe ſort of *coal*, called *foot-coal*; a black brittle bat; 6. the *heathen-coal*; 7. a ſubſtance like coarſe *coal*; though called a *bat*, becauſe it does not burn well; and 8. *bench-coal.*

Coal, *Bovey*, ſo called from Bovey Heath in Devonſhire, where it is found. Dr. Milles, whoſe paper of remarks upon it is publiſhed in the Philoſophical Tranſactions, vol. li. part 2. N° 53. anno 1760, thinks it is the ſame with the foſſil wood, or as the miners call it, the foſſil coal deſcribed by Hollman, ibid. vol. xlix. p. 506. ib. N° 85.

Coal, *Canal.* See Ampelites.

Coal-*balls*, balls made of *coal* and clay, or flack, for firing. Theſe balls are made with $\frac{1}{3}$ of clay, without ſand or gravel, and $\frac{2}{3}$ of *coal-duſt*, or culm, well mixed, and formed either into round balls or into bricks. This *coal-duſt* being the refuſe of the mine, makes this ſort of firing cheap. See Phil. Tranſ. N° 460. ſect. 3.

Coal-*mines.*—Wilfully ſetting *coal-mines* on fire, is by ſtatute felony, without benefit of clergy. 10 G. II. c. 32. § 6.

Coal-*ſoot.* See Soot.

Coal-*ſpirit.* *Coals* diſtilled in a retort not only afford a phlegm, and black oil, but a ſpirit, which is apt to force the lute and break the glaſſes, and will catch fire at the flame of a candle. We are told that bladders may be filled with this ſpirit, which may be kept a conſiderable time. If the bladder be pierced with a pin, and ſqueezed near the flame of a candle, the ſpirit will take fire, and afford an amuſing ſpectacle. See Phil. Tranſ. N° 452. ſect. 5. See Damps.

Small-Coal is a ſort of charcoal, prepared from the ſpray, and bruſh-wood, ſtripped off from the branches of coppice-wood, ſometimes bound in bavins for that purpoſe, and ſometimes prepared without binding.

The wood they diſpoſe on a level floor, and ſetting a portion of it on fire, they throw on more and more, as faſt as it kindles; whence ariſes a ſudden blaze, till all be burnt that was near the place. As ſoon as all the wood is thrown on, they caſt water on the heap, from a large diſh, or ſcoop; and thus keep plying the heap of glowing *coals*, which ſtops the fury of the fire, while, with a rake, they ſpread it open, and turn it with ſhovels till no more fire appears. When cold, the *coals* are put up into ſacks for uſe.

COALESCENCE, the union or growing together of two bodies before ſeparate. It is principally applied to ſome bones in the body, which are ſeparate during infancy, but afterwards grow together; or to ſome morbid union of parts, which ſhould naturally be diſtinct from each other. Thus there is a *coaleſcence* of the ſides of the vulva, anus, and nares; of the eye-lids, fingers, toes, and many other parts.

COALITION, the re-union, or growing together of parts before ſeparated. See Conglutination, &c.

COAMINGS, in *Ship-Building*, are thoſe planks, or that frame, forming a border round the hatches, which raiſe them up higher than the reſt of the deck. Loop-holes for muſkets to ſhoot out at, are often made in the *coamings*, in order to clear the deck of the enemy when the ſhip is boarded.

COANE, among the Greeks, a name given to a peculiar ſpecies of *tutia* or tutty, which was always found in a tubular form. It had its name from κωνη, a word uſed to expreſs a ſort of cylindric tube, into which the melted braſs was received from the furnace, and in which it was ſuffered to cool. In cooling, it always depoſited a ſort of recrement on the ſides of the veſſel or tube, and this was the *tutty* called *coane.*

COAST, a ſea-ſhore, or the country adjoining to the edge of the sea.

Coast-*Mary*, or Cost-*Mary*, in *Botany.* See Tanzy.

COASTING, that ſort of navigation, wherein the places ſailed to and from, are not far diſtant; ſo that a ſhip may ſail in ſight of the land, or within ſounding, between them.

Such are the voyages on the Narrow, or Britiſh ſeas, between England, Holland, and France; alſo thoſe about the Britiſh ſeas, and in the Mediterranean, &c.

For the performance hereof, there is only required good knowlege of the land, of the time and direction of the tide, of the reigning winds, of the roads and havens, the uſe of the compaſs, and of the lead, or ſounding-line.

Coasting *Pilot.* See Pilot.

Coasting, in *Agriculture*, &c. denotes the tranſplanting of a tree, and placing it in the ſame ſituation, with reſpect to eaſt, weſt, north, &c. as it ſtood in before.

COAT, in *Anatomy.* See Tunic and Eye.

Coat *of Arms*, in *Heraldry*, a cloak, or habit, worn by the ancient knights over their arms, both in war, and at tournaments; and ſtill borne by the heralds at arms.

It was a kind of ſurcoat, reaching only as low as the navel; open at the ſides, with ſhort ſleeves; ſometimes furred with ermines and vair; whereon were applied the armories of the knight, embroidered in gold and ſilver, and enamelled with beaten tin, coloured black, green, red, and blue: whence the rule, never to apply colour on colour, nor metal on metal.

The *coats of arms* were frequently open, and diverſified with bands and fillets of ſeveral colours, alternately placed, as we ſtill ſee cloths ſcarleted, watered, &c. hence they were alſo called *divizes*, or *diviſes*, as being divided, or compoſed of ſeveral pieces, ſewed together; whence the words *feſſe*, *pale*, *chevron*, *bend*, *croſs*, *ſaltier*, *lozenge*, &c. which have ſince become honourable pieces, or ordinaries of the ſhield. See each in its place, Bend, Cross, Fesse, &c.

Coats of arms, and *banners*, were never allowed to be worn by any but knights, and ancient nobles. They were not introduced into seals, nor indeed to any other uſe, till about the reign of Richard I. who brought them from the croiſade in the Holy Land, where they were firſt invented and painted on the ſhields of the knights, to diſtinguiſh the variety of perſons from every nation, who, when completely clad in ſteel, could not otherwiſe be known. Blackſt. Com. vol. ii. p. 306.

Coat *of Mail*, *jacque de mail*, a kind of armour made in form of a ſhirt, conſiſting of iron rings wove together net-wiſe. See Mail.

Coat, in a *Ship*, a piece of tarred canvas put about that part of the maſts, or bowſprit, which joins to the deck, or lies over the ſtem of a ſhip. They are alſo put about the pumps at the decks, that no water may go down there; and they are alſo uſed at the rudder's head.

Coat likewiſe denotes the materials with which the ſhip's ſides and maſts are varniſhed, to preſerve them, as tar, &c.

COATI, in *Zoology*. See Rackoon.

COATING, in *Chemiſtry*. See Lorication.

Coating, in *Electricity*, denotes a covering of ſheet-lead, tin-foil, or any other conducting ſubſtance, applied to the Leyden phial, or to any electric body, and ſerving to accumulate the electricity, to increaſe the force of the charge, and to facilitate the operation of *diſcharging*. The firſt perſon who diſcovered the uſe of *coating* in electrical experiments, was Dr. Bevis: it was firſt applied to the Leyden phial, but has been ſince extended to a great variety of other electrical ſubſtances. When glaſs plates, or jars, ſufficiently wide at the neck, are to be *coated*, the beſt method is to *coat* them with tin-foil on both ſides, which may be fixed on the glaſs with varniſh, gum-water, bees-wax, &c. but if the internal *coating* cannot be conveniently introduced, braſs filings may be uſed, and ſtuck to the ſurface of the glaſs with gum-water, or bees-wax, &c. However, care ſhould be taken that the oppoſite *coatings* do not come too near to each other: that of glaſs jars ſhould be kept at the diſtance of, at leaſt, two inches from the top. Glaſs phials may be *coated* with ſilver, by burning it into the very ſubſtance of the glaſs, ſo that nothing can remove it without injuring the glaſs, together with the metal. Glaſs, thus *coated* and burniſhed, exhibits an elegant appearance, has no inequalities in its ſurface, and is capable of being charged as highly and readily, as when *coated* with tin-foil. Glaſſes of this kind will diſcharge ſpontaneouſly, and are apt to burſt by the exploſion. Phil. Tranſ. vol. lxvii. part i. p. 108.

Electric ſubſtances, which are eaſily melted, ſuch as reſin, ſealing-wax, &c. may be eaſily *coated* by pouring them on a circular plate of tin-foil, placed on a marble table, and two inches leſs in diameter than the electric plates propoſed; and then preſſing them with a pane of glaſs, or any thing elſe with a ſmooth ſurface, to the required dimenſions. When this is done, let another piece of tin-foil, of equal ſize with the former, be applied to the upper ſurface, by preſſing it gently with a hot iron. Electric ſubſtances in a fluid ſtate may be *coated* by fixing a piece of tin-foil to the bottom of an earthen diſh, reaching within an inch of the ſides, and by introducing, through a hole in the bottom, a ſlender wire, ſo as to communicate with the tin-foil; then pour the fluid electric into the diſh; and let a braſs plate of the ſame dimenſions with the tin-foil be ſuſpended from a glaſs arm, or from the prime conductor, and touch the ſurface of the electric. A plate of air may alſo be *coated*, by means of two ſmooth circular boards, about three or four feet in diameter: let one ſide of each of theſe boards be *coated* with tin-foil, which ſhould be paſted down, and burniſhed, and turned over the edge of the boards. Then inſulate the boards in an horizontal poſition, and with their *coated* ſides turned towards each other, and ſo diſpoſed, that they may be eaſily moved to or from each other. If theſe boards are placed at the diſtance of about an inch aſunder, they may be uſed exactly as the *coatings* of a pane of glaſs. It will be ſhewn, that the electric matter does not reſide in the *coating* of a charged electric under the article Leyden *Phial*.

COB *nut*. See Hazle.

COBALT, in *Natural Hiſtory*, a denſe, compact, and ponderous mineral, very bright and ſhining, and much reſembling ſome of the antimonial ores.

It is ſometimes found of a deep, duſky, bluiſh black, very heavy and hard, and of a granulated ſtructure, looking like a piece of pure iron, when freſh broken. At other times, it is more compact and heavy, of a very even texture, and not granulated, or compoſed of any ſeparate moleculæ, but reſembling a duſky maſs of melted lead, not an ore.

The inner part, when freſh cut or broken, is in ſome ores found much more beautiful than in either of theſe ſtates, being of a fine bright ſilvery grey, and of a beautiſul and evenly ſtriated ſtructure; the ſtriæ all running great lengths, but being all variouſly inflected and undulated, and in ſome parts broken. Theſe are the more uſual appearances of *cobalt* in its ore: but beſide theſe, it is ſubject to an alteration in the bowels of the earth, by means of ſubterraneous fires and ſulphur, which reduce it to a body which cannot be ſuppoſed at firſt ſight the ſame with *cobalt*, though it proves to be exactly the ſame ſubſtance, on a chemical analyſis.

In theſe ſtates, inſtead of the lead-like appearance of the common kind, it is of a fine florid red colour, though ſometimes debaſed by accidental mixtures to a grey, black, or yellow, either wholly, or in part; and in this ſtate it has two ſubordinate diſtinctions, as it appears ſometimes in form of a compact maſs of an uniform texture, and ſometimes in a ſtriated and beautifully ridged maſs, reſembling the fibraria. The three firſt ſtates of *cobalt* are commonly called *cobalt* ore, without any diſtinction; but the firſt of theſe red kinds is called by the Germans *kupfſer nicol*, and the latter, or ſtriated one, the flower of *cobalt*. It contains arſenic or ratſbane, and a fixt earth, which on fuſion with fluids and pot-aſh, or any other alkali ſalt, yields that fine blue glaſs which we call ſmalt, and which our painters and waſher-women uſe under the names of ſmalt and powder-blue. It is dug about Sneeberg and Annaberg, and in ſome parts of Bohemia. It is always found below, not mixt with the ores of metals, and is very rich in the arſenic in ſome places, and but poor in others: all our arſenic is made from it. The miners are directed where the veins of *cobalt* lie, by a ſort of foſſil which they call therefore the flower of *cobalt*: it is a very elegant ſubſtance, of a fine blooming red colour, and of a radiated ſtructure; ſometimes of a paler red, and in form of powder.

Cobalt is found in Germany, Saxony, Bohemia, England, and Scotland, and probably in other parts of Europe; and that it is in the eaſtern parts of Aſia, appears from the colouring on old oriental porcelain. Ours is but a poor kind, but is met with in conſiderable plenty on Mendip-hills, and at Giſennep in Cornwall. The German *cobalt* generally contains a large quantity of biſmuth, and the Bohemian of ſilver.

The world is obliged to Kunckel for the hiſtory of the ſeveral arſenics, zaffre, and ſmalt, which are all the produce of *cobalt*. See Arsenic, &c.

Cobalt, when expoſed for a conſiderable time by itſelf in a heap to the ſun and rain, yields an efflореſcence of a roſe or peach-bloſſom colour, called by the miners the flower of *cobalt*, and very much reſembling the native flowers of *cobalt* deſcribed before, but leſs beautiful: this effloreſcence, when properly treated, affords a very fine red colour for the painter's uſe, and a little green vitriol. Spirit of nitre diſſolves the *cobalt* with a violent efferveſcence; four times the quantity of the acid is ſufficient to diſſolve ſome *cobalt*, but other ores require ſix times or more: this is owing to the purity or impurity of the ore. The ſolution is of an uncertain colour, according to the other matters contained in the *cobalt*; when it contains vitriol it is blue, when it contains copper, as is often the caſe, but particularly in that kind called, by the miners, *copper nickle*, which has an appearance of copper on the ſurface, the ſolution is then green; it is alſo ſometimes green from the pureſt ores to appearance. This green colour reſembles very much that of ſalt of ſteel well purified, but it ſtill ſeems to have ſome ſhare of copper in it.

Oil of vitriol, and ſpirit of ſea-ſalt, act on *cobalt*, but do not properly diſſolve it: they may rather be ſaid to erode it, and particularly the acid of vitriol, which turns it into a white powder, ſo that ſpirit of nitre ſeems the proper ſimple ſolvent of it. Phil. Tranſ. Nº 396. p. 199.

The *cobalt* is roaſted in a reverberatory furnace, and the flowers, which it yields in great abundance, are collected in long wooden funnels, which ſupply the place of chimnies, on the inſide of which it ſticks in form of ſoot, and from this ſoot or flower are made all the ſeveral ſorts of arſenic or ratſbane. If this is only reſublimed, or but barely melted in a covered veſſel, the ſubſtance which we call white arſenic, or common ratſbane, is produced. If a tenth part of ſulphur be mixed with them, and they are ſublimed together, the product is our yellow arſenic; and the red arſenic is made by adding to the flowers only one fifth of ſulphur, and a little copper-ſlag.

When the flowers or ſoot of *cobalt* is all diſcharged, the remaining matter is powdered very fine, and being mixed with three times the weight of common flints in powder, and wetted with water, the whole concretes into a ſolid maſs, and is what is called zaffer.

Two parts of this being fuſed with three parts of common ſalt, and one part pot-aſh, the whole becomes a beautiful blue ſubſtance, called smalt.

As ſprinkling the powder of the calx of flints and *cobalt*, for making them into *zaffer*, gives them a pretty firm coaleſcenee, and even the hardneſs of a common ſtone, perſons who were unacquainted with the proceſs, have taken *zaffer* for a native mineral.

Cobalt is alſo uſed by ſome to expreſs that ſuffocative vapour or damp in mines, which often proves fatal to the miners. It is common among the Germans, to ſay on this occaſion, that the *cobalt* roſe and choaked them. See Damps.

COBBAN, in *Botany*, a ſmall tree like a peach-tree, which grows in Sumatra, called *Perſicæ affinis in Taprobana*, C. B.

C. B. *Arbor Getruph, ſive cobban*, J. B. It bears a ſmall leaf, like that of the tree which produces the *ſiliqua cathartica*, with ſhort branches, and a yellowiſh or ſaffron-coloured bark. The fruit is thick and round like a tennis-ball, encloſing a nut as big as a filberd, which contains a very bitter kernel, taſting like the root of angelica.

The fruit is very proper to quench thirſt; but the kernel, however bitter, is far ſuperior in virtue. The inhabitants of Sumatra, where the tree grows, extract an oil from the kernel, which is very efficacious in pains of the liver and ſpleen, taken inwardly, or uſed by way of unction; and is alſo a ſovereign remedy in the pain of the gout, to which the inhabitants of that iſland are very ſubject.

From the ſame tree diſtils a gum, which is very ſerviceable in the before mentioned diſorders, if it be diſſolved with a moderate quantity of oil, and applied to the affected parts by way of cataplaſm.

COBBING, in *Sea Language*, a puniſhment inflicted at ſea on thoſe who quit their ſtation during the night-watch. It conſiſts of a number of ſtrokes on the breech with a flat piece of wood called the *cobbing-board*.

COBELLA, in *Zoology*. See Coluber.

COBITIS, in *Zoology*, the name of a ſmall freſh-water fiſh, commonly called in Engliſh the *loach*. It very much reſembles our common gudgeon, both in figure and colour, but it is much ſmaller, about two inches being its uſual length, and three, or a little more, the utmoſt that it ever arrives at. Its body is ſoft and ſlippery; its tail flat and broad, and it has either extremely minute ſcales, or none at all. It is of a brown colour, ſpotted all over with black ſpecks, and it has three pair of beards at its upper-jaw. It is caught in freſh water in many parts of the world, and is eſteemed by many a very delicate fiſh, eſpecially when very young and ſmall.

Artedi enumerates three ſpecies of this fiſh. This is the fiſh called *miſgum* and *fiſgum* at Nuremberg and Ratiſbon. It has ten or more *cirri* at the mouth.

The word *cobitis* is truly Roman, and uſed by the beſt authors to expreſs the ſame fiſh we now call by it; but its derivation is uncertain.

Linnæus makes this a genus of the *abdominales*, including five ſpecies.

Cobitis *aculeata*, called alſo *cobitis oxyrynchus*, a ſmall freſh-water fiſh of the loach kind, but armed with two prickles on the coverings of each of its gills, by means of which it moves nimbly about among the ſtones. See Dacolithus.

COBIUS, in *Ichthyology*, a name given by Ariſtotle, Ælian, Appian, and the other Greek writers, to the GOBIUS *marinus*, or ſea-gudgeon of authors, diſtinguiſhed by Artedi by the name of the blackiſh variegated gobius, with fourteen rays on the ſecond fin of the back. It is called by the French *goulerot*, or *boulerot*.

Cobius *leucoterus*, in *Ichthyology*, a name given by Ariſtotle, Athenæus, and ſome other of the old Greek writers, to the fiſh called GOBIUS *albus* by later authors. It is a genuine ſpecies of the gobius, and is diſtinguiſhed by Artedi by the name of the gobius with the ventral fin blue, and the rays of the anterior back fin riſing above the membrane. This is a ſufficient diſtinction from all the other *gobii*.

COBLE, a boat uſed in the turbot fiſhery, twenty feet ſix inches long, and five feet broad. It is about one ton burthen, rowed with three pair of oars, and admirably conſtructed for encountering a mountainous ſea.

COBOB, the name of a diſh among the Moors. It is made of ſeveral pieces of mutton wrapt up in the cawl, and afterwards roaſted in it; the poorer people, inſtead of the meat, uſe the heart, liver, and other parts of the entrails, and make a good diſh, though not equal to the former. Phil. Tranſ. Nº 251.

COBOOSE, in *Sea-Language*, is derived from the Dutch *kambuis*, and denotes a ſort of box, reſembling a ſentry-box, uſed to cover the chimneys of ſome merchant ſhips. It generally ſtands againſt the barricade, on the fore-part of the quarter deck. It is called in the Weſt Indies *cobre vega*.

COBRA *de las cabeças*, in *Zoology*, the Portugueſe name for an American ſpecies of ſerpent of the *amphiſbæna* kind, whoſe bite is very fatal. It lives under ground, and feeds on ants. See Ibijara.

Cobra *de coral*, in *Zoology*, the name of a ſpecies of ſerpent found in America, and called by the natives IBEBOBOCA; it is about two foot long, and has a great deal of a fine red in its variegations.

Cobra *de cipo*, in *Zoology*, the name given by the Portugueſe in America, to a ſpecies of ſerpent more uſually known by its Braſilian name BOITJAPO.

COBRAS *de capello*, in *Zoology*, the Portugueſe name of a peculiar ſpecies of ſerpent, called by authors *ſerpens Indicus coronatus diademate, ſeu conſpicillo inſignis*, and by us the *ſpectacle-ſnake*, from the ſtrange reſemblance on the back of his head and neck to a pair of ſpectacles. It grows to ſomewhat more than the ſize of our viper; its ſnout is long; its head flat or depreſſed; its bite is very terrible. It is thought by many that there is a ſtone in the back part of its head, which is a remedy for the bite; but the ſtones commonly ſold with us, under the name of *lapides cobræ de capello*, are well known to be all artificial compoſitions.

COBRE *de verd*, in *Zoology*, the name given by the Portugueſe in America, to a ſpecies of ſerpent called by the natives, and from them, by moſt authors, BOIOBI.

COBWEB. See Web, and Silk.

COCCEIRA, in *Botany*, a name by which ſome authors have called the coco-nut tree, the *palma nucifera Indica* of moſt writers.

COCCIFEROUS, in *Botany*, ſuch plants or trees as bear berries. See Bacciferous.

COCCINELLA, in *Zoology*, a genus of inſects of the *coleoptera* order, the characters of which are theſe: the *antennæ* are clavated and truncated; and the *thorax*, with the exterior wings, which are marginated, conſtitute an hemiſpherical figure. Of this genus are ſeveral ſpecies, diſtinguiſhed by the colour and ſpots of their wings, among which are comprehended our common *lady-cows*.

COCCO, the name of a plant in the Weſt Indies, and in ſome of the iſlands of the South Sea, called alſo *Indian kale*.

COCCODES, in *Natural Hiſtory*, a name given by Mercatus to thoſe ſtones of the AMMITES kind, whoſe grains are very large.

COCCOLOBA, in *Botany*. See *Sea-ſide* Grape.

COCCOTHRAUSTES, in *Zoology*, the name of a very remarkable bird, conſiderably larger than the chaffinch, very ſhort-bodied, and large-beaked, whence it is called in Engliſh the *groſs-beak* or *hawfinch* Its head is very large in proportion to its body, and its great beak tapers from a very thick baſe to a ſharp point, reſembling the ſhape of a funnel. It is common in Germany, and lives there in the woods and mountains all ſummer; in winter it comes into the flat country. It is never ſeen in England, except in the winter months; it feeds on the kernels in the ſtones of fruits, as cherry-ſtones, and the like, and breaks theſe with great dexterity; it will alſo eat the ſeeds of many different plants. Ray.

Coccothrauſtes *criſtata*, in *Zoology*, the name by which naturaliſts call the bird uſually known among us by the name of the *Virginian nightingale*, it being truly a *coccothrauſtes*, though called by the improper name NIGHTINGALE. Ray.

COCCULUS *Indicus*, a poiſonous narcotic berry, known moſtly now to poachers, who have got a trick of intoxicating fiſh therewith, ſo as to take them out of the water with their hands; for which reaſon theſe berries are called *baccæ piſcatoriæ*, *fiſher-berries*.

The good women uſe it with ſtaveſacre, for deſtroying vermin in childrens heads. Brewers have uſed it alſo in their brewing; but this is expreſly prohibited by act of parliament.

Coccus, in the *Writings of the Ancients*, a name given by ſome authors to that fine ſhining red colour uſed to illuminate the capital letters in manuſcripts, and more generally known by the name of *encauſtum ſacrum*, from its being uſed in ornamenting the manuſcript Bibles, and its reſembling the fine red glow of the enamel of that colour.

Coccus, in the *Hiſtory of Inſects*, the name of a very comprehenſive genus of the *hemiptera* claſs, the trunk of which ariſes from their breaſt; the body is cetoſe behind; the wings only two, placed erect, and to be found only on the males.

This genus comprehends all the *progal-inſects* of Reaumur.

Coccus, or Cocos, in *Botany*, the name of a genus of plants of the *palmæ* claſs, called in the Hortus Malabaricus, TEUGA. It produces male and female flowers on the ſame plant. The male flowers have the whole ear for their cup, which is divided into three ſegments; the corolla has three petals; the ſtamina are ſix ſingle filaments, of the length of the flower; the apices are oblong and incumbent. The germen of the piſtil is ſo ſmall in theſe flowers as to be ſcarce viſible. The ſtyle is ſhort and thick, and is obſcurely trifid, and the ſtigma is ſmall. Theſe flowers never produce any fruit, yet they are not ſimply male flowers, but a ſort of hermaphrodite ones, the female organs of which are always abortive. The female flowers grow on the ſame ſpike with the male. The calyx is divided into five parts, but the ſegments are very ſmall; the corolla has three petals; the germen of the piſtil is of an oval figure, and terminates in a ſhort-pointed ſtyle; the ſtigma is ſmall, and is divided into three parts. The fruit is very large, and membranaceous; it is of a ſomewhat rounded figure, but with ſome obſcure traces of a trigonal form; the ſeed is a very large nut of an oval form, pointed, trivalve, and obtuſely trigonal, as the fruit is; it has three holes in the baſe, and the kernel is hollow.

The *coco-tree*, which the Malabarians call *teuga*, grows ſtrait, without any branches, and ordinarily is thirty or forty feet high; its wood is too ſpongious to be uſed in carpentry. At the top it bears twelve leaves, ten feet long, and half a foot broad, uſed in the covering of houſes, making mats, &c. Above the leaves grows a large excreſcence, in form of a cabbage, excellent to eat; but the taking this off is mortal to the tree. Between the leaves and the top ariſe ſeveral ſhoots, of the thickneſs of the arm; which, when cut, diſtil a white, ſweet, agreeable liquor, ſerving as a wine, and intoxicating: it becomes acid, if kept a few hours; and at the end of twenty-four hours is converted into a ſtrong vinegar; but it may be prepared into brandy. While this liquor diſtils, the tree yields no fruit; but when the ſuckers are let grow, it puts forth a large cluſter or bunch, wherein the *coco-nuts* are faſtened, to the number of ten or twelve.

While they are yet new, and the bark tender, they yield each about half a pint of clear cooling water, which in a little time becomes firſt a white ſoft pulp, and at length condenſes, and aſſumes the taſte of the nut.

The tree yields fruit thrice a year, and thoſe ſometimes as big as a man's head. Many travellers aver, from the ſize, and the many uſeful products of this tree, that from a ſingle *coco*-tree, and its fruit, a ſhip might be built, equipped, and loaden with merchandize and proviſion.

The *cocos* of the Antilles are not ſo large as thoſe of the Eaſt Indies, Africa, and Arabia: the trees ſeldom exceed twenty-five feet in height; and the fruits are in proportion: theſe are uſed among us.

In the kingdom of Siam, the *coco* fruit, dried, and emptied of its pulp, ſerves as a meaſure, both for things liquid and dry.

As theſe ſhells are not all of the ſame capacity, but are ſome larger, others leſs; their content is firſt meaſured with cauris, thoſe little Maldives ſhells, which ſerve as ſmall money in ſeveral ſtates of the Indies. Some *cocos* contain a thouſand cauris, others five hundred, &c.

The ſhell is likewiſe much uſed by miners, carvers, &c. in divers works.

Coccus *Maldivia*, the Maldivia nut, in the *Materia Medica*, the name of the fruit of the *palma Maldivienſis* of Johnſton, an oval-figured fruit, of a ſweet taſte, and famous for its virtues in nervous diſorders. See Coll. Acad. P. Etr. tom. iii. p. 525.

Coccus *Polonicus*, an inſect which may properly enough be called the *cochineal* of the northern part of the world. As the cochineal loves only the hot climates, this creature affects only the cold ones. It is collected for the uſe of dyers, but the crops of it are much ſmaller, more difficultly made, and the drug itſelf greatly inferior to the true cochineal. It is commonly known by the name of *coccus Polonicus*, or the ſcarlet grain of Poland. Poland is indeed the place where it is gathered in greateſt abundance, but it is not the only one; it is found in many other of the northern countries, and may very poſſibly be produced in ſome of the more temperate ones, where it is not known, as it is very much hid by nature from the eyes of common obſervers.

This kermes of Poland, if it may be ſo called, is found affixed to the root of a ſmall plant, and uſually to the ſame plant, which has been thence called the *polygonum cocciferum*. Authors have informed us of the ſame berry, as it is often called, alſo growing at the roots of the mouſe-ear, rupture-wort, pimpernel, and pellitory of the wall, and that it is in no other than dry ſandy places, that it is found at the roots of theſe plants. Breynius, in 1731, printed at Dantzick a very curious account of this production, which proves it inconteſtably to be an animal, and gives us many reaſons for knowing it to be of the progall-inſect claſs. There is a particular account of this inſect in the Philoſophical Tranſactions, vol. liv. Nº 15. and vol. lvi. Nº 20. See Cochineal.

COCCYGÆUS *anterior*, a muſcle fixed, by a broad inſertion, in the anterior portion of the ſmall tranſverſe ligament at the upper part of the *foramen ovale* of the *os innominatum*; from thence it runs between this great ligament and the *muſculus obturator intimus*, with which it is often confounded by anatomiſts, and contracting in breadth, it is inſerted in the lower part of the *os coccygis*.

Coccygæus *poſterior*, a muſcle fixed to the inner, or concave edge of the two firſt *vertebræ* of the *os ſacrum*, to the inner and lower edge of the *ligamentum ſacro-ſciaticum*, and to the ſpine of the *os iſchium*; from thence, contracting in breadth, it is inſerted in the inſide of the *os coccygis*, above the anterior.

COCCYGIS *Os*, in *Anatomy*, a bone joined to the extremity of the *os ſacrum*; compoſed of three or four bones, whereof the lower is ſtill leſs than the upper, till the laſt ends in a ſmall cartilage. See *Tab. Anat.* (*Oſteol.*) *fig.* 7. *n.* 21.

It reſembles a little tail turned inwards; or rather, as ſome imagine, the beak of a cuckow; whence the name.

Its uſe is to ſuſtain the ſtrait gut: it yields to the preſſure of the fœtus in women in travail; and midwives uſe to thruſt it backwards; but ſometimes too violently, which is the occaſion of great pain, and ſeveral bad effects.

The *os coccygis* may be thruſt inwards by a violent fall or blow, and it is often puſhed outward in hard births. When this happens it is uſually attended with violent pain and inflammation about the lower part of the ſpine; abſceſſes are formed in the *inteſtinum rectum*, and the fæces are conſtipated, or ſuppreſſed. The replacing this bone is not very difficult, if an able ſurgeon is applied to in time. If it be thruſt outwards, it muſt be depreſſed into its right place by the thumb; after which compreſſes dipt in warm wine, or ſpirit of wine, are to be applied to the part; theſe are to be made broad above, and narrow below, that they may fill up the *poſterior ſinus* of the *nates*; and theſe may be conveniently held on by the T bandage.

When the *os coccygis* happens to be luxated inwards, the fore-finger is to have its nail cut cloſe, and being dipt in oil, is to be introduced up the *anus*, and muſt be thruſt in as far as poſſible, that it may the more readily drive out the depreſſed bone: the other fingers being placed externally, are to conduct the bone into its right poſture. When the bone is replaced, the patient muſt reſt ſome time upon a bed; and when he ſits up, it muſt be in a chair with a hole in its bottom, leſt the affected part ſhould otherwiſe be compreſſed or diſturbed.

Coccygis *oſſis muſculi*. Theſe are ſmall, thin, radiated muſcles, lying on the inner, or concave ſide of the *os ſacrum*, and neighbouring parts of the *pelvis*. They are four in number, two on each ſide, one placed more forward, the other more backward; for which reaſon the firſt may be termed *coccygæus anterior*, ſive *iſchio coccygæus*, and the other *coccygæus poſterior*, ſive *ſacro coccygæus*.

COCCYGRIA, in *Botany*. See Sumach.

COCCYX, in *Anatomy*. See Coccygis *Os*.

Coccyx, in *Ichthyology*, a name given by Ariſtotle, and the other old Greek writers, to the fiſh called cuculus, and lyra, by other authors. It is a ſpecies of the trigla, diſtinguiſhed by Artedi by the name of the trigla all over red, with a bifid ſnout, and the coverings of the gills ſtriated.

COCETUM, among the *Ancients*, a kind of drink made of honey and poppies.

COCHIA, in *Medicine*, the name of officinal pills, which are diſtinguiſhed into the greater and leſs: the former is a compoſition of hiera picra, troches of Alhandal turpeth, diagrydium, and ſyrup of buckthorn, taken from Rhaſes, but ſeldom uſed in the preſent practice. The latter is compounded of equal quantities of bright aloes, the pureſt ſcammony, and the pulp of colocynth, made into a maſs with ſyrup of buckthorn. Two drams of the diſtilled oil of cloves are added to an ounce of each of the former ingredients. Theſe pills are preſcribed to diſcuſs viſcidities, watry humours, and flatulencies.

COCHINEAL, or Cocheneel, a drug uſed by the dyers, &c. for giving red colours, eſpecially crimſons and ſcarlets, and for making carmine; and likewiſe in medicine as a cardiac, cordial, ſudorific, alexipharmic, and febrifuge.

It is brought from the Weſt-Indies; but authors have been divided as to its nature; ſome taking it to be a kind of worm, and others for the berry of a tree. F. Plumier, a celebrated botaniſt, has maintained the former opinion, and Pomet very abſurdly the latter. That author is very wide of the truth in the deſcription he has given of *cochineal*.

The *cochineal*, in the ſtate in which it is brought to us, is in ſmall bodies of an irregular figure, uſually convex, and ridged and furrowed on one ſide, and concave on the other. The colour of the beſt is a purpliſh grey, powdered over with a ſort of white duſt. All that the world knew of it for a long time was, that it was gathered from certain plants in Mexico, and therefore it was naturally ſuppoſed to be a ſeed.

In the year 1692, father Plumier gave Pomet, the French author of a Hiſtory of Drugs, an account of its being an animal: this, however, was diſregarded; but Meſſrs. Hartſoeker, De La Hire, and Geoffroy, afterwards evidently proved it to be one; and after this there were printed the depoſitions, in form, of a number of perſons upon the ſpot, who all declare it to be a viviparous animal, and that it paſſes a great part of its life fixed to the vegetable body on which it feeds, and that it was a creature ſubject to no change, nor ever appearing in any other ſtate. Theſe and many other qualities found in the *cochineal*, all analogous to thoſe of the claſs of *progall-inſects*, give great room to believe that it is truly and properly an inſect of this claſs.

There are two kinds of *cochineal*, the finer called *meſtique*, the other termed the wild *cochineal*. The firſt is gathered from ſuch plants of the opuntia as are prepared and managed properly on purpoſe for the production of the animal, the other is found wild on the wild plant, and is much inferior to the *meſtique* in value.

Dampier tells us there are two ſorts; one an inſect, and the other a ſeed; and gives a preciſe deſcription of each kind.

The **COCHINEAL** *worm*, *Coccus*, otherwiſe called the *progall-inſect*, is an inſect engendered in a fruit reſembling a pear: the plant which bears it is five or ſix feet high. At the top of the fruit grows a red flower, which, when mature, falls on the fruit; and that opening, diſcovers a cleft two or three inches in diameter. The fruit then appears full of little red inſects, having wings of ſurpriſing ſmallneſs, and which would continue and die, and rot there, if not taken out.

The Indians, therefore, ſpreading a cloth under the tree, ſhake it with poles, till the inſects are forced to quit their lodging, and fly about the tree; which they cannot do many moments, but tumble down dead into the cloth; where they are left till they be entirely dry: when the inſect flies, it is red; when it is fallen, black; and when firſt dried, it is greyiſh; though it afterwards changes colour. Dampier's Voyages. See *Tab. Nat. Hiſt. fig.* 24.

The figure of this inſect is oval, and its utmoſt ſize is that of a ſmall pea. It has ſix legs armed with claws, two eyes, and a trunk by which it ſucks its nouriſhment. The ants, and many other little animals, are very fond of eating the *cochineals*; and it is with great difficulty that the Indians defend the young brood from thoſe devourers.

After the Indians have gathered the *cochineal* they kill it, otherwiſe they would loſe a great part of their harveſt; for the parent race would live ſome days after their being taken from the plant, and would produce their young, which would be nimble enough to run away in great numbers. Some to kill the creatures plunge them in hot water, and afterwards dry them in the ſun; others kill them by a proper degree of heat, and others again by ſmoke.

The accounts from the place where the *cochineal* is produced, furniſh all theſe particulars; but to decide the long diſputed point, whether they are of the animal or vegetable kingdom, we have the means in our own hands, even in this part of the world. We need only moiſten and ſoak in water, or in vinegar, a number of *cochineals* till they are ſwelled and diſtended, to know that every one is the more or leſs perfect body of an inſect; the moſt imperfect and mutilated ſpecimens always ſhew the rings of the body, and from obſerving others it will be eaſy to find the number and diſpoſition of the legs; parts, or even whole ones, being left on ſeveral, and often complete pairs. In this way the legs, antennæ, and proboſcis, may be diſcovered.

If a full grown *cochineal* be ſoaked a conſiderable time in water or vinegar, and afterwards gently preſſed, there will frequently be protruded from its hinder part a number of ſmooth oblong bodies, which might be eaſily miſtaken for eggs; but a good microſcope will ſhew in theſe the traces of the legs and other lineaments ſufficient to prove it to be a true embryo fœtus. Theſe eggs exhibit a vivid crimſon hue.

It is eaſy to ſee in ſome the head, and ſometimes a tubercle on each ſide of it, which may very naturally be ſuppoſed the eyes, or elſe the roots of the *antennæ* or horns. The firſt pair of legs are thus found to be very near the head of the animal, and placed exactly as in all the gall-inſect and *progall-inſect* claſs; a little above theſe one may diſtinguiſh alſo the remainder of the trunk ſituated exactly as in the gall-inſects and *progall-inſects*; the anus is alſo eaſily diſtinguiſhed.

As the manner of the fecundation of the gall-inſects was ſo long unknown in Europe, it is no wonder that that of the *cochineal* ſhould not be very early diſcovered in Mexico: but we have an account among Mr. Ruyſche's pieces, from whence almoſt all the true hiſtory of this animal is had, that at the ſeaſon of the *cochineals* becoming big, there is ſeen continually among them a ſmall butterfly, which is bred upon the ſame plants, and by means of which the *cochineals* conceive. This is ſo ſtrictly analogous to the manner of the gall-inſect claſs, that there is no room to doubt the fact; and it is a farther great proof, how little truth was before in the gueſſes concerning the claſs of animals this belonged to. Reaumur's Hiſt. of Inſects, tom. iv.

The female *cochineal* has been long known, and is well deſcribed by Reaumur, Dr. Brown, and Linnæus; but neither of them had ever ſeen the male; and therefore the hiſtory of this valuable inſect has been very defective. Mr. Ellis, being informed that this inſect bred in great abundance on the *cactus opuntia* of Linnæus, in South Carolina and Georgia, as well as on the *cactus coccinellifer* in Mexico and Jamaica, obtained from Dr. Garden ſome branches of the former, with the inſects upon them. In examining ſeveral of theſe ſpecimens, he, at laſt, diſcovered three or four minute dead flies with white wings; and having moiſtened them in ſpirit of wine, and obſerving them with a microſcope, found, that they were of a bright red colour, which convinced him, that theſe were the true male inſects. Dr. Garden, to whom this diſcovery was communicated, made ſeveral obſervations on the male ſpecies. This is very rarely found; ſo that he imagines there may be a hundred and fifty, or two hundred females, for one male. The male is much leſs than the female, more active, and better made; and the body of it is of a lighter red than that of the other. See a minute deſcription of the male ſpecies, illuſtrated by microſcopical drawings, in the Phil. Tranſ. vol. lii. part ii. art. 107.

The male-fly of the Poliſh *cochineal* was alſo diſcovered by Dr. Wolfe of Warſaw. See Phil. Tranſ. vol. liv. p. 95. and vol. lvi. art. 20.

Cochineal has been ſuppoſed to poſſeſs ſeveral medicinal virtues, ſimilar to thoſe of the KERMES; but its principal uſe is as a colouring drug. When infuſed or boiled in water, it yields a crimſon tincture, inclining to a purple. Fixed alkali renders the crimſon deeper, but leſſens its luſtre. Volatile alkali heightens the colour, without diminution of luſtre. The beſt method of applying volatile alkali for this purpoſe in dying, was found by M. Hellot to be, by dipping the cloth dyed with *cochineal* in a ſolution of ſal ammoniac, and then throwing into the ſolution ſome pot-aſh, by which the volatile alkali of the ſal ammoniac is diſengaged. By a ſmall quantity of vitriolic acid the crimſon decoction of *cochineal* is rendered purple; a greater quantity makes it fleſh-coloured; and by adding more ſtill, it becomes colourleſs. This colour is firſt changed to a yellow, and afterwards deſtroyed by nitrous acid. Solution of tin in aqua regia heightens the colour of this decoction to a ſcarlet, which is darker or brighter as the quantity is leſs or greater. Other metallic ſolutions have different effects. French dyers give fire to their ſcarlets, by the addition of turmeric; but this tinge does not penetrate the cloth, and ſoon periſhes. Woollen cloth requires, for the ſcarlet dye, about one ſixteenth its weight of *cochineal*, part of which is uſed with tartar in the preparatory liquor, and the reſt for finiſhing the dye, to each of which decoctions a proper quantity of the ſolution of tin is added. M. Hellot obſerves, that if *cochineal*, after the uſual pulverization, be mixed with one fourth of its weight of pure dry cryſtals of tartar, and the mixture be levigated into an impalpable powder, the ſaving of *cochineal*, both for the crimſon and ſcarlet dye, will be about one part in four, without any injury to the colour. The wild or ſylveſter *cochineal* is much inferior to the other: four parts of the former have no greater effect in dying than one of the latter; nor does it give equal beauty to the colour, eſpecially the ſcarlet. Neumann's Works, with Dr. Lewis's additions, p. 506, &c. See DYING.

Joſſelin, in his account of the products of New England, mentions a particular kind of ſun-flower, called by ſome a ſpecies of *golden-rod*; the ſtalks of which are covered about the knots, in the ſummer months, with inſects of the ſize of large fleas. Theſe, preſerved in a proper manner, yield a very elegant ſcarlet colour, and the author thinks might be made to ſupply the uſe of *cochineal*.

There are whole plantations of the *cochineal* plant, or *tonna*, as the natives call it, about Guatimala, Chepe, and Guexaca, in the kingdom of Mexico. It is called renegrida, jaſpeada, &c. according to the manner of its preparation.

The **COCHINEAL** *grain*, or, as Dampier calls it, *ſylveſtris*, is a red berry, growing in America, found in a fruit reſembling that of the *cochineal* plant, or *tonna*. The firſt ſhoot produces a yellow flower; then comes the fruit, which is long, and, when ripe, opens with a cleft of three or four inches. The fruit is full of kernels, or grains, which fall on the leaſt agitation, and which the Indians take care to gather. Eight or ten of theſe fruits may yield about an ounce of grain. See *fig.* 24. *n.* 2.

This berry yields a dye almoſt as beautiful as that of the inſect; and a perſon may be eaſily deceived in them; though the other is much the moſt eſteemed. Dampier is miſtaken in ſuppoſing this laſt a ſeed. It is an animal of the ſame kind with the other.

COCHLEA, in *Anatomy*, the third part of the labyrinth, or inner cavity of the EAR.

The *cochlea* lies directly oppoſite to the ſemicircular canals, and is properly ſo called from the reſemblance it has to the ſhells that ſnails lie in; through its parietes a ſmall branch of the auditory nerve paſſes.

Its canal is divided by a ſeptum compoſed of two ſubſtances, one almoſt cartilaginous, the other membranous.

The two canals that are divided by the ſeptum, are called *ſcalæ*: whereof the one, looking towards the tympanum, by the feneſtra rotunda, is called *ſcala tympana*; the other, having a communication with the veſtibulum, by the feneſtra ovalis, is called the *ſcala veſtibuli*: the firſt lies uppermoſt, and is the largeſt; the laſt lowermoſt, and is the leaſt.

The parts to be diſtinguiſhed in this in its true ſituation, are the *baſis*, the *apex*, the ſpiral *lamina*, the half ſeptum, by which its cavity is divided into two half canals; the ſpindle round which the *cochlea* turns; and laſtly, the orifices and union of the two ducts. The baſis is turned directly inward, toward the internal *foramen auditorium*; the apex outward, and the axis of the ſpindle is nearly horizontal; but in all of theſe allowance muſt be made for the obliquity of the *os petroſum*, in which they lie. The baſis of the *cochlea* is gently hollowed, and towards the middle is perforated by ſeveral ſmall holes. The ſpindle is a kind of ſhort cone, with a very large baſis, which is the middle of the baſis of the *cochlea*; through its whole length runs a double ſpiral groove, which, through a microſcope, ſhews a great number of pores. The *cochlea* makes about two turns and a half from the baſis to the apex, and the two ducts being ſtrictly united together, through their whole courſe, form an entire common ſeptum, which muſt not be confounded with the half ſeptum, or ſpiral lamina, as is often done. The firſt of theſe may be properly termed the common ſeptum, the other the particular, or half ſeptum; both of them are cloſely joined to the ſpindle, being thicker there than in any other place. The common ſeptum is complete, and ſeparates the turns entirely from one another, whereas the half ſeptum in the ſkeleton is only a ſpiral lamina, the breadth of which is terminated all round by a very thin border lying in the middle cavity of the *cochlea*. In a natural ſtate there is a membranous half ſeptum, which completes the partition between the two ducts. The two half canals turn jointly about the ſpindle, one being ſituated towards the baſis of the *cochlea*, the other toward the apex; for which reaſon, one of them may very well be termed the internal, the other the external; the uſual diviſion of them into the upper and lower flight not being agreeable to the natural ſtate, but liable to convey a falſe idea of it. The ſpiral volute of the *cochlea* begins at the lower part of the veſtibulum, runs from thence forward to the top, then backward down to the bottom, afterwards upward and forward, and ſo on from the baſis, which is turned inward, to the apex, which is turned outward. It is eaſy hence to know to which ear a *cochlea* has belonged, when it is ſeen prepared. The two half canals communicate fully at the apex of the *cochlea*. Their ſeparate openings are toward the baſis, one of them being immediately into the lower part of the veſtibulum, the other into the feneſtra rotunda. Theſe two openings are ſeparated by a particular turning. Winſlow's Anat. p. 51.

COCHLEA, in *Conchyology*, the name of a very large family of ſea ſhell-fiſh, which are divided by authors into three diſtinct genera, from the figure of their mouths, ſome of which are circular, ſome ſemicular, ſome oval. Theſe are expreſſed by the generical names *cochleæ lunares*, *cochleæ ſemilunares*, and *cochleæ ore depreſſo*. The two former genera ſee under LUNARIS *cochlea*, and SEMILUNARES *cochleæ*.

The characters of the third are theſe: it has an univalve ſhell of a broad figure, with a conoide baſe and an elevated ſummit, or ſometimes a plane and depreſſed one. It is umbilicated, and of a pearly colour within, and has a mouth of an oval figure, ſometimes furniſhed with teeth, ſometimes without any. The conic figure of theſe ſhells uſually diſtinguiſhes them at firſt ſight from all the other kinds.

Some of the ſpecies of this genus have their apex elevated to a conſiderable height, and forming ſeveral ſpiral turns. Theſe are properly called *ſabots* by the French, and *trochi* by the authors of other nations. Others have the apex leſs elevated, and are more of the common ſhape of ſnails. And finally, ſome of them have the apex quite depreſſed. This is enough to ſhew that in ſhells, in general, the elevation of the apex is no genuine character of a genus. Among the *trochi* there is one ſingle ſpecies which is umbilicated, the others are none of them ſo; and hence this forms a very grand diſtinction. Rondeletius obſerves that this genus of *cochleæ* was called *trochus*, from the reſemblance of ſome of the ſpecies to the ſhape of a boy's whipping top.

From the figures of theſe ſeveral ſpecies of ſhells, it will be eaſily ſeen that the name *trochus*, according to the common derivation of the word, very badly expreſſes the ſeveral kinds, ſome of which are of that figure, and ſome no way approaching to it. They are much better expreſſed by the name *cochlea ore depreſſo*, which conveys an idea of an abſolute diſtinction, which takes place in them all, and in no other ſhells. See *Tab. of Shells*, Nº 5, 6, 7.

COCHLEA, in *Mechanics*, one of the five mechanical powers; otherwiſe called the SCREW.

It is thus denominated, from the reſemblance a ſcrew bears to the ſpiral ſhell of a ſnail, which the Latins call *cochlea*.

COCHLEARIA. See *Horſe*-RADISH, and SCURVY-*Graſs*.

COCK, *Gallus*, in *Ornithology*, the name of the males of gallinaceous birds; the diſtinguiſhing characters of which are, that the feet have each four toes, the front of the head has a comb, and the wattles are two, and are naked and flat. See GALLINÆ and GALLINACEUS.

In the choice of a *dunghill-cock*, he ſhould be of a large body, very long from the head to the rump, thick in the girth, the neck long, looſe, and high; the comb, wattles, and throat large; the eyes round and large, and anſwerable to the colour of his plume or main, as grey with grey, yellow with yellow, and ſo of the reſt; his beak ſhould be ſtrong and hooked; and his main or neck-feathers very long and gloſſy, covering his neck and ſhoulders; the legs ſhould be ſtraight, and of a long beam, with very large and long ſpurs, a little bending; the colour ſhould be black, yellow, or browniſh; the claws ſhould be long and ſtrong; the tail long, bending back, and covering the whole body; the wings very ſtrong; and the general colour ſhould be reddiſh. See FOWL.

COCK, *game*. In the choice of the *game*, or *fighting-cock*, four things are principally to be conſidered; theſe are the ſhape, colour, courage, and ſharpneſs of the heel. As to the ſhape, ſuch a one ſhould be choſen, as is neither too ſmall nor too large; the very large ones are always clumſy and unwieldy, and the ſmall ones are ſlow and tedious in fighting, and are generally too weak to ſtand a very tight battle: another diſadvantage in theſe extremes is, that both are very difficult to be matched; the middle ſized one ought therefore ever to be preferred, as he is generally the moſt nimble and active with his ſtrength, and the matching him is eaſy. The head ought to be ſmall, the eyes large and briſk, and the beak ſtrong and hooked at the ſetting on; its colour ought alſo to anſwer to that of the principal or general colour of the feathers, whether that be yellow, reddiſh, or grey. The beam of his leg ought to be very ſtrong, and according to his plumage, either blue, grey, or yellow; and the ſpurs ought to be rough, long, and ſharp, a little bending, and pointing inward. The three colours eſteemed in the *game-cock* are grey, yellow, and red, with a black breaſt. The perfection of a *cock* is not, however, tied down abſolutely to theſe colours; for experience has ſhewn, that there are *cocks* of other colours which have proved excellent ones, but theſe are in general the beſt; the pied *cock* ſometimes turns out good, but the white and dun are ſeldom of any value.

If the neck of a *cock* be inveſted with a circle of a ſcarlet complexion, it is a ſign that he is ſtrong, vigorous, and has great courage; but, on the contrary, if it be pale and wan, it denotes him to be defective in theſe material particulars.

In order to prepare a *cock* for fighting, his mane is to be clipped off with a pair of ſhears cloſe to the fleſh, all the way down the neck, from the head to the ſhoulders; the feathers are alſo all to be clipped off cloſe to the rump, and the redder that appears, the better condition the *cock* is in. The wings are to be ſpread by the length of the firſt riſing feather, and all the others are to be cut ſloping with ſharp points, that in riſing he may endanger the eyes of his adverſary. There muſt be no feathers left on the crown of the head, that the opponent can take hold of, and his head ſhould be moiſtened with ſpittle; then the ſpurs being put on, he is to be turned into the pit to try his fortune.

The beſt ſeaſon for breeding the *game-cocks* is from the beginning of February to the middle or latter end of March; the neſt for the hen is to be made of ſweet and clean ſtraw, and ſhould be placed in ſome warm corner, out of the way of diſturbance from other fowl; for this ſort of interruption provokes this quarrelſome bird in ſuch a manner, as to endanger the eggs. That ſhe may never have occaſion to leave the neſt, and cool her eggs, it will be proper to lay all ſorts of food, that ſhe is likely to approve of, before her, and to put clean water every day, not only for her to drink, but to waſh and trim herſelf in; ſome aſhes, ſand, and gravel, ſhould alſo be ſifted on about the neſt. The chickens are hatched in about three weeks, and the neſt is to be carefully watched about this time, for there are always ſome of the chickens hatched before the others; theſe ſhould be taken away as ſoon as out of the ſhell, and laid before the fire, or in ſome warm place in wool, and as ſoon as the reſt are hatched, theſe ſhould be given back to the hen. They are not to be ſuffered to go abroad for the firſt fortnight, and the room they are kept in muſt be boarded, all other floors being too cold and too moiſt. At about a month old the chickens may be turned out into a walk of ſome freſh graſs, that they may feed at liberty, and eat worms and other inſects; but there muſt be no puddle of water near the place, for they are apt to get into ſuch, and it occaſions them a number of diſeaſes. As ſoon as the comb and wattles appear on the *cocks*, they muſt be cut away, and the ſore place anointed with freſh butter till it is well. The chickens may all be ſuffered to run together till they begin to peck one another, then the *cocks* are to be ſeparated; each muſt have his particular walk, and the more free from diſturbance this is, the better. The place of feeding them muſt either be a boarded floor, or a very ſoft and dry piece of ground. If the place be hard, as a ſtony pavement, or a plaſtered floor, the taking up their food will injure and blunt their beaks, ſo that they will never be able to hold faſt afterwards. Any white corn is good for the young *game-cock* in his walks, and ſo is a white bread toaſt ſteeped in ale; at times this may be given him ſteeped in urine, which will ſerve to ſcour and cool him very well. There ſhould never be more than three hens allowed to one *cock* in his walk; for if there are more, he will conſume his ſtrength in the treading; and though his courage may *not* fail, yet he will never have the ability to go through a battle. Care is to be taken alſo as to his rooſting place, that the perch be not too ſmall in the gripe, and be ſo placed, that he may ſit on it without ſtradling; if the perch be crooked it is alſo very diſadvantageous, for it will accuſtom the *cock* to ſuch an uneven diſpoſition of his feet, that he will be no good ſtriker in the battle. The beſt method of contriving the rooſting place is to have a row of ſhort perches, about eight inches long, and the loweſt ten inches from the ground, that he may aſcend with the more eaſe; and when he is come to the rooſting perch, be conſtrained to ſit with his legs cloſe together. A *cock* bred in this manner may be fought young; but the beſt method is not to hazard a battle till he is ſomewhat more than two years old.

Game-cocks are commonly brought to the ſtate of their greateſt ſtrength and activity in about ten days, which Dr. Robinſon calls their *athletic* WEIGHT; but they will ſcarce remain twenty-four hours in this condition; nay, ſome have been known to change for the worſe in twelve hours.

COCK, *black*. See GROUSE.

COCK, *bloody-heeled*. See HEELER.

COCK, *gor*. See GOR-*cock*.

COCK, *grubbing a*. See GRUBBING.

COCK, *high-bearing*, is a term uſed with reſpect to fighting cocks; denoting one larger than the *cock* he fights.—As a *low-bearing cock* is one overmatched for height.

COCK, *Indian*. See CRAX.

COCK *of the mountain*, *Urogallus*, the name of a bird of the gallinaceous kind, being a ſpecies of the TETRAO. See *Tab. of Birds*, Nº 25.

In ſhape it reſembles the turkey, and approaches to it in ſize. Its legs are feathered down to the toes before, and naked behind. It is common on the Alps, and in ſome parts of Italy, and is ſaid to be found alſo in the mountainous parts of Ireland. Its fleſh is very delicate.

COCK, *wood*. See WOOD-*cock*.

COCK-*boats*, ſmall boats uſed in rivers, or near the ſhore, which are of no ſervice at ſea, becauſe too tender, weak, and ſmall.

COCK'*s-comb*, in *Botany*. See LOUSEWORT, and AMARANTH.

COCK *of a dial*, the pin, ſtyle, or gnomon, See GNOMON.

COCK'*s-foot graſs*. See GRASS.

COCK'*s-head*. See SAINTFOIN.

COCK-*paddle*, the Scotch name for the *lumpus*, a ſea-fiſh, common on the Engliſh coaſts, and called the lump-fiſh, or ſea-owl.

COCK-*throppled*, a name given by dealers in horſes to one whoſe wind-pipe is ſmall, and bends like a bow when he bridles his head. See HORSE and HUNTER.

COCK-*water*, is a ſtream of water brought in a trough, through a long pole, in order to waſh out the ſand of the TIN-*ore* into the *launder*, while it is bruiſing in the coffer of a ſtamping-mill.

COCK in a watch or clock. See BALANCE.

COCKS aboard a ſhip, are little ſquare pieces of braſs, with holes in them, and put into wooden ſhivers, to keep them from ſplitting and galling by the pins of the blocks in which they move.

COCKATOON, a name uſually given to the white MACAW, but more properly belonging to the whole MACAW-*tribe*.

COCKERINGS, an exaction, or tribute, in Ireland, now reduced to chief-rents.

COCKET, or COCQUET, a SEAL belonging to the king's cuſtom-houſe.

COCKET, or COCQUET, is a ſcroll of parchment, ſealed and delivered by the officers of the cuſtom-houſe to the merchants, upon entering their goods; certifying that the goods were cuſtomed. It likewiſe gives name to an office appointed for this purpoſe.

The ſame word is alſo uſed in the ſtatute of bread and ale, 15 Hen. III. where there is mentioned *cocket-bread*, among ſeveral other kinds: it ſeems to have been hard ſea-biſcuit, which, perhaps, had then ſome *cocket*, mark, or ſeal; or elſe was ſo called from its being deſigned for the uſe of the cockſwains, or ſeamen.

COCKING *Cloth*, a device for the catching of pheaſants. It conſiſts of a piece of coarſe canvas, about an ell ſquare, dipped in a tan-pit to colour it; and kept ſtretched by two ſticks, placed from corner to corner, diagonal-wiſe; a hole being left to peep through. The ſportſman then, being provided with a ſhort gun, carries the cloth before him at arms-end; under cover of which, he may approach his game as near as he pleaſes: when near enough, he puts the noſe of his gun through the hole, and ſhoots.

COCKLE, *Pectunculus*. See PECTEN.

COCKLE. See *Darnel*-GRASS.

COCKLE-*ſtairs*. See STAIRS.

COCKPIT, a ſort of theatre, whereon game-cocks fight their battles. The *cockpit* is uſually a houſe, or hovel, covered over: they fight on the clod, or green ſod; which is generally marked out round, and encompaſſed with ſeats, one above another.

The COCKPIT *Laws*, are principally theſe: when cocks are ſet, none are to be on the ſod but the two ſetters. When the cocks are ſet beak to beak, in the middle of the clod, and there left by the ſetters, if the ſet cock does not ſtrike in counting twenty, and ſix times ten, and twenty after all, the battle is loſt: but if he does ſtrike, the battle is to begin again, and they muſt count again. If any one offers a mark to a groat, or forty to one, and the wager be taken, the cock muſt be ſet, and they are to fight it out. Done, and done, is a ſufficient bet, or wager, when the cocks are caſt on the clod.

COCKPIT, in a man of war, is a place on the lower floor, or deck, abaft the main-capſtan, lying between the platform, and the ſteward's room; where are ſubdiviſions, or partitions, for the purſer, the ſurgeon, and his mates. See *Tab. Ship. fig.* 2. *lit.* Z.

COCKROAD, a contrivance for the taking of woodcocks. This bird lies cloſe by day, under ſome hedge, or near the root of an old tree, to peck for worms under dry leaves, and will ſcarce ſtir out, unleſs diſturbed; as not ſeeing his way ſo well in the morning; toward the evening he takes wing, to ſeek for water, flying generally low; and when he finds any thoroughfare in a wood, he ventures through it.

To take them, therefore, they plant nets in ſuch places; or, for want of ſuch places ready to their hands, they cut roads through woods, thickets, groves, &c.

Theſe roads they uſually make thirty-five, or forty feet broad, perfectly ſtrait, and clear; and to two oppoſite trees they tie the net, which has a ſtone faſtened to each corner. Then, having a ſtand, or place to lie concealed in, at a proper diſtance, with a ſtake near the ſame, to faſten the lines of the net to; when they perceive the game flying up the road, they unwind the lines from off the ſtake; upon which, the ſtones drawing it down, the birds are entangled in the ſame.

COCKSWAIN, or COCKSON, an officer on board a man of war, who hath the care of the boat, or ſloop, and all things belonging to it. He is to be always ready with his boat's gang, or crew, and to man the boat on all occaſions. He ſits in the ſtern of the boat, and ſteers; and hath a whiſtle to call and encourage his men.

COCOA, or more properly CACAO, the nut whoſe kernel yields the chocolate. See CACAO.

COCOI, in *Zoology*, the name of a very beautiful bird of the Braſils, of the heron-kind, of the bigneſs of the common ſtork: its fleſh is very well taſted.

COCOON. See SILK.

COCROTALEON, in *Natural Hiſtory*, a name given by the ancients to an animal generated between the hyæna and the lioneſs. This animal is deſcribed as having many of the qualities of the MANTICHORA; and it ſeems with ſome to be only another name for the ſame beaſt. It is called alſo LEOCROCOTTA, and *leucocrotta*, and ſometimes ſimply *crocotta*, or *cocrotta*.

COCTION, a general name for all alterations made in bodies, by the application of fire, or heat.

There are various ſpecies of *coction*; as MATURATION, FRICTION, ELIXATION, ASSATION, TORREFACTION, USTION, DECOCTION, and CONCOCTION.

Various liquors are uſed, and different portions of time allotted, for *coction*, according to the different intentions of operators, or the particular natures of the ſubſtances to be boiled; ſo that nothing general can be determined with reſpect to this, the obſervation of which would be of general uſe to the operator: but we are to judge of the manner in which particular ſubſtances are to be boiled, from a knowlege of the reſpective natures of the bodies to be ſubjected to this operation.

The *coction* of the aliments in the ſtomach, is their digeſtion or reduction to a ſort of emulſion or chyle.

COD-*fiſh*, is the largeſt of the genus of the *aſelli*, called ASELLUS *maximus* by authors; and ſometimes, ASELLUS *varius*, *ſive ſtriatus*. The characters by which this is diſtinguiſhed from other fiſhes of the ſame genus are theſe: its colour on the back and ſides is a duſky olive colour, variegated with yellow ſpots; its belly is white; its ſides have a long white line running their whole length, from the gills to the tail, which, at the abdomen, is curved, but elſewhere is ſtraight; its ſcales are very ſmall, and adhere firmly to the ſkin; its eyes are large; at the angle of the lower jaw there hangs a ſingle beard, which is ſhort, ſeldom exceeding a finger's length; its tongue is broad; it has ſeveral rows of teeth, one of which is much longer than all the others. Among theſe there are ſome moveable teeth, as in the pike; and in the palate, near the orifice of the ſtomach, and near the gills, it has ſmall cluſters of teeth. It has three back-fins, two at the gills, and two at the breaſt, and two others behind the anus; and the tail is plain.

This fiſh, according to its age, the places where it is caught, or cured, and other accidents, has alſo ſeveral names given it. From the various places, it is called, the *Haberdeen*, from Aberdeen in Scotland; the *Green-fiſh*, from Greenland; the *North-ſea cod*, from the Northern ocean; and the *Iceland-fiſh*, from Iceland. From other cauſes, it is called *ſtock-fiſh*, from the neceſſity of beating it with ſticks, before it is fit to be dreſſed; *barrelled-cod*, when cured, and put up in barrels; when young, a *codling*; and by the Dutch and Americans, *cabelow*.

According to the Artedian ſyſtem, it is a ſpecies of GADUS; and it is diſtinguiſhed from the other ſpecies of that genus, by having beards at the mouth, the upper jaw longeſt, and the tail not forked.

The *cod*, when freſh, produces good juice, and is nouriſhing; but when ſalted, and become too old, it is neither ſo well taſted, nor ſo eaſy of digeſtion. The pickle of *cod* is of a diſſolving and drying nature, when outwardly applied; it is alſo uſed, among other things, in clyſters; for it is laxative, becauſe it contains much ſalt, irritates the inteſtinal glands, and forces liquor out of them.

COD-*fiſhery*. See *Cod* FISHERY.

CODA, in *Italian Muſic*, literally ſignifies a *tail*; but is uſed often at the end of a canon, for two or three meaſures to cloſe with, after having repeated it ſeveral times. The *coda* ſerves only to end the piece, which, without it, might be carried on to infinity.

CODA *lancea*, in *Zoology*, the name given by the Italian authors to the ſpecies of duck called by others the *anas caudacuta*, and vulgarly known, in ſome parts of England, by the names of the CRACKER, or *ſea-pheaſant*. It differs from all other birds of the duck kind in the ſhape of its tail, which has two feathers longer than the reſt, and ending in a point.

CODAGA-*bark*, a name given to that otherwiſe called CONESSI, or *coneſti*.

CODDAM-*pulli*, in *Botany*, a name by which ſome authors have called the tree which produces the gamboge, the *gutta gamba* of the ſhops.

CODDY-*moddy*, in *Zoology*, the Engliſh name of a common water-fowl of the *larus*, or GULL kind, and diſtinguiſhed by the names of the *larus fuſcus*, or *larus Hybernus*.

CODE, CODEX, a collection of the laws and conſtitutions of the Roman emperors; made by order of Juſtinian.

The word comes from the Latin *codex*, *a paper book*; ſo called *à codicibus*, or *caudicibus arborum*, *the trunks of trees*; the bark whereof, being ſtripped off, ſerved the ancients to write their books on.

The *Code* is compriſed in twelve books, and makes the ſecond part of the civil, or Roman law.

There were ſeveral other *Codes* before the time of Juſtinian; all of them collections, or abridgments of the Roman laws. Gregorius and Hermogenes, two lawyers, made each a collection of this kind, called, from their names, the *Gregorian Code*, and *Hermogenean Code*. The former included the conſtitutions of the emperors from Adrian, or, as ſome ſay, of Auguſtus, to Diocleſian and Maximian. The latter was compiled in the age of the Conſtantines, and compriſed all the imperial conſtitutions of Diocleſian and Maximian, beſides thoſe of Claudius, Aurelian, Probus, Caius, and Caginus, to the year 306 or 312. We have nothing remaining of them but a few fragments; the compilations themſelves falling to the ground, for want of authority to put them in execution.

Theodoſius the Younger was the firſt emperor who made a *Code*, which was compriſed in ſixteen books, formed out of the conſtitutions of the emperors from Conſtantine the Great to his own time; abrogating all other laws not included in it: and this is what we call the Theodoſian *Code*; which was publiſhed in the year 438, and received and obſerved, till annulled by the *Code* of Juſtinian.

The Theodoſian *Code* has been a long time loſt in the Weſt: Cujas took a great deal of pains to retrieve it, and to publiſh it in a better condition than ever. Gothofred has given us a comment on the Theodoſian *Code*; a work which coſt him thirty years.

In 506, Alaric king of the Goths made a new collection of the Roman laws, taken from the three former *Codes*, the Gregorian, Hermogenean, and Theodoſian, which he likewiſe publiſhed under the title of the Theodoſian *Code*. This *Code* of Alaric continued a long time in force; and was all the Roman law received into France.

This *Code* of Alaric is ſometimes called the *Code* of Anian, becauſe compiled by Anian, who was chancellor to Alaric.

Laſtly, the emperor Juſtinian, finding the authority of the Roman law exceedingly weakened in the Weſt, upon the decline of the empire, made a general collection of the whole Roman juriſprudence. The management hereof he committed to his chancellor Trebonianus; who choſe out the moſt excellent conſtitutions of the emperors, from Adrian to his own time; and publiſhed his work in 529, under the title of the New *Code*.

But becauſe Juſtinian had made ſeveral new deciſions, which made ſome alteration in the ancient juriſprudence, he retrenched ſome of the conſtitutions inſerted by Trebonianus, and added his own in their place: on which account he publiſhed a new edition of the *Code* in 534, and abrogated the former. See CIVIL *Law*.

There have been various other later *Codes*, particularly of the ancient Gothic, and ſince of the French kings; as the *Code* of Frederic, the *Code* Michault, *Code* Louis, *Code* Neron, *Code* Henry, *Code* Marchand, *Code* des Eaux, *code* Noire, &c.

CODE *of canons*, *Codex canonum*. See CANON.

CODEX, in *Antiquity*, a kind of puniſhment by means of a clog, or block of wood, to which ſlaves, who had offended, were tied faſt, and obliged to drag it along with them; and ſometimes they ſat on it cloſely bound.

CODIA, Κωδία, in *Botany*, is uſed for the top, or head of any plant; but, by way of eminence, for that of the white poppy: whence the ſyrup made therewith is called *diacodium*.

CODICIL, a ſchedule, or ſupplement to a will, or other writing.

It is uſed as an addition to a teſtament, when any thing is omitted which the teſtator would add, explain, alter, or retract; and is of the ſame nature as a teſtament, except that it is without an heir, or executor.

So that a *codicil* is a leſs ſolemn will, of one that dies either teſtate or inteſtate, without the appointment of an heir: teſtate, when he that hath made his *codicil* hath either before or afterwards made his teſtament, on which that *codicil* depends, or to which it refers: inteſtate, when one leaves behind him only a *codicil* without a teſtament, wherein he gives legacies only to be paid by the heir at law, and not by any heir inſtituted by will, or teſtament.

A *codicil*, as well as a will, may be either *written*, or *nuncupative*. Some authors call a teſtament, a *great will*; and a *codicil*, a *little one*.

But there is this further difference between a *codicil* and a teſtament, that a *codicil* cannot contain the inſtitution of an heir; and that in a *codicil*, a man is not obliged to obſerve ſtrictly all the formalities preſcribed by law for ſolemn teſtaments.

In cuſtomary countries, teſtaments, properly ſpeaking, are no more than *codicils*; becauſe cuſtom itſelf names the heir, and does not allow of teſtamentary inheritors.

Codicils were firſt brought into uſe in the time of Auguſtus, by L. Lentulus: they were originally intended to follow the teſtament; which was, as it were, their baſis. In proceſs of time, *codicils* came to have their effect, even though made before the teſtament; provided there was nothing in the teſtament contrary to the *codicil*. People were alſo allowed to make *codicils* without teſtaments.

Raymond Lully has a book which he calls The *Codicil*; wherein he pretends to have left his readers the ſecret of the philoſophers ſtone; provided they do but underſtand it.

CODLIN-*tree*. See APPLE-*tree*.

CODON, in *Antiquity*, a cymbal, or rather little braſs-bell, reſembling the head of a poppy. They were faſtened to the trappings and bridles of horſes.

CODON is alſo uſed to ſignify the orifice of a trumpet.

COECUM, in *Anatomy*, the *blind gut*; the firſt of the thick inteſtines; ſo called, becauſe made like a ſack, having but one aperture, which ſerves it both for entrance and exit.

It is ſituate on the right ſide, below the kidney; and in length is about the breadth of three or four fingers. In children new-born, and in quadrupeds, it is found full of excrements; but in adults, &c. it frequently diſappears, or hangs like a worm.

Its uſe in adults is very obſcure: in a *fœtus*, or infant newly born, it appears to ſerve as a receptacle of the *fæces* during ſuch time as the animal does not diſcharge by ſtool. See APPENDIX.

Dr. Gliſſon imagines it may likewiſe ſerve in ſuch animals as have it large, as dogs, coneys, rats, &c. for a kind of ſecond ventricle, or bag, wherein the prepared aliment may be retained, while a richer and more nutritious juice is drawn from it.

Others will have it contain a ferment; and others, the flatus of the inteſtines: others fancy it may ſeparate a humour, by ſome glands placed in it to harden the excrements as they paſs through the colon.

Dr. Liſter aſſigns the uſe of the *cœcum* to be, to keep the excrements which paſs into the cavity (as moſt of thoſe of found animals, he thinks, do), till they are ſufficiently drained, baked, and hardened, to receive the figure to be given them by the colon and rectum. He adds, to confirm this, that wherever there are regularly figured excrements of the firſt kind, there is a capacious *cœcum*, and *vice verſa*. This indeed is true, that ſome animals, which are naturally looſe, have either no *cœcum* at all, or very little; as the *talpa*, *echinus terreſtris*, *gula*, &c. The intention of nature, in thus providing for the figuration of the excrements, he takes to be, firſt, to prevent diarrhœas; ſecondly, to make the creature abide hunger the better (thus it is, that ſnails, in winter, reſt with full inteſtines); and, laſtly, to heighten the digeſtion and fermentation in the ſtomach and ſmall guts.

Dr. Muſgrave gives us an account, in the Philoſophical Tranſactions, of the *cœcum* of a dog being cut out, without any prejudice to the animal. M. Giles gives us another, of the *cœcum* of a lady being diſtended ſo as to form a tumour, that held almoſt three chopines of a thin, greyiſh, and almoſt liquid ſubſtance, whereof ſhe died. And Mr. Knowles, a third, of a boy's *cœcum* being vaſtly extended, and ſtuffed with cherry-ſtones, which likewiſe proved mortal.

Some ſay, the name *cœcum* is miſtaken; not allowing this to be the *cœcum* of the ancients, which they imagine to be the thick globous part of the colon, immediately appended to the ileum; and therefore give this part the name of *appendicula vermiformis*.

CO-EFFICIENTS, in *Algebra*, are numbers, or given quantities, prefixed to letters, or unknown quantities, into which they are ſuppoſed to be multiplied; and therefore, with ſuch letters, or with the quantities repreſented by them, make a rectangle or product, *co-efficient production*; whence the name.

Thus, in $3a$, or bx, or Cxx; 3 is the *co-efficient* of $3a$; b, of bx; and C, of Cxx. If a letter have no number prefixed, it is always ſuppoſed to have unit for the *co-efficient*. Thus, a, or bc, import as much as $1a$, or $1bc$. The *co-efficient*, in a quadratic equation, is according to its ſign, either the ſum, or the difference of the two roots.

In any equation of a higher nature, the *co-efficient* of the ſecond term is always the aggregate of all the roots retaining their proper ſigns: ſo that if all the negatives be equal to all the affirmatives, the ſecond term will vaniſh; and where the ſecond term is thus wanting, it is a ſign that the quantities under contrary ſigns were thus equal.

The *co-efficient* of the third term is the aggregate of all the rectangles ariſing by the multiplication of every two of the roots, how many ways ſoever thoſe combinations of duals can be had; as three times in a cubic, ſix in a biquadratic equation, &c.

The *co-efficient* of the fourth term is the aggregate of all the ſolids made by the continual multiplication of every three of the roots, how often ſoever ſuch a ternary can be had; as there may be four in a biquadratic, five in an equation of five dimenſions, &c. And thus it will go on infinitely.

CO-EFFICIENTS *of the ſame order*, in *Algebra*, is a term ſometimes uſed for the *co-efficients* prefixed to the ſame unknown quantities, in different equations.

Thus, in the equations $\left\{\begin{array}{l} ax+by+cz=m \\ dx+ey+fz=n \\ gx+hy+kz=p \end{array}\right\}$ the *co-efficients* a, d, g are of the ſame order, being the *co-efficients* of x; alſo b, e, h are of the ſame order, being the *co-efficients* of y, &c. The *co-efficients* alſo that affect no unknown quantity, are ſaid to be of the ſame order.

CO-EFFICIENTS, *oppoſite*, ſuch as are taken each from a different equation, and from a different order of *co-efficients*. Thus, in the foregoing equations, a, e, k, and a, h, f, as alſo d, b, k, are *oppoſite co-efficients*.

COELESTIAL, in a general ſenſe, denotes any thing belonging to *cœlum* or the heavens. Thus,

COELESTIAL *obſervations*, are obſervations of the phænomena of the heavenly bodies, made with a proper apparatus of aſtronomical inſtruments, in order to determine their places, motions, phaſes, &c.

The inſtruments chiefly uſed in *cœleſtial* obſervations are the aſtronomical GNOMON, QUADRANT, MICROMETER, and TELESCOPE.

Obſervations in the day-time are eaſy; becauſe the croſs hairs in the focus of the object-glaſs of the teleſcope are then diſtinctly perceivable: in the night, thoſe croſs hairs are to be illumined to make them viſible.

This illumination is either performed by a candle, placed obliquely near them, ſo that the ſmoke doth not intercept the rays; or, where this is inconvenient, by making an aperture in the tube of the teleſcope, near the focus of the object-glaſs, through which a candle is applied to illumine the croſs hairs.

M. De la Hire has made an improvement on the firſt method, which renders it of very good uſe; and it is by covering that end of the tube next to the object-glaſs with a piece of gauſe, or fine white ſilken crape. For, in ſuch caſe, a link, placed at a good diſtance from the tube, ſo enlightens the gauſe, as to render the croſs hairs very perceivable.

Obſervations of the ſun are not to be made without placing a glaſs, ſmoked in the flame of a lamp or candle, between the teleſcope and the eye; to take off from its luſtre, which would otherwiſe damage the eye, were not a good part of its beams intercepted.

Note, when any of the heavenly bodies are obſerved through a teleſcope of only two glaſſes, they appear inverted.

Cœleſtial obſervations are chiefly of two kinds: the one, when the objects are in the MERIDIAN; the other, when they are in VERTICAL circles.

COELESTIAL *globe*. See GLOBE.

COELIA, Κοιλια, or Κοιλιη. This has many different ſignifications: firſt, it imports a cavity in any part of the body, or in any of the viſcera; ſecondly, it implies the ſame as *aleres*. The κοιλιη, with the addition of ανω, that is, ἡ κατω κοιλιη, is the lower belly, or inteſtinal tube.

COELIAC *artery*, the firſt artery detached from the deſcending trunk of the aorta into the abdomen.

It divides into two branches, the one on the right ſide, the other on the left: of which the firſt gives the *gaſtrica dextra*, which goes to the ſtomach; the *cyſtica*, which goes to the gall-bladder; the *epiplois dextra* to the *omentum*; the *inteſtinalis* to the *duodenum*, and to a part of the *jejunum*; and the *gaſtro epiploïs* to the ſtomach, to the *omentum*, and ſome branches to the liver, which enter the *capſula communis*, to accompany the branches of the *vena porta*.

The left branch of the *cœliaca* gives the *gaſtrica dextra*, which is alſo ſpread upon the ſtomach; the *epiploïs ſiniſtra*, which goes to the *omentum*; and the *ſplenica* to the ſubſtance of the ſpleen. See each branch deſcribed in its place.

COELIAC *paſſion*, is a ſort of diarrhœa, or flux of the belly; wherein the aliment comes away either crude or chylified, in lieu of excrements.

Dr. Freind recommends for this diſorder, ſuch medicines as gently ſtimulate the inteſtinal tube, and deterge the obſtructed glands; ſuch as light and frequent purges, and gentle vomits of ipecacuanha.

Authors frequently confound the *cœliac paſſion* with the *lientery*; but they are different.

There is alſo a COELIAC *diabetes*, called *cœliaca urinalis*, wherein the chyle paſſes off along with, or inſtead of urine. See DIABETES.

COELIAC *vein*, is that which runs through the *inteſtinum rectum*. See RECTUM.

COELICOLOR, in *Natural Hiſtory*, a name given by ſome to the OPAL.

COELOMA, in *Medicine*, a hollow and round ulcer, in the horny tunic of the eye.

COELUM. See HEAVEN.

COELI *fundus*. See FUNDUS.

COELUM is alſo uſed by ſome anatomiſts for the cavity of the eye towards the angles, or *canthi*. See EYE, CANTHUS, &c.

COELUS, in *Mythology*, one of the heathen deities, the ſame with the Greek *Uranus*.

COEMETERIUM. See CEMETERY.

COEMPTIONALES, among the Romans, an appellation given to old ſlaves, which were ſold in a lot with others, becauſe they could not be ſold alone.

COENA *domini*, *bull*. See BULL.

COENOBITE, a religious, who lives in a convent, or in community, under a certain rule; in oppoſition to ANACHORET, or HERMIT, who lives in ſolitude.

The word comes from κοινος, *communis*, and βιος, *vita*, *life*. Caſſian makes this difference between a *convent* and a *monaſtery*, that the latter may be applied to the reſidence of a ſingle religious, or recluſe; whereas the *convent* implies *cœnobites*, or numbers of religious living in common.

Fleury ſpeaks of three kinds of monks in Egypt: *anachorets*, who live in ſolitude; *cœnobites*, who continue to live in community; and *ſarabaites*, who are a kind of monks errant, that ſtroll from place to place.

He refers the inſtitution of *cœnobites* to the times of the apoſtles, and makes it a kind of imitation of the ordinary lives of the faithful at Jeruſalem. Though St. Pachomius is ordinarily owned the inſtitutor of the *cœnobite* life; as being the firſt who gave a rule to any community.

COENOBIUM, the ſtate of living in a ſociety, or community, where all things are in common. Pythagoras is thought to be the author, or firſt inſtitutor of this kind of life, his diſciples, though ſome hundreds in number, being obliged all to give up their private eſtates, in order to be annexed to the joint ſtock of the whole. The Eſſenians among the Jews, and Platoniſts, are ſaid to have lived in the ſame manner. Many of the Chriſtians alſo have thought this the moſt perfect kind of ſociety, as being that in which Chriſt and his apoſtles choſe to live. See COENOBITE.

COENOTAPH. See CENOTAPH.

CO-EQUALITY, a term expreſſing the relation of EQUALITY between two things.

The retainers to St. Athanaſius's doctrine of the Trinity hold the Son and Holy Spirit *co-equal* with the Father. The Arians, &c. deny the *co-equality*. See TRINITY, and ARIAN.

COERULEUM *montanum*, ſignifies MOUNTAIN-BLUE, which is called by ſome authors, CHRYSOCOLLA; it is a blue ORE *of copper*.

COERULEUM *nativum*. See ARMENIUS *lapis*.

COES, among *Miners*, are little houſes which the miners make over their mines to lay ore in.

CO-ETERNITY is uſed among *Divines* to denote the ETERNITY of one being equal to that of another.

The orthodox hold the ſecond and third perſons in the Trinity *co-eternal* with the firſt.

COEUR, in *Heraldry*.—*Party en* COEUR, ſignifies a ſhort line of partition in pale, in the center of the eſcutcheon, which extends but a little way, much ſhort of top and bottom; being met by other lines, which form an irregular partition of the eſcutcheon, as repreſented in *Tab. Herald. fig.* 43.

CO-EXISTENCE, a term of relation, denoting two or more things to exiſt together at the ſame time, &c. See EXISTENCE.

COFFEE, in *Natural Hiſtory*, a ſeed, or berry, brought from Arabia Felix; uſed for making a potable liquor of the ſame name.

That from the Levant is moſt eſteemed, being greener, heavier, and appearing riper and plumper, than that from Mocha; which is larger, lighter, and whiter.

For *coffee-berries*, ſome ſubſtitute peas, beans, rye, and barley, which, roaſted, yield an oily matter, reſembling in flavour, but leſs agreeable, as well as much leſs ſtrong, than *coffee*.

COFFEE alſo denotes a kind of drink prepared from theſe berries; very familiar in Europe for more than a hundred years, and among the Turks for two hundred and fifty. Its original is not well known: ſome aſcribe it to the prior of a monaſtery, who, being informed by a goat-herd, that his cattle, ſometimes browſing on the tree, would wake and caper all night, became curious to prove its virtue: accordingly, he firſt tried it on his monks, to prevent their ſleeping at matins. Others, from Schehabeddin, refer the invention of *coffee* to the Perſians; from whom, they ſay, it was learned in the fifteenth century by Gemaleddin, mufti of Aden, a city near the mouth of the Red ſea; and who, having tried its virtues himſelf, and found that it diſſipated the fumes which oppreſſed the head, inſpired joy, opened the bowels, and prevented ſleep, without being incommoded by it; recommended it firſt to his derviſes; with whom he uſed to ſpend the night in prayer.

Their example brought *coffee* into vogue at Aden; the profeſſors of the law for ſtudy, artiſans to work, travellers to walk in the night, in fine, every body at Aden, drank *coffee*. Hence it paſſed to Mecca, where firſt the devotees, then the reſt of the people, took it. From Arabia Felix it paſſed to Cairo.

In 1511, Khaiae Beg prohibited it, from a perſuaſion that it inebriated, and that it inclined to things forbidden. But ſultan Cauſou immediately after took off the prohibition, and *coffee* advanced from Egypt to Syria and Conſtantinople.

The derviſes declaimed againſt it from the Alcoran, which declares that coal is not of the number of things created by God for food. Accordingly, the mufti ordered the *coffee*-houſes to be ſhut up; but his ſucceſſor declaring *coffee* not to be coal, they were opened again.

During the war in Candia, the aſſemblies of news-mongers making too free with ſtate-affairs, the grand vizier Cuproli ſuppreſſed the *coffee*-houſes at Conſtantinople; which ſuppreſſion, though ſtill in force, does not prevent the public uſe of the liquor there. Thevenot the traveller was the firſt who brought it into France; and a Greek ſervant, called Peſqua, brought into England by Mr. Dan. Edwards, a Turky merchant, in 1652, to make his *coffee*, firſt ſet up the profeſſion of *coffee*-man, and introduced the drink among us: though ſome ſay Dr. Harvey had uſed it before. The firſt mention of it in our ſtatute-books is in the year 1660, when a duty of four pence was laid on every gallon of *coffee* made and ſold; and in 1675, king Charles iſſued a proclamation to ſhut up the *coffee*-houſes, becauſe they were ſeminaries of ſedition. The French firſt conveyed ſome plants to Martinico in 1727, whence it probably ſpread to the neighbouring iſlands.

The word *coffee* is originally Arabic: the Turks pronounce it *cahueh*, and the Arabs *cahuah*; which ſome authors maintain to be a general name for any thing that takes away the appetite; others, for any thing that promotes appetite; and others, again, for any thing that gives ſtrength and vigour.

The Mahometans, it is obſerved, diſtinguiſh three kinds of *cahuah*: the firſt is wine, or any liquor that inebriates: the ſecond is made of the pods that contain the *coffee*-berry; this they call the *ſultanas coffee*, from their having firſt introduced it, on account of its heating leſs than the berry, as well as its keeping the bowels open: the third is that made with the berry itſelf, which alone is uſed in Europe, the pods being found improper for tranſportation. Some Europeans, who imported the pods, called them the *flower of the coffee-tree*.

The deep brown colour of the liquor occaſioned its being firſt called *ſyrup of the Indian mulberry*; under which ſpecious name it firſt gained ground in Europe.

The preparation of *coffee* conſiſts in roaſting, or giving it a juſt degree of torrefaction, on an earthen, or metalline plate, till it hath acquired a browniſh hue, equally deep on all ſides: it is then ground in a mill, as much of it as ſerves the preſent occaſion. A proper quantity of water is next boiled, and the ground *coffee* put in it. After it has juſt boiled, it is taken from the fire; and the decoction having ſtood a-while to ſettle, and fine, they pour, or decant it into diſhes.

The cuſtom is to drink *coffee* as hot as poſſible, with ſugar; though the Turks do not trouble themſelves to take off its bitterneſs with any ſugar: their grandees add to each diſh a drop of eſſence of ambergris; others boil it with a couple of cloves; others, a little Indian aniſe; others, cacouleh, or the grain of the cardamomum minus.—*Coffee* is one of the neceſſaries with which the Turks are obliged to furniſh their wives.

The ordinary method of roaſting *coffee* among us, is in a tin cylindrical box, full of holes; through the middle whereof runs a ſpit: under this is a ſemicircular hearth, wherein is a large charcoal fire: by help of a jack, the ſpit turns ſwift, and ſo roaſts the berries; being now and then taken up to be ſhaken. When the oil riſes, and it is become of a dark brown colour, it is emptied into two receivers, made with large hoops, whoſe bottoms are iron plates, into which theſe ſhut: there the *coffee* is ſhaken, and left till almoſt cold; and if it look bright and oily, it is a ſign it is well done.

Coffee is taken with very different, nay, frequently with directly oppoſite intentions; ſome uſe it to prevent ſleep, others to promote digeſtion, &c. Its more real virtues, owned by the phyſicians, conſiſt in this; that being an excellent drier, it carries off fumes and diſorders of the head, ariſing from too much moiſture, diſſipates megrims, and abſorbs acrimonies of the ſtomach; whence its uſe after a debauch of ſtrong liquors; and hence alſo its uſe in promoting watching, bracing the fibres, and rendering them too tenſe for the relaxation required in ſleep.

It likewiſe promotes circulation, but that beſt with people of a pretty corpulent habit; being found hurtful to thoſe who are thin, lean, dry, and of a bilious temperament; as it dries up the nerves, and inclines them to tremors: it is ſaid to be prejudicial likewiſe to thoſe who digeſt too faſt; where the circulation is too quick, or where there is a ſpitting of blood ariſing from the mouths of any of the veins and arteries being too open, or the blood too thin and ſharp.

Mr. Boyle mentions an inſtance of a perſon to whom *coffee* always proved emetic; and that much drinking of it produced the palſy. It is alſo known to be purgative to others.

The oily matter that ſeparates from the *coffee*, and appears on its ſurface when roaſted; and its particular ſmell, which diſtinguiſhes it from peas, beans, rye, &c. which ſome ſubſtitute in lieu of *coffee*, are to be the real indications of its effects. If conſidered with regard to the oil drawn by the retort, this, as well as that, contains volatile principles, both ſaline and ſulphureous.

It is to the diſſolution of its ſalts, and the mixture of its ſulphurs in the blood, that its chief faculty of promoting watchfulneſs is to be attributed: hence alſo its property of promoting digeſtion, of precipitating foods, of preventing eructations, and of correcting acrimonies of the ſtomach, when taken after meals.

Hence alſo that fermentation in the blood, ſerviceable to corpulent people: hence alſo its diuretic virtue. By experience it is found of ſervice to drink a glaſs of water before *coffee*, to render it laxative; and to mix it with milk or cream, to extinguiſh its ſulphurs, embarraſs its ſaline principles, and to render it nouriſhing.

S. Pauli, a Daniſh phyſician, maintains, that it enervates men, and renders them incapable of generation; and it is certain the Turks attribute the ſame effects to it; and from the immoderate uſe hereof, account for that thinneſs of inhabitants found in their provinces formerly the beſt peopled. But this opinion is refuted by Du Four.

M. Malebranche gave the Royal Academy of Sciences an account of a perſon cured of an apoplexy, by means of ſeveral clyſters of *coffee*. It has proved of ſervice in the caſe of an ASTHMA.

For the laws relating to this commodity, ſee 6 and 7 W. III. c. 7. 3 and 4 Ann. c. 4. 10 Ann. c. 26. 5 Geo. I. c. 11. 10 Geo. I. c. 10. 11 Geo. I. c. 30. 5 Geo. II. c. 24. 15 Geo. II. c. 11. 5 Geo. III. c. 45. The duty on *coffee* paid on importation is three pence a pound; beſides an inland duty to be charged on the maker or ſeller of 2*s.* 6*d.* a pound, excepting for *coffee* grown in America, which pays only 1*s.* 6*d.* a pound. No perſon is allowed to ſell or retail *coffee* without a licence, under the penalty of 5*l.* a month; and no perſon ſhall mix any materials to increaſe the weight, under a penalty of 100*l.*

COFFEE-*tree*, *Coffea*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath one petal, which is funnel-ſhaped, having a narrow cylindrical tube; and is plain at the top, where it is indented in five parts: it hath five ſtamina, which are faſtened to the tube. The roundiſh germen afterward becomes an oval berry, containing two hemiſpherical ſeeds, plain on one ſide, and convex on the other. We have but one ſpecies, which is ſuppoſed to be a native of Arabia Felix, where it was firſt cultivated for uſe; and to this day is the country from whence the beſt *coffee* is brought to Europe. It is a low tree in the native country of its growth, where it ſeldom riſes more than ſixteen or eighteen feet high.

The great faults of the American *coffee*, is the want of flavour, or having a diſagreeable one; though the berries are much larger than thoſe imported from Arabia. It is the conſtant practice of the planters to gather the fruit while it is red; at which time the berries are larger, and of greater weight, than thoſe which are permitted to ripen perfectly on the trees, which is not until they are turned black: whereas in Arabia they always ſhake the berries from the trees, ſpreading cloths under them to receive them; and take only ſuch as readily fall each time.

As the *coffee-tree* is an ever-green, it makes a beautiful appearance at every ſeaſon in the ſtoves; but particularly when it is in flower, and alſo when the berries are red, which is generally in the winter, ſo that they continue a long time in that ſtate: there is ſcarce any plant therefore which deſerves a place in the ſtove more than this.

It is propagated by the berries, which muſt be ſown ſoon after they are gathered from the tree; for if they are kept out of the ground any time, they will not grow.

COFFER, a long ſquare box about three feet long, and one and a half broad, uſed for breaking in pieces tin ore in a ſtamping-mill.

COFFER, *Capſa*, in *Architecture*, a ſquare depreſſure, or ſinking, in each interval between the modillions of the Corinthian cornice; ordinarily filled up with a roſe, ſometimes with a pomgranate, or other enrichment.

Theſe ſinkings, called alſo *panels*, are of different figures in the compartments of vaults and ſoffits.

COFFER, in *Fortification*, denotes a hollow lodgment, athwart a dry moat, from ſix to ſeven feet deep, and from ſixteen to eighteen feet broad; the upper part made of pieces of timber raiſed two feet above the level of the moat; which little elevation has hurdles laden with earth for its covering; and ſerves as a parapet, with embraſures.

The *coffer* is nearly the ſame with the caponiere, excepting that this laſt is ſometimes made beyond the counterſcarp on the glacis, and the *coffer* always in the moat, taking up its whole breadth, which the caponiere does not.

It differs from the traverſe, and gallery, in that theſe latter are made by the beſiegers, and the *coffer* by the beſieged.

The beſieged generally make uſe of *coffers* to repulſe the beſiegers, when they endeavour to paſs the ditch. To ſave themſelves from the fire of theſe *coffers*, the beſiegers throw up the earth on that ſide towards the *coffer*.

COFFER-*dams*, in French *Battardeaux*, in *Bridge-Building*, denote incloſures formed for laying the foundation of piers, and for other works in water, in order to prevent the ambient water from interrupting the workmen. Theſe incloſures are ſometimes ſingle, ſometimes double, with clay rammed between them: ſometimes they are made with piles driven cloſe by one another; ſometimes the piles are notched or dove-tailed into one another; but the moſt uſual method is to drive piles with grooves in them, at the diſtance of five or ſix feet from each other, and then boards are let down between them. See BRIDGE.

COFFERER *of the King's Houſhold*, a principal officer in the court, next under the comptroller; who, in the compting-houſe, and elſewhere at other times, has a ſpecial charge and overſight of other officers of the houſe, for their good demeanour and carriage in their offices: to all whom he pays the wages. See HOUSHOLD.

COFFIN, in a general ſenſe, a wooden box or trunk, into which the bodies of dead perſons are put, in order for burial.

COFFIN, in the *Manege*, the whole hoof of a horſe's foot, above the coronet; including the *coffin*-bone, the ſole, and the fruſh.

COFFIN-*bone*, is a ſmall ſpongy bone, encloſed in the midſt of the hoof, and poſſeſſing the whole form of the foot.

COFFIN-*joint*, is that where the leſſer paſtern joins the foot. A ſtrain in this joint occaſions a ſtiffneſs, which can only be removed by bliſtering and firing.

COFFIN, in the *Manufacture of China*. See CASSETTE.

COGGESHALL's *Sliding-Rule*, an inſtrument uſed in gauging, ſo called from its inventor. See the deſcription and uſe under SLIDING-RULE.

COGGLE, or COG, a ſmall fiſhing-boat upon the coaſts of Yorkſhire: and *cogs* (*cogones*) are a kind of little ſhips or veſſels uſed in the rivers Ouſe and Humber. Stat. 23 H. VIII. c. 18. *Præparatis* cogonibus, *galleis, & aliis navibus, &c.* Mat. Paris, ann. 1066. And hence the cogmen, boatmen, and ſeamen, who after ſhipwreck or loſſes by ſea, travelled and wandered about to defraud the people by begging and ſtealing; until they were reſtrained by divers good laws.

COGITATION, the act or operation of thinking. See THINKING.

COGNATION, in the *Civil Law*, the bond of relation between all the deſcendents of the ſame ſtock, both males and females: by which it is diſtinguiſhed from *agnation*, which only comprehends the deſcendents of the male ſex.

In France, for the ſucceſſion to the crown they follow *agnation*; in England, Spain, &c. *cognation*; women coming to the ſucceſſion, according to the degree of proximity, in default of males, or their deſcendents from branch to branch.

In the *Roman Law*, the words *cognatio* and *cognati* are alſo taken in a more limited ſenſe; *cognatio* ſignifying only the bond of relation between the deſcendants from the ſame ſtock by women; and *cognati* thoſe between whom there was ſuch a bond of relation ſubſiſting.

COGNIOL, in *Zoology*, a name given by ſome to the fiſh more uſually called *colias*, a kind of mackrel, differing from the common kind in nothing but that it is much ſmaller.

COGNISEE, or Connusee, in *Law*, is the perſon to whom a fine of lands, &c. is acknowleged.

COGNISOR, or Conusor, is he that paſſeth, or acknowlegeth, a FINE of lands and tenements to another. See Cognizance.

COGNITIVE is ſometimes applied to that faculty or power of the human mind, by which we know any thing, or are enabled to diſtinguiſh truth from falſity.

Latin writers uſe the term *facultas cognoſcitiva* in the ſame ſenſe.

Hobbes has made uſe of the term *cognitive* power, for the power of knowing, or conceiving, in contradiſtinction to *motive* power, or appetite.

COGNITIONIBUS *mittendis*, in *Law*, a writ to any of the king's juſtices of the common pleas, who has the power of taking a fine, and who, having taken a fine, defers to certify it, commanding him to certify the ſame.

COGNIZANCE, or Cognisance, in *Heraldry*. See Crest.

Cognizance, or Conusance, in *Law*, is the acknowlegement of a fine; or the conceſſion of a thing done. In which ſenſe we ſay, *cognoſcens latro, a thief that confeſſes*.

Cognizance is alſo uſed for a power, or juriſdiction. Thus, *cognizance of pleas*, denotes an ability to call a plea out of another court; which no one but the king can do, unleſs he can ſhew a particular charter for it. Thus, if a ſcholar, or other privileged perſon of the univerſities of Oxford or Cambridge, is impleaded in the courts of Weſtminſter, for any cauſe of action, except a queſtion of freehold; in ſuch a caſe, the chancellor or vice-chancellor, by charter confirmed by ſtatute, may put in a claim of *cognizance*; which, if made in time, and accompanied with due proof of the facts alleged, is allowed by the courts.

Cognizance is ſometimes uſed alſo for an audience, or hearing of a matter judicially. In which ſenſe we ſay, *to take cognizance*, &c.

Cognizance, again, is uſed for a badge on a waterman's, or ſervingman's ſleeve, which is commonly the giver's creſt, whereby he is diſcerned to belong to this or that nobleman, or gentleman.

COGNOVIT *actionem*, in *Law*, is where a defendant acknowleges or confeſſes the plaintiff's cauſe againſt him to be juſt and true; and after iſſue, ſuffers judgment to be entered againſt him without trial. But moſt frequently the defendant confeſſes one part of the complaint, ad traverſes or denies the reſt.

COGS. See Coggle.

COGWARE is ſaid to be a ſort of coarſe cloths, made in divers parts of England, of which mention is made in 13 R. II. c. 10.

CO-HABITATION, implies a concubinage, copulation, or carnal knowlege, between two perſons. It is rarely uſed, except in a criminal ſenſe.

CO-HEIR, a perſon who ſhares an inheritance or eſtate with another HEIR.

COHERENCE, a ſchool-term, applied to propoſitions, diſcourſes, &c. which have a CONNEXION, or dependance, on one another.

COHESION, or Cohæsion, in *Phyſics*, the action whereby the particles, or primary corpuſcles, whereof natural bodies conſiſt, are connected, or bound together, ſo as to form particles; and thoſe, again, kept together, ſo as to form ſenſible maſſes, or bodies.

The cauſe of this *coheſion*, or *nexus materiæ*, has extremely perplexed the philoſophers of all ages. In all the ſyſtems of phyſics, matter is ſuppoſed originally to be in minute, indiviſible atoms.

How and by what principle, theſe ſeveral and diſtinct corpuſcles ſhould come firſt joined and combined into little ſyſtems; and how they ſhould come to perſevere in that ſtate of union; is a point of the moſt difficulty, and even of the moſt importance, of any in phyſics.

The opinion maintained by many, is that ſo ſtrenuouſly defended by J. Bernouilli, De Gravitate Ætheris; who accounts for the *cohesion* of the parts of matter, from the uniform preſſure of the atmoſphere: confirming this doctrine from the known experiment of two poliſhed marble planes, which cohere very ſtrongly in the open air, but eaſily drop aſunder in an exhauſted receiver.

However, if two plates of this kind be ſmeared with oil, to fill up the pores in their ſurfaces, and prevent the lodgment of air, and one of them be gently rubbed upon the other, they will adhere ſo ſtrongly, when ſuſpended even in an exhauſted receiver, that the weight of the lower plate will not be able to ſeparate it from the upper one.

But though this theory might ſerve tolerably well to explain the *cohesion* of compoſitions, or greater collections of matter; yet it falls ſhort of accounting for that firſt *cohesion* of the atoms, or primitive corpuſcles, whereof the corpuſcles of hard bodies are compoſed.

Sir Iſaac Newton delivers his doctrine of *cohesion* thus:
“ The particles of all hard homogeneous bodies, which
“ touch one another, *cohere* with a great force; to ac-
“ count for which, ſome philoſophers have recourſe to a
“ kind of hooked atoms, which, in effect, is nothing
“ elſe but to beg the thing in queſtion. Others imagine,
“ that the particles of bodies are connected by reſt, i. e.
“ in effect, by nothing at all; and others by conſpiring
“ motions, i. e. by a relative reſt among themſelves.
“ For myſelf, it rather appears to me, that the particles
“ of bodies *cohere* by an attractive force, whereby they
“ tend mutually toward each other: which force, in
“ the very point of contact, is very great; at little diſ-
“ tances is leſs; and at a little farther diſtance is quite
“ inſenſible.”

It is not certain in what proportion this force increaſes or decreaſes: Deſaguliers conjectures, from ſome phænomena, that it decreaſes in a biquadratic ratio of the increaſed diſtance, ſo that at twice the diſtance it acts ſixteen times more weakly, &c.

“ Now, if compound bodies be ſo hard, as by expe-
“ rience we find ſome of them to be, and yet have a
“ great many hidden pores within them, and conſiſt of
“ parts only laid together; no doubt thoſe ſimple parti-
“ cles which have no pores within them, and which
“ were never divided into parts, muſt be vaſtly harder.
“ For ſuch hard particles, gathered into a maſs, cannot
“ poſſibly touch in more than a few points: and there-
“ fore much leſs force is required to ſever them, than
“ to break a ſolid particle, whoſe parts touch through-
“ out all their ſurfaces, without any intermediate pores
“ or interſtices. But how ſuch hard particles, only laid
“ together, and touching only in a few points, ſhould
“ come to *cohere* ſo firmly as in fact we find they do, is
“ inconceivable; unleſs there be ſome cauſe, whereby
“ they are attracted and preſſed together.
“ Now, the ſmalleſt particles of matter may *cohere* by
“ the ſtrongeſt attractions, and conſtitute larger, whoſe
“ attracting force is feebler: and, again, many of theſe
“ larger particles *cohering*, may conſtitute others ſtill
“ larger, whoſe attractive force is ſtill weaker; and ſo
“ on for ſeveral ſucceſſions, till the progreſſion end in
“ the biggeſt particle, on which the operations in che-
“ miſtry, and the colours of natural bodies, do depend;
“ and which by *cohering* compoſe bodies of a ſenſible
“ magnitude.”

The different degrees of *cohesion*, conſtitute bodies of different forms and properties. Thus, the ſame great author obſerves, the particles of fluids, which do not *cohere* too ſtrongly, and are ſmall enough to render them ſuſceptible of thoſe agitations which keep liquors in a fluor, are moſt eaſily ſeparated and rarefied into vapour, and make what the chemiſts call *volatile bodies*; being rarefied with an eaſy heat, and again condenſed with a moderate cold.

Thoſe whoſe particles are groſſer, and ſo are leſs ſuſceptible of agitation, or *cohere* by a ſtronger attraction, are not ſeparable without a greater degree of heat; and ſome of them not without fermentation: and theſe make what the chemiſts call *fixt bodies*.

Air, in its fixed ſtate, poſſeſſes the interſtices of ſolid ſubſtances, and probably ſerves as a bond of union to their conſtituent parts; for when theſe parts are ſeparated, the air is diſcharged, and recovers its elaſticity. See Air, *fixed*.

This kind of attraction is evinced by a variety of familiar experiments; as, by the union of two contiguous drops of mercury; by the mutual acceſs of two pieces of cork, floating near each other in a baſon of water; by the adheſion of two leaden balls, whoſe ſurfaces are ſcraped and joined together with a gentle twiſt, which is ſo conſiderable, that, if the ſurfaces are about a quarter of an inch in diameter, they will not be ſeparated by a weight of 100 lb.; by the aſcent of oil or water between two glaſs planes, ſo as to form the hyperbolic curve, when they are made to touch on one ſide, and kept ſeparate at a ſmall diſtance on the other—ſee Ascent; by the depreſſion of mercury, and by the riſe of water in CAPILLARY *tubes*, and on the ſides of glaſs veſſels; and alſo in ſugar, ſponge, and all porous ſubſtances. And where this *cohesive* attraction ends, a power of REPULSION begins.

Profeſſor Muſchenbroek has made many experiments, in order to determine the force of *coheſion* in a great variety of different ſubjects. The adheſion of poliſhed planes, about two inches in diameter, heated in boiling water, and beſmeared with greaſe, required the following weight to ſeparate them:

	Cold greaſe.	Hot greaſe.
Planes of Glaſs,	130 lb.	300 lb.
Braſs,	150	800
Copper,	200	850
Marble,	225	600
Silver,	150	250
Iron,	300	950

But when the planes were made to adhere by other ſorts of matter, the reſults were as in the following table:

With Water,	12 ounces.
Oil,	18
Venice turpentine,	24
Roſin,	850 lb.
Tallow candle,	800
Pitch,	1400

In eſtimating the *abſolute coheſion* of bodies, he applied weights to ſeparate them according to their length: his pieces of wood were of a long ſquare figure, each ſide of which was .26 of an inch, and they were broken aſunder by the following weights:

Wood of Linden tree,	1000 lb.
Alder,	1000
Fir,	600
Oak,	1150
Elm,	950
Beech,	1250
Aſh,	1250

He alſo tried wires of metal one tenth of a Rhinland inch in diameter: the metals and weights were as follow:

Of Copper,	299¼ lb.
Yellow braſs,	360
Gold,	500
Silver,	370
Iron,	450
Tin,	40¼
Lead,	29¼

He then tried the *relative coheſion*, or the force with which bodies reſiſt an action applied to them in a direction perpendicular to their length. For this purpoſe he put pieces of wood by one end into a ſquare hole of a metal plate, and hung weights towards the other end ſufficient to break them at the hole: the weights and diſtances from the hole are exhibited in the following table:

	Diſtance.	Weights.
Fir,	9 inches,	40 ounces.
Oak,	8½	48
Elm,	9	44
Pine,	9½	36½
Alder,	9¼	48
Beech,	7	56½

See Introductio ad Cohærentiam Corporum firmorum apud Phyſicæ Exper. & Geom. Diſſertationes, p. 431, &c. and Introductio ad Philoſ. Nat. 4to. ed. 1762. tom. i. cap. 21.

COHOBATION, in *Chemiſtry*, a repeated diſtillation of the ſame matter, with the liquor drawn from it; that liquor being again and again returned upon the matter left at the bottom.

Cohobation is a kind of circulation; only differing from it in this, that the liquor is drawn off in *cohobation* as in common diſtillation, and thrown back again; whereas in CIRCULATION it riſes and falls in the ſame veſſel, without ever being carried out.

The intention of *cohobation* is to diſſolve the body, or to produce ſome change upon it. The operation is now neglected; but the ancient chemiſts practiſed it with great patience and zeal. To make it eaſier, and to prevent the great trouble of changing or moving the veſſels, a particular kind of alembic is contrived, very convenient for the purpoſe, which is called a PELICAN.

COHORS *equitata*, in old inſcriptions, has perplexed ſeveral antiquaries, who have been taught to conſider the *cohorts* as appropriated to the foot ſervice, as the *alæ* and *turmæ* were to the horſe. Mr. Horſeley, in particular, imagines, the *cohors prima Claudia equitata*, which he had met with, was intended to intimate that this *cohort* had been promoted from the horſe ſervice; but when, by another inſcription, he was led to conſider that corps as conſiſting of a thouſand horſe, his difficulty is increaſed to that degree, that he knows not what to affirm upon it. But the learned Dr. Taylor thinks there is an eaſy ſolution of this difficulty.

The auxiliary, or provincial *cohorts*, were either entirely, or purely foot, like the legionary, or ordinary *cohorts*; or elſe they had a mixture of both kinds of militia, as appears from Gruter, DLXXIV. 5. This latter ſort, as they could not properly be ranked under either denomination of horſe, or foot, being made up of both, ſeem to have appropriated to themſelves the diſtinguiſhing title of *cohortes equitatæ*, corps of infantry with a mixture of horſe. And of this term we find frequent mention in inſcriptions.

Hyginus alſo, De Caſtrametatione, gives us a full and deciſive proof of this denomination, and of the number of which ſuch COHORTS conſiſted. Theſe troops conſiſted of a thouſand men, part horſe, and part foot, and were hence called *milliariæ*. The proportion of the horſe to the foot was 240 to 760. His words are; *Habet* cohors equitata *milliaria pedites ſeptingentos ſexaginta, centurias decem*; *equites ducentos quadraginta, turmas decem.* Vid. Phil. Tranſ. Nº 482. ſect. 3.

COHORS *milliaria.* See above COHORS *equitata.*

COHORT, COHORS, in *Roman Antiquity*, a body of infantry, conſiſting of five or ſix hundred men; anſwering in moſt reſpects to our BATTALION.

The *cohort* was divided into three manipules, or companies; the manipule into two centuries; and the century into an hundred men.

The firſt centurion in the firſt *cohort* was called *primipilus*; and had the charge of the eagle, or ſtandard of the legion.—A legion conſiſted of ten *cohorts.*

When the army was ranged in order of battle, the *cohorts* were diſpoſed in the following manner: the firſt *cohort* took up the right of the firſt line, as the companies of grenadiers do in our regiments; the reſt followed in their natural order; ſo that the third was in the center of the firſt line of the legion, and the fifth on the left; the ſecond between the firſt and third; and the fourth between the third and fifth. The five remaining *cohorts* formed a ſecond line in their natural order: thus the ſixth was behind the firſt, and ſo of the reſt.

The firſt, third, and fifth *cohorts* were eſteemed the beſt; at leaſt it appears ſo from the poſts they took up, which were looked on by the Romans as the moſt important.

Marius is by ſome ſaid to have been the firſt who divided the Roman forces into *cohorts:* which opinion ſeems confirmed by Roſinus; *Non enim in tota Livii hiſtoria cohortium fit mentio. Ideoque docti viri ſentiunt a C. Mario primum cohortes eſſe inſtitutas.* But yet this is a great miſtake; for the *cohorts* are often mentioned in Livy, and particularly, lib. xxvii. c. 13. *Marcellus—cohortibus quæ ſigna amiſerant hordeum dari juſſit: centurioneſque manipulorum quorum ſigna amiſſa fuerant diſtrictis gladiis diſtinctos deſtituit.* This happened A. U. C. 543. and conſequently ſeveral years before Marius was born.

COHORTS were diſtinguiſhed according to their appointment and office, into *auxiliary*, which were ſent by allies; *equitata*, ſee above; *peditata*, which conſiſted of foot-ſoldiers only; *prætorian*, which was formed of the beſt ſoldiers, and ſerved to guard the *prætor* or general. This *cohort* was inſtituted by Publius Poſthumus, the dictator. Auguſtus likewiſe formed a *cohort*, under this appellation, conſiſting of nine thouſand men: which was afterwards increaſed by Septimius Severus. There were alſo the *cohort togata*, a kind of militia, which guarded the ſtreets of Rome; the *cohorts vigilum*, inſtituted by Auguſtus, which ſerved on occaſion of fires; and the *cohorts urbanæ*, eſtabliſhed by Auguſtus, to guard the city.

COHUAGIUM, a tribute paid by thoſe who meet promiſcuouſly in a market, or fair; *cohua* ſignifying a promiſcuous multitude of men in a fair, or market, probably from the French *cohue.*

COIF, the badge of a ſerjeant at law; who is hence alſo called SERJEANT *of the coif.*

The *coif* is of lawn, and is worn on the head, under the cap, when they are created, and ever after.

The uſe of the *coif* was to cover the *tonſura clericalis*, or clerical crown; becauſe the crown of the head was originally cloſe ſhaved, and only a border of hair left around the lower part, which gave it the appearance of a CROWN. See TONSURE, &c.

COILE, on board a ſhip. See QUOIL.

COILON, in *Antiquity.* See CAVEA.

COIN, *Matrice*, in the manufacture of money, medals, and counters, is a piece of ſteel well tempered, four or five inches deep, ſquare at bottom, and round at top; whereon are engraved, dent-wiſe, with puncheons, and other inſtruments, the ſeveral figures, marks, &c. to be ſtruck on the moneys, &c. See COINING.

For the manner of engraving COINS, ſee ENGRAVING *on ſteel.*

COIN is more generally uſed for a piece of metal converted into money, by the impreſſing of certain marks or figures thereon.

Coin may be defined, a ſpecies of money, ſtruck either with a hammer, or mill.

Hence, *coin* differs from money, as the ſpecies does from the genus. Money is any matter, whether metal, wood, leather, glaſs, horn, paper, fruits, ſhells, or kernels, which have courſe as a medium in commerce.

Coins are a particular branch of moneys, viz. ſuch as are made of metal, gold, ſilver, or copper, and ſtruck according to a certain proceſs, called *coinage*.

It is obſerved, under the article MONEY, that the preciſe epocha of the invention of money is not known; it is too ancient for our annals: and if we might argue from the neceſſity and obviouſneſs of the thing, it muſt be nearly coeval with the world.

Whether *coins* be of equal antiquity, may admit of ſome doubt; eſpecially as moſt of the ancient writers are ſo frequent and expreſs in their mention of leathern moneys, paper moneys, wooden moneys, &c. Some, however, notwithſtanding all this, are of opinion, that the firſt moneys were of metal: the reaſons they give, are the firmneſs, neatneſs, cleanlineſs, durableneſs, and univerſality of metals; which, however, do rather conclude, that they ought to have been ſo, than they actually were ſo.

In effect, the very commodities themſelves were the firſt moneys, i. e. they were current for one another by way of exchange; and it was the difficulty of cutting, or dividing certain commodities, and the impoſſibility of doing it without great loſs, that firſt put men on the expedient of a general medium.

Indeed, thus much may be ſaid in behalf of *coins*, that, on this view, it was natural for men to have their firſt recourſe to metals as being almoſt the only things whoſe goodneſs, and as it were integrity, is not diminiſhed by partition; beſides the advantages above expreſſed, and the conveniencies of melting, and returning them again into a maſs of any ſize or weight.

It was probably, then, this property of metals which firſt accuſtomed people, who trafficked together, to account them in lieu of quantities of other merchandizes in their exchanges; and at length to ſubſtitute them wholly in their ſtead; and thus aroſe money: as it was their other property to preſerve any mark or impreſſion a long time, which confirmed them in the right; and thus was the firſt riſe of *coins*.

In the firſt ages, each perſon cut his metal into pieces of different ſizes and forms, according to the quantity to be given for any merchandize, or according to the demand of the ſeller, or the quantity ſtipulated between them: to this end, they went to market, loaden with metal, in proportion to the purchaſe to be made, and furniſhed with inſtruments for proportioning it, and with ſcales for dealing it out, according as occaſion required.

By degrees it was found more commodious to have pieces ready weighed; and as there were different weights required, according to the value of the different wares, all thoſe of the ſame weight began to be diſtinguiſhed with the ſame mark, or figure: thus were *coins* carried one ſtep further.

At length, the growing commerce of money beginning to be diſturbed with frauds, both in the weights and the matter, the public authority interpoſed; and hence aroſe the firſt ſtamps, or impreſſions, of money: to which ſucceeded the names of the moneyers; and at length the effigy of the prince, the date, legend, and other precautions to prevent the alterations of the ſpecies: and thus were *coins* completed.

On the foot whereon money now ſtands, it is divided into *real*, or *effective* money; and *imaginary* money, or money of *accompt*.

Coins, *modern*, or *ſpecies current in Europe, Aſia, Africa, and America.*—All the current ſpecies in the four quarters of the earth, at this day, are either made of metals, or they are ſhells, and fruits.

The metals are, gold, ſilver, copper, tin, and lead; to which may be added billon, a mixture of ſilver and copper in a certain proportion.

In Europe none are uſed beſide gold, ſilver, copper, and billon: in ſome parts of the Eaſt Indies they likewiſe uſe tin and lead: as to ſhells and fruits, they are the ſmall money of ſeveral nations in Aſia, Africa, and America.

Coins, *Britiſh*.—In England, the current ſpecies of gold are, the guinea, half-guinea, jacobus, laureat, angel, and roſe-noble; the four laſt of which are now ſeldom met with, having been moſt of them converted into guineas, chiefly during the reigns of Charles II. and James II.

The ſilver *coins* are, the crown, half-crown, ſhilling, and ſix-pence; the copper *coins* are, the half-penny, and farthing.

Value and proportions of the Engliſh Coins.

The Carolus, or Laureat,			23	$9\frac{1}{5}$	$4\frac{3}{5}$	

It was made treaſon to counterfeit the *coin* of this realm, or to import counterfeit money, with intent to utter it, knowing it to be falſe, by 25 Edw. III. ſtat. 5. c. 2.

Counterfeiting foreign *coin*, current in this realm, is made treaſon by 1 Mary, ſeſſ. 2. c. 6.

Clipping, waſhing, filing the proper *coin* of this realm, or of any other realm current within this realm by proclamation, for lucre or gain, is made treaſon by 5 Eliz. c. 11.

Impairing, diminiſhing, falſifying the proper *coin* of this realm, is made treaſon by 18 Eliz. c. 1.

Making, mending, or aſſiſting in ſo doing; buying, ſelling, or having in poſſeſſion, inſtruments proper only for the coinage of money; and marking *coin* on the edges, by perſons not employed in the mint; are made treaſon by ſtat. 8 and 9 W. III. c. 26. ſect. 3. which is made perpetual by 7 Ann. c. 25.

Colouring, gilding, caſing, or waſhing any *coin*, reſembling the current gold *coin* of the realm, is treaſon, by ſtat. 8 and 9 W. III. c. 26. ſect. 4. 15 and 16 Geo. II. c. 28.

Lord Hale makes a query whether counterfeiting copper *coin* be not treaſon within the ſtatute of 25 Edw. III.?

Clippings or filings of the *coin*, bought or ſold, or knowingly found in the cuſtody of any perſon other than the officers of the mint, forfeited, with 500*l.* half to the king, and half to the informer. 6 and 7 W. III. c. 19. ſect. 4. And the offender ſhall be branded in the cheek with the letter R.

Selling of blanched copper, or any compoſitions of metals or minerals, in imitation of ſtandard gold, is made felony by 8 and 9 W. III. c. 26. ſect. 6. 9.

Receiving or paying any diminiſhed or counterfeit money, under value, is made felony by 8 and 9 W. III. c. 26. ſect. 6. 9. 15 and 16 Geo. II. c. 28.

In Scotland, by the articles of the Union, it is appointed, that all the *coins* be reduced to the Engliſh, and the ſame accompts obſerved throughout. Till then the Scots had their pounds, ſhillings, and pence, as in England; but their pound was but twenty pence Engliſh, and the others were in proportion: accordingly, their mark was $13\frac{1}{3}$*s.* Scotch, current in England at $13\frac{1}{2}$*d.* their noble in proportion.

Beſide theſe, they had their Turnorer pence, and halfpence; their penny, one twelfth of that of England; beſides baſe money of achiſons, babees, and placks: the bodle, one ſixth of the penny, one fourth of the achiſon, one third of the babee, and one half of the plack.

In ſome parts of Scotland and the Iſle of Man, the penny is ſix ſevenths of the Engliſh penny, the ſhilling or Manks equal to 10*d.* $\frac{2}{7}$, and the Engliſh ſhilling equal in value to 14*d.* and the pound or Manks equal to 17*s.* 1*d.* $\frac{5}{7}$.

In Ireland, the *coins* are as in England; viz. ſhillings, pence, &c. with this difference, that their ſhilling, or harper, is but equal to $11\frac{3}{40}$ *d.* ſterling; or a ſhilling Engliſh is equal to twenty-ſix halfpence: whence their pound is only 18*s.* 5*d.* $\frac{1}{2}$ of Engliſh money.

Coins, *French*.—The only gold *coin* now current in France is, the lewidore, or louis d'or; with the half, and the double louis. Till the year 1700, they had gold lys, and ecus, or crowns; but they are now no more.

The ſilver *coins* are, the greater ecu, or crown of ſix livres, the ecu of three livres, the piece of a livre four ſols, and pieces of twelve ſols, and of ſix.

The billon *coins* are of three kinds, each called *ſols*; ſome of twenty-four deniers, others of eighteen, and others of twelve; beſides the old half-ſol of nine deniers. To theſe may be added the deniers current in the Lionnois, Provence, Dauphiné, and other parts.

Laſtly, the copper *coin* is the liard, equal to three deniers; the double liard equal to ſix, and the ſou law of twelve deniers.

Value and proportion of the French Coins.

Denier, equal to 1/24 of a penny ſterling.

									l.	s.	d.
2	Double.										
3	1½	Liard.									
6	3	2	Dardene.								
12	6	4	2	Sol Paris, equal to					0	0	0½
240	120	80	40	20	Livre Tournois of acc.				0	0	10
720	360	240	120	60	3	Ecu of exch.			0	2	6
1440	720	480	240	120	6	2	Ecu,		0	5	0
2400	1200	800	400	200	10	3⅓	1⅔	A piſtole of acc.	0	8	4
5760	2880	1920	960	480	24	8	4	Louis d'or,	1	0	0

Beſides theſe, there are other *coins* of accompt in different provinces: as, the petard of 15 deniers; the piette of 15 petards, and alſo the piette of 15 ſols; the florin of 20 petards; the ducat current of 10½ livres; and the moeda of 30⅓ livres.

Coins, *Spaniſh*.—In Spain, and the ſtates depending thereon, the gold *coin* is the piſtole; above which is the double-piſtole, and the piece of four piſtoles; and under it the half-piſtole: to which muſt be added the caſtillans of gold. See Pistole.

The ſilver money are, the piaſtre, or piece of eight rials, and its diminutions; as alſo the ſimple rial, with its diminution. See Rial.

The copper *coins* are, the ochavos, or octavos; which are of three kinds: the one equal to two maravedis; the next equal to four maravedis, and ordinarily called quarta, or quartil; the other double this, and called double quarta: laſtly, the maravedis. See Maravedis.

It muſt be obſerved, that in Spain they have new money and old. The old, current in Seville, Cadiz, Andaluſia, and ſome other places, is worth 25 *per cent.* more than the new, current at Madrid, Bilboa, St. Sebaſtian, &c. i. e. 100*l.* old is equal to 125*l.* new. This difference is owing to their king Charles II. who, in 1668, to prevent the export of money abroad, raiſed it 25 *per cent.* which, however, he was only able to effect in part; ſeveral provinces ſtill retaining the ancient rate.

Value and proportion of the Spaniſh Coins.

Maravedis of Madrid, &c. new plate, equal to 43/272 of a penny Engliſh.

N. B. At Gibraltar, Malaga, &c. the maravedis of account is equal to 23/272 of an Engliſh penny; two of theſe are equal to an ochavo, and four equal to a quartil: 34 maravedis = a rial velon of 2⅞*d.*: 15 rials = a piaſtre of exchange; and 512 maravedis = a piaſtre current: 60 rials = a piſtole of exchange, or 14*s.* 4*d.*; and 70 rials = a piſtole of 16*s.* 9*d.*

Coins, *Portugueſe*.—Thoſe of gold are, the milre, or St. Stephen; and the moeda d'oro, or, as we call it, the moidore, which is properly their piſtole: above this are doppio moedas, or double piſtoles; and quadruple ſpecies, equal to five piſtoles. See Moidore, Doubloon, &c.

Their ſilver *coins* are, the cruzada, pataca, or piece of eight; and the vintin, whereof they have two ſorts, the one ſilver, and the other billon.

The re is of copper, which ſerves them in accompts, as the maravedis do the Spaniards.

Re, or Rez, equal to 27/480 of a penny ſterling.

						l.	s.	d.

54,	a xequin,	0	9	0
100,	a piſtole,	0	16	9

Coins, *Perſian.*—Theſe are either ſilver, or copper; gold they have none. Of the firſt kind are, the abaſſi, mamoudi, ſhahee, and biſti; of the ſecond. the kabeſqui, and half-kabeſqui: the tela, or cheraſis, indeed, is gold; but it is leſs a money than a medal, though it has ſome courſe in commerce.

		l.	s.	d.
Coz,	= $\frac{2}{5}$ Engliſh penny.			
4,	a biſti,	0	0	$1\frac{3}{5}$
10,	ſhahee,	0	0	4
20,	mamooda,	0	0	8
25,	larin,	0	0	10
4 ſhahees,	an abaſhee,	0	1	4
5 abaſhees,	an or,	0	6	8
12,	a bovello,	0	16	0
50,	a tomond or TOMAN of acc.	3	6	8

Some relations make the biſti a *coin* worth about one penny half-penny; but others only a term of accompt, ſignifying ten demars, or one thouſandth part of a toman. See Toman.

Caſbequi, or cabeſqui, equals five twelfths of a penny ſterling. Tela, or cheraſis, is uſually ſtruck at the acceſſion of a new king, and at the beginning of a new year; its weight and worth various.

Coins, *Chineſe.*—Throughout the kingdom of China and Tonquin, there are not properly any *coins* ſtruck: inſtead of theſe, they cut their gold and ſilver into little pieces of different weights. Thoſe of gold, the Dutch, from their figure, which reſembles a boat. call *golchuts*: thoſe of ſilver, the natives call *leam*; the Portugueſe, *taels*. Their ſmall money is of copper: ten of theſe pieces make their ſhilling; and ten of thoſe their crown, or leam. Beſide theſe, they have a ſmall money of lead, mixed with the ſcum of copper, having holes in the middle to ſtring them on for the eaſe of numbering: this ſpecies is called caxa, cas, and pitis; and the ſtring, which uſually holds two hundred, is called ſanta. They are ſo very brittle, that they never fall without breaking into a great number of pieces; and, if left all night in ſalt water, they ſtick ſo cloſe together, that they cannot be ſeparated.

There are two kinds of golchuts; great, and ſmall. Golchut, an ingot, which, at 3 *l.* 3 *s.* per ounce, uſually amount to 101 *l.* 5 *s.* ſterling. Other golchuts only weigh half as much; their value is in proportion.

		l.	s.	d.
A caxa,	= $\frac{2}{25}$ Engliſh penny.			
10,	a candereen.			
10 candereens,	a mace,	0	0	8
35,	a rupee,	0	2	6
2 rupees,	a dollar,	0	4	6
70 candereens,	a rix-dollar,	0	4	$4\frac{1}{2}$
7 maces,	an ecu,	0	5	0
2 rupees,	a crown,	0	5	0
10 maces,	a tael of acc.	0	6	8

Coins *of Japan.*—The Japoneſe, ſtrike coupants, both of gold and ſilver; and copper pieces with holes in the middle, like thoſe of China : ſix hundred of theſe make the tael, or tale. Their other moneys, or quaſi-moneys, are, ignots, which they cut, like the Chineſe, of different weights, chiefly three; the largeſt of the weight of ſix rials, viz. forty-eight taels, the tael equivalent to ſeventy-five Dutch ſtivers. The ſecond equal to ſix taels and an half; and the third to $\frac{5}{8}$ of a rial, or one tael $\frac{1}{16}$.

Beſide theſe, they have a ſmall ſilver money, in form of round beans, of no determinate weight, but uſually weighed by maiſes; the common payment being by ten maiſes, which make one tael.

(Sterling.)	l.	s.	d.
Coupant of gold, weighing one ounce ſix drachms; its figure is a long oval, the longeſt diameter about four inches, and the ſhorteſt half an inch.	6	12	6
Other coupants of gold, near $\frac{1}{3}$ of the former, amounting to about	2	4	2
Coupant of ſilver, current at -	0	4	6

Other *coins* are as follow :

		l.	s.	d.
Piti,	= $\frac{1}{5}$ Eng. penny.			
20,	a mace,	0	0	4
15 maces,	an ounce ſilver,	0	4	$10\frac{1}{3}$
20 maces,	a tale,	0	6	8
30 maces,	an ingot,	0	9	$8\frac{2}{3}$
13 ounces ſilver,	an ounce gold,	3	3	0
2 ounces gold,	a Japaneſe,	6	6	0
2 Japaneſes,	a double,	12	12	0
21 ounces gold,	a cattee of account,	66	3	0

Coins *of Siam,* viz. of *Pegu, Malacca, Sumatra, Java, Borneo, &c.* In the dominions of Siam are ſtruck gold pieces five or ſix grains heavier than the half piſtole of Spain; but theſe are rather pieces of curioſity, than of uſe in commerce. Their ſilver *coin* is the tical, or baat; the diminutions whereof are the mayon, or ſeling, foang, and ſompayc. Theſe pieces are all ſtrangely ſtruck: in form they reſemble nuts, a little flatted at the extremities; and are ſome of them cloven like horſe-ſhoes; on two of the ſides there are ſome Siameſe letters. Their copper money, called bia, is round and thick: beneath this is the cauris, or cork.

		l.	s.	d.
Cori,	= $\frac{3}{40000}$ Eng. penny.

4 ſoocos,	an ecu,	0	5	0
8 ſateleers,	a crown,	0	5	0

Coins *of the coaſts and iſlands of the Indies.*—The principal, and thoſe moſt generally current, are pagodas, rupees, larins, fanos, or fanons, and coupans, each whereof are ſtruck both of gold and ſilver.

Beſide theſe general *coins*, there are alſo particular ones, viz. at Goa, S. Thomas's of gold.—Along the Perſian Gulf, about Mecca, and throughout Arabia, the larin; along the coaſts of Malabar, and at Goa, the parado and xeraphin of ſilver.—At Bantam, the fardos; at Malabar, the tare; at Siam the tayl, with its diminutions the mayam, foang, ſompayc, and demi-foang: all of ſilver.—At Surat, Agra, and the reſt of Indoſtan, the pecha, or peſſa, and doudous, all of copper.—The baſarucos and chedas, of tin. See laſt and following articles.

Coins, *Mogul.*—In the dominions of the Great Mogul, are roupies, mamoudas, and pechas; the firſt both of gold and ſilver; the ſecond of ſilver alone; and the third of copper.

There are others ſtruck by the princes tributary to him, and the powers bordering on him; but theſe are ſcarce current beyond their reſpective territories: particularly a ſmall ſilver *coin* ſtruck by the king of Matoucha, whoſe territories lie to the north of Agra, of the value of the pecha of Mogul, but half as heavy again.—The rajah of Parta-jajamoula, to the north of Patua, likewiſe ſtrikes ſome little pieces, both of ſilver and copper, of ſmall value.—The rajah of Ogden, who commands between Brampour, Seronge, and Amadabath, a ſmall ſilver *coin*, equal to ſix pence ſterling; and another of copper, equal to an halfpenny ſterling.—The king of Cheda and Pera, a tin money called cheda.—The king of Achem, little ſlight gold pieces, worth about fifteen pence ſterling.—And tin pieces, eighty of which are equal to the Engliſh penny, current in the iſles of Sumatra.—The gold *coin* of the king of Macaſſer and Celebes, is taken by the Dutch for a florin.—The king of Camboyas ſtrikes only pieces of ſilver and copper: his gold, wherein he abounds, is negotiated by weight.—The king of Java and Bantam, in the ſame iſland, and thoſe of the Molucca iſlands, ſtrike only copper *coins*: they allow foreign ſilver ſpecies to be current in their territories, but they coin none.

Coins *of Gazzurat, &c.*

For all the Spaniſh, Portugueſe, Dutch and Daniſh dominions in the Weſt Indies, or on the American continent, ſee the *coins* of the reſpective nations: but it muſt be obſerved, that the value of the CURRENCY alters according to the plenty or ſcarcity of *coins* imported. See Univerſal Table of *Coins*, annexed to Guthrie's Geography.

To the number of current *coins* which have diſtinct names to ſpecify them, may be added many more, both in Europe and Aſia, only denominated and known from their value: ſuch are thoſe called ſimply *pieces*, with the addition of their price; as in Spain, the piece of eight rials; in England, the piece of twenty-one ſhillings, or guinea; in France, the piece of four francs; pieces of ten ſols, or ſhillings; piece of four ſols; piece of two ſols; or of ſix franks, of 30, 15, 6, 4, &c. deniers, or pence. See PIECE.

Coins, *Shells current for.*—Theſe ſerve in many places for money; and are brought from the Maldives, and called in the Indies *cowries:* on the coaſts of Africa they change their names, and are called *bouges*.

In America they take a third name, viz. *porcelains.* Indeed theſe laſt do not come from the Maldives; there being ſhells found in the Weſt Indies much like thoſe of the Eaſt.

In the kingdom of Congo there is another kind of ſhells, called *zimbi*; though ſome will have them the ſame with the cowries. Cowries, coris, or bouges, are white ſhells, current particularly in the ſtates of the Great Mogul; ſixty-five are uſually reckoned equivalent to the done, a ſmall copper *coin*, worth about an halfpenny ſterling; which brings each cowry to $\frac{1}{130}$ of a penny ſterling.

Porcelains are nearly on the ſame footing with the cowries. See PORCELAIN.

Zimbi are current, particularly in the kingdoms of Angola and Congo. Two thouſand zimbis make what the negroes call a *maciute*, or *macoute*; which is no real money, whereof there is none in this part of Africa, but only a manner of reckoning: thus, two Flemiſh knives they eſteem a macoute; a copper baſon, two pounds weight, and twelve inches diameter, three macoutes; a fuſee ten, &c.

Coins, *Fruits current for.*—There are kinds of fruits current for *coins*; two in America, particularly among the Mexicans; which are the cacao and maiſe: the other in the Eaſt Indies, viz. almonds; brought thither from Lar, and growing in the deſarts of Arabia.

Cacao, fifteen of theſe are eſteemed equivalent to a Spaniſh rial, or ſeven pence ſterling. See CACAO.

Maiſe has ceaſed to be a common money ſince the diſcovery of America by the Europeans.

Almonds are chiefly uſed where the cauris are not current. As the year proves more or leſs favourable to this fruit, the value of the money is higher or lower: in a common year, forty almonds are ſet againſt a peſcha, or halfpenny ſterling; which brings each almond to $\frac{1}{20}$ of a farthing.

Coins, *Ancient*, are thoſe chiefly which have been current among the Greeks, Jews, and Romans.

For Jewiſh COINS, *their Values and Proportion ſtand thus:*

				(Sterling.)	l.	s.	d.
Gerah,					0	0	$1\frac{59}{160}$
10	Bekah,				0	1	$1\frac{11}{16}$

1200	120	50	Maneh, Mina Hebraica,		5	14	$0\frac{3}{4}$
60000	6000	3000	60	Talent,	342	3	9
Solidus aureus, or ſextula, worth,					0	12	$0\frac{1}{2}$
Siclus aureus, worth,					1	16	6
A talent of gold, worth,					5475	0	0

Value and Proportion of the ancient Grecian COINS.

										(Sterling.)	s.	d.	qrs.
Lepton,											0	0	$0\frac{31}{336}$
7	Chalcus,										0	0	$0\frac{31}{48}$
14	2	Dichalcus,									0	0	$1\frac{7}{24}$
28	4	2	Hemiobolum,								0	0	$2\frac{7}{12}$
56	8	4	2	Obolus,							0	1	$1\frac{1}{6}$
112	16	8	4	2	Diobolum,						0	2	$2\frac{1}{3}$
224	32	16	8	4	2	Tetrobolum,					0	5	$0\frac{2}{3}$
336	48	24	12	6	3	$1\frac{1}{2}$	Drachma,				0	7	3
662	96	48	24	12	6	3	2	Didrachmon,			1	3	2
1324	112	96	48	24	12	6	4	2	Tetradrach. ſtater,		2	7	0
1660	384	120	60	30	15	$7\frac{1}{2}$	5	$2\frac{1}{2}$	$1\frac{1}{4}$	Pentadrach.	3	2	3

Note, Of theſe the drachma, didrachma, &c. were of ſilver, the reſt for the moſt part of braſs. The other parts, as tridrachm, triobolus, &c. were ſometimes coined.

Note alſo, the drachma is here, with the generality of authors, ſuppoſed equal to the denarius: though there is reaſon to believe, the drachma was ſomewhat the weightier. See DRACHMA, and DENARIUS.

(Sterling.)	l	s.	d.
The Grecian gold *coin* was the ſtater aureus, weighing two Attic drachms, or half of the ſtater argenteus; and exchanging uſually for 25 Attic drachms of ſilver; in our money,	0	16	$1\frac{3}{4}$
According to our proportion of gold to ſilver,	1	0	9
There were likewiſe the ſtater Cyzicenus, exchanging for 28 Attic drachms, or	0	18	1
Stater Philippicus, and ſtater Alexandrinus, of the ſame value.			
Stater Daricus, according to Joſephus, worth 50 Attic drachms, or	1	12	$3\frac{1}{2}$
Stater Crœſius, of the ſame value.			

Value and Proportion of the Roman COINS.

					(Sterling.)	s.	d.	qrs.
Teruncius,						0	0	$0\frac{775}{1000}$
2	Sembella,					0	0	$1\frac{55}{100}$
4	2	Libella, As,				0	0	$3\frac{1}{10}$
10	5	$2\frac{1}{2}$	Seſtertius,			0	1	$3\frac{3}{4}$
20	10	5	2	Quinarius, Victoriatus,		0	3	$3\frac{1}{2}$
40	20	10	4	2	Denarius,	0	7	3

Note, Of theſe the denarius, victoriatus, ſeſtertius, and ſometimes the as, were of ſilver, the reſt of braſs.

There were ſometimes alſo coined of braſs the triens, ſextans, uncia, ſextula, and dupondius.

(Sterling.)	l.	s.	d.
The Roman gold *coin* was the aureus, which weighed generally double the denarius; the value of which, according to the firſt proportion of coinage, mentioned by Pliny, was,	1	4	$3\frac{1}{4}$
According to the proportion that obtains now amongſt us, worth,	1	0	9
According to the decuple proportion, mentioned by Livy and Julius Pollux, worth,	0	12	11
According to the proportion mentioned by Tacitus, and which afterwards obtained, whereby the aureus exchanged for 25 denarii, its value,	0	16	$1\frac{1}{4}$

Theſe tables are formed on the ſuppoſition that ſilver is worth five ſhillings, and gold four pounds an ounce.

See Arbuthnot's Tables of Ancient Coins. See alſo on this ſubject an excellent paper by M. Raper, Eſq. intitled an Enquiry into the Value of the Ancient Greek and Roman Money, in the Phil. Tranſ. vol. lxi. part ii. art. 48. p. 462. See DENARIUS and DRACHM.

COIN, in *Architecture*, a kind of dye, cut diagonal-wiſe, after the manner of the flight of a ſtaircaſe; ſerving at bottom to ſupport columns in a level; and at top to correct the inclination of an entablature, ſupporting a vault.

Theſe *coins* have alſo the ſame effect with round baluſters, which are not inclined according to any flight.

COIN is alſo uſed for a ſolid angle, compoſed of two ſurfaces inclined towards each other; whether that angle be exterior, as the *coin* of a wall, a tree, &c. or interior, as the *coin* of a chamber, or chimney: from the word *cuneus*, wedge. See QUOIN.

COIN, or **QUOIN**, in *Artillery*, a wedge of wood, ſerving to raiſe, or lower, the breech of a gun.

COINS, on board a man of war. See QUOINS.

COIN-*moulds*. See MOULDS.

Canting **COINS**, on board a ſhip, little ſhort pieces of wood, or billets, cut wedge-like, to lie betwixt the caſks.

Standing **COINS**, on board a ſhip, billets, or pipe-ſtaves, to keep the caſks from ſtirring, or giving way.

Standing-coins are made of barrel boards, about four inches broad, and of a fit length to be driven in between the ends of a caſk, about two or three hoops from the chine hoops, to keep the buts from jogging.

COINAGE, or **COINING**, the art, or act of making money.

Coining, is either performed by the hammer or the mill. The firſt method is now little uſed in Europe, eſpecially in England, France, &c. though the only one known till the year 1553, when a new machine, or *coining* mill, invented by an engraver, one Antoine Brucher, was firſt tried in the French king's palace at Paris, for the *coining* of counters: though ſome attribute the invention of the mill to Varin, a famous engraver, who, in reality, was no more than an improver of it; and others to Aubry Olivier, who had only the inſpection of it.

The mill has met with various fate ſince its firſt invention; being now uſed, and again laid by, and the hammer reſumed: but it has at length got that footing, by the neatneſs and perfection of the ſpecies ſtruck with it, that there appears no great probability of its ever being again diſuſed. See MILL.

In either kind of *coining*, the pieces of metal are ſtamped, or ſtruck with a kind of punchions or dyes, wherein are engraven the prince's effigies, with the arms, legend, &c. The manner of preparing and cutting of which, ſee under ENGRAVING.

The firſt operations in *coining* are the mixing, and melting of the metal. For the firſt, it is to be obſerved, that there are no ſpecies coined of pure gold or ſilver, but always a quantity of ALLOY of copper is mixed with them, or a mixture of ſilver and copper, for gold; becauſe ſilver alone would make the gold too pale, and copper too red: the reaſons are partly the ſcarcity of thoſe two metals, partly the neceſſity of making them harder by ſome foreign admixture; and partly to defray the expences of *coining*.

Now there are two kinds of alloying or mixing. The proportioning of the alloy with the fine metal is eaſy in the firſt caſe; in the other it is more difficult. See ALLOY. Yet it is readily effected by the following method, taken from the anonymous author of the treatiſe at the end of that of Mr. Boiſard; viz.

Write down the ſeveral materials to be melted, their quality, weight, and fineneſs, in two diſtinct articles; the one containing thoſe above the ſtandard, the other thoſe under it: by caſting up the firſt, you ſhall have the exceſs; by the latter, the defect. Then comparing the two ſums, you will find, by ſubtraction, how much alloy muſt be added to bring the ſeveral matters to the fineneſs required.

For the melting, if the metal be gold, it is done in earthen crucibles; if ſilver, or copper, in pots or crucibles of iron.

There are two kinds of furnaces proper for the melting of the metals; thoſe with only a draught of wind, and thoſe with bellows. See each explained under FURNACE.

When the gold and ſilver are in balneo, i. e. are entirely melted, they are to be ſtirred and brewed together; the ſilver and copper with an iron ſtirrer, the gold with one of baked earth. In this ſtate they are poured into moulds or frames, for caſting them into long flat bars: the method of doing which, is exactly the ſame with that uſed by the founders, in ſand; both with regard to the frame, the manner of working the earth, and that of ranging the models or patterns.

The models are flat plates of copper, about fifteen inches long, and nearly of the thickneſs of the ſpecies to be ſtruck. In each mould are placed eight of theſe to make bars or plates, ten for half guineas, five for crowns, &c. and in proportion for copper; all the difference between caſting the bars of gold, and thoſe of the other metals, conſiſting in this; that the latter are taken out of the crucibles with ladles, and poured into the aperture of the mould; and that for gold, the pot or crucible is taken off the fire with a kind of tongs, and thence poured into the mould.

Thus far the proceſs is the ſame, in *coining* either with the mill, or the hammer: when the bars are taken out of the moulds, the difference commences; ſo that here the article of *coining* divides into two branches.

COINING *by the Mill, or milled Money.*—The bars or plates being taken out of the moulds, and ſcraped, and bruſhed, are paſſed ſeveral times through a mill, to flatten them further, and bring them to the juſt thickneſs of the ſpecies to be coined; with this difference, however, that the plates of gold are heated again in a furnace, and quenched in water, before they undergo the mill; which ſoftens and renders them more ductile: whereas thoſe of ſilver paſs the mill juſt as they are, without any heating; and when afterwards they are heated, they are left to cool again of themſelves, without water.

The plates, whether gold, ſilver, or copper, thus reduced as near as poſſible to their thickneſs, are cut into round pieces, called *blanks* or *planchets*, near the ſize of the intended ſpecies, with a cutting inſtrument faſtened to the lower extremity of an arbor, whoſe upper end is formed into a ſcrew; which, being turned by an iron handle, turns the arbor, and lets the ſteel, well ſharpened, in form of a punch-cutter, fall on the plates; and thus is a piece punched out. See the cutting inſtrument repreſented in *Tab. Miſcellany*, *fig.* 1.

Theſe pieces are now given to be adjuſted, and brought by filing, or raſping, to the weight of the ſtandard, whereby they are to be regulated: and what remains of the plate between the circles is melted again, under the denomination of *ſizel*.

The pieces are adjuſted in a fine balance; and thoſe which prove too light, are ſeparated from thoſe too heavy; the firſt to be melted again, and the ſecond to be filed down. For it may be obſerved, that the mill through which the plates are paſſed, can never be ſo juſt, but there will be ſome inequality, whence will ariſe a difference in the blanks. And this inequality, indeed, may be owing to the quality of the matter as well as of the machine; ſome parts being more porous than others.

When the blanks are adjuſted, they are carried to the blanching, or whitening-houſe, i. e. the place where the gold blanks have their colour given them, and the ſilver ones are whitened; which is done by heating them in the furnace, and, when taken out and cooled, boiling them ſucceſſively in two copper veſſels, with water, common ſalt, and tartar; and, after that, ſcouring them well with ſand, and waſhing them with common water, drying them over a wood fire, in a copper ſieve, wherein they are put when taken out of the boilers.

The whitening, or BLANCHING, was formerly performed very differently from what it now is: and as the ancient method is ſtill in uſe among goldſmiths, and other workmen who uſe gold and ſilver, we have made a diſtinct article of it.

Formerly the planchets, as ſoon as blanched, were carried to the preſs, to be ſtruck, and receive their impreſſions; but now they are firſt marked with letters or graining, on the edges, to prevent the clipping and paring of the ſpecies, which is one of the ways wherein the ancient money uſed to be damaged. The machine uſed to mark the edges is very ſimple, yet ingenious; it conſiſts of two plates of ſteel, in form of rulers, about the thickneſs of a line, on which the legend or edging is engraven, half on the one, and half on the other. One of theſe plates is immoveable, being ſtrongly bound with ſcrews to a copper plate; and that again to a ſtrong board, or table: the other is moveable, and ſlides on the copper plate by means of a handle, and a wheel, or pinion of iron, the teeth whereof catch in a kind of other teeth, on the ſurface of the ſliding plate. Now, the planchet, being placed horizontally between theſe two plates, is carried along by the motion of the moveable one; ſo as by that time it has made half a turn, it is found marked all round. See *Fig.* 2.

This machine is ſo eaſy, that a ſingle man is able to mark twenty thouſand planchets in a day: Savang pretends it was invented by the Sieur Caſtagin, engineer to the French king, and firſt uſed in 1685. But it is certain we had the art of lettering the edges in England long before that time; witneſs the crowns and half-crowns of Oliver

Cromwell ſtruck in 1658, which for beauty and perfection far exceed any French *coins* we have ever ſeen.

Laſtly, the planchets, being thus edged, are to be ſtamped, i. e. their impreſſion is to be given them in a ſort of mill, or preſs, by the French called a *balancier*, invented towards the latter end of the ſixteenth century. See its figure in *Tab. Miſcellany*, *fig.* 3.

Its chief parts are a beam, ſcrew, arbor, &c. all contained in the body of the machine, except the firſt, which is a long iron bar, with a heavy ball of lead at each end, and rings, to which are faſtened cords, which give it motion: this is placed horizontally over the body of the machine. In the middle of the beam is faſtened a ſcrew, which, by turning the beam, ſerves to preſs the arbor underneath it; to the lower extremity of which arbor, placed perpendicularly, is faſtened the dye, or matrice, of the reverſe, or arm ſide, in a kind of box, or caſe, wherein it is retained by ſcrews: and under this is a box, or caſe, containing the dye of the image-ſide, firmly faſtened to the lower part of the engine, *fig.* 4. See **Matrice.**

Now when a planchet is to be ſtamped, it is laid on the image-matrice, upon which two men draw, each on his ſide, one of the ropes of the beam, and turn the ſcrew faſtened in it; which by this motion lowers the arbor to which the dye of the arms is faſtened: by which means the metal being in the middle, at once receives an impreſſion on each ſide, from either dye. As to the preſs formerly uſed; it has all the eſſential parts of a balancier, except the beam, which is here, as it were, divided, and only drawn one way.

The blanks having now all their marks and impreſſions, both on the edges and faces, become money; but they have not currency till they have been weighed and examined.

For the **Coining** *of Medals*, the proceſs is the ſame, in effect, with that of money: the principal difference conſiſts in this, that money, having but a ſmall relievo, receives its impreſſion at a ſingle ſtroke of the engine; whereas, for medals, the height of their relievo makes it neceſſary, that the ſtroke be repeated ſeveral times: to this end the piece is taken out from between the dyes, heated, and returned again; which proceſs, in medallions, and large medals, is ſometimes repeated fifteen or twenty times, before the full impreſſion be given; care being taken, every time the planchet is removed, to take off the ſuperfluous metal ſtretched beyond the circumference, with a file.

Add to this, that medallions, and medals of high relievo, on account of the difficulty of ſtamping them in the balancier, or preſs, are uſually firſt caſt or moulded in ſand, like other works of that kind, and are only put in the preſs to perfect them; becauſe the ſand does not leave them clean, ſmooth, and accurate enough. Medals, therefore, receive their form and impreſſion by degrees; money all at once.

The rule whereby they judge the metal to be ſufficiently ſtamped, is, when feeling it with the hand, it is found firm, and not to be ſhaken, as filling the dye equally every where.

Coining *with the hammer, or hammered money*.—In this method of making money, the bars or plates of gold, ſilver, or copper, being taken out of the moulds, or frames, as above, are heated and ſtretched, by beating them on the anvil: when ſufficiently beaten, they are cut into pieces; which being again heated, flatted, and further ſtretched with the hammer, are adjuſted by cutting off the angles with ſheers: thus, by cutting and rounding them, they are reduced to the weight of the ſtandard; and their roundneſs finiſhed with another hammer, which beats down all the points and angles ſtill remaining on the edges. In this manner they are brought to the ſize of the ſpecies to be coined.

In this ſtate the pieces become blanks or planchets, and are carried to the blanching-houſe; where they undergo the ſame preparation as the milled money already deſcribed, and are given to the minter to ſtamp them with the hammer.

For this laſt operation, which finiſhes the money, they uſe two punchions, or matrices; the one called the *pile*, and the other the *truſs*, or *quiver*; each engraven dentwiſe; the pile bearing the arms, and the truſs the image, or croſs; both their legend, date, &c.

The pile, which is about eight inches high, has a kind of talon or heel in the middle, and ends in a point: which figure it had, for the ſake of being more eaſily ſunk, and more firmly faſtened to the block whereon the money is ſtruck.

The minter, then, laying the planchet horizontally on the pile, and covering it with the truſs, which he holds ſteadily in his left hand, gives ſeveral ſmart blows on the truſs with an iron mallet held in the right; more or leſs, as the graving of the dyes is more or leſs deep. If after theſe firſt ſtrokes, the planchet be not ſufficiently ſtamped, it is returned again between the matrices, exactly in its former poſition, and the ſtrokes are repeated till the impreſſion be perfect.

Thus is the *coinage* finiſhed, and the planchets converted into money; which, after they have been examined as to their weight become current.

Coinage, *Engliſh*. - Since the invention of milling money (the author whereof is not agreed on, nor even the country, where it took its riſe, though the French lay claim to both) it has been imitated by ſeveral other nations; but by none with ſucceſs equal to that of the Engliſh, who carried it to the utmoſt perfection; both by the beauty of their graving, and by their inventing the impreſſions on the edges, that admirable expedient, for preventing the alteration of the ſpecies, abovementioned.

Till the time of K. Charles II the Engliſh money was generally ſtruck with the hammer, as that of other nations; and in effect, it is but very late, viz. in the reign of king William III. that the hammered ſpecies ceaſed to be current. Before they were put down, the Engliſh money was in a woful condition; having been filed and clipped by natives as well as foreigners, eſpecially the Dutch, ſo as to be ſcarce left of half the value: the retrieving this diſtreſſed ſtate of the Engliſh money is looked upon as one of the glories of king William's reign; for which we are obliged, in good meaſure, to the happy conduct of the earl of Halifax.

The *coinage* of England is now performed wholly in the Tower of London; where there is a corporation for it, under the title of the *mint*.

Formerly there were here, as there are ſtill in other countries, what we call the *rights of ſeignorage and braſſage*; but ſince the eighteenth year of king Charles II. there is nothing taken, either for the king, or for the expences of *coining*; it having been ſettled by act of parliament, that all money ſhould be ſtruck at the public expence: ſo that weight is returned for weight, to all perſons who carry their gold and ſilver to the Tower.

There is a duty of ten ſhillings per tun on wine, beer, and brandy imported, called the *coinage* duty, granted for defraying the expence by ſtat. 18 Car. II. cap. 5. and continued and advanced by ſubſequent ſtatutes, 4 and 5 Anne, cap. 22. 1 Geo. I. cap. 43. 4 Geo. II. cap. 12. 1 Geo. III. cap. 16, &c.

The ſpecies coined in England are eſteemed contraband goods, and not to be exported; all foreign ſpecies are allowed by act of parliament, made in 1673, to be ſent out of the realm; as well as gold and ſilver in bars, ingots, duſt, &c. Indeed, in the ſeſſion of parliament in 1718, endeavours were made to put a ſtop to this licence, which drains England of its richeſt metals; but in vain; the parliament having laid aſide the bill, without coming to any reſolution.

Coinage *of Fez and Tunis* is not under any diſcipline; each goldſmith, Jew, and even every private perſon, undertaking it at pleaſure: which renders their money exceedingly bad, and their commerce very unſafe.

Coinage, *Muſcovite*.—The czar ſtrikes no money but ſilver, and that only in the cities of Moſcow, Novogrod, Twere, and Pleſcou; to which may be now added Peterſburg, the favourite city of her late czarian majeſty. The *coinage* of each of theſe cities is let out to farm, and makes part of the royal revenue.

Coinage, *Perſian*.—All the money made in Perſia is ſtruck with the hammer: and the ſame may be underſtood of the reſt of Aſia and America, and the coaſts of Africa, and even Muſcovy; the invention of the mill not being yet gone out of Europe, nor even eſtabliſhed in every part of it. The king's duty, in Perſia, is ſeven and a half per cent. for all the monies coined; which are now reduced to ſilver and copper: there being no gold coined there, except a kind of medals at the acceſſion of a new ſophi.

Coinage, *The Spaniſh*, is eſteemed one of the leaſt perfect in Europe: it is ſettled at Seville and Segovia, the only cities where gold and ſilver are ſtruck. It is true, there are brought from Mexico, Peru, and other provinces of the Spaniſh America, ſuch vaſt quantities of pieces of eight, and other ſpecies both of gold and ſilver, that, in this reſpect, it muſt be owned, there is no ſtate in the world where ſo much money is coined, as in that of the king of Spain.

To take the repreſentation of a *coin* on paper, card, or paſteboard. See **Medal.**

CO-INDICATIONS, in *Medicine*, ſigns which do not indicate by themſelves alone, but together with other circumſtances, &c. help the phyſician to form a judgment.

COINING, in the *Tin-works*, is the marking the tin, when caſt into blocks, or ſlabs, with the figure of the lion rampant. This is done by the king's officer. The king's cuſtom is four ſhillings for every hundred weight.

COINUS, in *Natural Hiſtory*, a name given by ſome writers to the genus of ſhells called PORCELLANA and *Concha venerea.*

COITION, the intercourſe between male and female in the act of generation.

It is obſerved that frogs are forty days in the act of *coition.*

Bartholine, &c. relate, that butterflies make an hundred and thirty vibrations of the wings in one act of *coition.*

COITION is alſo ſometimes uſed for that mutual attraction, or tendency toward each other, which is found between iron and the magnet.

COJUMERO, in *Ichthyology*, a name given by ſome to the *manati*, or *ſea-cow.*

COIX, in *Botany*. See JOB's *Tears.*

COKE, denotes pit-coal or ſea-coal charred. It is prepared by burning them in ovens conſtructed for this purpoſe; and extinguiſhing the fire in the manner uſed for making CHARCOAL.

COLAPTICE, the art of carving, or cutting, the reſemblances and figures of natural things in ſtone. The term for the artiſt is *lithoxos.*

COLARBASIANS, or COLORBASIANS, a ſect of Chriſtians in the ſecond century; ſo called from their leader Colarbaſus, a diſciple of Valentinus; who, with Marcus, another diſciple of the ſame maſter, maintained the whole plenitude, and perfection, of truth and religion, to be contained in the Greek alphabet; and that it was upon this account that Jeſus Chriſt was called the *alpha* and *omega*. This ſect was a branch of the VALENTINIANS. See alſo MARCOSIANS.

COLARIN, in *Architecture*. See HYPOTRACHELIUM and GORGERIN.

COLARIN is alſo uſed for the CINCTURE.

COLASISI, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a very ſmall but very beautiful ſpecies of the parrot, common in that part of the world, and called by others *cuſi* and *gula ſiſi.*

COLATURE. See FILTRATION.

COLCHESTER-PLOUGH. See PLOUGH.

COLCHICUM, in *Botany*, ſee *Meadow* SAFFRON.

COLCHICUM, in *Medicine*. The general conſent of authors condemns the root of the *colchicum* as a poiſon, on account of its acid and corroſive quality: yet it is evident that the ancients eſteemed it greatly: they called it *hierobulbus*. Some even gave it internally, in caſes where it was neceſſary to make the patient vomit, it being eſteemed a very good emetic: and others ordered its uſe externally, bruiſing it, and applying it to places where there were fixed and violent pains.

Wedelius recommends it as an alexipharmic, and has written a treatiſe expreſly on this ſubject. He frankly confeſſes to have taken his knowlege of its virtues from an obſcure author, who, in a treatiſe of the plague, recommends it internally as a very beneficial medicine, and tells us, that people were ſo well acquainted with its virtues, that they took it in conſiderable doſes, and wore it about their necks, as a preſervative againſt the infection. He found the virtues of this medicine were not confined to the peſtilential and petechial fevers alone, but he gave it with the ſame ſucceſs in the ſmall-pox, the purple-fever, and even in the worſt kind of the meaſles.

M. Storck, of Vienna, diſcovered to the public the medicinal virtues of *colchicum*, and by experiments on himſelf aſcertained it to be a moſt powerful diuretic, and a kind of miraculous remedy in the moſt deſperate dropſies. He digeſted an ounce of the ſolid root in a pound of vinegar for twenty-four hours, and then made an oxymel of this vinegar by mixing with it twice its quantity of honey: this medicine adminiſtered in doſes of a tea-ſpoonful, or a dram, promoted a copious diſcharge of urine. He alſo found, by many trials, that by giving a dram of it twice a day, and encreaſing the doſe to an ounce or an ounce and a half in the day, it proved a very powerful diuretic, and of excellent ſervice in hydropic and other ſerous diſorders.

COLCOTHAR, in *Natural Hiſtory*, &c. The Latin writers of the middle ages uſe *colcothar* as a name of vitriol in general, which was called by the Greeks *chalcanthum.*

Colcothar is originally an Arabic word, which does not ſignify the common vitriol, but the *chalcitis*. The word has been ſpelt *calchuthar*, and from this the word *chalcitis* differs not very much. The Greeks of the middle ages followed the Arabians in the uſe of the word *colcothar*, but added to it a termination proper to their language, and particularly to the cuſtom of thoſe times, which ſeemed not to expreſs exactly the ſame thing, but a diminutive of it: they wrote it *colcotharion*, or *chalcitarion*. This they alſo called the *orchis*, *orchidion*, the *ladi eladion*, and ſo in a thouſand other inſtances. Aviſenna uſes the word *zagi* to expreſs this ſubſtance, but then he is by no means determinate in it, but makes it include the *miſy*, *ſory*, and *melanteria*, as well as the *chalcitis*; but diſtinguiſhing in another place the ſeveral kinds of *zagi*, he tells us, that one was the *chalcand*, which was green; a ſecond the *chalcitis*, which was yellow; a third the *ſory*, which was red. *Alzagiat* is a name alſo uſed by him to expreſs all theſe kinds; and this word the interpreters generally render *atramenta*, inks. This is generally ſuppoſed to expreſs their being all black ſubſtances, which is not the caſe; but it properly ſignifies, that they are all vitriolic foſſils: *atramentum* being a name of vitriol, as a ſubſtance uſed in the making of ink.

There are two kinds of *colcothar*, *natural*, and *factitious.*

COLCOTHAR, *Natural*, otherwiſe called *chalcitis*, is a red vitriol, brought from Germany; formed from the common green vitriol, calcined naturally by ſome ſubterraneous fire.

COLCOTHAR *Artificial*, is a ſubſtance which remains after martial vitriol has been calcined, and diſtilled for a long time by an intenſe fire; and by that means reduced to the redneſs of blood.

Mr. Le Fevre propoſes an eaſy method of making *colcothar of vitriol:* he mixes two parts of filings of iron with one of ſulphur, and a little water. After the acid of the ſulphur has diſſolved the iron, he expoſes the paſte to the air, and it changes into *colcothar*. See Mem. of the A. D. S. an. 1730, H. 52.

Colcothar of vitriol, after the action of the fire being dulcified, or the metallic parts precipitated by an alkali, or by zink, or any other of the imperfect metals, and ſublimed with ſal armoniac, in either caſe an inflammable ſulphur is prepared in the operation, and may be ſeparated both from the ſublimed flowers, and from the caput mortuum. This, and the ſulphureous ſmell of ſpirit of vitriol, together with the ſulphur produced by oil of vitriol and ſpirit of wine, prove abundantly what has been ſuſpected by ſome, that vitriol contains ſulphur as one of its principles, and a natural and neceſſary part of its compoſition. Phil. Tranſ. Nº. 103.

Colcothar, after calcination, retains ſome of its acid and imbibes moiſture from the air: but if it is waſhed in water, the remaining acid is diſcharged; it no longer attracts moiſture, and becomes what is called the *ſweet earth* of vitriol. Unwaſhed *colcothar* is an antiſeptic, tonic, aſtringent and corroſive, and is therefore applied externally to all putrid, ſanious, and fungous ulcers. See VITRIOL.

COLCUICUILTIC, in *Zoology*, the American name of a bird of the partridge kind, deſcribed by Nieremberg. It is variegated with black, white and red, and is a very beautiful bird. Its colours are for the moſt part diſpoſed not in ſpots, but in longitudinal lines on the back; but on the belly they are rather in form of ſmall and ſhort ſpots. Its legs and feet are blue. It is a well-taſted bird.

COLD, ſomething devoid of HEAT, or which contains in it no particles of FIRE.

This definition is agreeable to the ſentiments of moſt of the modern philoſophers, who make *cold* a mere negative term; and ſuppoſe the thing to conſiſt in a privation, or diminution of heat. Others define *cold*, much on the ſame principle, to be that ſtate of the minute parts of a body, wherein they are more ſlowly and faintly agitated than thoſe of the organs of feeling.—In which ſenſe, *cold* is a mere term of relation; and hence the ſame body become liable to be perceived hot or *cold*, as its particles are in a greater or leſs degree of motion than thoſe of the ſenſible organs.

Heat is ſuppoſed to conſiſt in a particular motion of the parts of the hot body; and hence the nature of *cold*, which is its oppoſite, is eaſily deducible: for *cold*, we find, extinguiſhes, or rather abates heat; whence it ſeems to follow, that thoſe bodies are *cold*, which check and reſtrain the motion of the particles wherein heat conſiſts.

Now, there are three kinds of bodies which may do this; viz. either thoſe whoſe particles are perfectly at reſt; or thoſe whoſe particles are indeed agitated, but that leſs violently than thoſe of the hot body to which they are applied: or, laſtly, thoſe whoſe particles have a motion proper for exciting the ſenſation of heat, but which move with a different determination; ſo as to retain and change the motion of the particles of the organ.

Hence, there ariſe three different kinds of *cold*, or cold bodies: the firſt is, that *cold* common to all hard bodies, which conſiſts in the reſt of their parts. The ſecond is that which ariſes on plunging any part of our body in water; which conſiſts in this, that the parts of our præcordia, being more briſkly agitated than thoſe of the fluid, communicate part of their motion to it. The third, the *cold* felt on collecting even warm air with a fan, or in blowing hot breath out of our mouth, with the lips cloſe ſhut; which conſiſts in this, that the direct motion of the particles of air does, in ſome meaſure, change and rebate the motion and determination of the parts of the body: and hence it is, that a *cold* body cannot cool another without heating itſelf. Hence alſo it is, that the more parts of a frigid body are at reſt, the more muſt the particles of a warm body, applied to heat them, loſe of their motion, and by conſequence of their heat. Thus a marble, having more quieſcent parts than wood, which is full of pores and interſtices, is felt colder than wood. Hence alſo we ſee why air, near marble and other denſe bodies, feels ſomewhat colder than in other places.

On this principle, the two latter kinds of *cold* appear ſomewhat more than privations: the particles inducing the *cold* may be eſteemed real frigorific corpuſcles; and the coldneſs be deemed a real quality as well as hotneſs.

Theſe particles do not only check the agitation of thoſe continually diffuſed from the inner parts of the animal to the outer; but, having an elaſtic power, they bend and hang about the filaments of the body, pinch and ſqueeze them; and hence that acute pungent ſenſation called *cold*.

That *cold* is more than a mere relation, or compariſon, is evident from its having real and poſitive effects; ſuch as FREEZING, CONGELATION, CONDENSATION, RAREFACTION, BURSTING, &c.

Cold is the deſtroyer of all vegetable life, when increaſed to an exceſſive degree; and it is difficult to ſay how much increaſe of it the hardier of them are, or are not able to bear. We find many of our garden plants and flowers, which ſeem to be very ſtout and hardy, go off at a little increaſe of *cold* beyond the ordinary ſtandard. In the ſevere winter in 1683, Mr. Robarts tells us, that the artichoaks and cauliflowers all periſhed; and that the odoriferous ſuffrutices, ſuch as thyme, ſage, lavender cotton, and the like, were generally killed, very few eſcaping, except ſuch as had been planted the preceding year, and were therefore ſo low as to have the advantage of a covering of ſnow over them; which is the defence nature has given to the natives of the coldeſt countries, and proves ſuperior to any thing that can be invented by art for their preſervation. In the corn-fields, ſuch parts of them as had remained covered with ſnow, had eſcaped very well, the corn all looking freſh and vigorous, after the melting of it in the ſpring: but when the lands had lain ſo expoſed that the ſnow had melted off, the crop was generally deſtroyed, and the farmer obliged to ſow the place anew. Phil. Tranſ. N° 165. See Frost.

Dr. Clarke takes *cold* to be owing to certain nitrous, and other ſaline particles, endued with particular figures proper to produce ſuch effects. Hence, ſal ammoniac, ſaltpetre, or ſalt of urine, and many other volatile and alkalizate ſalts, mixed with water, increaſe its degree of *cold* very ſenſibly. Hence alſo that popular obſervation, that *cold* prevents corruption; which, however, muſt not be admitted without an exception; ſince, if a hard, porous body have its interſtices filled with water, and this be too much dilated by freezing, the including body will be burſt. And thus it is, that *cold* proves deſtructive to the parts of ſome plants.

Cold, *Artificial.* See Freezing, or Thermometer.

Cold, *Potential.* See Potential.

Cold *Baths.* See Baths.

Cold *Fuſion.* See Fusion.

Cold *Diamargariton.* See Diamargariton.

Cold *Diatragacanth.* See Diatragacanth.

Cold *Diſtillations.* See Distillation.

Cold, in *Medicine*, ariſes from obſtructed perſpiration, and is found to be productive of inflammatory diſorders, as frozen limbs, gangrenes, coughs, pleuriſies, peripneumonics, rheumatic pains, conſumptions, apoplexies, palſies, &c. which ſee under their proper heads.

To remove a cold in the beginning, ſmall and repeated bleedings are recommended, which likewiſe prove beneficial in coughs, and in the confirmed conſumption, even after a purulent ſpitting and hectic ſymptoms have appeared. The quantity to be taken away at a time, may be from four to ſeven or eight ounces, once in eight or ten days: concerning which it is obſervable, that the patients do not find themſelves ſo much relieved on the firſt, as on the ſecond or third night after bleeding.

What we commonly call catching *cold*, may be cured by lying much in bed; by drinking plentifully of warm ſack whey, with a few drops of ſpirits of hartſhorn in it; poſſet-drink, water-gruel, or any other warm ſmall liquor. In ſhort it ought to be treated firſt as a ſmall fever, with gentle diaphoretics; and afterward, if any cough or ſpitting ſhould remain, by ſoftening the breaſt with a little ſugar-candy, and oil of ſweet almonds, or a ſolution of gum ammoniac in barley-water; taking care to go abroad well cloathed.

This is a much more eaſy, natural, and effectual way, than the common practice by balſams, linctuſes, pectorals, &c. which ſerve only to ſpoil the ſtomach, oppreſs the ſpirits, and hurt the conſtitution.

To prevent the catching of *cold*, the Jeſuits bark is recommended in the Philoſophical Tranſactions. Phil. Tranſ. N° 478. p. 3. See Peruvian-*bark*.

Cold is alſo a diſeaſe to which horſes are ſubject: this is uſually occaſioned by want of regular exerciſe, by overheating them in riding, and ſuffering them to cool too faſt, or neglect of rubbing them down when they come in hot after journeys. The ſigns of a *cold* are a cough, heavineſs, watery eyes, kernels about the ears and under the jaws, gleets of the noſe, and rattles in breathing, &c. Bleedings, hot maſhes of bran and water, and moderate exerciſe will, in moſt caſes, be an effectual remedy. To theſe may be added balls conſiſting of warm opening ingredients: Dr. Bracken preſcribes the following; take anniſeed, carraway ſeed, and greater cardamoms, finely powdered, of each one ounce, two ounces of flower of brimſtone, one ounce and a half of turmeric in fine powder, two drams of ſaffron, two ounces of Spaniſh juice diſſolved in water, half an ounce of oil of anniſeed, one ounce and a half of liquorice powder, and a ſufficient quantity of wheat flour: let theſe ingredients be well beat in a mortar and made into a ſtiff paſte; and given in ſmall quantities about the ſize of a pullet's egg.

Cold-*charge*, in *Farriery*, a medicine, conſiſting of vinegar, bole, and the whites of eggs, mixed to the conſiſtence of a poultice, and ſpread over the injured part for the cure of ſtrains, &c.

Cold-*finch*, in *Zoology*, the name of a bird of the *œnanthe* kind, or nearly approaching to that genus, common about the Peak in Derbyſhire. Its belly is white; its breaſt of a yellowiſh brown, and its head and back of a browniſh or greeniſh grey; the long feathers of its wings and tail are black, but with ſome variegation of white toward the end; its beak is ſlender, ſtraight, and ſomewhat ridged or triangular; it feeds on worms and other inſects.

Cold *water*. See Water.

COLDENIA, in *Botany*, a genus of the *tetrandria tetragynia* claſs. Its characters are theſe; it hath a funnel-ſhaped flower of one petal, ſpreading at the top, and obtuſe; and four ſtamina, which are inſerted in the tube of the petal. In the centre are inſerted four oval germina, each ſupporting a hairy ſtyle: the germina afterward become ſo many oval, compreſſed, rough fruits, terminated by four beaks, incloſed by the empalement. We know but one ſpecies of this genus, which is a native of India.

COLDSHIRE *Iron*, ſuch as is brittle when it is cold; ſee Iron.

COLE-*fiſh*, a name for a fiſh of the whiting-kind, called by authors *aſellus niger*, by Artedi and Linnæus reckoned a ſpecies of the GADUS, and in Cornwall, and ſome other parts of England, the *rawlin-pollack*. It is very common on the coaſts of Northumberland, Yorkſhire, and other northern counties of England, and is called the *cole-fiſh*, or coal-fiſh, from its blackneſs. It has ſomething of the taſte of the cod, but much inferior to it. This fiſh is ſalted and dried for ſale.

Cole-*mouſe*, in *Zoology*, the name of a ſmall bird of the tit-mouſe kind, diſtinguiſhed from all the reſt by being the ſmalleſt of all the tit-mouſe kind, and having a white ſpot on the back part of its head. See Parus.

Cole-*pearch*, in *Natural Hiſtory*, a name given to a ſmall fiſh, much eſteemed about Dantzick and other places, for its delicate flavour. It is very like the common river pearch, but that it does not grow ſo large, and has a greater variety of colours, and its head is proportionably larger. Phil. Tranſ. N° 83.

Cole-*ſeed*, the ſeed of the naphew or napus, propagated in many parts of England to great advantage, for the oil expreſſed from the ſeeds. It is much ſowed in the moory land in the fen countries; and the land is prepared for it by the method of Burn-*baking*, or Burning. The freſheſt mould is found beſt for it, or what the farmers call a luſty ſoil, which is newly broken up, and has been long at reſt; but with plenty of manure, and deep frequent plowing, it will grow in any ſoil. Indeed the land cannot be too mellow, nor too much pulverized for this plant.

It loves rich fat land, and ſucceeds very well on marſh and fen-lands, and particularly on ground newly recovered from the ſea. The ranker the land is for *cole-ſeed* the better. This ſeed is principally brought from Holland, though it is very good when taken from our own plants, for growth as well as other uſes. The ſowing this ſeed is a very advantageous piece of huſbandry. The beſt ſeed is that which is largeſt, faireſt, and of the cleareſt colour. It is very apt to be mouldy, if not kept very dry. It is to be ſown in July, the land being previouſly ploughed and harrowed: the quantity of ſeed is half a peck allowed for an acre.

The plants are afterwards hoed like turneps. The ſlugs and inſects which infeſt this plant are deſtroyed by a mixture of ſlacked lime and wood aſhes; ten buſhels of lime and fifteen of aſhes being allowed to an acre, and this alſo ſerves to forward the crop.

Some ſow it for the ſake of the ſeed: others by way of a winter food for the cattle in the months of January February, and March, when other food is wanting. It will do very well in poor lands for this purpoſe; but the richer grounds only will make it rank enough for ſeed. If the winter be mild, it will after feeding grow again, and afford a ſecond winter's ſupply, and after cutting up the ſtumps, will ſhoot out young ſprouts, very ſweet, and in great abundance.

But Mr. Young obſerves, that turneps will anſwer the purpoſe much better; and he diſcourages the culture of it for food in April and May to ſucceed turneps, becauſe it produces only a ſmall quantity per acre: as he obſerves that if it is fed off with ſheep or cattle, and afterward reſerved for ſeed, the crop is much damaged by it; and he adds, that the principal profit of the crop is the ſeed, which amounts to five times the value of food gained by it.

Mr. Miller, however, alleges that one acre of land planted with *cole*, will produce nearly as much food as two acres of turneps: and there is this advantage attending the culture of this plant, that it will bear a ſevere froſt, and yield a conſtant ſupply of food, when the ground is ſo frozen, that the turneps cannot be taken up. But caution ſhould be uſed in feeding cattle with this plant In the fen countries they turn their ſheep to fatten upon the ſeed about Michaelmas; and it is obſerved that ſheep will thrive more on this paſture in a month than they will on turneps in two.

In Flanders *cole-ſeed* is ſown and tranſplanted like cabbages: the land in which it is ſown is ploughed twice before winter; it is again ploughed in May, harrowed two or three times and rolled: and theſe operations are repeated in July; when the ſeed is ſcattered over it by the three fingers, the land lightly harrowed and afterwards rolled. Twenty-four pounds of ſeed will ſow three acres, and yield plants ſufficient for twelve acres. The land for the plants, when the previous crop is removed, is thrice ploughed; afterwards harrowed, and ploughed again with an open trench at ſmall intervals in September. In the beginning of October the plants are removed and placed in rows acroſs the furrows, at the diſtance of a foot, and about ſix inches diſtant from one another. The ground may be afterwards ſown with pulverized pigeon's dung, which is the beſt manure for theſe plants; allowing about thirty buſhels to an acre. The looſe earth in the trenches is then thrown among the plants in the rows: which is again repeated early in the ſpring. When it turns yellow, or about the beginning of July, it is reaped like corn, and after remaining three or four days ſtacked in the field, where it heats and yields a greater quantity of oil than it would have otherwiſe done, in September it is threſhed and dreſſed on a kind of floor in the field.

When it is kept for ſeed, it is to be reaped in the manner of wheat, as ſoon as one half of the ſeed looks brown: it is to be left a fortnight to dry on the ground, never turning it, for fear of ſhedding the ſeed; and when this time is over, it is to be gathered up in large ſheets, and carried to the barn for immediate threſhing; or it may be threſhed in the field on a large ſheet. Its common produce is five quarters of ſeed from an acre, and the value of this about five pounds.

Mr. Donellan, near Dublin, obtained a crop by the horſe-hoeing culture, of ſeventy-three tons ſix hundred weight on an Engliſh acre; but Mr. Young, by broadcaſt ſowing, and hand-hoeing, which he reckons the beſt method of cultivating this plant, obtained only five tons per acre.

The land where this has grown, is very well prepared by it for wheat; though ſome ſow oats upon it, as what ſucceeds beſt of all after it. When the oil is preſſed out of the ſeeds, they uſe the remaining cakes in ſome places as firing; but in others they give them to their cows and other cattle in winter, when other food is ſcarce. They will very ſoon fatten thoſe deſigned for ſale; and the yellowneſs and rankneſs of the fat may eaſily be remedied, by feeding them on dry fodder a fortnight or three weeks before they are killed. In ſome places, they mix the powder of theſe cakes with water, and give it to their calves till they are three or four days old, inſtead of milk, and it does as well for them, till they are able to eat graſs or hay. It is a good method to burn the ſtubble on the *cole-ſeed* lands, for it is ſo ſtumpy that it is of no uſe to plow it in.

COLEOPTERIA, in *Zoology*, an order of inſects, comprehending all thoſe with four wings; the external pair of which are hard, rigid, and opake, and form a kind of caſe for the interior pair; add to this, that the mouth conſiſts of two tranſverſe jaws.

Theſe animals are known in Engliſh by the general name of beetles; whereof authors have eſtabliſhed a great many genera, from the different figures of their antennæ, or horns, and other general diſtinctions; ſuch are the *ſcarabæus*, or beetle properly ſo called, the *dermeſtes*, *caſſida*, *coccinella*, *chryſomela*, *dytiſcus*, *tenebrio*, &c.

COLEWORTS, in *Gardening*, for the botanical characters ſee BRASSICA. The common *colewort*, or Dorſetſhire kale, is now almoſt loſt near London; where the markets are uſually ſupplied with cabbage plants inſtead of them. Indeed, where farmers ſow *coleworts* to feed their milch cattle in the ſpring, when there is a ſcarcity of herbage, the common *colewort* is to be preferred, as being ſo very hardy that no froſt will deſtroy it. The beſt method to cultivate this plant in the field, is, to ſow the ſeeds about the beginning of July, in moiſt weather, which will bring up the plants in about a fortnight. The quantity of ſeed for an acre of land is nine pounds. When the plants have got five or ſix leaves they ſhould be hoed, as is practiſed for turneps; but they ſhould be kept thicker than turneps, as being in greater danger of being deſtroyed by the fly: this work ſhould be performed in dry weather, that the weeds may be killed. About ſix weeks after, the plants ſhould have a ſecond hoeing, which if carefully performed will clean the ground, ſo that they will require no farther culture. In the ſpring they may be drawn up and carried out to feed the cattle, or theſe may be turned in to feed upon them as they ſtand; but the former method is to be preferred; for when the cattle are turned in among the plants, they will tread down and deſtroy more than they eat; eſpecially if they are not fenced off by hurdles. Miller.

COLIBERTS, *Coliberti*, in *Law*, were tenants in ſoccage, and particularly ſuch villeins as were manumitted, or made freemen. Domeſday.

But they had not an abſolute freedom; for though they were better than ſervants, yet they had ſuperior lords to whom they paid certain duties, and in that reſpect might be called ſervants, though they were of middle condition between freemen and ſervants. Du-Cange.

COLIBRI, in *Ornithology*, the name of a bird very remarkable for its beauty, its form, its manner of living, and its littleneſs. It ſucks its food from flowers, on which it ſeldom lights, but extracts the honey from their nectaria with its long, fine, delicate tongue. There are ſpecies of them which have all the colours of precious ſtones, and the fineſt and moſt beautiful plumage imaginable. They fly with great rapidity, and are heard before they are ſeen, making a kind of humming noiſe, from which they are called HUMMING-*birds*.

COLIC, in *Medicine*, a ſevere gnawing pain, felt in the lower venter; ſo called, becauſe the ordinary ſeat of the diſorder was anciently ſuppoſed to be in the inteſtine colon.

Phyſicians uſually diſtinguiſh four kinds of *colic*, the *bilious*, *inflammatory*, *windy*, and *nephritic*.—The *bilious* COLIC has its riſe from certain ſharp, bilious, ſtimulating humours, which, being diffuſed through the inteſtines, vellicate their fibres, and occaſion a ſenſation of pain: though Willis takes the part here principally affected to be the meſentery.

Dr. Sydenham obſerves, that the *bilious colic* uſually attacks people about the beginning of ſummer; that it is generally attended with a vomiting of bilious green liquor; that the patient complains of exceſſive heat, great gripings, faintneſs, &c. and that if it be not ſoon remedied, it is apt to turn into the iliac paſſion.

Baglivi notes, that if the patient ſweat much, and be much enfeebled, the diſeaſe is apt to degenerate into a palſy. The cure, he ſays, depends on bleeding, gentle cathartics, and clyſters; and if it ariſe from a crapula, an emetic is to proceed: after which, the cure is to be completed with proper anodynes.

COLIC, *Inflammatory*, is the moſt dangerous, and ariſes from an inflammation of the ſtomach and inteſtines. See INFLAMMATION.

COLIC, *Wind*, is a vague pain, never ſtaying in any fixed place; being produced by windy vapours, which ſwell and diſtend the inteſtines they are incloſed in.

COLIC, *Nephritic*, is that felt particularly in the reins, whence it has its name.

It uſually has its riſe from ſome ſtone, or gravel detached from the kidneys, and fallen into the pelvis. The pareira brava is ſaid to be a ſpecific for *nephritic caſes*.

Some, particularly Sydenham, mention a *nervous colic*, moſtly incident to hyſteric and hypochondriac perſons; but this appears only a ſpecies of the *windy colic*.

Perſons ſubject to colics. Theſe are diſeaſes that attack both ſexes, but in general women are more ſubject to them than men; and they are the more violent, and uſually of longer duration in that ſex than in the other. In women they uſually appear gentle, and often trifling at firſt; but they gain ſtrength by time, and often become convulſive. The perſons of that ſex, peculiarly ſubject to *colics*, are thoſe of a ſanguine temperament, and ſuch as have had obſtructions of the menſes. Women in child-bed are alſo very ſubject to flatulent *colics*, when the belly has not been properly bound round after delivery: in this caſe, the *colics* not only are troubleſome during the month of lying-in, but often become habitual, and do not leave them afterwards. In men, the middle-age is more ſubject to *colics*, than either the young or old periods of life; and people are moſt ſubject to fall into them who have been ſubject to irregularities in the hæmorrhoidal diſcharges, and who have nephritic complaints. Men are often thrown into the bilious *colic* by violent paſſions of anger, eſpecially if they eat or drink immediately afterwards, or they themſelves be of a *choleric* temperament.

Prognoſtics in colics. The oftener any perſon has been afflicted with *colics*, the more ſubject they are to return on any ſlight occaſion, and the more likely to become habitual. All *colics* that attack perſons with a chillneſs firſt, are more violent than thoſe which do not, and they often are either attended at the very firſt with an inflammation, or have one come on ſoon afterwards. In general alſo, *colics* attended with coſtiveneſs are worſe than thoſe in which the patients have ſome ſtools. Reachings to vomit are always bad ſymptoms in *colics*, and give a ſuſpicion of the caſe turning to a miſerere or iliac paſſion: but this is to be obſerved, that when the patient has juſt before eaten very heartily, and drank much, eſpecially of cold liquors, then ſuch reachings are natural, and are not to be accounted the bad ſymptoms they are at other times. In women, when the reachings are violent, there is always danger of a vomiting of blood. The more violent the pains of the *colic* are, the more danger there is of their bringing on convulſions. A *colic* ariſing from a ſtoppage of the menſes, and attended with a ſtagnation of blood about the viſcera, when it is of long ſtanding, threatens the coming on of a quartan, a dropſy, or a cachexy. And a hæmorrhoidal *colic*, when ariſing from a retropulſion of the gout or ſciatica, by wrong medicines, is always a caſe of great danger. This, however, always happily goes off, if there comes on a diſcharge of blood, or even of a ſerous matter, from the hæmorrhoidal veins. Sometimes alſo it goes off at once, but very unhappily, by a ſudden regurgitation of the matter upon the viſcera, eſpecially upon the liver, the conſequences of which are, obſtruction of that viſcus, aſcites, hectics, or dropſies. Sometimes alſo this *colic* goes off by the appearance of ſcorbutic ſpots on the body, in different parts.

The bilious *colic*, if the offending matter be not immediately evacuated, after its acrimony has been obtunded by a proper medicine to fit it for evacuation, too often brings on dangerous inflammatory fevers. In *colics* which have held the patient a long time, a hiccough coming on is a very bad omen. Finally, a *colic*, when improperly treated with opiates and anodynes, often brings on a palſy.

Method of cure. In flatulent and mucous colics, carminative and emollient clyſters are to be injected, compoſed of decoctions of chamomile-flowers, marſhmallows, and a mixture of the elixir proprietatis, or common ſalt, by way of ſtimulus; and after this the carminative medicines, ſuch as angelica-root, winter's bark, aniſe and caraway ſeeds, and cloves, with the other ſpices, are to be given, with intermediate doſes of laxative medicines; and to theſe medicines may be added occaſionally, the digeſtive ſalts, ſuch as vitriolated tartar, with nitre and cinnabar, and the ſpirit of tartar, and ſweet ſpirit of nitre, with the eſſence of orange-peel, &c.

In the bilious colic, the attemperating and abſorbent medicines are to be given; as nitre, mother of pearl, calcined cryſtal, oil of almonds, and manna, with the broths of white meats, and the carminative ſeeds. If theſe things are thrown up by vomit, recourſe muſt be had to clyſters, and to applications of warm things to the abdomen, ſuch as are before deſcribed.

In the hæmorrhoidal and nephritic colic, clyſters are to be frequently given of oil of olives and linſeed, with a little nitre. After this, warm broths, with oil of ſweet almonds, are to be drank in frequent draughts, and powders compoſed of nitre, crab's eyes, and cinnabar, are to be given at frequent intervals; and if the pains are vehement, a ſmall doſe of theriaca, or of the ſtorax-pill, may be given with the powder, to be taken at night. When the violence of the fit is over, the gentle alexipharmics are to be given, with ſtrengthening medicines, to reſtore the due tone of the parts. Externally, fomentations may be applied to the rectum, and cataplaſms of the leaves of mullein and mellilot, on which the patient may ſit while they are warm; and heat may be applied to the abdomen by bladders half filled with water, or milk made of a due warmth, and by bricks heated a little, and by bags containing carminative and nervine ingredients. Liniments may alſo be rubbed in of the oils of nutmegs and bays, and ſpirit of wine and camphor, particularly in the part where the pain is moſt violent.

In the hyſteric colic, clyſters are frequently to be injected, made of decoctions of the herb veronica in broth, with a little of the oil of dill and common ſalt. When the patient is averſe to clyſters, and the caſe is not violent, warm baths for the feet, and the ſitting over the ſteam of warm water, will ſometimes prove ſufficient, and gentle purges of decoctions of ſena, and the like, are to be given, or a gentle doſe of the reſin of jalap, diſſolved with the yolk of an egg in ſome of the uterine waters: after theſe, alexipharmics and carminatives are to be given, ſuch as the roots of pimpernel and angelica, with aniſe, and the other warm ſeeds. If the caſe is violent, the attemperating nitrous medicines may be given, and with them gentle anodynes; and finally, ſuch things as will reſtore the due tone of the parts. The perſon ſhould be kept in a gentle warmth during the whole time of the diſeaſe, and ſpirit of caſtor may be occaſionally rubbed in on the abdomen.

By way of preſervative from the hæmorrhoidal and hyſteric *colic*, it is very proper to bleed in the foot at the ſpring and autumn ſeaſons, and proper uterine medicines ſhould be taken to keep up the menſtrual diſcharges; and to prevent ſuppreſſions of the hæmorrhoidal, leeches ſhould be applied to the parts, and the bowels ſhould be carefully kept gently lax. Juncker's Conſp. Med. p. 573.

Dr. Percival recommends alum, in doſes of ten to twenty grains every four or ſix hours, as an effectual remedy in various painful diſorders of the bowels. CASTOR-oil, adminiſtered either in clyſters, or by the mouth, is likewiſe an excellent remedy in all caſes of this kind. See Med. Obſ. vol. ii. d. 285, &c.

This diſtemper has ſometimes taken its riſe from concretions formed on plum-ſtones lodged in the guts. See Medic. Eſſ. Edinb. vol. i. art. 32. Abridgm. vol. ii. p. 214.

Colic pains ſometimes ariſe from viſcidities in the inteſtines; and the VITRUM *antimonii ceratum* has been found ſucceſsful in ſuch caſes.

Baglivi recommends chamomile as an antidote againſt the *colic*, from what cauſe ſoever it ariſe. Where the diſeaſe is obſtinate, much riding has been found of eſpecial ſervice.

COLICA *Dammoniorum*, or *Devonſhire* COLIC of Huxham, is probably the ſame diſeaſe with the *colica ſaturnina* of Juncker, the *colica Pictonum*, and *plumbariorum*, of others, and the dry belly-ache of the Weſt Indies; and has been deſcribed by different writers under a variety of names, as the *bilious colic*, the *painters colic*, &c. taken from the peculiar circumſtances that have attended it: and as the immediate cauſe of it is a ſpaſm, it has been frequently called the *ſpaſmodic colic*. The *colic* of *Poitou*, and that of *Devonſhire*, have been aſcribed by Dr. Baker to the ſame cauſe: viz. the poiſonous quality of lead. As the former diſeaſe prevailed moſt, where the wines were weak and ſour, ſome writers attributed it to the acid of the wine; whilſt others, with greater probability, aſcribed it to the litharge which was uſed to correct the acid, and to improve the taſte of the wine: and it is obſervable, that the moſt acid wines were drank with impunity, till this fraudulent adulteration was introduced. Dr. Baker has attributed the endemial *colic* of Devonſhire to the lead, with which the cyder of that county is impregnated: in proof of which charge, he alleges, that this diſeaſe is no longer known in the province of Poitou, and other parts of France and Germany, ſince the pernicious method of adulteration, above recited, has been made puniſhable with death: and that in the counties of Hereford, Glouceſter, and Worceſter, where no lead is uſed in the cyder apparatus, this diſeaſe is not known: that it prevails moſt in thoſe parts of Devonſhire where the greateſt quantity of cyder is made; and that their machinery for making it has a quantity of lead in it; and that the muſt, or expreſſed juice of the apples before fermentation appeared, by experiment, to have diſſolved lead in it. Others have aſcribed this diſeaſe to the roughneſs and acidity of the Devonſhire cyder, and not to the lead ſolution. Gentle purges and opiates have been recommended for the cure of this diſorder: ſome have preſcribed mercurial ſalivation: others have applied bliſters to the thighs, near the groin, and to the belly; and others again have extolled alum. Med. Tranſ. vol. i. p 175, &c. &c. Ib. vol. ii. p. 68, &c. Huxham de Morbo Colico Dammoniorum apud Obſerv. de Aere, &c. vol. i.

COLICA *Arteria* and *Vena*, in *Anatomy*; ſee MESENTERIC.

COLIC-*ſhell*, in *Natural Hiſtory*, a name given by ſome to the *porcellana*, or *concha venerea*, from its ſuppoſed virtue in curing that diſeaſe.

COLIC-*ſtone*, in *Natural Hiſtory*, the name given by ſome modern authors to a ſtone found in New Spain, and ſome other parts of America, and eſteemed of great virtues there in the cure of the colic, and in diſeaſes of the womb. It is a ſpecies of jaſper very nearly approaching to the lapis nephriticus, and called by the natives *tlayotic*, and by the Spaniards, *piedra de hyada*. It is of a conſiderable weight and hardneſs, and is of a duſky green colour, without any variegations. The Indians cut it into various forms, ſometimes of men, ſometimes of their idols; ſometimes alſo they figure it into long and even columns, and ſometimes into round and flat pieces. All theſe are nicely poliſhed, and thoſe of the laſt ſhape are what are principally uſed in the cure of the colic. They wet theſe with their ſpittle, and then rubbing them, till hot, with their hands, they apply them to the navel in a fit of the colic; and they ſay, that they immediately carry it off, by determining the humours to paſs off, either upwards, or downwards, or both ways. They ſometimes cut this ſtone into flat plates alſo with two holes cut at each end, by means of which it may be worn, tied to the wriſt by a ribband, and it is ſuppoſed thus to be a preſervative from all diſeaſes of this kind, and from many others.

COLIN, in *Zoology*, the name of an American bird, called by moſt authors a quail, but ſuppoſed by Nieremberg to be rather a ſpecies of partridge. There are ſeveral diſtinct ſpecies of this bird, all very common in the Spaniſh Weſt Indies, very well taſted, and much valued at table.

COLIPHIUM, a name given by Athenæus, and ſome other authors, to coarſe bread made of meal with the bran among it, and ſuch as is eaten by the poorer people in moſt countries.

The word is derived from κῶλον, *a limb*, and ἶφι, *ſtrength*, and is a very expreſſive word, as this ſort of bread makes people robuſt and ſtrong, and is greatly preferable to any other kind for people of ſtrong conſtitutions, who uſe hard labour, or much exerciſe. It ſignifies alſo a kind of food compoſed of bread, new cheeſe, and roaſted fleſh, which Pythagoras taught the athletæ to uſe, who before had been uſed to live on figs.

COLIR, an officer in China, who inſpects what paſſes in every court or tribunal in the empire; and though himſelf not of the number yet is aſſiſting at all aſſemblies, the proceedings whereof are communicated to him.

He is properly what we may call an *inſpector*: he gives ſecret intelligence to the court; and even, on occaſion, accuſes the mandarins of their faults openly; and that not only of faults in their public offices, but even in private life. To keep him impartial, he is kept independent; by having the poſt for life. Theſe *colirs* make even the princes of the blood tremble.

COLISEUM, or **COLISÆUM**, in the *Ancient Architecture*, an oval amphitheatre, built at Rome by Veſpaſian, in the place where ſtood the baſon of Nero's gilded houſe.

The word is formed from *coloſæum*, on account of the coloſſus of Nero, that ſtood near it; or, according to Nardini, from the Italian *coliſeo*.

In this were placed ſtatues, repreſenting all the provinces of the empire; in the middle whereof ſtood that of Rome, holding a golden apple in her hand. The ſame term, *coliſeum*, is alſo given to another amphitheatre of the emperor Severus.

In theſe *coliſea* were repreſented games, and combats of men and wild beaſts; but there are now little remaining of either of them; time and war having reduced them to ruins.

COLITES, in *Natural Hiſtory*, a name given by ſome writers to a ſtone ſuppoſed to imitate the human *penis*, or *teſtes*, ſeparately, or both together.

COLLAR, an ornament, worn by the knights of ſeveral military orders, hanging over their ſhoulder, on the mantle; and its figure drawn around their armories.

The *collar* ordinarily conſiſts of a chain of gold, enamelled; frequently ſet with cyphers, or other devices, and having the badge of the order ſuſpended at bottom.

The *collar* of the order of the garter conſiſts of SS, with roſes enamelled red, within a garter enamelled blue, the George at the bottom.

Maximilian is ſaid to have been the firſt of the emperors, who put the *collar* of an order round his arms, upon his being made chief of that of the golden fleece.

COLLAR, in *Roman Antiquity*, a chain fixed round the necks of ſlaves who had run away, after they were taken, with an inſcription denoting that they were deſerters, and requiring them to be reſtored to their proper owners.

COLLARS, in *Antiquity*, were not only worn by way of ornament, but alſo as AMULETS, againſt incantations, &c.

COLLAR, *Knights of the*, a military order in the republic of Venice; called alſo the *order of St. Mark*, or *the medal*. It is the doge and the ſenate that confer this order: the knights bear no particular habit, only the *collar*, or chain, which the doge puts around the neck; with a medal, whereon is repreſented the winged lion of the republic.

COLLAR *of Brawn*. See BRAWN.

COLLAR, in *Building*; ſee CINCTURE.

COLLAR *of the plough*, a term uſed in agriculture to expreſs a ring of iron, which is fixed to the middle of the beam, and ſerves to receive the ends of two chains, the lower one called the tow chain, and the upper one called the bridle chain. The lower chain is fixed at its other end to the box, and the upper, or bridle chain, to the ſtake which runs parallel with the left hand crow-ſtaff. Theſe chains, by means of this *collar*, and their other inſertions, ſerve to join the head and tail of the PLOUGH together. In ſome places the bridle chain is not fixed to the *collar*, but to the beam itſelf, by means of a pin; and this is the better way on many accounts.

COLLAR-*beam*, among *Houſe Carpenters*, the beam which is framed acroſs between two principal rafters.

COLLAR, in *Ship-building*, a rope faſtened about her beak-head, into which the dead man's eye is raiſed that holds the main ſtay. There is alſo a *collar*, or garland, about the main-maſt head, which is a rope wound about there, to ſave the ſhrouds from galling.

COLLATERAL, in *Geography*, any thing, place, country, &c. ſituate by the ſide of another.

The word is compounded of *con*, *with*, and *latus*, *ſide*.

COLLATERAL *Points*, in *Coſmography*, the intermediate points; or thoſe between the cardinal points. The *collateral points* are either *primary*, which are thoſe removed by an equal angle on each ſide from two cardinal points: or *ſecondary*; which, again, are either thoſe of the firſt, or ſecond order. The firſt are thoſe equally diſtant from a cardinal and firſt primary; the latter equally diſtant from ſome cardinal or primary, and firſt ſecondary.

COLLATERAL *Winds*, are thoſe blowing from *collateral* points. See WIND.

Such are the north-eaſt, ſouth-eaſt, north-weſt, ſouth-weſt, &c. with their ſubdiviſions.

COLLATERAL *Bee-boxes*. See HIVE.

COLLATERAL, in *Genealogy*, is underſtood of thoſe relations which proceed from the ſame ſtock, but not in the ſame line of aſcendants, or deſcendants; but being, as it were, aſide of each other.

Thus uncles, aunts, nephews, nieces, and couſins, are *collaterals*, or in the *collateral* line. Thoſe in a higher degree, and nearer the common root, repreſent a kind of paternity with regard to thoſe more remote; but there is a kind of equality between *collaterals* in the ſame degree.

Collateral deſcent ſtands in oppoſition to *direct deſcent* to poſterity; the former paſſing to brothers children, but the latter only from father to ſon. See DISTRIBUTION, INTESTATE, KINDRED.

COLLATERAL *Aſſurance*, in *Law*, is a bond, or other ſecurity, made over, and beyond the deed itſelf, for the performance of covenants between man and man; thus called, as being external, and without the nature and eſſence of the covenant.

Crompton ſays, that to be ſubject to the feeding of the king's deer, is *collateral* to the ſoil within the foreſt. It may be added, that liberty to pitch booths in a fair, or another man's ground, is *collateral* to the ground.

COLLATERAL *Condition*. See CONDITION.

COLLATERAL *Warranty*. See WARRANTY.

COLLATERALIS *Penis*, in *Anatomy*, a muſcle, otherwiſe called *erigens*, or ERECTOR *penis*.

COLLATIO *Honorum*. See HOTCHPOT.

COLLATION, in *Canon Law*, the conferring, or beſtowing of a benefice by a biſhop, who has it in his own gift, or patronage, and this he does *jure pleno*.

Collation differs from *inſtitution*, in that the latter is performed by the biſhop, at the motion or preſentation of another: and the former on his own motion.

Beſides, by *collation* the church is not full; for the higheſt patron may at any time remove the collatee, except he hath a right to *collate*, which *plenarty* by *collation* may be pleaded: the biſhop's *collation* in this reſpect is no more than a temporary proviſion for celebration of divine ſervice, till the patron preſents.

Collation alſo differs from *preſentation*, in that the latter is properly the act of a patron, offering his clerk to the biſhop, to be inſtituted into a benefice; whereas the former is the act of the biſhop himſelf. The *collator* can never confer a benefice on himſelf.

In the Romiſh church, the pope is the collator of all benefices, even elective ones, by prevention; ſetting aſide conſiſtorial benefices, and thoſe in the nomination of lay patrons. Prelates and biſhops are called *ordinaries*, or ordinary collators.

If the ordinary collator neglect to exerciſe his right for ſix months, the ſuperior collator may collate by devolution. Thus, if the biſhop neglect, the metropolitan may confer;

then the primate; and ſo on from degree to degree. In France, the king is the collator of all the benefices whereof he is patron, excepting conſiſtorial ones, to which he has only the nomination, and the pope, by virtue of the concordat, is obliged to confer on whomſoever the king nominates. For the reſt, he is direct and abſolute collator; and may confer them, by virtue of a kind of prieſthood annexed to the royalty.

Other laypatrons have ſeldom more than a mere preſentation; the *collation* properly belonging to the biſhop: yet there are ſome abbots who have the full right of *collation*. The canoniſts reckon two kinds of *collation*; the one free and voluntary, the other neceſſary. The firſt depending on the mere will of the collator, who may chuſe whom he pleaſes to fill the vacancy. In the latter, the collator is not at his liberty: which is the caſe where a benefice has been reſigned, or changed, and that reſignation or permutation allowed of by the ſuperior; for here the collator is obliged to grant the proviſion to the reſignatory, or compermutant.

It is a maxim in the new cannon law, *collationes ſunt in fructibus*; "Thoſe who have the fruits of a benefice, "have the *collation*." But in that caſe, the word *collation* is uſed for preſentation.

COLLATION, in *Common Law*, is the compariſon, or preſentation of a copy to its original, to ſee whether or no it be conformable: or the report, or act of the officer who made the compariſon.

A collated act is equivalent to an original, provided all the parties concerned were preſent at the *collation*

COLLATION is alſo uſed among the Romaniſts for the meal or repaſt made on a faſt-day, in lieu of a ſupper.

Only fruits are allowed in a *collation*: F. Lobineau obſerves, that anciently there was not allowed even bread in the *collations* in lent: nor any thing beſide a few comfits, and dried herbs, and fruits: which cuſtom, he adds, obtained till the year 1513.

Cardinal Humbert obſerves further, that in the middle of the eleventh century, there were no *collations* at all allowed in the Latin church in the time of lent; and that the cuſtom of *collations* was borrowed from the Greeks; who themſelves did not take it up till about the eleventh century.

COLLATION, *collatio*, *συμϐολη*, in *Rhetoric*, is uſed for COMPARISON.

But Scaliger diſtinguiſhes, alledging that in *collation*, one thing is compared to another that has preceded it; and that the contrary happens in compariſon. That to which any thing is compared is called protaſis, and that which is compared is called antapodoſis.

COLLATION is alſo popularly uſed for a repaſt between dinner and ſupper.

The word *collation*, in this ſenſe, Du-Cange derives from *collocutio*, *conference*; and maintains, that originally, *collation* was only a conference, or converſation on ſubjects of piety, held on faſt-days in monaſteries; but that, by degrees, the cuſtom was introduced of bringing in a few refreſhments; and that by the exceſſes to which thoſe ſober repaſts were at length carried, the name of the abuſe was retained, but that of the thing loſt.

COLLATION *of ſeals*, denotes one ſeal ſet on the ſame label, on the reverſe of another.

COLLATIONE *facta uni poſt mortem alterius*, in *Law*, a writ directed to the juſtices of the common-pleas, commanding them to iſſue their writ to the biſhop, for the admiſſion of a clerk, in the place of another preſented by the king, who died during the ſuit between the king and the biſhop's clerk: for, judgment once paſſed for the king's clerk, and he dying before admittance, the king may beſtow his preſentation on another.

COLLATIONE *heremitagii*, in *Law*, a writ whereby the king conferred the keeping of an hermitage upon a clerk.

COLLATIONIS *forma*. See CONTRA.

COLLATIVE *Advowſons*. See ADVOWSON.

COLLEAGUE, a companion, partner, or ASSOCIATE in the ſame office, or magiſtrature. See ADJUNCT.

The word is particularly uſed in ſpeaking of the Roman conſuls, and emperors.

COLLECT, COLLECTION, a voluntary gathering of money, for ſome pious or charitable purpoſe.

Some ſay, the name *collect* or *collection*, was uſed, becauſe thoſe gatherings were anciently made on the days of *collects*, and in *collects*, i. e. in aſſemblies of Chriſtians; but it was more probably, *quia colligebatur pecunia*.

COLLECT is ſometimes alſo uſed for a tax, or impoſition, raiſed by a prince for any pious deſign.—Thus, hiſtories ſay, that in 1166, the king of England, coming into Normandy, appointed a *collect* for the relief of the Holy Land, at the deſire, and after the example, of the king of France.

COLLECT, in the liturgy of the church of England, and the maſs of the Romaniſts, denotes a prayer accommodated to any particular day, occaſion, or the like. In the general, all the prayers in each office are called *collects*; either becauſe the prieſt ſpeaks in the name of the whole aſſembly, whoſe ſentiments and deſires he ſums up by the word *oremus*, *let us pray*, as is obſerved by pope Innocent III. or becauſe thoſe prayers are offered when the people are aſſembled together; which is the opinion of Pamelius on Tertullian.

The congegation itſelf is in ſome ancient authors called *collect*.

The popes Gelaſius and Gregory are ſaid to have been the firſt who eſtabliſhed *collects*. Deſpenſe, a doctor of the faculty of Paris, has an expreſs treatiſe on *collects*, their origin, antiquity, authors, &c.

COLLECTIVE *Idea*, in *Logic*, is a COMPLEX idea, which unites many ideas of the ſame kind under one name, or under one view: as army, dictionary, flock, &c. See COMPOUNDED *idea*.

COLLECTION, *collectio*, in *Logic*, a term uſed by ſome for what is commonly called SYLLOGISM, and RATIOCINATION.

COLLECTIVE, in *Grammar*, a term applied to a word that expreſſes a multitude; though itſelf be ſingular.

Thus, troop, company, and army, are nouns *collective*.

COLLECTOR, a perſon nominated by the commiſſioners of any duty, the inhabitants of a pariſh, or the like, to raiſe or gather any tax, &c.

COLLECTORS, in *Botany*, ſuch ſtudents as have attempted the knowledge of plants, without reducing it to any certain ſcience, being barely employed about obſerving, or getting together the various ſpecies. Linnæi Fund. Bot. p. 1.

COLLEGATARY, in the *Civil Law*, a perſon to whom is left a legacy in common with one or more other perſons. If the thing be bequeathed *in ſolido*, the portion of a deceaſed *collegatary* accrues to the reſt.

COLLEGE, an aſſemblage of ſeveral bodies, or ſocieties; or even of ſeveral perſons into one ſociety.

College, *collegium*, among the Romans, was uſed for an aſſemblage of ſeveral perſons employed in the ſame functions, and as it were bound together to act, or ſerve in concert. It ſerved indifferently for thoſe employed in the offices of religion, of government, the liberal arts, and even mechanical arts, or trades; ſo that the word properly ſignified what we call a *corporation*, or *company*. In the Roman empire, there were not only the *college of augurs*, and the *college of capitolini*; i. e. of thoſe who had the ſuperintendence of the capitoline games; but alſo *colleges* of artificers, *collegia artificum*; *college* of carpenters, *fabricorum*, or *fabrorum tignariorum*; of potters, *figulorum*; of founders, *ærariorum*; the *college* of lockſmiths, *fabrorum ferrariorum*; of engineers of the army, *tignariorum*; of butchers, *laniorum*; of dendrophori, *dendrophororum*; of centonaries, *centonariorum*; of makers of military caſques, *ſagariorum*; of tent-makers, *tabernaculariorum*; of bakers, *piſtorum*; of muſicians, *tibicinum*, &c.

Plutarch obſerves, that it was Numa who firſt divided the people into *colleges*; which he did to the end, that each conſulting the intereſts of their *college*, whereby they were divided from the citizens of the other *colleges*, they might not enter into any general conſpiracy againſt the public repoſe.

Colleges were diſtinguiſhed from other ſocieties not formed into *colleges* by public authority, in this, that thoſe who compoſed a *college*, were qualified to treat of the common intereſts of their *college*, which was, as it were, a member of the ſtate, and had a common purſe, an agent to negotiate their affairs; ſent deputies to the magiſtrates when they wanted to treat with them; might make ſtatutes and by-laws for the adminiſtration of their *college*, &c.

There are various *colleges* on foot among the moderns, built on the model of thoſe of the ancients; as the *three colleges of the empire*, viz. the *college of electors*, *college of princes*, and *college of cities*, &c.

COLLEGE *of Electors*, is the body of electors, or their deputies, aſſembled in the diet at Ratiſbon. See ELECTOR.

Anciently, the king of Bohemia had no deputy in this *college*; at preſent he has.

COLLGE *of Princes*, is the body of princes, or their deputies, at the diet of Ratiſbon.

COLLEGE *of Cities*, is, in like manner, the body of deputies which the ſeveral imperial cities ſend to the diet.

COLLEGE *of Cardinals*, or the *ſacred* COLLEGE, is a body compoſed of the three orders of cardinals, viz. cardinal-biſhops, cardinal-prieſts, and cardinal-deacons.

Each order has its dean, or chief. The dean of the cardinal-biſhops is always the biſhop of Oſtia. See CARDINAL.

COLLEGE is alſo uſed for a public place, endowed with certain revenues, where the ſeveral parts of learning, both divine and human, are taught, in ſchools, halls, or claſſes, appointed for that purpoſe.

An aſſemblage of ſeveral of theſe *colleges* conſtitute an univerſity.

The univerſity of Oxford conſiſts of twenty *colleges*, and five halls; that of Cambridge of twelve *colleges*, and four halls; and that of Paris of fifty-four *colleges*, ſuch as they are: in reality there are but eleven where there is *full exerciſe*, as it is called; for the reſt, the author of a late deſcription of Paris ſays it is needleſs to recite their names, ſince there is no teaching in them.

Among the Greeks, the lyceum and academy were celebrated *colleges*; the latter of which has given its name to our univerſities, which in Latin are called *academiæ*. With them, the houſe or apartment of each philoſopher, or rhetor, might be eſteemed a kind of *college* of itſelf.

The Romans came late into the inſtitution of ſuch *colleges:* they had, however, ſeveral, founded by their emperors; eſpecially in Gaul; the chief whereof were thoſe of Marſeilles, Lions, Beſançon, and Bourdeaux.

The Jews, and Egyptians too, have had their *colleges*; the chief of the firſt were thoſe of Jeruſalem, Tiberias, Nardea, Pompodita, Sura, and Babylon: this laſt is ſaid to have been inſtituted by Ezekiel, and to have ſubſiſted in the time of Mahomet.

Colleges of this kind have been generally in the hands of thoſe conſecrated to the offices of religion: the Magi in Perſia, the Gymnoſophiſts in the Indies, and the Druids in Gaul and Britain, had the care of educating youth in the ſciences.

After Chriſtianity became eſtabliſhed, there were almoſt as many *colleges* as monaſteries; Charlemagne, in his Capitulars, injoining the monks to inſtruct youth in muſic, grammar, and arithmetic: but this calling the monks from their ſolitude, and taking up too much of their time, the care of the *colleges* was at length put into the hands of thoſe who had nothing elſe to do.

In the canon law, it is ſaid, three perſons make a *college, tres collegium faciunt.*—The *colleges* in London, are,

COLLEGE *of Civilians*, commonly called *Doctors Commons*; a *college* founded by Dr. Harvey, dean of the arches, for the profeſſors of the civil law reſiding in this city; where uſually, likewiſe, reſides the judge of the arches court of Canterbury, judge of the admiralty, of the prerogative court, &c. with other *civilians*; who all live, as to diet and lodging, in a collegiate manner, commoning together; whence the appellation of *Doctors Commons*.

Their houſe being conſumed in the great fire, they all reſided at Exeter-houſe in the Strand, till 1672; when their former houſe was rebuilt, at their own expence, in a very ſplendid manner. To this *college* belong thirty-four proctors; who make themſelves parties for their clients, manage their cauſes, &c.

COLLEGE, *Greſham*, or **COLLEGE** *of Philoſophy*; a *college* founded by Sir Thomas Greſham, and endowed with the revenue of the Royal Exchange: one moiety of this endowment the founder bequeathed to the mayor and aldermen of London, and their ſucceſſors, in truſt, that they ſhould find four able perſons to read, within the *college*, divinity, geometry, aſtronomy, and muſic; who are choſen by a committee of the common council, conſiſting of the lord mayor and three aldermen and eight commoners, and allowed each, beſides lodging, fifty pounds *per annum*. The other moiety he left to the company of mercers, to find three more able perſons, choſen by a committee of that company, conſiſting of the maſter and three wardens, during their office, and eight of the court of aſſiſtants, to read law, phyſic, and rhetoric, on the ſame terms; with this limitation, that the ſeveral lecturers ſhould read in term-time, every day in the week, except Sundays; in the morning in Latin, in the afternoon the ſame in Engliſh: but that in muſic to be read only in Engliſh.

By 8 Geo. III. cap. 32. the building appropriated to this *college* was taken down, and the exciſe-office erected in its room. Each of the profeſſors is allowed fifty pounds *per annum*, in lieu of the apartments, &c. relinquiſhed by them in the *college*, and is permitted to marry, notwithſtanding the reſtriction of Sir Thomas Greſham's will. The lectures are now read in a room over the Royal Exchange; and the city and mercers company are required to provide a proper place for this purpoſe.

In this *college* formerly met the Royal Society, that noble academy, inſtituted by king Charles II. and celebrated throughout the world, for their improvements in natural knowlege. See their hiſtory and policy, under **SOCIETY**.

COLLEGE *of Heralds*, or **COLLEGE** *of Arms*, a corporation founded by charter of king Richard III. who granted them ſeveral privileges; as, to be free from ſubſidies, tolls, offices, &c. See **HERALD**.

They had a ſecond charter from king Edward VI. and a houſe built near Doctors Commons, by the earl of Derby, in the reign of king Henry VII. was given them by the duke of Norfolk, in the reign of queen Mary; which houſe is now rebuilt.

Of this collegiate ſociety, are three officers ſtyled *kings of arms, reges armorum Anglicorum*, see **KING** *at arms*; *ſix* **HERALDS**, and four **PURSUIVANTS**.

COLLEGE *of Heralds* in Scotland, conſiſts of Lyon king at arms, ſix heralds, and ſix purſuivants, and a number of meſſengers.

COLLEGE *of Phyſicians*, a corporation of phyſicians, in London; who, by ſeveral charters, and acts of parliament of Henry VIII. and his ſucceſſors, have certain privileges, whereby no man, though a graduate in phyſic of any univerſity, may, without licence under the ſaid *college-ſeal*, practiſe phyſic, in, or within ſeven miles of London; with power to adminiſter oaths, fine and impriſon offenders, in that and ſeveral other particulars: to ſearch the apothecaries ſhops, &c. in and about London, to ſee if their drugs, &c. be wholſome, and their compoſitions according to the form preſcribed by the ſaid *college* in their diſpenſatory.

By the ſaid charter they are alſo freed from all troubleſome offices; as to ſerve on juries, be conſtable, keep watch, provide arms, &c.

The ſociety had anciently a *college* in Knight-rider-ſtreet, the gift of Dr. Linacre, phyſician to king Henry VIII. Since that they have had a houſe built them by the famous Dr. Harvey, in 1652, at the end of Amen-corner, which he endowed with his whole inheritance in his lifetime; but this being burnt in the great fire in 1666, a new one was erected at the expence of the fellows, in Warwick-lane; with a noble library, given partly by the marquis of Dorcheſter, and partly by Sir Theodore Mayerne.

Of this *college* there are at preſent, a preſident, four cenſors, eight electors, a regiſter, and a treaſurer, choſen annually in October: the cenſors have, by charter, power to ſurvey, govern, and arreſt, all phyſicians, or others practiſing phyſic, in, or within ſeven miles of London; and to fine, amerce, and impriſon them, at diſcretion.

The number of fellows was anciently thirty, till king Charles II. increaſed their number to forty; and king James II. giving them a new charter, allowed the number of fellows to be enlarged, ſo as not to exceed fourſcore; reſerving to himſelf and ſucceſſors the power of placing and diſplacing any of them for the future.

The *college* is not very rigorous in aſſerting their privileges; there being a great number of phyſicians, ſome of very good abilities, who practiſe in London, &c. without their licence, and are connived at by the *college:* yet, by law, if any perſon, not expreſly allowed to practiſe, take on him the cure of any diſeaſe, and the patient die under his hand, it is deemed felony in the practiſer.

In 1696, the *college* made a ſubſcription, to the number of forty-two of their members, to ſet on foot a diſpenſatory for the relief of the ſick poor: ſince that, they have erected two other diſpenſatories.

COLLEGE, *Royal, of Phyſicians*, in Scotland, is a corporation of phyſicians at Edinburgh, eſtabliſhed by patent of Charles II. This *college* conſiſts of a preſident, two cenſors, a ſecretary, and the ordinary ſociety of fellows. They have ſimilar rights and privileges with thoſe of the Engliſh *college*.

COLLEGE, *Sion*, or the *college* of the London clergy; which has been a religious houſe time out of mind, ſometimes under the denomination of a priory, ſometimes under that of a ſpital, or hoſpital: at its diſſolution under 31 Hen. VIII. it was called Elſyn's *Spital*, from the name of its founder, a mercer, in 1329.

At preſent it is a compoſition of both, viz. a *college* for the clergy of London, who were incorporated in 1630, in purſuance to the will of Dr. White, under the name of the *Preſident and Fellows of* **SION-COLLEGE**; and an hoſpital for ten poor men, and as many women.

The officers of the corporation are the preſident, two deans, and four aſſiſtants; who are annually choſen from among the rectors and vicars of London; and are ſubject to the viſitation of the biſhop. They have a good library, built and ſtocked by Mr. Simpſon, and furniſhed by ſeveral other benefactors, chiefly for the clergy of the city, without excluding other ſtudents on certain terms; and a hall, with chambers for ſtudents, generally occupied by the miniſters of the neighbouring pariſhes.

COLLEGE *de propaganda fide*, was founded at Rome, in 1622, by Gregory XV. and enriched with ample revenues. It conſiſts of thirteen cardinals, two prieſts, one monk, and a ſecretary; and was deſigned for the propagation and maintenance of the Romiſh religion in all parts of the world. The funds of this *college* have been very conſiderably augmented by Urban VIII. and many private donations. Miſſionaries are ſupplied by this inſtitution, together with a variety of books ſuited to their ſeveral appointments. Seminaries for their inſtruction are ſupported by it, and a number of charitable eſtabliſhments connected with, and conducive to the main object of its inſtitution.

Another *college* of the ſame denomination was eſtabliſhed by Urban VIII. in 1627, in conſequence of the liberality of John Baptiſt Viles, a Spaniſh nobleman. This is ſet apart for the inſtruction of thoſe who are deſigned for the foreign miſſions. It was at firſt committed to the care of three canons of the patriarchal churches; but ever ſince the year 1641 it is under the ſame government with the former inſtitution.

COLLEGE *of juſtice*, in Scotland. See SESSION.

COLLEGES *of common law*. See INNS *of Court*, and CHANCERY.

COLLEGES *for diſabled ſoldiers, ſeamen, &c.* See HOSPITALS.

COLLEGIAL. See COLLEGIATE.

COLLEGIANS, COLLEGIANI, COLLEGIANTS, a religious ſect formed among the Arminians and Anabaptiſts in Holland, about the beginning of the ſeventeenth century; ſo called, becauſe of their *colleges*, or meetings, twice every week; where every one, females excepted, has the ſame liberty of expounding the Scripture, praying, &c.

They are ſaid to be all either Arians, or Socinians: they never communicate in the *college*, but meet twice a year from all parts of Holland at Rhinſbergh, whence they are alſo called *Rhinſberghers*, a village two miles from Leyden, where they communicate together; admitting every one that preſents himſelf, profeſſing his faith in the divinity of the holy Scriptures, and reſolution to live ſuitably to their precepts and doctrines, without regard to his ſect or opinion. They have no particular miniſters, but each officiates as he is diſpoſed. They never baptize without dipping.

COLLEGIATE, or COLLEGIAL *churches*, are thoſe which have no biſhop's ſee, yet have the ancient retinue of the biſhops, the canons and prebends.

Such are, among us, Weſtminſter, Rippon, Windſor, &c. governed by DEANS and CHAPTERS.

Of theſe *collegiate* churches, there are two kinds; ſome of royal foundation, others of eccleſiaſtical foundation: each of them, in matters of divine ſervice, are regulated in the ſame manner as the cathedrals.

There are even ſome *collegiate* churches which have the epiſcopal rights. Some of theſe churches were anciently abbeys; which, in time, were ſecularized.

The church of St. Peter's, Weſtminſter, was anciently a cathedral; but the revenues of the monaſtery being, by act of parliament, 1 Eliz. veſted in the dean and chapter, it commenced a *collegiate* church.—In ſeveral cauſes, the ſtyling it *cathedral*, inſtead of *collegiate church of* Weſtminſter, has occaſioned error in the pleadings.

COLLEGIATE *auditors*. See AUDITOR.

COLLEGIATE *churches, vergers of*. See VERGER.

COLLET, in the *Glaſs Trade*, that part of a glaſs veſſel which, in the manufacture, ſticks to the hollow iron by which the metal is firſt taken out of the melting-pot. This is broken off before the veſſel is faſhioned, and is never ſeen in the leaſt mark, when finiſhed.

Theſe they throw together, and afterwards grind down, and put into the green glaſs metal, for the pureſt green glaſs, but never into any other, though they be the product of the fineſt virgin metal.

COLLET, among *Jewellers*, the ſmall horizontal plane, or face, at the bottom of the brilliant.

COLLETICS, COLLETICA, in *Medicine*, ſuch remedies as join and glue together the ſeparated parts, or lips, of a wound, or ulcer; and thus re-eſtabliſh them in their natural union. See AGGLUTINANT.

The word comes from κολλητικος, ſomething that has the virtue of gluing together: of κολλα, *gluten*.

Colletics are more deſiccative than SARCOTICS; but leſs ſo than EPULOTICS. Among *colletics* are ranked litharge, aloes, myrrh, &c.

COLLICLÆ, in *Anatomy*, is uſed by ſome, as Steno, for the CARUNCULÆ *lacrymales*.

COLLIERS, are veſſels employed to carry coals from one port to another; and ſerving as an excellent nurſery for ſeamen.

COLLIERY, ſee COAL.

The moſt remarkable *colliery*, or coal-work, that we have ever had in this iſland, was that wrought at Burrowſtoneneſs, under the ſea. The veins of coal were found to continue under the bed of the ſea in this place, and the colliers had the courage to work the vein near half way over; there being a mote half a mile from the ſhore, where there was an entry that went down into the coal-pit, under the ſea. This was made into a kind of round key, or mote, as they call it, built ſo as to keep out the ſea, which flowed there twelve feet. Here the coals were laid, and a ſhip, of that draught of water, could lay her ſide to the mote, and take in the coal.

This famous *colliery* belonged to the earl of Kinkardin's family. The freſh water which ſprung from the bottom and ſides of the coal pit, was always drawn out upon the ſhore by an engine moved by water, that drew it forty fathom. This coal pit continued to be wrought many years to the great profit of the owners, and the wonder of all that ſaw it; but, at laſt, an unexpected high tide drowned the whole at once, and the labourers had not time to eſcape, but periſhed in it. Phil. Tranſ. Nº 93.

COLLIGENDUM *bona defuncti, letters ad.* See ADMINISTRATION.

COLLIMATION, *line of*, in a teleſcope, is a line paſſing through the interſection of thoſe wires, which are fixed in the focus of the object-glaſs, and the center of the ſame glaſs. It is alſo called the line of *ſight*.

COLLINSONIA, in *Botany*, a genus of the *diandria monogynia* claſs. The characters are theſe: the flower is funnel-ſhaped, of one petal, which is unequal, cut into five parts at the top, the upper part being ſhort and obtuſe, and two of them reflexed; the lower lip or beard being longer, and ending in many points. It hath two long briſtly ſtamina, which are erect; and a quadrifid obtuſe germen, with a large gland, ſupporting a briſtly ſtyle, which afterward becomes a ſingle roundiſh ſeed, ſituated in the bottom of the empalement. We have but one ſpecies of this plant, which was brought from Maryland.

COLLINS's *Quadrant*. See QUADRANT.

COLLIQUAMENTUM denotes a very tranſparent fluid obſervable in an egg two or three days after incubation, containing the firſt rudiments of a chick. It is incloſed in its own proper membrane, diſtinct from the *albumen*. Harvey calls it *oculus*.

COLLIQUATION, from *colliqueo, to melt*, in *Pharmacy*, the action of melting together two, or more, ſolid ſubſtances; or rendering them liquid by fuſion, or diſſolution; as wax, mucilages, &c. by heat; gums, &c. by moiſture.

COLLIQUATION is alſo uſed to expreſs ſuch a temperament, and diſpoſition of the animal fluids, as proceeds from a too lax compages; whereby they flow off through the ſeveral glands, and particularly through thoſe of the ſkin, faſter than they ought; which occaſions fluxes of many kinds, but moſtly, profuſe, greaſy, clammy ſweats.

If this *colliquation* continue, it generally terminates in an hectic fever, and is uſually a concomitant of one.

The curative intention in this caſe is the giving a better conſiſtence to the juices by balſamics and agglutinants; and the hardening of the ſolids by ſubaſtringents. Hence,

COLLIQUATIVE *fever* is a fever attended with a diarrhœa, or profuſe ſweats, from too looſe a contexture of the fluids.

COLLISEUM. See COLISEUM.

COLLISION, the friction, or PERCUSSION, of two bodies moving violently with different directions, and daſhing againſt each other.

COLLOQUIUM, in *Law*, (*a colloquendo*) a talking together, or affirming of a thing, laid in declarations for words in actions of ſlander, &c.

COLLUCIANISTÆ, in *Church Hiſtory*, a deſignation given to the Arians, from the martyr Lucian, a preſbyter of Antioch.

COLLURIO, in *Zoology*, a name by which ſome authors have called the lanius, or butcher bird, a very ſmall ſpecies of hawk, not larger than a thruſh, but a great deſtroyer of ſmall birds. See LANIUS.

COLLUM, in *Anatomy*. See NECK, and CERVIX.

COLLI *interſpinales*. See INTERSPINALES.

COLLI *intertranſverſales*. See INTERTRANSVERSALES.

COLLI *tranſverſalis*. See TRANSVERSALIS.

COLLUSION, a ſecret underſtanding between two parties, who plead, or proceed, fraudulently againſt each other, to the prejudice of a third.

In the canon law, *colluſion*, in matters of benefices, vacates the benefice, and incapacitates the perſon from holding any benefice at all.

COLLUTHIANS, a religious ſect, who roſe about the beginning of the fourth century; on occaſion of the indulgence ſhewn to Arius by Alexander patriarch of Alexandria.

Several people being ſcandalized at ſo much condeſcenſion; and, among the reſt, Colluthus, a prieſt of the ſame city; he hence took a pretence for holding ſeparate aſſemblies, and by degrees proceeded to the ordination of prieſts, as if he had been a biſhop; pretending a neceſſity for this authority, in order to oppoſe Arius. To his ſchiſm he added hereſy; teaching, that God did not create the wicked; that he was not author of the evils that befal men, &c.—He was condemned by a council held at Alexandria by Oſius, in the year 330.

COLLUTION, *Collutio*, in *Medical Writers*, is ſometimes uſed for the waſhing of the mouth, particularly, when done to clean or faſten bad or looſe teeth; or free the gums, &c. from ulcers.

COLLYBUS, Κολλυϐος, in *Antiquity*, the ſame with what is now called the rate of EXCHANGE.

COLLYRÆ, or COLLYRIDES, in *Antiquity*, a certain ornament of hair, worn by the women on their necks. It was made up in the form of the ſmall, roundiſh cakes, called κολλυραι, *collyræ*.

COLLYRIDIANS, in *Church Hiſtory*, a ſect, towards the cloſe of the fourth century, denominated from a little cake, called by the Greeks κολλυριδιαι, *collyridia*, which they offered to the Virgin Mary.

This ſect, it ſeems, conſiſted chiefly of Arabian women, who, out of an extravagance of devotion to the Virgin, met on a certain day in the year, to celebrate a ſolemn feaſt, and to render divine honours to Mary as to a goddeſs; eating the cake which they offered in her name.—St. Epiphanius, who relates the hiſtory of this ſuperſtitious ceremony, ridicules it. They ſprung up in oppoſition to the ANTIDICO-MARIANITES.

COLLYRIUM, in *Medicine*, an external remedy, appropriated to diſeaſes of the eyes.

The word comes from κολλυριον; and that, according to Martinius, from κολλαν τον ῥυν; becauſe it glues up, and prevents defluxions.

There are two kinds of *collyriums*; the one *liquid*, the other *dry*. *Liquid collyriums*, ὑδροκολλυρια, are compoſed of ophthalmic powders in water; as roſe-water, plantain-water, that of fennel, eyebright, &c. wherein they diſſolve tutty, white vitriol, or ſome other proper powder.

The *dry collyria*, ξηροκολλυρια, are troches of rhaſis, ſugar-candy, iris, tutty prepared, &c. blown into the eye with a little pipe.

COLLYRIUM is alſo a name given to unguents uſed for the ſame purpoſe; as unguent of tutty, and ſeveral others.

COLLYRIUM is alſo a denomination given, though improperly, to ſome liquid medicines uſed againſt venereal ulcers.

COLLYRIUM *Samium*. See SAMIA *terra*.

COLMESTRE, in *Zoology*, the name of a bird of the LAGOPUS kind, more uſually called OTOMO, and ſuppoſed not to differ from the lagopus, otherwiſe than by its changing its colour, in the ſummer months.

COLOBIUM, Κολοϐιον, from κολυω, *I mutilate*, among the *Ancients*, an upper garment, without ſleeves, longer than the tunic.

COLOBOMA, in *Medical Writers*, is uſed for the preternatural growing together of the lips, or eyelids, or for the adheſion of the ears to the head.

COLOCOLO, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of bird, called alſo there *caſſili*, and by ſome authors, the water raven, *corvus fluviatilis*. It is very much of the ſhape of a common raven, but is truly an amphibious bird, living more of its time under water than in the air; it is black in colour; its neck is remarkably long; and it feeds on fiſh, which it hunts under water, as they do one another; it feeds likewiſe on frogs, ſerpents, and ſhell-fiſh. It is common to ſee it under water in clear rivers, where it ſeems perfectly at eaſe, and runs about with great ſwiftneſs; at times it comes up to the ſurface, and dries its wings in the air and ſunſhine. Phil. Tranſ. N° 285. p. 1896.

COLOCYNTHIS, in *Botany*, the name of a genus of plants of the gourd kind, of which there are many ſpecies, the COLOQUINTIDA of the ſhops being the pulp of one of them. In the Linnæan diſtribution, it is a ſpecies of the CUCUMBER, or *cucumis*. The characters which diſtinguiſh this genus from the others of the ſame claſs, are, that the leaves are very deeply divided, and the fruit is not eatable, but of an intolerable bitterneſs.

COLOGNE *Earth*, a ſubſtance uſed in painting, as a water-colour, much approaching to amber in its ſtructure, and of a deep brown. It has generally been eſteemed a genuine earth, but has been diſcovered to contain a great deal of vegetable matter, and, indeed, it is a very ſingular ſubſtance.

It never conſtitutes an entire ſtratum in the earth, but is lodged among other ſtrata in large flat detached maſſes. It is moderately dry, while in the earth, and of a ſoft crumbly texture. When dried, it is of a deep, duſky brown, of a very cloſe, compact, and fine ſtructure, and very remarkably light; it is of a ſmooth, even ſurface, dry, but not harſh to the touch, crumbles eaſily to pieces between the fingers, and ſlightly ſtains the hands; it adheres firmly to the tongue, and is of a very auſtere and aſtringent taſte, but not at all reſembling the aſtringency of the boles, or any thing elſe of the mineral kingdom, but plainly reſembling the taſte of oak bark. It makes no effervеſcence with acids; if thrown into water, it ſwims on the ſurface, till thoroughly wetted; and if brought into contact with burning coals, it takes fire, and burns of itſelf, till reduced to yellowiſh aſhes.

It is eaſy to diſcern from this account, that, though this is generally eſteemed an earth, and known to the world by no other name, it is no pure native foſſil, but contains more vegetable than mineral matter, and owes its origin to the remains of wood which has been long buried in the earth. It is dug in Germany and France: the quantities conſumed in painting, in London, are brought from Cologne, where it is found very plentifully; but our own kingdom is not without it, it being found near Birmingham, and on Mendip hills in Somerſetſhire; but what has been yet found there is not ſo pure or fine, as that imported from Cologne. Hill's Hiſt. of Foſſils, p. 64. and Da Coſta's Hiſt. of Foſſils, p. 121.

COLON, in *Anatomy*, denotes the ſecond of the thick inteſtines.

Some derive the word from κωλυειν, *to retard*; in regard it is in the folds of this inteſtine that the excrements are ſtopped and formed. Others fetch it from κοιλον, on account of its capacity: others again from κολαζεσθαι, *to be tormented*; in regard of the grievous pain it frequently undergoes.—It is from this part that the colic takes its name.

The *colon* is placed between the *ilion* and *rectum*, and is wider than either of them: in length it is eight or nine hands. It begins where the *ilion* ends, viz. in the cavity of the *os ilium*, on the right ſide; whence, aſcending by the kidney on the ſame ſide, it paſſes under the concave ſide of the liver, to which it is ſometimes tied, as likewiſe to the gall-bladder, which tinges it yellow in that place: then it runs under the bottom of the ſtomach to the ſpleen in the left ſide, to which it is alſo knit; from thence it turns down to the left kidney; and thence paſſing in form of an S, it ends at the upper part of the *os ſacrum* in the *rectum*.

At the beginning of this gut, there is a valve formed by the production of the inmoſt coat of the inteſtines in this place; which hinders the excrements, when once fallen into the *colon*, from returning again to the *ilium*.

It has ſtrong ligaments, which running along its upper ſide, from the *ilium* to the *rectum*, ſtrengthens it againſt the weight of the excrements, and draws it together into cells; which, with the *valvulæ conniventes*, retard the paſſages of the excrements, that we may not be continually obliged to be going to ſtool.

The fleſhy fibres of its ſecond coat are greater and ſtronger than thoſe of the other inteſtines; becauſe a greater ſtrength is requiſite to cauſe the excrements to aſcend.

The chief deſign of the *colon* ſurrounding the abdomen, and, with the *rectum*, touching all the parts contained in it, ſeems to be, that by immediate fomentation with clyſters, they might be eaſed of their maladies.

Meſo-COLON. See MESO-COLON.

COLON, in *Grammar*, a point, or character, formed thus [:] ſerving to mark a pauſe, and to divide the members of a period. See POINTING. See alſo PERIOD, COMMA, and SEMICOLON.

Grammarians generally aſſign the uſe of a *colon* to be to mark the middle of a period; or to conclude a ſenſe leſs perfect than the dot, or period: but a ſenſe leſs perfect than the period is an expreſſion extremely vague and indeterminate.

Others ſay, a *colon* is to be uſed when the ſenſe is perfect, but the ſentence not concluded: but neither is this ſufficiently clear and expreſs. Add to this, that in practice our beſt writers confound the *colon* with the ſemicolon.

F. Buffier attempts to fix the uſe of the *colon*; but he does not much diſtinguiſh it from the ſemicolon: he preſcribes the uſe of either, indifferently; and calls them by a common name, *intermediate pointings*; as being mediums between the comma, and full-point, or period. Their uſe, according to this author, is to diſtinguiſh the ſupernumerary members of a period. By ſupernumerary members are meant ſuch as the precedent ones do not raiſe any expectation of; i. e. ſuch parts as have indeed dependence on what goes before, even though what goes before has a complete ſenſe, independent hereon: v. gr. *The Auguſtan age was ſo eminent for good poets, that they have ſerved as models to all others: yet did it not yield any good tragic poets.* Where the ſupernumerary member, and the uſe of the *colon*, are obvious. The moſt obvious and ſenſible uſe of the *colon*, he adds, is, when the ſupernumerary member is diſtinguiſhed by ſome conjunction; as, *notwithſtanding, however, but, except that, unleſs, inaſmuch as, yet, ſince, the rather as, provided that*, &c. Some, indeed, uſe the *colon* in the middle of long periods, without any regard to ſupernumerary members: which cuſtom was probably introduced, to mark that the breath is here to be taken almoſt as much as in a common period, in the place where the ſupernumerary period commences. But this, at beſt, is arbitrary; and the intermediate pointings may always be omitted in a period, if there be no ſubſequent ſupernumerary member, i. e. if there be no ſubſequent member, but what is expected from the precedent. As to the occaſions where the *colon* is to be uſed, rather than the ſemicolon, there is nothing preciſe to be ſaid of it; except that the *colon* ſhews the ſupernumerary member more detached, and ſets it at a greater diſtance from the reſt; and therefore marks a longer pauſe than the ſemicolon.

Accordingly it ſeems preferable to the ſemicolon before conjunctions adverſative, reſtrictive, conditional, &c. as, *nevertheleſs*, *but*, *excepting that*, *however*, *otherwiſe*, *provided that*. Again, where the ſupernumerary phraſes not only ſuppoſe the precedent, but depend on them for their regimen, and are, as it were, new parts thereof; there the ſemicolon ſeems preferable to the *colon*: v. gr. *You are regardleſs of the goodneſs of God, who firſt choſe you; a God who is only jealous of your heart for your own happineſs; a God who could be equally glorious in deſtroying you by his juſtice, as in ſaving you by his mercy.* Or thus: *The diſcourſe conſiſted of two parts; in the firſt was ſhewn the neceſſity of fighting; in the ſecond, the advantages that would redound from it.* But this difference, it muſt be owned, has a dependence on ſomething that influences all the points, and ſways the whole doctrine of punctuation; viz. the length, or ſhortneſs, of the members and periods: for, when the phraſes are long, we point higher than when ſhort.

A later author, in an ingenious diſcourſe, De Ratione Interpungendi, marks the office of the *colon*, and its difference from the ſemicolon, &c. more preciſely; a *colon*, on his principles, ſerves to diſtinguiſh thoſe conjunct members of a ſentence, which are capable of being divided into other members; whereof one, at leaſt, is conjunct.

Thus, in the ſentence, *As we cannot diſcern the ſhadow moving along the dial-plate, ſo the advances we make in knowlege are only perceived by the diſtance gone over*; the two members being both ſimple, are only ſeparated by a comma: in this, *as we perceive the ſhadow to have moved, but did not perceive it moving; ſo our advances in underſtanding, in that they conſiſt of ſuch minute ſteps, as are only perceivable by the diſtance*; the ſentence being divided into two equal parts, and thoſe conjunct ones, ſince they include others; we ſeparate the former by a ſemicolon, and the latter by commas: but in this, *as we perceive the ſhadow to have moved along the dial, but did not perceive it moving; and it appears the graſs has grown, though nobody ever ſaw it grow: ſo the advances we make in knowlege, as they conſiſt of ſuch minute ſteps, are only perceivable by the diſtance.* The advancement in knowlege is compared to the motion of a ſhadow, and the growth of graſs; which compariſon divides the ſentence into two principal parts: but ſince what is ſaid of the movement of the ſhadow, and likewiſe of the growth of graſs, contains two ſimple members, they are to be ſeparated by a ſemicolon; conſequently a higher pointing is required to ſeparate them from the other part of the ſentence, which they are oppoſed to: and this is a *colon*.

Biſhop Lowth obſerves, that a *colon* diſtinguiſhes a member of a ſentence, whether ſimple or compounded, which of itſelf would make a complete ſentence, and ſo requires a greater pauſe than a ſemicolon, yet is followed by an additional part, making a more full and perfect ſenſe. He adds, that a *colon* may be alſo uſed, when a ſemicolon has preceded, and a greater pauſe is ſtill neceſſary, though the ſentence be incomplete; and that it is commonly uſed, when an example, or a ſpeech, is introduced. Introd. to Eng. Gram. ed. 1772. p. 207.

COLONEL, an officer in the army, who has the command in chief of a regiment, either of horſe, foot, or dragoons.

Skinner derives the word from *colony*; being of opinion, the chiefs of colonies, called *coloniales*, might give the name to chiefs of forces.

In the French and Spaniſh armies, *colonel* is confined to the infantry and dragoons: the commanding officer of a regiment of horſe they uſually call *meſtre de camp*.

Formerly, inſtead of *colonel*, the French uſed the word *coronel*; and this old ſpelling comes nearer to our common way of pronouncing the word *colonel*.

COLONEL *Lieutenant*, is he who commands a regiment of guards, whereof the king, prince, or other perſon of the firſt eminence, is *colonel*.

Theſe *colonels lieutenants* have always a *colonel's* commiſſion, and are uſually general officers.

COLONEL-*Lieutenant* is the ſecond officer in the regiment: who is at the head of the captains, and commands in the abſence of the *colonel*.

Lieutenant-colonel of horſe, or dragoons, is the firſt captain of the regiment. See CAPTAIN.

COLONNADE, a PERISTYLE of a circular figure; or a ſeries of columns diſpoſed in a circle, and inſulated within-ſide. Such is that of the little park at Verſailles, which conſiſted of thirty-two Ionic columns; all of ſolid marble, and without incruſtation.

A polyſtile COLONNADE is that whoſe number of columns is too great to be taken in by the eye at a ſingle view. Such is the *colonnade* of the palace of St. Peter at Rome; which conſiſts of two hundred and eighty-four columns of the Doric order, each above four feet and an half in diameter; all of Tiburtine marble.

COLONUS, an huſbandman, or villager, who was bound to pay yearly a certain tribute, or, at certain times of the year, to plow ſome part of the lord's land; and from hence comes the word *clown*, who is called by the Dutch *boor*.

COLONY, COLONIA, a company of people, of all ſexes and conditions, tranſported into a remote province, in order to cultivate and inhabit it.

Originally the word *colony* ſignified no more than a *farm*; i. e. the habitation of a peaſant, *colonus*, with the quantity of land ſufficient for the ſupport of his family; *quantum colonus unus arare poterat*.

We may diſtinguiſh three kinds of *colonies*: thoſe ſerving to eaſe, or diſcharge the inhabitants of a country; where the people are become too numerous, ſo that they cannot any longer conveniently ſubſiſt.

The ſecond are thoſe eſtabliſhed by victorious princes and people, in the middle of vanquiſhed nations, to keep them in awe and obedience.

The third may be called *colonies of commerce*; becauſe, in effect, it is trade that is the ſole occaſion and object thereof.

It was by means of the firſt kind of *colonies*, that ſome ages after the deluge, the eaſt, firſt, and ſucceſſively all the other parts of the earth, became inhabited: and without mentioning any thing of the Phœnician and Grecian *colonies*, ſo famous in ancient hiſtory, it is notorious that it was for the eſtabliſhment of ſuch *colonies*, that, during the declenſion of the empire, thoſe torrents of barbarous nations, iſſuing, for the generality, out of the North, over-ran the Gauls, Italy, and the other ſouthern parts of Europe; and after ſeveral bloody battles, divided it with the ancient inhabitants.

For the ſecond kind of *colonies*, the Romans uſed them more than any other people; and that to ſecure the conqueſts they had made from the weſt to the eaſt. Every one knows how many cities in Gaul, Germany, Spain, and even in England, value themſelves on their having been of the number of Roman *colonies*.

Laſtly, the *colonies of commerce* are thoſe eſtabliſhed by the Engliſh, French, Spaniards, Portugueſe, and other nations, within theſe two laſt centuries, and which they continue ſtill to eſtabliſh in ſeveral parts of Aſia, Africa, and America; either to keep up a regular commerce with the natives, or to cultivate the ground, by planting ſugar-canes, indigo, tobacco, and other commodities. See CHARTER-*Governments*.

The principal of this kind of *colonies* are, or were, in the one and the other America, northern and ſouthern; particularly Peru, Mexico, Canada, Virginia, New England, Carolina, la Louiſiane, l'Acadia, Hudſon's Bay, the Antilles iſlands, Jamaica, Domingo, and the other iſlands.—In Africa, Madagaſcar, Cape of Good Hope, Cape Verd, and its iſlands, and all thoſe vaſt coaſts extended thence as far as to the Red Sea.—Laſtly, in Aſia, the famous Batavia of the Dutch; Goa, Diu, of the Portugueſe; and ſome other leſs conſiderable places of the Engliſh, French, and Danes.

There were two kinds of *colonies* among the Romans; thoſe ſent by the ſenate; and the military ones, conſiſting of old ſoldiers, broken and diſabled with the fatigues of war, who were thus provided with lands, as the reward of their ſervices.

The *colonies* ſent by the ſenate were either Roman, or Latin; i. e. they were compoſed either of Roman citizens, or Latin. The *colonies* of Roman citizens had the right of ſuffrages; but had no part in the offices or honours of the republic. The inhabitants of Latin *colonies* had no right of ſuffrages without an expreſs permiſſion.

According to Ulpian, (lib. i. D. de Cenſ.) there were other *colonies*, which had little more than the name; only enjoying what they called *jus Italicum*, i. e. they were free from the tribute and taxes paid by the provinces.—Such were the *colonies* of Tyre, Berytus, Heliopolis, Palmyra, &c.

M. Vaillant has filled a volume in folio with medals ſtruck by the ſeveral *colonies*, in honour of the emperors who founded them. The ordinary ſymbol they engraved on their medals, was, either an eagle; as when the veteran legions were diſtributed in the *colonies*: or a labourer, holding a plough drawn by a pair of oxen; as when the *colony* conſiſted of ordinary inhabitants. On all the medals are ſeen the names of the decemviri, who held the ſame rank, and had the ſame authority there as the conſuls had at Rome.

Colony *of Bees*. See Hive.

COLOPHONY, in *Natural Hiſtory* and *Chemiſtry*, a reſinous ſubſtance prepared of turpentine, by boiling it in water. When cold, it becomes of a hard conſiſtence, and has the ſame properties as other reſins, and the ſame principles may be obtained from it by analyſis.

The chief uſe of this drug is in the cure of venereal ailings, ſeminal weakneſſes, the whites in women, &c. The apothecaries make it into pills, which they roll in liquorice-powder, or cover with gold-leaf, and call them *turpentine-pills*.

It is alſo uſed by muſicians, to rub the hairs of their bow; the effect whereof is, that the gum cleaving to the hairs, and communicating to them a tenacious quality, prevents their ſliding too eaſily over the ſtrings; and promotes that trembling which forms the ſound.

The common black *colophony*, or black reſin, is ſaid to be procured from the turpentine of the mountain pine. The oil being extracted from this by diſtillation, what remains in the ſtill is the *colophony*.

To be good, it muſt be ſhining and odoriferous; and when thrown on the fire, render a ſmoke like that of frankincenſe.

Pliny ſays, *colophony* took its name from *Colophon*, a city of Ionia, whence it was firſt brought. It is now frequently called *Spaniſh wax*, or *Grecian reſin*, as it is brought from the one or the other of thoſe countries. It is found to warm, dry, ſoften, and agglutinate; and uſually enters the compoſition of plaſters and unguents.

COLOQUINTIDA, or Colocynthis, uſually called *bitter apple*; the fruit of a plant of the ſame name, brought from the Levant; about the bigneſs of a large orange.

This word comes from κολοκυνθις, a name which was given it, becauſe it κοιλιαν κινει, *moves the belly*.

Its colour is a ſort of golden brown: its inſide is full of kernels, which are to be taken out before the *colocynth* be uſed. The pulp is intolerably bitter.

Coloquintida is of conſiderable uſe in medicine, but moſtly in officinal compoſitions; the violence of its operation rendering it unſafe to be given inwardly in extemporaneous preſcriptions, except with great caution.

It enters, as an ingredient, in the confectio hamec, and moſt of the purging pills, called *pilulæ corticæ*; and in ſuch caſes as require briſk purging, is attended with great ſucceſs. But it requires proper management, as it is one of the moſt violent purgative drugs known; inſomuch that it excoriates the paſſages to that degree, as ſometimes to bring away blood, and induce a ſuperpurgation. Sometimes it is taken boiled in water, or ſmall beer, in obſtructions of the menſes; which, in ſtrong conſtitutions, is often attended with ſucceſs. Some women have made uſe of it, in the ſame manner, in the beginning of pregnancy, to procure abortion; which it often effects by the violence of its operation.

The powder of *coloquintida* is ſometimes uſed externally, with aloes, &c. in unguents, emplaſters, &c. with remarkable ſucceſs againſt worms; and ſome, for the ſame purpoſe, recommend decoctions of the pulp, given clyſterwiſe. In the iliac paſſion, clyſters of *coloquintida* have been found of ſervice, after moſt other medicines have failed.

In the common analyſis by chemiſtry, there appears no principle predominant in this fruit, by which its violent effects may be accounted for. Diſtilled by the retort, it yields firſt a phlegm; then a phlegm with an acid ſalt diſſolved in it; after this, a phlegm leſs acid, and containing a quantity of an urinous alkaline ſalt, which ſtrongly affects the ſmell. Theſe three liquors bring over with them a fœtid oil, and the fixed ſalt drawn from the remainder in the retort, was of the nature of the reſt of the ſalts of that kind. Mem. Acad. Par. 1701.

Colocynth, infuſed in rain water, yields only an inſipid phlegm by diſtillation, but the remainder yields a very fine extract of a tolerably mild purgative virtue; a pound of the pulp of *colocynth* thus yields two ounces and an half of extract, and the remaining maſs of the *colocynth* does not appear to contain any reſin. It is uſual to attribute the violence of all purgative medicines to their abounding in reſinous parts. To try whether this was the caſe in this ſimple, Mr. Boulduc finiſhed his experiments on it by making an extract from it, by means of ſpirit of wine. Eight ounces of the clean pulp yielded only half an ounce of a reſinous extract, and the reſiduum yielded two ounces of a coarſe extract, by means of water; but this was of a bad conſiſtence, and would ſcarce hang together.

Either of theſe extracts, given alone, proved troubleſome medicines: and all that appeared from this, and from the whole, was, that in order to have the virtues of this fruit in a gentle, and ſafe manner, its ſaline and reſinous parts muſt be left together, and only ſeparated from its terreſtrial and mucilaginous ones, by means of long fermentation with muſt or water, before its being evaporated into an extract; becauſe all its violent effects are owing to theſe terreſtrial and mucilaginous particles.

Troches made of *colocynth* are called *troches of alhandal*: they are prepared by cutting the *coloquintida* very ſmall, and reducing it to a fine powder in a mortar, rubbed with oil of ſweet almonds; adding gum tragacanth, and maſtich afterwards.

COLOR, in the *Ancient Muſic*. See Colours.

Color *Indicus*. See Indicus *color*.

COLORATURA, in the *Italian Muſic*, is uſed to denote all ſorts of variations, trillos, diminutions, &c. that can render a ſong agreeable.

COLOBRASIANS. See Colarbasians.

COLORISATION, or Coloration, in *Pharmacy*, a term applied to the ſeveral changes of colour which bodies undergo in the various operations of nature, or art; as by fermentations, lotions, coctions, calcinations, &c.

COLORITES, in *Eccleſiaſtical Hiſtory*, a congregation of Auguſtin monks inſtituted about 1530, and ſo called from *Colorito*, a mountain near Morano in Calabria, where a church was erected to the Virgin Mary.

COLOSSAL *column*. See Column.

COLOSSUS, a ſtatue of enormous, or gigantic ſize.

The moſt eminent of this kind was the *coloſſus* of Rhodes, one of the wonders of the world, a brazen ſtatue of Apollo, ſo high, that ſhips paſſed with full ſails betwixt its legs. It was the workmanſhip of Chares, a diſciple of Lyſippus; who ſpent twelve years in making it; it was at length overthrown by an earthquake, after having ſtood ſixty-ſix years. Its height was a hundred and five feet: there were few people who could fathom its thumb, &c.

Some critics obſerve, that the *coloſſus* of Rhodes gave its own name to the people among whom it ſtood; and that many, at leaſt among the ancient poets, call the Rhodians, *Coloſſians*: hence they advance an opinion, that the Coloſſians in Scripture, to whom St. Paul directs his Epiſtle, are, in reality, the inhabitants of Rhodes. Of this ſentiment are Suidas, Calepine, Munſter, &c.

When the Saracens became poſſeſſed of the iſland, A.D. 672, the ſtatue was found proſtrate on the ground: they ſold it to a Jew, who loaded nine hundred camels with the braſs, which amounted to ſeven hundred and twenty thouſand pounds weight.

The baſis that ſupported it was of a triangular figure: its extremities were ſuſtained with ſixty pillars of marble. There was a winding ſtair-caſe to go up to the top of it; from whence one might diſcover Syria, and the ſhips that went into Egypt, in a great looking-glaſs that was hung about the neck of the ſtatue. Among the antiquities of Rome, there are ſeven famous *coloſſuſes*: two of Jupiter, as many of Apollo, one of Nero, one of Domitian, and one of the ſun.

COLOSTRUM, or Colostra, in *Medicine*, the firſt milk of any animal after bringing forth young, called in common *beaſtings*.

It is remarkable that this milk is generally cathartic, and purges off the meconium; thus ſerving both as an aliment and medicine.

This name is likewiſe given to a diſeaſe which this thick coagulated milk ſometimes occaſions.

An emulſion prepared with turpentine, diſſolved with the yolk of an egg, is ſometimes alſo called by this name.

COLOUR, Color, in *Philoſophy*, a property inherent in light, whereby, according to the different ſizes or magnitudes of its parts, it excites different vibrations in the fibres of the optic nerve; which, propagated to the ſenſorium, affect the mind with different ſenſations.

Or, *colour* may be defined a ſenſation of the ſoul, excited by the application of light to the retina of the eye; and different, as that light differs in the degree of its refrangibility, and the magnitude of its component parts.

In the former view, therefore, light is the ſubject of *colour*; in the latter it is the agent. See its properties under the article Light.

Various are the opinions of ancient and modern authors, and of the ſeveral ſects of philoſophers, with regard to the nature and origin of the phænomenon *colour*: the moſt popular opinion was long that of the Ariſtotelians; who maintain *colour* to be a quality reſiding in the coloured body; and to exiſt independently of light.

The Carteſians come nearer the matter: they own, that as the coloured body is not immediately applied to the organ, to occaſion the ſenſation; and that as no body can affect the ſenſe but by immediate contact, the coloured body does not excite the ſenſation of itſelf, or contribute any thing to it, otherwiſe than by moving ſome interpoſed medium, and by that the organ of ſight.

They add, that, as we find that bodies do not affect the ſenſe in the dark, light only occaſions the ſenſe of *colour*, by moving the organ; and that coloured bodies are no further concerned in this, than as they reflect the light with a certain modification: the differences in their *colours* ariſing from a difference in the texture of their parts, whereby they are diſpoſed to reflect the light with this or that modification.

B. Porta thought that light was *colourleſs*, but that it was capable of having *colour* ſuperinduced upon it from foreign cauſes, in certain circumſtances. Dr. Hooke maintained, that the primary *colours* are only two, viz. blue and red, and that all the reſt are compoſed of them; and that theſe two *colours* are occaſioned by impreſſions on the retina from pulſes of light, of different ſtrength. M. de la Hire reſolves the difference of *colours* into the degree in which the light agitates or affects the optic nerve; and he obſerves, that whatever tends to weaken this impreſſion, makes a change in the *colour*. See Prieſtley's Hiſt. of Viſion, &c. p. 43. 146, 147.

But it is to Sir Iſaac Newton alone we are to refer for a ſolid and conſiſtent theory of *colours*; built on ſure experiments, and ſolving all the phænomena thereof: his doctrine is as follows.

It is found by experience, that rays, or beams of light, are compoſed of particles very heterogeneous, or diſſimilar to each other: i. e. ſome of them, as it is highly probable, are larger, and others leſs. For a ray of light, as FE (*Tab. Optics, fig.* 5.) being received on a refracting ſurface, as AD, in a dark place, is not wholly refracted to L; but it is ſplit, as it were, and diffuſed into ſeveral radioli, or little rays, ſome whereof are refracted to L, and others to the other intermediate points between L and G; i. e. thoſe particles of the light which are the moſt minute, are of all others the moſt eaſily and moſt conſiderably diverted, by the action of the refracting ſurface, out of their rectilinear courſe towards L; and with reſpect to the reſt, as each exceeds another in magnitude, ſo is it with more difficulty, and leſs conſiderably, turned out of its right line to the points between L and G. Now, each ray of light, as it differs from another in its degree of refrangibility, ſo does it differ from it in *colour*: this is warranted by numerous experiments. Thoſe particles, v. gr. which are moſt refracted, are found to conſtitute a ray of a violet *colour*, i. e. in all probability, the moſt minute particles of light, thus ſeparately impelled, excite the ſhorteſt vibrations in the retina; which are thence propagated by the ſolid fibres of the optic nerves into the brain, there to excite the ſenſation of violet *colour*; as being the moſt duſky and languid of all *colours*.

Again, thoſe particles which are the leaſt refracted, conſtitute a radiolus, or ray of a red *colour*; i. e. the largeſt particles of light excite the longeſt vibrations in the retina; ſo as to excite the ſenſation of red *colour*, the brighteſt and moſt vivid of all others.

The other particles, being in like manner ſeparated, according to their reſpective magnitudes, into little rays, excite the intermediate vibrations, and thus occaſion the ſenſations of the intermediate *colours*; much in the ſame manner as the ſeveral vibrations of the air, according to their reſpective magnitudes, excite the ſenſations of different ſounds.

To this it may be added, that not only the more diſtinct and notable *colours* of red, yellow, blue, &c. have thus their riſe from the different magnitude and refrangibility of the rays; but alſo the intermediate degrees or ſhades of the ſame *colour*; as of yellow up to green, or red down to yellow, &c.

Further, the *colours* of theſe little rays, not being any adventitious modifications thereof, but connate, primitive, and neceſſary properties; as conſiſting, in all probability, in the magnitudes of their parts, muſt be perpetual and immutable; i. e. they cannot be changed by any future refraction or reflexion, or any modification whatſoever.

This is confirmed by abundance of experiments; all endeavours having been uſed, after ſeparating a coloured ray from thoſe of other kinds, to change it into ſome other *colour*, by repeated refractions, but to no effect. Apparent tranſmutations of *colours*, indeed, may be effected; viz. where there is an aſſemblage, or mixture of rays of different kinds, the component *colours* never appearing in their natural hue in ſuch mixtures, but always allayed and tempered with each other: whence reſults an intermediate kind of *colour*, which, by refraction, may be ſeparated into the component ones: and theſe after ſeparation, being remixed, return to their former *colour*.

Hence, the tranſmutation of *colours*, by mixing thoſe of different kinds, are not real, but mere appearances, or deceptions of the ſight; for the rays, being again ſevered, exhibit the ſame *colours* as at firſt. Thus, blue and yellow powders, well mixed, appear to the naked eye green; yet, without having paſſed any alteration; for, when viewed through a microſcope, the blue and yellow particles ſtill appear diſtinct.

Mr. Melvill apprehends, that differently *coloured* rays may be affected with different velocities at their emiſſion from the luminous body, and that the velocity is greater, if the luminous body is placed in a denſer medium, and proportional to its refractive power; and this hypotheſis he thinks preferable to that of Sir Iſaac Newton, which makes them to conſiſt of particles of different ſizes and denſities. Mr. Muſchenbroeck alſo infers, from the leſs degree of refrangibility of red rays, that they move more ſlowly than the reſt, after their ſeparation from thoſe of other *colours*, though in a ſtate of union with the reſt, they have the ſame velocity; but he does not think that the *colour* depends upon the velocity, ſince this changes with the medium through which the rays are tranſmitted. Their different refrangibility will be the ſame on this hypotheſis, and their different velocities will be nearly as the ſines of refraction out of air into glaſs, beginning from the extreme red, and ending with the extreme violet, viz. as 78000, 77873, 77797, 77663, 77496, 77330, 77220, 77000, the ſine of incidence being 120120: therefore, ſince the time which the extreme violet rays take to move through any ſpace, is to that which the red takes as 78 to 77, the laſt violet light reflected from a ſatellite, before its total immerſion into the ſhadow of Jupiter, in a quadrate aſpect with the ſun, when his light takes about 41′ in coming to the earth, ought to affect the eye 32 ſeconds after the red light, reflected at the ſame time, is gone; and at the emerſion, there would be a contrary ſucceſſion of *colours*; and the difference of time between the arrival of the different *coloured* rays, being more than half a minute, would afford time ſufficient to make the obſervation. The marquis de Courtivron, in a treatiſe publiſhed in 1752, advanced the ſame opinion with Mr. Melvill, and propoſed the ſame trial of his hypotheſis, viz. by obſerving the eclipſes of Jupiter's ſatellites; but he ſtates the difference of velocity, by a theorem of M. Clairaut, in the proportion of 45 to 44. Mr. Short made the obſervation recommended by Mr. Melvill, and could not perceive the leaſt alteration in the *colour* of the light reflected by the ſatellite; and therefore the hypotheſis ſtill wants that kind of confirmation. By this hypotheſis, Mr. Melvill accounts for Newton's fits of reflexion and tranſmiſſion, as ariſing from the pulſes of the medium through which the differently *coloured* rays paſs; theſe pulſes muſt overtake rays, moving with different velocities, at different times; and thus the intervals of the fits would be leaſt in the violet, and gradually increaſing in the priſmatic order, agreeably to obſervation. This hypotheſis, however plauſible, is liable to many inſuperable objections. The difficulty, which prevented Mr. Muſchenbroeck from aſcribing the *colour* of rays to their velocity, viz. that the *colour* of homogeneous rays is not altered by paſſing through different mediums, though their velocity is thereby always increaſed or diminiſhed, is reſolved by Mr. Melvill, by ſuppoſing that every ray, as it muſt at laſt paſs through the humours of the eye, in order to viſion, falls upon the retina with one given velocity, however it may have been previouſly refracted; ſince the velocity of any ray, in any one medium, is to its velocity in any other medium, in a conſtant and invariable proportion. It has been objected, that if this hypotheſis were true, a ſtar muſt change its place, on account of the aberration $\frac{1}{77}$th more for the deepeſt blue rays than the red ones, according to Mr. Melvill, and $\frac{1}{45}$th more, according to M. de Courtivron; and conſequently a ſtar placed in the pole of the ecliptic, whoſe mean ABERRATION is about 20″, ought to appear in the form of a ſpectrum, formed by a priſm of $\frac{20}{77}''$, or 17‴ nearly in length, by the former hypotheſis, and of $\frac{20}{45}''$, or 27‴, by the latter. This is a quantity which would be ſufficiently viſible in teleſcopes of pretty high magnifying powers; but no ſuch appearance has yet been obſerved. Beſides, the experiments of Mr. Dollond clearly prove, that the different refrangibility of the rays of light reſults from properties that are independent of their different velocity; ſince the proportion of it varies according to the nature of the ſubſtance from which it falls; (ſee ABERRATION) and the diſtances at which differently *coloured* rays are attracted and repelled are different. M. Clairaut, in the courſe of his inquiry concerning Mr. Dollond's improvements in teleſcopes, has taken occaſion to examine this hypotheſis, and found, that the refractions which would reſult from it, were very different from thoſe which actually took place in nature. Phil. Tranſ. vol. xlviii. part i. art. 38. and part ii. art. 92. Hiſt. Acad. Sc. 1756. p. 194. and Prieſtley's Hiſt. of Viſion, &c. p. 401, &c.

From the Newtonian theory above explained, there ariſe two kinds of *colours*, the one *original* and *ſimple*, produced by homogeneal light; or by rays that have the ſame degree of refrangibility, and the ſame magnitude of their parts: ſuch as red, yellow, green, blue, violet-purple, orange, and indigo; with all their intermediate teints and gradations.

The other kind of *colour* is *ſecondary*, or *heterogeneous*; compounded of the primary ones, or of a mixture of rays differently refrangible, &c.

There may alſo be ſecondary *colours* produced by compoſition, like the primary ones, or thoſe conſiſting of homogeneal light, as to the ſpecies or appearance of the *colour*; but not as to the permanency, or immutability thereof. Thus, yellow and blue make green; red and yellow, orange; orange and yellowiſh green, yellow: and in the general, if any two colours be mixed, which, in the ſeries of thoſe generated by the priſm, are not too far apart, from their mixture there reſults that *colour*, which in the ſaid ſeries is found in the mid-way between them: but thoſe ſituated at too great a diſtance do not produce the ſame effect.

Indeed, the more any *colour* is compounded, the leſs perfect and vivid it is; by too much compoſition they may be diluted and weakened till they ceaſe. By compoſition there may likewiſe be produced *colours* not like any of thoſe of homogeneal light.

The moſt extraordinary compoſition is that of whiteneſs; for to this, all the primary *colours* above mentioned are required; and theſe to be mixed in a certain degree. Hence it is that white is the ordinary *colour* of light; light being nothing elſe but a confuſed aſſemblage of rays of all *colours*.

If the rays of different *colours* do thus begin to be ſeparated by one refraction of one ſingle ſurface, that ſeparation is much promoted, ſo as even to become ſenſible to the eye by a double refraction. This is obſerved in the two ſurfaces of any glaſs, provided thoſe ſurfaces be not parallel; but, of all others, it is moſt ſenſible in the two faces of a triangular priſm; the phænomena whereof, as they are the touchſtone of all theories of *colours*; and as they contain the foundation of that here delivered, we ſhall lay down as follows.

1. The rays of the ſun, tranſmitted through a triangular priſm, exhibit an image of various *colours* (the chief whereof are red, yellow, green, blue, and violet) on the oppoſite wall.

The reaſon is, that the differently coloured rays are ſeparated by refraction: for the blue rays, v. gr. marked with the dotted lines (*Tab. Optics*, *fig*. 6.) which begin to be ſeparated from the reſt by the firſt refraction in *d d*, of the ſide *ca* of the priſm *abc* (as alſo in the firſt ſurface of the globe of water *a b c*, *fig*. 7.) are ſtill farther ſeparated in the other ſide of the priſm *bc* (as alſo in their egreſs out of the globe *abc*) by a ſecond refraction in *c e*, in the ſame direction as in the former: whereas, on the contrary, in the plain glaſs *a b c f*, *fig*. 9. (as alſo in the priſm *g l c*, *fig*. 8. now placed in another ſituation) thoſe blue rays which begin to be ſeparated from the reſt in the firſt ſurface, in *d d*, by a ſecond refraction, the contrary way, paſs out parallel, i. e. remixed with all the *colours* of the other rays.

2. This image is not round, but oblong; its length, when the priſm forms an angle of 60 or 65 degrees, being five times its breadth. The reaſon is, that ſome of the rays are refracted more than others; and by that means, they exhibit ſeveral images of the ſun, extended lengthwiſe, inſtead of one.

3. Thoſe rays which exhibit yellow, are turned farther from the rectilinear courſe, than thoſe which exhibit red; thoſe which exhibit green, farther than thoſe which exhibit yellow; but of all others, thoſe which exhibit violet the moſt: accordingly, if the priſm through which the light is tranſmitted be turned about its axis, ſo that the red, yellow, green, &c. rays be projected in order, through a narrow aperture into another priſm, placed at the diſtance of about twelve feet; the yellow, green, &c. rays, though falling through the ſame aperture, in the ſame manner, and on the ſame point of the ſecond priſm, will not be refracted to the ſame place as the red, but to a point at ſome diſtance from it; on that ſide to which the rotation is made.

This is what Sir Iſaac Newton calls the ***experimentum crucis***: being that which led him out of the difficulties into which the firſt phænomenon, &c. had thrown him; and plainly ſhewed a different degree of refrangibility, and a different *colour* correſponding thereto in the rays of light; and that yellow rays, v. gr. are more refracted than red ones, green ones more than yellow ones, and blue and violet ones moſt of all.

4. The *colours* of coloured rays, well ſeparated by the priſm, are not at all changed or deſtroyed by paſſing thro' an illuminated medium, nor by their mutual decuſſation, their bordering on a deep ſhadow, nor their being reflected from any natural body, or refracted through any one in a place howſoever obſcure.

The reaſon is, that *colours* are not modifications ariſing from refraction or reflexion, but immutable properties; and ſuch as belong to the nature of the rays.

5. An aſſemblage of all the kinds of coloured rays, collected either by ſeveral priſms, by a convex lens, or a concave mirror, or in any other manner, form what we call *whiteneſs*; yet each of theſe, after decuſſation, becoming ſeparated, again exhibits its proper *colour*: for, as the ray was white before its parts were ſeparated by refraction; ſo, the parts being remixed, it becomes white again: and coloured rays, when they meet together, do not deſtroy one another, but are only interſperſed.

Hence, a red, green, yellow, blue, and violet *colour*, being mixed in a certain proportion, appear whitiſh, i. e. they are of ſuch a *colour* as ariſes from white and black mixed together; and if there were not ſome rays abſorbed and loſt, they would be plainly white. In like manner, if a paper cut into a circle, be ſtained with each of thoſe *colours*, ſeparately, and in a certain proportion; then ſwiftly turned round its centre, ſo that the ſpecies of *colours* be mixed together in the eye, by the briſkneſs of the motion, the ſeveral *colours* will diſappear, and the whole paper appear of one continued *colour*; which will be a mean between white and black.

6. If the rays of the ſun fall very obliquely on the inner ſurface of a priſm, thoſe that are reflected will be violet; thoſe tranſmitted, red.

For the rays were coloured before any ſeparation; and by how much they are the more refrangible, by ſo much they are the more eaſily reflected; and by that means are ſeparated.

7. If two hollow priſms, the one filled with a blue fluid, the other with a red one, be joined together, they will be opake; though each, apart, be tranſparent.

For, the one tranſmitting none but blue rays, and the other none but red ones, the two together will tranſmit none at all.

8. All natural bodies, eſpecially white ones, viewed through a priſm held to the eye, appear fimbriated, or bordered, on one ſide with red and yellow, and on the other with blue and violet. For thoſe *fimbriæ* are the extremes of entire images, which the rays of any kind, as they are more or leſs refracted, would exhibit nearer, or at a greater diſtance from the real place of the object.

9. If two priſms be ſo placed, as that the red of the one, and the purple of the other, meet together, in a paper fit for the purpoſe, encompaſſed with darkneſs, the image will appear pale; and if viewed through a third priſm, held to the eye at a proper diſtance, it will appear double; the one red, the other purple.

In like manner, if two powders, the one perfectly red, the other blue, be mixed; any little body covered pretty deeply with this mixture, and viewed through a priſm held to the eye, will exhibit a double image, the one red, and the other blue: becauſe the red and purple of blue rays are ſeparated by their unequal refraction.

10. If the rays tranſmitted through a convex lens, be received on a paper before they meet in a focus, the confines or boundary of light and ſhadow will appear tinged with a red *colour*: but if they be received beyond the focus, with a blue one.

Becauſe, in the firſt caſe, the red rays, being ſomewhat more refracted, are the higher; but, in the ſecond, after decuſſation in the focus, the blue ones.

11. If the rays about to paſs through either ſide of the *pupilla*, be intercepted by the interpoſition of any opake body near the eye; the extremes of bodies, placed as if viewed through a priſm, will appear tinged with *colours*; though they are not very vivid.

For, then, the rays tranſmitted through the reſt of the pupil, will be ſeparated by refraction into *colours*; without being diluted with the admixture of the intercepted rays, which would be refracted in a different manner.—And hence it is, that a body viewed through a paper pierced with two holes, appears double, and alſo tinged with *colours*.

COLOURS *of thin laminæ, or plates*. As rays of different *colours* are ſeparated by the refraction of priſms, and other thick bodies; ſo are they ſeparated, though in a different manner, in the thin lamellæ, or plates of any pellucid matter, v. gr. in the bubbles raiſed in water, thickened by ſoap, &c. For all lamellæ, under a determinate thickneſs, tranſmit rays of all *colours*, without reflecting any at all: but, as they increaſe in thickneſs, in arithmetical proportion, they begin to reflect, firſt, blue rays; then, in order, green, yellow, and red, all pure: then, again, blue, green, yellow, red, more and more mixed and diluted; till, at length, arriving at a certain thickneſs, they reflect rays of all *colours* perfectly intermixed, viz. white.

But, in whatſoever part a ſlender lamella reflects any one *colour*, v. gr. blue, or violet, in that part it always tranſmits the oppoſite *colour*, v. gr. red, or yellow.

It is found, by experiment, that the difference of *colour* of a plate does not depend on the medium that encompaſſes it; but the degree of vividneſs does: *cæteris paribus*, the *colour* will be more vivid, if the denſer medium be encompaſſed with the rarer. A plate, *cæteris paribus*, reflects more light as it is thinner; as far as a certain degree of thinneſs, beyond which it reflects no light at all.

In plates whoſe thickneſſes increaſe in the arithmetical proportion of the natural numbers, 1, 2, 3, 4, 5, &c. If the firſt, or thinneſt, reflect any homogeneal ray, the ſecond will tranſmit it; the third again will reflect it: and thus is the ſame ray alternately reflected and tranſmitted; i. e. the plates correſponding to the odd numbers, 1, 3, 5, 7, &c. will reflect the ſame rays that thoſe correſponding to the even ones, 2, 4, 6, 8, &c. tranſmit. Hence, an homogeneous *colour* in a plate is ſaid to be of the *firſt order*, if the plate reflect all the rays of that *colour*. In a plate whoſe thinneſs is triple the firſt, it is ſaid to be of the *ſecond order:* in another, whoſe thinneſs is five times that of the firſt, it is ſaid to be of the *third order*, &c.

A *colour* of the firſt order is the moſt vivid of any; and, ſucceſſively, the vividneſs of the *colour* increaſes, as the quantity of the order increaſes: the more the thickneſs of the plate is increaſed, the more *colours* it reflects; and thoſe of more different orders. In ſome plates, the *colour* will vary as the poſition of the eye varies; in others it is permanent. See on this ſubject Prieſtley's Hiſt. of Viſion, p. 279, &c. p. 311, &c. p. 498. and Rings *of Colours*.

Colours *of natural bodies*. Bodies only appear of different *colours*, as their ſurfaces are diſpoſed to reflect rays of this or that *colour* alone; or of this or that *colour* more abundantly than any other: hence bodies appear of that *colour* which ariſes from the mixture of the reflected rays. See Body.

All natural bodies conſiſt of very thin, tranſparent *lamellæ*; which, if they be ſo diſpoſed, with regard to each other, as that there happen no reflexions or refractions in their interſtices, thoſe bodies become pellucid, or tranſparent: but if their intervals be ſo large, and thoſe filled with ſuch matter; or ſo empty (with regard to the denſity of the parts themſelves) as that there happen a number of reflexions and refractions within the body; the body, in that caſe, becomes opake.

The rays which are not reflected from an opake body, penetrate into it; and there, ſuffering innumerable reflexions and refractions, at length unite themſelves to the particles of the body itſelf.

Hence, an opake body grows hot the ſooner, as it reflects light leſs copiouſly: whence we ſee why a white body, which reflects almoſt all the rays that ſtrike upon it, is heated much more ſlowly than a black one, which reflects ſcarce any.

To determine that conſtitution of the ſurface of bodies whereon their *colour* depends, it muſt be obſerved, that the ſmalleſt corpuſcles, or firſt particles whereof ſurfaces are made up, are moſt thin and tranſparent, and ſeparated by a medium of a different denſity from the particles themſelves. In the ſurface, then, of every coloured body, are innumerable ſmaller thin plates, correſponding to thoſe of bubbles: wherefore, what has been obſerved of thoſe, may be underſtood of theſe. Hence we gather, that the *colour* of any body depends on the denſity and thickneſs of the parts of the body, between the pores of the ſurface: that the *colour* is more vivid and homogeneous, as the parts are thinner: that, *cæteris paribus*, the ſaid parts are the thickeſt when the body is red; and the thinneſt when violet: that the parts of bodies are uſually much denſer, than the medium contained in their interſtices; but that in the tails of peacocks, in ſome ſilks, and, generally, in all bodies whoſe *colour* varies according to the ſituation of the eye, it is leſs: and that the *colour* of a body is leſs vivid to the eye, as it has a denſer medium within its pores.

Now, of the ſeveral opake bodies, thoſe conſiſting of the thinneſt *lamellæ* are black; thoſe conſiſting either of the thickeſt *lamellæ*, or of *lamellæ* very different from each other in thickneſs, and on that account fitted to reflect all *colours*, as the froth of water, &c. are white: thoſe, again, conſiſting of *lamellæ*, moſt of which are of ſome intermediate thickneſs, are blue, green, yellow, or red; inaſmuch as they reflect the rays of that particular *colour*, much more copiouſly than that of any other *colour*; moſt of which laſt they either abſorb and extinguiſh, by intercepting them, or elſe tranſmit. Hence it is, that ſome liquors, v. gr. an infuſion of *lignum nephriticum*, will appear red, or yellow, if viewed by reflected light; and blue by tranſmitted light; and gold leaves yellow in the former circumſtances, but green or blue in the latter.

To this may be added, that ſome of the powders uſed by painters have their *colour* changed by being very finely ground; which muſt be occaſioned by the comminution or breaking of their ſmaller parts into others ſtill ſmaller; juſt as a *lamella* has its *colour* altered, by altering its thickneſs.

In fine, thoſe odd phænomena ariſing from the mixture of liquors of different *colours*, can no way be better accounted for, than from the various actions of the ſaline, &c. corpuſcles of one liquor, with the coloured corpuſcles of another: if they unite, the maſs will either ſwell or ſhrink, and thereby its denſity will be altered: if they ferment, the ſize of the particles may be diminiſhed, and thereby coloured liquors may become tranſparent: if they coagulate, an opake liquor may be produced out of two tranſparent ones.

Hence it is eaſy to ſee why a coloured liquid, in a glaſs of a conical figure, placed between the eye and the light, appears of a different *colour* in different parts of the veſſel; there being more and more rays intercepted, as they paſs through a longer or a ſhorter ſection of the veſſel; till, at the baſe, they are all intercepted, and none ſeen but thoſe reflected.

From the various *colours* of natural bodies, Sir Iſaac Newton obſerves, the bigneſs of their component parts may be eſtimated: becauſe the parts of bodies do properly exhibit the ſame *colour* with a *lamella* of equal thickneſs, provided the denſity in both be the ſame.

The Newtonian doctrine concerning the *colours* of bodies, as depending on the thickneſs of thoſe *lamellæ*, or fine plates, which form their ſurfaces, is more lately confirmed by means of electrical exploſions. Dr. Prieſtley found, that, if theſe are received on the ſurface of any metal, they will mark it with a ſpot, conſiſting of all the priſmatic *colours* diſpoſed in concentric circles, and formed by ſcales of the metal ſeparated by the force of the exploſion. Beſides other curious obſervations, he informs us, that when a pointed piece of metal is fixed oppoſite to a plain ſurface, the nearer it is placed to the ſurface, ſo much the ſooner the *colours* appear, the cloſer do the rings ſucceed one another, and the leſs ſpace they occupy, and *vice verſa*; and that the more acutely the wire or needle, from which the electric matter iſſues, or at which it enters, is pointed, ſo much greater is the number of rings that appears: whilſt a blunt point produces larger, but fewer rings. He adds, that it is of no importance, whether the electric matter iſſue from the pointed body on the plate, or from the plate on the pointed body, and that the points themſelves are *coloured* in concentric rings to a conſiderable diſtance, but not very diſtinctly. Mr. Canton likewiſe produced all the priſmatic *colours* from all the metals, by extending fine wires of them over the ſurface of pieces of glaſs; and when the wires were exploded, he obſerved that the glaſs was tinged with all the *colours*. The experiment has been often repeated, and with peculiar advantage, by the ingenious Mr. Henly. Phil. Tranſ. vol. lviii. art. 10. Prieſtley's Hiſt. of Elect. vol. ii. p. 260. 8vo. ed. 1775. See Circular *Spots*, and Fairy *Circles*.

Colours, *accidental*. See Accidental.

Colour *of the clouds* is thus accounted for by Sir Iſaac Newton. Concluding from a ſeries of experiments, that the tranſparent parts of bodies, according to their ſeveral ſizes, reflect rays of one *colour*, and tranſmit thoſe of another, he hence obſerves, that when vapours are firſt raiſed, they are divided into parts too ſmall to cauſe any reflexion at their ſurfaces, and therefore do not hinder the tranſparency of the air; but when they begin to coaleſce, in order to compoſe drops of rain, and conſtitute globules of all intermediate ſizes, theſe globules are capable of reflecting ſome *colours*, and tranſmitting others, and thus form clouds of various *colours*, according to their ſizes. Mr. Melvill controverts this doctrine, in its application to the red *colour* of the morning and evening clouds. "Why, he ſays, ſhould the particles of the " clouds become at that particular time, and never at " any other, of ſuch a magnitude as to ſeparate theſe " *colours?* And why are they rarely, if ever, ſeen tinc- " tured with blue and green, as well as red, orange, or " yellow? Is it not more credible, that the ſeparation " of rays is made in paſſing through the horizontal at- " moſphere, and that the clouds only reflect and tranſ- " mit the ſun's light, as any half-tranſparent colourleſs " body would do? For ſince the atmoſphere reflects a " greater quantity of blue and violet rays than of the " reſt, the ſun's light tranſmitted through it ought to " incline towards yellow, orange, or red; eſpecially " when it paſſes through a long tract of air: and thus "it is found that the ſun's horizontal light is tinctured "with a deep orange, and even red; and the *colour* becomes ſtill deeper after ſun-ſet." And hence he concludes, that the clouds, according to their different altitudes, may aſſume all the variety of *colours* at ſun riſing and ſetting, by barely reflecting the ſun's incident light as they receive it. Edinb. Eſſ. vol. ii. p. 75. Prieſtley's Hiſt. of Viſion, p. 446, &c.

For the diſtinct properties, &c. of the ſeveral Colours, ſee Black, White, Blue, &c. See alſo Rainbow, &c.

Colour, in *Painting*, is applied both to the drugs, and to the teints produced by thoſe drugs, variouſly mixed and applied.

The principal *colours* uſed by painters, are red and white lead or ceruſs; yellow okers; ſeveral kinds of earth, as umber, &c. beſide orpiment, black lead, cinnabar, gamboge, lake, bice, verditer, indigo, vermilion, verdegris, ivory black, biſtre, lamp black, ſmalt, ultramarine, and carmine; each of which, with the manner of preparing them, their uſes, &c. ſee under their reſpective heads.

Of theſe *colours*, ſome are uſed ground in oil, others only in freſco, others in water, and others only for miniature.

Colours, *dark and light.* Under theſe two claſſes the painters reduce all the *colours* they uſe: under *light colours* are comprehended white, and all thoſe which approach neareſt it; and under *dark colours*, black, and all thoſe which are obſcure and earthy, as umber, biſtre, &c.

Colours, *ſimple and mineral*, is another diviſion among the painters: under *ſimple colours*, they range all thoſe uſed by limners, illuminers, &c. extracted from vegetables; and which will not bear the fire: as the yellow made of ſaffron, of French berries, &c. lacca, and other tinctures extracted from flowers. The reſt are *mineral*, drawn from metals, &c. and are able to bear the fire: theſe alone are uſed in enamelling.

Colours, *changeable and permanent*, is another diviſion of *colours:* by *changeable*, are meant thoſe which depend on the ſituation of objects with regard to the eye; as that of taffetas, of a pigeon's neck, &c. The laſt, however, being attentively viewed with a microſcope, each fibre of the feathers appears compoſed of ſeveral little ſquares, alternately red and green; ſo that they are really fixed *colours*.

Kircher tells us, that the *changeable colours* obſerved in the necks of pigeons, peacocks, &c. ariſe from the feathers being tranſparent, and of a figure reſembling a priſm; and conſequently the light's being differently refracted from them. On the contrary, the fixed and *permanent colours* are not exhibited by refraction, but reflexion.

M. Mariotte obſerves, that there are two different gradations, or ſeries of *colours*, from white to black; the one white, yellow, red, and black; the other white, blue, violet, and black.

Colours, *local.* See Local.

Colours, *rings of.* See Rings.

Colours, *water.* See Water.

Colour, in *Dying.*—There are five ſimple, primary, or mother *colours*, uſed by the dyers; from the mixture whereof all the other *colours* are formed: theſe are blue, red, yellow, brown, and black; each of which ſee under their proper head, Blue, Red, &c.

Of theſe *colours*, variouſly mixed and combined, they form the following *colours*, *panſy*, *blue*, *red:* from the mixture of blue and ſcarlet, are formed *amaranth*, *violet*, and *panſy:* from the ſame mixture of blue and crimſon-red, are formed the *columbine*, or *dove-colour*, *purple*, *crimſon*, *amaranth*, *panſy*, and *crimſon-violet*. It may be obſerved, that they give the name *crimſon* to all *colours* made with cochineal. See Crimson, Cochineal, &c.

Of blue, and red madder, they likewiſe make a good *purple*, *a pepper-colour*, *tan-colour*, and *dry roſe*. The ſame blue, with red half in grain, makes *amaranth*, *tan-colour*, and *dry roſe*. Blue, and half-red crimſon, compoſe *amaranth*, *tan-colour*, *dry roſe*, a *brown panſy*, and *ſurbrun*.

Blue and yellow. Theſe two *colours*, mixed together, compoſe a *yellow green*, *ſpring green*, *graſs green*, *laurel green*, *brown green*, *dark green*; as well as *ſea green*, *parrot green*, and *cabbage green*, &c. Theſe three laſt *colours* are to be leſs boiled than the firſt.

Note, with regard to green, there is no ſimple ingredient or drug in nature that will dye it; but the ſtuffs are dyed twice; firſt in blue, then in yellow.

Blue and brown. Theſe two *colours* are never mixed alone; but with the addition of red, either of madder or cochineal, they form ſeveral *colours*.

Red and yellow. All the ſhades compoſed of theſe two *colours*, as *gold-yellow*, *aurora*, *marigold*, *orange*, *nacarat*, *granat-flower*, *flame-colour*, &c. are made with yellow, and red of madder; ſcarlet being leſs proper, as well as too dear.

Red and brown. Of theſe two *colours* are formed *cinnamon-colours*, *cheſnut*, *muſk*, *bears-hair*, and even *purple*; if the red be that of madder.

Yellow and brown. The *colours* formed from theſe two are all the ſhades of *feuille-morts* and *hair-colours*.

It may be obſerved, that though we ſay there are no *colours*, or ſhades, made from ſuch and ſuch mixtures, it is not that none can be made; but only that they are more eaſily formed from the mixture of other *colours*. See Dying.

The greateſt perfection in the art of *colours* would be to find the means of preparing the fineſt *colours* without the uſe either of acid or alkaline ſalts, which uſually ſubject the *colours* to change, or elſe are apt to prey upon the cloth, canvas, &c. as we ſee in verdigriſe, the blue and green cryſtals of copper, &c. It appears highly probable, that the Indians, for making the fine bright and durable *colours*, wherewith their chintzes and callicoes are ſtained, make uſe of metalline ſolutions; for ſome ſtained callicoes, brought from thence, having been kept forty or fifty years, the bright *colours* have been obſerved to eat out the cloth, exactly in the ſame manner as acid ſpirits, which diſſolve metals, are found to do.

Since theſe, then, are the inconveniencies attending ſuch *colours*, we ought to ſearch for menſtruums with which to extract *colours*, which are neither acid, nor alkaline; and for ſuch metalline calxes, precipitates, or powders, as will not loſe their *colours*, by being well waſhed to get out their ſalts; to prepare certain metalline matters by mere calcination, or the bare aſſiſtance of fire; and laſtly, to look out for native *colours*, wherein no ſaline matter abounds.

Mr. Geoffroy has given a very curious proceſs for making two clear, ſpirituous, inflammable liquors, which differ very little in taſte and ſmell, and being mixt together give a fine carnation *colour*, without any ſenſible fermentation.

To make the firſt of theſe liquors, put a ſmall handful of dried red roſes into a glaſs bottle; pour on them rectified ſpirit of wine, till it covers them an inch; let this ſtand in a cold infuſion four or five hours; then pour off the liquor, which will be clear and colourleſs, as when put on. The ſecond liquor is made by dropping into rectified ſpirit of wine ſo much oil of ſulphur, by the bell, or ſpirit of vitriol, as will be borne in it without giving it any very ſenſible acidity when taſted. When theſe liquors are thus prepared, let a ſmall quantity of the latter be dropped into ſome of the former, and the whole will become of a fine carnation *colour*, though there is no fermentation, nor any other change perceived in it, but barely that of *colour*. If, inſtead of this laſt liquor, there be added to the firſt a few drops of the ſpirit of ſal ammoniac, the whole will become green.

Make a ſlight infuſion of galls in water, ſo as not to *colour* the water; make alſo a weak ſolution of green vitriol in water, ſo that it may appear colourleſs; mix theſe two colourleſs liquors together, and an inky blackneſs is immediately produced; add to this black liquor a little oil of vitriol, and the liquor becomes pellucid and colourleſs again; then add to this a little ſalt of tartar, and the whole is black again.

Put a little bruiſed camphor into rectified clear oil of vitriol; ſhake the mixture, and it will become black, and the camphor will be diſſolved; add to this a little water, and the liquor becomes clear, and the camphor is found ſeparated at top, in its own form, and native whiteneſs.

Infuſe lignum nephriticum in cold water, and pour off the clear liquor. This held up againſt the light, appears of a fine yellow, but, viewed from the light, of a beautiful blue; a little ſpirit of nitre put to this liquor makes it loſe the power of reflecting the blue rays, and a little oil of tartar, afterwards added, recovers that power again.

Logwood, infuſed in water, gives a red colour. Put to this a little ſpirit of urine, and it becomes of a fine purple; and drop in afterwards a little ſpirit of ſalt, and it becomes of a pale red.

A beautiful blue tincture may be made from filings of copper, by digeſting them in ſpirit of urine, hartſhorn, or the like. The addition of oil of vitriol deſtroys the blue *colour*; and a little ſpirit of ſalt turns it green.

Pellucid oil of vitriol, mixed with pellucid oil of turpentine, produces a thick red balſam. And common oil, mixed with fair water, by means of a little wax, and continued rubbing, turns into a thick white balſam, called cold cream.

Oil of vitriol, diſtilled from quickſilver, leaves a white powder behind, which, if water be poured on it, becomes yellow.

Diſſolve quickſilver in ſpirit of nitre, and to part of it add ſpirit of urine, and a white powder is precipitated; to another part of the ſolution add oil of tartar, and a yellow powder falls to the bottom.

Dip a new pen in ſpirit of vitriol, and write with it on common blue paper, and the letters will appear red.

A pellucid ſolution of ſaccharum ſaturni being written with on paper, becomes inviſible, when dried; but the bare fumes of an infuſion of quick lime, and orpiment, in water, will render the inviſible writing black and legible.

Volatile ſalt of ſal ammoniac, which is white, mixed with cryſtals of copper, which are green, produce a fine purple.

The original and ſimple, as well as the mixt, *colours* are producible by mixture. Thus, if the ſun's rays paſs through two pieces of glaſs, the one blue, and the other yellow, and be afterwards received upon a white paper, the *colour* there ſeen is green. The dyers make cloth blue with woad, and then turn it green by the yellow herb called luteola, or dyer's weed. To a yellow ſolution of gold in aqua regia, add a blue one of copper in ſpirit of urine, and the mixture becomes green. The painters every day practiſe this art of producing new colours by mixture.

Metalline and mineral matters are reducible to a conſiderable degree of ſubtlety, or ſmallneſs of parts, by fire, or dry calcination, ſo as to leave them durably poſſeſſed of their native or adventitious *colours*. Thus lapis lazuli, by being calcined, becomes the fine rich blue called ultramarine; light ochre, by the ſame treatment, becomes a light red, or fleſh-colour, the moſt uſeful fleſh-colour in painting. Lead, by calcination, becomes durably red, and iron durably brown; but a proper method ſeems wanting for the dry calcinations of the nobler metals, gold and ſilver; though, for the uſes of gilding, theſe are eaſily prepared by dipping linen rags in their reſpective ſolutions, and then drying, and burning them to aſhes, whereby a dry and fine metalline powder is procured.

Colours *from metals*. See Metal.

Colour, *gold*. See Gold.

Colour *wine*. See Wine.

Colour, in *Heraldry*. The *colours* generally uſed in heraldry, are red, blue, black, green, and purple; which, by the learned in that ſcience, are called *gules*, *azure*, *ſable*, *vert*, or *ſinople*, and *purpure*. *Tenne*, or *tawny*, and *ſanguin*, are not ſo common. See each *colour* under its proper article, Gules, Azure, Vert, Sinople, &c. As to yellow and white, called *or* and *argent*, they are metals, not *colours*.

Theſe *colours* and metals are ſometimes alſo expreſſed in blazon by the names of precious ſtones; and ſometimes by thoſe of planets, or ſtars.—Thus, or is called *Sol*, and *topaz*; argent, *Luna* and *pearl*; gules, *Mars*, and *ruby*; azure, *Jupiter*, and *ſapphire*; ſable, *Saturn*, and *diamond*; vert, *Venus*, and *emerald*; purpure, *Mercury*, and *amethyſt*; tenne, the *Dragon's-head*, and *hyacinth*; and ſanguin, the *Dragon's-tail*, and *ſardonyx*.

It is a general and fundamental rule in blazon, not to place *colour* upon *colour*, nor metal upon metal. That is, if the field be of a *colour*, the bearing muſt be of a metal: though this rule, on ſome occaſions, and in ſome circumſtances, is diſpenſed with; as in the diminutions and differences which diſtinguiſh the younger from the elder branches of families; and in the extremities of animals tongues, claws, horns, &c. In which caſes *colour* may be on *colour*, and metal on metal, without falſe heraldry.

Oenomaus is ſaid to have firſt invented the diſtinction of *colours*, to diſtinguiſh the quadrillæ of combatants at the Circenſian games: the green for thoſe who repreſented the earth; and the blue for thoſe who repreſented the ſea.

Hence the ancient cavaliers took occaſion to diſtinguiſh themſelves in their tournaments, by habits, plumes, and ribbands of different *colours*; which were ordinarily thoſe of their miſtreſſes, and were the ſymbol of ſome paſſion or quality.—Hence alſo the origin of *colours* in liveries.

Colours, in the *Military Art*, include the banners, flags, enſigns, &c. of all kinds, borne in an army, a fleet, or the like. See Flag, and Standard.

Colours, *field*. See Field.

Colours, are alſo uſed both in the Latin and Greek churches, to diſtinguiſh ſeveral myſteries and feaſts celebrated therein.

In the Latin church are only regularly admitted five *colours*; viz. *white*, *red*, *green*, *violet*, and *black*: the *white* is for the myſteries of our Saviour, the feaſts of the Virgin, thoſe of the angels, ſaints, and confeſſors; the *red* for the myſteries and ſolemnities of the holy ſacrament, the feaſts of the apoſtles and martyrs; the *green* for the time between Pentecoſt and Advent, and from Epiphany to Septuageſima; *violet* in Advent, Chriſtmas, in vigils, rogations, and in votive maſſes in time of war: laſtly, *black* for the dead, and the ceremonies thereto belonging. Cloths of gold and ſilver, and embroideries, ſerve indifferently for all ſolemnities.

In the Greek church the uſe of *colours* is almoſt obliterated, as well as among us: *red*, among them, was the *colour* for Chriſtmas, and the dead; as black is ſtill for the laſt among us.

Colour, in *Law*, is a probable, or plauſible plea; though in reality falſe at bottom; and only calculated to draw the trial of the cauſe from the jury to the judge.

Thus, e. gr. in an action of treſpaſs for taking away the plaintiff's beaſts, the defendant urges, that before the plaintiff had any intereſt in them, he himſelf was poſſeſſed of them, as his proper goods; and delivered them to A. B. to deliver to him again, when, &c. and A. B. gave them to the plaintiff: and the plaintiff, ſuppoſing the property to be in A. B. at the time of the gift, took them; and the defendant took them again from the plaintiff; whereupon the plaintiff brings his action.—This is a good *colour*, and even a good plea. Doct. and Stud.

Colours, *Colores*, in the *Ancient Muſic*, was uſed to ſignify the muſical ſpecies belonging to a genus.

In this ſenſe the chromatic *genus* was ſaid to have three *colours*; and the diatonic two. The enharmonic, having no ſubordinate ſpecies, had but one *colour*. Hence the ancients reckoned three *genera*, and ſix *colours*, in muſic; that is, ſo many different diviſions of the *diateſſaron*, or fourth.

Colour *of office*, is when ſome unjuſt action is done, under countenance of office, or authority.

To **Colour** *ſtrangers goods*, is when a freeman allows a foreigner to enter goods at the cuſtom-houſe in his name.

COLOURABLE *title*. See Title.

COLOURING, in *Painting*, the manner of applying, and conducting the colours of a picture; or the mixture of lights and ſhadows, formed by the various colours employed in a painting.

The *colouring* is one of the principal branches in painting. M. Felibien divides the painter's art into three parts; the deſign, the compoſition, and the *colouring*. The *colouring* ſtrikes the moſt; but among maſters it always gives place to exactneſs of deſign.

De Piles obſerves, that the word *colouring*, in its confined ſenſe, is chiefly applicable to a hiſtory-piece; ſcarce at all to a landſcape. He adds, that the term *colouring* relates more immediately to the carnations than any thing elſe.

The *colouring*, in its general ſenſe, takes in whatever relates to the nature and union of *colours*; their agreement or antipathy; as alſo how to uſe them to advantage in light and ſhadow, ſo as to ſhew a relievo in the figures, and a ſinking of the ground; what relates to the aereal perſpective, i. e. the diminution of colours by means of the interpoſition of air; the various accidents and circumſtances of the luminary and the medium; the different lights, both of the bodies illuminating and illuminated; their reflexions, ſhadows, different views, with regard either to the poſition of the eye, or the object; what produces ſtrength, boldneſs, ſweetneſs, &c. in paintings well coloured; the various manners of *colouring*, both in figures, landſcapes, &c.

Colouring, *doctrine of*. *Colours* are conſidered, either in reſpect of their uſe, or their œconomy and diſpoſition.

1. With regard to their uſe. They are either in oil, or water: thoſe in oil, again, may either be conſidered with a view to their preparation, or application.

In the preparation of oil colours, care muſt be taken that they be ground fine; that in putting them on the pallet, thoſe which will not dry of themſelves, be mixed with drying oil, or other driers; and that the tinged colours be mixed in as ſmall quantities as poſſible.

For their *application*, it is conſidered either with regard to the kinds of painting, whether in works of various colours, or in thoſe of one ſingle colour.

For the *firſt*: in the larger pieces, the colours are either laid on full, ſo as that they may be impaſted, or incorporated together, which makes them hold the more firmly. Or elſe they mix thoſe more agreeable ones, which dry too hard, and too haſtily, with a little colour, and the cleareſt of the oil: but, in both caſes, the colours are to be laid on ſtrong at firſt; it being eaſy to weaken thoſe that are to be thruſt back, and to heighten the others: the touches to be bold, by the conduct of a free and ſteady pencil; that the work may appear the moſt finiſhed at a proper diſtance, and the figures animated with life and ſpirit.

For glazed colours, particular care muſt be taken that the under-colour be painted ſtrong, and that it be a body-colour, and laid ſmooth.

In finiſhed works, which are to be viewed near at hand, they proceed, either by applying each colour in its place; preſerving their purity, without fretting or tormenting them, but ſweetly ſoftening off their extremities; or by filling up all the great parts with one ſingle colour; and laying the other colour, which are to form the little things, upon it; which is the more expeditious way, but is more apt to decay.

For the *ſecond:* the kinds of pictures in one colour are two; viz. *camieux*, where the degradations of colours of objects afar off are uſually managed by lights, as with crayons; and *baſſo-relievo*, which is an imitation of ſculpture, of whatſoever matter and colour: in both theſe, the colours are wrought dry.

For water-colours, they are wrought various ways; viz. in *diſtemper*, as the painters expreſs it, where the colours are prepared in ſize; which method is uſed in all kinds of matter; in *freſco*, or painting on freſh mortar; where the *colouring* muſt be quick, that the matter dry not; and with much care and neatneſs, laying each colour in its place, and intermingling them by parcels: in *agouache*, where the colours are mixed with gum, and the pencil dragged; as in paint and waſhings: in *miniature*, for ſmall and delicate works; where the colours are to be very fine and clean, mixed with gums, and wrought in dots or points.

But in all the kinds of painting, both in oil and diſtemper, eſpecially the latter, proper care muſt be taken, that the deſign be fixed, and all the parts marked out, before any colours be applied.

For the ſecond part of *colouring*, or the œconomy and diſpenſing thereof in paintings; regard is either had, firſt, to the qualities of the colours, to appropriate them according to their value or agreement; or, ſecondly, to their effect, in the union and œconomy of the work.

For the *qualities*, it muſt be obſerved, that white repreſents light, and gives the briſkneſs and heightening: black, on the contrary, like darkneſs, obſcures and effaces the objects: again, black ſets off the light parts; and by that they ſerve each other to looſen the objects. A proper choice is to be made of colours, and the too much charged manner to be avoided; both in carnations, where red colours are not to be affected, as rather reſembling the fleſh when flayed than the ſkin; and all bright glowing colours: the ſkin, how delicate ſoever, being always of a down colour; in the drapery, where the painter has his whole ſtock of colours to chuſe out of, to procure a good effect; and in the landſcape to diſpoſe thoſe colours near one another, which mutually aſſiſt and raiſe each other's force and briſkneſs; as red and green, yellow and blue. He is likewiſe to manage them ſo, as that they be accommodated to the effects of the great parts of light and colour: that the ſtrong colours lead to the ſoft ones, and make them more looked at; bringing them forwards, or keeping them back, according to the ſituation, and the degree of force required.

For the *effects of colours*, they either regard the union, or the œconomy: with reſpect to the firſt, care muſt be taken, that they be laid ſo as to be ſweetly united, under the briſkneſs of ſome principal one; that they participate of the prevailing light of the piece; and that they partake of each other by the communication of light, and the help of reflexion.

For the *œconomy in managing their degrees*, regard is to be had to the contraſt, or oppoſition, intervening in the union of the colours, that by a ſweet interruption, the briſkneſs, which otherwiſe fades and palls, may be raiſed to the harmony, which makes the variety of colours agree; ſupplying and ſuſtaining the weakneſs of ſome by the ſtrength of others; neglecting ſome places, on purpoſe to ſerve as a baſis or repoſe to the ſight, and to enhance thoſe which are to prevail through the piece: alſo, to the degradation, where, the better to proportion the colours that fall behind, ſome of the ſame kind are to be preſerved in their purity, as a ſtandard for thoſe carried afar off to be compared by, in order to juſtify the diminution: regard muſt always be had to the quality of the air, which, when loaded with vapours, weakens the colours more than when clear: to the ſituation of the colours, where care muſt be taken, that the pureſt and the ſtrongeſt be placed before, or in the front of the piece; and that by their force the compound ones, which are to appear at a diſtance, be kept back; particularly the glazed colours to be uſed in the firſt rank: laſtly, to the expreſſion of the ſubject, and the nature of the matters, or ſtuffs, whether ſhining or dull, opake or tranſparent, poliſhed or rough.

Colouring *and* **Non-colouring** *drugs.* Thus the dyers diſtinguiſh their materials: the firſt are applicative, and communicate their colours to the matters boiled in them, or paſſed through them; as woad, ſcarlet, green, cochineal, indigo, madder, turmeric, &c.

The ſecond ſerve to prepare and diſpoſe the ſtuffs, and other matters; and to extract the colour out of the *colouring* ingredients; as alum, ſalt or cryſtal of tartar, arſenic, realgal, ſalt-petre, common ſalt, ſal ammoniac, ſal gemmæ, agaric, ſpirit of wine, bran, peas-flour, wheat, ſtarch, lime, and aſhes.

Colouring *of glaſs.* See Glass.

Colouring *of earthen ware.* See Glazing.

Colouring *of porcelain.* See Porcelain.

Colouring *of ſpirits.* See Spirits.

COLPISCIS, a name given by ſome to the *falx Venetorum*, or ſickle fiſh, commonly called the marmot fiſh by the people of Venice. See Falx.

COLT, in *Zoology*. See Foal.

Colt-*evil*, a diſeaſe incident both to horſes and geldings. It is an unnatural ſwelling of the yard and cods, proceeding from wind, or elſe through the abundance of ſeed in horſes. It happens to geldings for want of natural heat.

Colt's-*foot*, *Tuſſilago*, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs. Its characters are theſe: the flower has one common cylindrical empalement, whoſe ſcales are linear, ſpear-ſhaped, and equal. The flower is made up of hermaphrodite florets, which compoſe the diſk, and female half-florets, which compoſe the rays or border. The hermaphrodite florets are funnel-ſhaped, cut at the brim into five ſegments; theſe have five ſhort, hair-like ſtamina, terminated by cylindrical ſummits, and a ſhort crowned germen, ſupporting a ſlender ſtyle, crowned by a thick ſtigma. The germen afterward becomes an oblong, compreſſed ſeed, crowned with a hairy down. The female half-florets are ſtretched out on one ſide with a narrow tongue-ſhaped ſegment: theſe have no ſtamina, but have a ſhort crowned germen, which turns to a ſeed like thoſe of the hermaphrodite florets, which ripen in the empalement. There are three ſpecies, the firſt of which is very common in watery places in moſt parts of England. See *Tab. of Botany*, *Claſs* 14.

The common *colt's-foot* ſtands generally recommended as a very great medicine in coughs, and all diſorders of the breaſt and lungs. It is alſo ſometimes uſed externally in inflammations.

Colt's-*foot*, *Alpine*, or *foreign*, *Cacalia*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs. Its characters are theſe: it hath compound flowers, which are included in one common cylindrical empalement; the flowers are tubulous and funnel-ſhaped, and have each five ſhort ſlender ſtamina. The germen is crowned with down, and afterward becomes a ſingle oblong ſeed, crowned with long down. There are eight ſpecies.

The root of *cacalia*, macerated in wine, and made into an eclegma, or chewed by itſelf, is ſaid to cure coughs. Its ſeeds pulveriſed and made into a cerate, and uſed as an ointment, render the ſkin ſmooth and free from wrinkles.

COLTIE, among the *Timber-Merchants*, a word uſed to expreſs a tree which has a defect in ſome one of its annual circles, which renders it unfit for many of the uſes it might have been otherwiſe fit for. In this caſe ſome one of the annual circles near the center is perceived by the eye to be thicker than the reſt, and its ſap-veſſels larger. It has an appearance much different from that of the others, and is ſo looſely connected both to its inveſtient, and inveſted circles, that, on ſawing a tranſverſe piece of the trunk off, it will ſlip out from the others, and ſo leave the heart looſe, and the reſt hollow, ſeeming to have been only fitted, not connected, to the others. In ſplitting the wood for other uſes, it yet more readily drops out, and the timber of ſuch a tree is therefore much leſs fit for general uſe than that of others. It is not eaſy to ſay to what accident, in the growth of the tree, this is owing, but it ſeems probable that it expoſes the tree to other accidents; in particular Bobart ſeems to think, that among the trees which were ſplit by the hard froſt, in the year 1683, while other trees of the like ſizes and kinds eſcaped, this *coltineſs* might be the occaſion of the miſchief, as well as their being windſhaken, or lagged. Phil. Tranſ. N° 165.

COLUBER, in *Zoology*, the name of a very numerous genus of ſerpents, the abdomen of which is covered with *ſcuta*, and the under part of the tail with *ſquamæ*, or ſcales.

COLUBRINUM *lignum*. See Lignum *colubrinum*.

COLUM, in *Ornithology*, is probably a ſpecies of the crane, and common at Surat in the Eaſt Indies. Theſe birds have a remarkable flection in the *aſpera arteria*, taken notice of by Dr. Parſons; and which he conjectures may ſerve for the retention of inſpired air, whilſt they plunge deep into the water in purſuit of food, or traverſe different climates through various degrees of rarefied and condenſed air. Phil. Tranſ. vol. lvi. art. 24. p. 211.

COLUMBA. See Pigeon.

Columba *Greenlandica*, in *Zoology*, a name given by authors to a ſmall, well-taſted, water-fowl, called, in Engliſh, the *ſea* turtle-*dove*.

Columba *marina*, the *ſea-dove*, in *Zoology*, the name of an Eaſt Indian fiſh, and appearing to be a ſpecies of the orbis, or moon-fiſh. It has its name from its head, and prominent cheſt, reſembling that of the dove; it has no ſcales, but is variegated with ſeveral very oddly placed marks on the back and ſides. It is a ſcarce fiſh, and not much valued, being but an ill-taſted one.

COLUMBA is alſo the name of a military order inſtituted by John I. of Caſtile, about the year 1739.

COLUMBA *Noachi*, a ſmall conſtellation in the ſouthern hemiſphere, conſiſting of ten ſtars. In Sharp's Catalogue their longitudes, latitudes, &c. are as follow.

Names and ſituations of the ſtars.	Signs	Longitud.			Latitude			Magnitude
		°	′	″	°	′	′	
Firſt of the brighteſt	♊	18	21	34	57	23	41	2.3

COLUMBAC denotes that part of the AGALLOCHUM, which is between the heart, and that part next to the bark.

COLUMBINA, a name given by Actuarius, and ſome other medical writers, to the *verbena*, or common VERVAIN.

COLUMBINA *Marga*. See MARLE.

COLUMBINE, *Aquilegia*, in *Botany*, a genus of the *polyandria pentagynia* claſs. Its characters are theſe: the flower hath no empalement, but is compoſed of five equal oval petals, which are plain, and ſpread open within, and have five equal nectariums, ranged alternately with the petals, each of the horns widening upward. It hath many awl-ſhaped ſtamina, and five oval germina, which afterward become five cylindrical veſſels, which are filled with oval ſhining ſeeds. There are four ſpecies.

The manner of propagating theſe flowers is either by ſowing, or parting the old roots; but the old roots being very apt to degenerate, the ſowing them is much the beſt method.

The ſeeds muſt be ſown in a nurſery-bed in Auguſt or September, and in the March following the plants will appear above the ground, at which time they muſt be carefully cleared of weeds, and watered gently at times, if the dryneſs of the ſeaſon requires it. In the beginning of May they will be ſtrong enough to be tranſplanted, and muſt then be placed at eight inches diſtance, in beds of good, freſh, undunged earth, and they muſt here be alſo kept cleaned from weeds, and watered as they may require it; at Michaelmas they may be removed into the borders of the flower-garden, and in the May following they will flower.

Its medicinal virtues are various; it removes the ſcurvy, promotes a diſcharge of urine, and the menſes. The flowers have a cordial quality, and are eſteemed good in malignant fevers, ſmall-pox, and meaſles. Its ſyrup is excellent in diſorders of the throat and breaſt; and a decoction of the whole herb and root in wine, with the addition of a little ambergris, is alſo recommended againſt impotency and barrenneſs.

COLUMBINE, *feathered*, in *Botany*. See *Meadow* RUE.

COLUMBINE, a kind of *violet*-COLOUR, called alſo *dove-colour*. See DYING.

COLUMBO *root* derives its name from *Columbo*, a town in the iſland of Ceylon, whither it was tranſplanted from Aſia. This root is compoſed of three laminæ, the cortical about one fourth of an inch thick, the ligneous about half an inch, and the medullary, which is about an inch in diameter. It is brought into Europe in circular pieces about three inches thick, covered with a wrinkled bark of a dark brown hue, and internally it is of a light yellow. It hath an aromatic ſmell, and is bitter, and ſlightly pungent to the taſte. It is reckoned almoſt a ſpecific in the cholera morbus, nauſea, indigeſtion, bilious fever, diarrhœa, dyſentery, and moſt diſorders of the ſtomach and bowels. It is ſedative, corroborant, and antiſeptic. It is more effectual than the bark in preſerving the bile from putridity, and in ſome caſes a good ſubſtitute for it. The common doſe is from ten to fifteen grains every three or four hours. A tincture is made by infuſing an ounce of this root in a pint of brandy, which may be taken in the quantity of a table ſpoonful, and ſpeedily relieves colicky pains ariſing from flatulence and indigeſtion. An extract likewiſe of this root is prepared by digeſting twelve ounces of the powder in three pints of rectified ſpirit of wine; then filtring the tincture, and boiling the reſiduum in different waters, till it yields little or no taſte to the liquor. This decoction is ſtrained and evaporated, until only ſix pints remain; which, after evaporation in a vapour bath, and having the tincture added to it, may be reduced to the conſiſtence of a pill.

COLUMBUS, *Congregation of St.* is the name of a congregation of regular canons, formerly of great extent; having under it an hundred abbeys, or monaſteries, in the Britiſh iſlands. See CONGREGATION, and CANON.

COLUMELLA, in *Natural Hiſtory*, a name given by Mr. Lhuyd to the *mycetitæ*, or FUNGITÆ, a ſort of ſea-corals, when found foſſil, as they very frequently are, in beds of clay, or lodged in ſtone.

COLUMELLA, in *Anatomy*. See UVULA.

COLUMELLÆ *muſculus teres*, a name given by Morgagni, and ſome others, to the muſcle called by Albinus *azygos uvulæ*.

COLUMN, in *Architecture*, a round pillar, made to ſupport, or adorn, a building.

The *column* is the principal, or reigning part, of an architectonical order.

The principal laws and properties of this eminent member of architecture are thus deduced. Every fulcrum, or ſupport, is ſo much the more perfect, as it is the firmer, or carries the greater appearance of firmneſs: and hence all *columns*, or pillars, ought to have their baſe, or foot, broader than themſelves. See BASE.

Again, as a cylinder and a quadrangular priſm are more eaſily removed out of their place than a truncated cone, or a pyramid, on the ſame baſe, and of the ſame altitude; the figure of *columns* ought not to be cylindrical; nor, that of a pilaſter, pyramidal; but both the one, and the other, to be contracted, or diminiſhed; i. e. to grow leſs and leſs, like a truncated cone, and a truncated pyramid.

For the ſame reaſon, the loweſt parts of *columns* ought to be cylindrical; that of pilaſters, pyramidal: hence, again, as *columns* are more firm, if their diameter bears a greater proportion to their height, than if it bore a leſs; the greater ratio is to be choſen, where a large weight is to be ſuſtained; and leſs, where a leſſer. Further, as the deſign of a *column* is to ſupport a weight, it muſt never be ſuppoſed without an entablature: though a *column* raiſed on an eminent place, ſo as to leave no room to fear its being thruſt out of its place, needs no pedeſtal.

The entire *column*, in each order, is compoſed of three principal parts; the *baſe*, the *ſhaft*, and the *capital*. See the proportions of each, under its reſpective head, CAPITAL, &c. Each of theſe parts, again, is ſubdivided into a great number of leſſer, called *members*, or *mouldings*: ſome whereof are eſſential, and found in all *columns*; others are only accidental, and found in particular orders.

Columns are different, according to the ſeveral orders they are uſed in; and likewiſe, not only with regard to their order, but alſo to their matter, conſtruction, form, diſpoſition, and uſe. With regard to order, we have the

COLUMN, *Tuſcan*, the ſhorteſt, and moſt ſimple, of all the *columns*. Its height, according to Vitruvius, Palladio, and Vignola, is ſeven diameters, or fourteen modules; according to Scamozzi, it is fifteen modules; to De Lorme, twelve; to Trajan's *column*, ſixteen. Its diminution, according to Vitruvius, is one fourth of the diameter; according to Vignola, a fifth; and according to Trajan's *column*, a ninth. Its ſeveral parts, mouldings, &c. ſee under their proper heads; and the entire figure, ſee repreſented in *Tab. Architect. fig.* 24.

COLUMN, *Doric*, is ſomewhat more delicate: its ſhaft is adorned with flutings: its height, according to Vitruvius, is from fourteen to fifteen modules; to Scamozzi, ſeventeen; to Vignola, ſixteen; in the Coliſeum, nineteen; in the theatre of Marcellus, fifteen two thirds. Its diminution, according to the theatre of Marcellus, twelve minutes; to the Coliſeum, four minutes and a half. See *Tab. Architect. fig.* 25.

COLUMN, *Ionic*, is more delicate ſtill; it is diſtinguiſhed from the reſt by the volute in its capital, and by its baſe. See VOLUTE.

Its height, according to Palladio, is ſeventeen modules one third; according to Vignola, eighteen. Its diminution, in the temple of Concord, ten minutes and a half; of Fortuna Virilis, ſeven and a half; Coliſeum, ten minutes. See *Tab. Architect. fig.* 26.

COLUMN, *Corinthian*, is the richeſt and moſt delicate of all the *columns*. Its capital is adorned with two rows of leaves, and with caulicoles; whence ſpring out little volutes.

Its height, according to Vitruvius, and many remains of antique porticos, temples, &c. is nineteen modules; according to Serlio, eighteen: to the Coliſeum, ſeventeen and ſeven tenths; to the three *columns* in the Campo Vaccino, twenty; the baſilica of Antoninus, twenty. Its diminution, according to the temple of Peace, is ſix minutes and a half; the Pantheon, ſix one eighth; temples of Sybil and Fauſtina, eight; Conſtantine's arch, ſeven; portico of Septimius, ſeven and a half. See *Tab. Architect. fig.* 27.

Column, *Compoſite*, has two rows of leaves in its capital, like the Corinthian; and angular volutes, like the Ionic. See Composite.

Its height, according to Vignola, and the arch of Titus, is twenty modules; to Scamozzi, and the temple of Bacchus, nineteen and a half; the arch of Septimius, nineteen and nine tenths. Its diminution, according to Titus's and Septimius's arches, ſeven minutes; baths of Diocleſian, eleven minutes one third; temple of Bacchus, ſix and a half. See *Tab. Architect. fig.* 28.

An ingenious architect has furniſhed the editor with the following table, accommodated to the meaſures of the moſt approved architects for the four firſt orders; and as the Compoſite (which many will not allow to be a diſtinct order) has the beſt effect when put to the meaſures of the Corinthian, the meaſures may be ſupplied from thoſe of that order.

It may be here obſerved, that there ſeems more of caprice than reaſon in that diverſity found in the heights of *columns* of the ſame order, in different authors; each of whom frequently takes the liberty of diſpenſing with his own rules. Vitruvius, for inſtance, makes the Doric *columns* of temples ſhorter than thoſe of porticos behind theatres; Palladio gives a greater height to *columns* ſtanding on pedeſtals, than to thoſe which have none; and Serlio makes his *column* a third ſhorter, when inſulate, or detached, than when contiguous to a wall.

But notwithſtanding the diverſity of height in *columns* of the ſame order in different authors, they ſtill bear a like proportion in the ſeveral orders compared with each other; by which they go increaſing, as the orders are leſs maſſive.

But this augmentation is greater in ſome ordonnances than in others: for in the antique it is but of five modules, or ſemidiameters for the five orders; the ſhorteſt *column*, that is, the Tuſcan, being fifteen modules; and the longeſt, the Compoſite, twenty. In Vitruvius, this increaſe is alſo of five modules; but commences from fourteen modules, and ends at nineteen. The moderns uſually make it greater: Scamozzi makes it five modules and a half; Palladio and Serlio, ſix.

From the ſeveral proportions of *columns* aſſigned by ſeveral authors, M. Perrault has drawn a new one; which is a mean between the extremes of the reſt. Thus, he makes the Tuſcan *column* fourteen modules two thirds; which is a kind of mean between the Tuſcan of Vitruvius, fourteen, and that of Trajan's *column*, eighteen: the height of the Doric *column* he makes ſixteen modules; which is a mean between the fourteen of Vitruvius, and the nineteen of the Coliſeum: the Ionic he makes ſeventeen modules one third; which is a mean between the ſixteen of Serlio, and the nineteen of the Coliſeum: the Corinthian *column* he makes eighteen modules two thirds; as being a medium between the ſixteen modules ſix minutes of the temple of the Sybil, and the twenty modules ſix minutes of the three *columns* of the Roman Forum: laſtly, the Compoſite *column*, by the ſame rule he makes twenty modules; that height being a mean between the arch of Titus, and the temple of Bacchus.

Indeed, the rule by which he proceeds ſeems very reaſonable; viz. that the progreſſional advance of each *column* in the different orders is to be equal; ſo that having ſettled the whole progreſſion, from the Tuſcan to the Compoſite, at five modules ten minutes; this being a mean between the five modules of the antique, and the five and a half of the moderns; he divides this ſum, which is one hundred and ſixty minutes, into four equal parts, giving forty minutes to the progreſſion of each order: this makes the Tuſcan *column* fourteen modules twenty minutes; the Doric becomes ſixteen, the Ionic ſeventeen ten minutes, the Corinthian eighteen twenty minutes, and the Compoſite twenty modules.

For the diſtinguiſhing characters of each order of *columns*, ſee **ORDER**. For the matter of *columns*, ſee **STONE**, **MARBLE**, &c. For their uſe and application, ſee **BUILDING**. For the ranging of *columns*, and the ſpaces to be obſerved between each, ſee **INTERCOLUMNATION**.

COLUMNS, *different with regard to their matter.*

COLUMN, *fuſible.* Under this term are comprehended, not only *columns* of various metals, and other fuſible matters, as glaſs, &c. but alſo thoſe of ſtone, ſaid to have been caſt; the ſecret of which ſome will have us believe to have been known to the ancients.

COLUMN, *hydraulic*, is that whoſe ſhaft appears to be of cryſtal; being formed by a number of little threads of water, falling from holes made in a girt of metal, at equal diſtances, by means of a pipe mounting through the middle thereof; as in the gardens at Verſailles.

COLUMN, *hydraulic*, alſo denotes a *column* from whoſe top proceeds a *jet d'eau*, to which the capital ſerves as a baſon; whence the water deſcends by a little pipe, which turns ſpirally around the ſhaft. Such are the Ionic *columns* of the caſcade of the Belvidera at Freſcati; and thoſe of the vineyard Matthei at Rome.

COLUMN, *moulded*, is that made by impaſtation, of gravel and flints of divers colours, which are bound together with a cement, which grows perfectly hard, and receives a poliſh like marble.

The ſecret of making theſe, it appears, the ancients were maſters of, by the *columns* lately diſcovered near Algiers; which are, doubtleſs, the ruins of the ancient Julia Cæſarea: on all theſe is found the very ſame inſcription in antique characters; the contours, accents, and even faults, being repeated in every ſhaft: an inconteſtable proof of their being moulded.

COLUMN, *tranſparent*, any *column* made of tranſparent matter: as were thoſe of cryſtal in the theatre of Scaurus, mentioned by Pliny; and thoſe of tranſparent alabaſter, in the church of St. Mark, at Venice.

COLUMN, *water*, is a ſort whoſe ſhaft is formed of a large *jet d'eau*; which, ſpouting out water violently from the baſe, drives it within the tambour of the capital, which is made hollow; whence, falling down again, it has the effect of a liquid cryſtal *column*. See **FOUNTAIN**.

An inſtance of this we have at Quinta d'Aveiro, near Liſbon.

COLUMN *of bands*, or *tambours*, that whoſe ſhaft is formed of ſeveral courſes of ſtone, or blocks of marble, leſs high than the diameter of the *column*: this is what Uppian means by *columna ſtructilis*, or *adpacta*; which is oppoſite to the *columna ſolida*, or *integra*, i. e. of one piece.

COLUMNS, *with regard to their conſtruction.*

COLUMN *of Joinery*, is that made of ſtrong timber-boards, joined, glued, and pinned together: it is hollow, turned in the lathe, and uſually fluted. Such are the *columns* in moſt altar-pieces.

COLUMN *of Maſonry*, is made of rough ſtone, well laid and covered with plaſter; or of bricks moulded triangular-wiſe, and covered with ſtucco.

COLUMN *in truncheons*, or pieces, conſiſts of three, four, or five pieces of ſtone, or metal; differing from the tambours, as being higher than the diameter of the *column*.

COLUMN, *geminated*, that whoſe ſhaft is formed of three ſimilar and equal ſides, or ribs of ſtone, fitted within one another; and faſtened at bottom with iron pins, and at the top with cramp-irons. This is to be fluted, that the joints may be the leſs diſcernible.

COLUMN, *incruſtated*, is made of ſeveral ribs, or thin ſhells of fine marble, or ſome other rare ſtone, cemented upon a mould of ſtone, brick, or the like. This is done with deſign both to ſave the precious matter, as oriental jaſper, lapis lazuli, agat, &c. or to repreſent pieces of ſuch ſtones of an extraordinary ſize, by the neatneſs and cloſeneſs of the incruſtation, which renders the joints imperceptible.

COLUMN, *cabled*, or *rudented*, is a *column* having projectures in form of cables, or canes, in the naked of the ſhaft; each cable having an effect oppoſite to that of a fluting; and accompanied with a little liſt on each ſide.

COLUMN, *corolitic*, that adorned with foliages, or leaves and branches turned ſpirally around the ſhaft; or in form of crowns and feſtoons.

Theſe were uſed by the ancients for erecting ſtatues on; which hence took the denomination of *corolitic*. They are very ſuitable in triumphal arches, and decorations of theatres.

COLUMN, *coloſſal*, a *column* of enormous ſize, too large to enter any ordonnance of architecture; to be placed ſolitary, in the middle of a ſquare, &c.

Such is the Trajan *column*; whoſe proportions are Doric, its profile Tuſcan, and its pedeſtal Corinthian; twelve feet and one eighth in diameter, and one hundred in height, including the baſe and the capital. Its baſe conſiſts of twelve ſtones of an enormous ſize, and it is raiſed on a ſocle or foot of eight ſteps. The pedeſtal of this *column* has eighteen feet, and the crowning ſixteen and a half. It ſupports a brazen ſtatue of St. Peter, thirteen feet high; the whole making one hundred and forty-ſeven ancient Roman feet. It was built by Apollodorus, in a large ſquare at Rome called the Forum Romanum; and conſiſts of thirty-four tambours, or blocks, or pieces of white marble, taking in the crowning. It is adorned from top to bottom with baſſo relievos, repreſenting the great actions of that emperor againſt the Dacæ.

Several learned men have explained the bas reliefs of the Trajan *column*; and among others, Ciaconius and Fabretti. The late king of France, Lewis XIV. had models of all the bas reliefs taken off in plaiſter of Paris. See **COLUMN**, *hiſtorical*, and *hollow*.

The Antonine *column*, which is alſo of white marble, is inferior to the Trajan in beauty of ſculpture, but exceeds it in height; being one hundred and ſixty-eight feet to the capital, beſides ſeven feet of the pedeſtal under-ground. See **COLUMN**, *hollow*.

Laſtly, the London *column*, or **MONUMENT**, is of ſtone, fiſteen feet in diameter, and two hundred and two high; taking in the pedeſtal and crowning.

COLUMN, *cylindrical*, is that which has neither ſwelling nor diminution.

COLUMN, *diminiſhed*, is that which has no ſwelling, but begins to taper, or diminiſh, from the baſe; in imitation of trees.

Such are moſt of the antique *columns* of granite; particularly the Corinthian ones in the porch of the Pantheon.

To diminiſh a column. Draw a tranſverſe line (*Plate Architecture*, *fig.* 36.) at one third of the whole height of the *column*; then ſet off the diminution on each end of that line: on the extreme diameter of the *column* inwards deſcribe a ſemicircle, and continue the diviſions laſt made to the neck of the *column*; divide the intermediate ſpace into ſix equal parts, and make the like number of diviſions on that part of the circle which is between the perpendiculars of the necking and the greateſt diameter; lines drawn from theſe diviſions will interſect the ſeveral tranſverſe lines, and give the diameter at each of thoſe points: a curve drawn that will touch in thoſe points, will form the outline of the *column* properly diminiſhed.

COLUMNS *denominated from their form.*

COLUMN, *fluted*, called alſo *channelled*, and *ſtriated column*; that whoſe ſhaft is adorned with flutes, or channellings; either from top to bottom, or only two thirds of its height.

Column, *fluted and cabled*, is that whoſe flutes are filled up with cables, reeds, or ſtaves; beginning from the bottom of the ſhaft, and reaching one third of its height.

Column, *fluted, enriched*, is that whoſe flutings are filled up with ornaments of foliages, rinds, ribbons, &c. inſtead of cables.

Column, *Gothic*, a round pillar, either too ſhort for its bulk, or too ſlender for its height; as having, ſometimes, twenty diameters; and this without either diminution, or ſwelling: yet its ornaments, and the characters of its work, being as far from thoſe of the antique, as its proportions.

Column, *Hermetic*, a kind of pilaſter, in manner of a terme; having the head of a man, in lieu of a capital. It had its name from a cuſtom, among the ancients, of placing Mercury's head, whom the Greeks call *Hermes*, at the top of *columns*.

Columns, *maſſive*, are thoſe too ſhort for the order whoſe capital they bear; as the pillars in Gothic churches uſually are. See Massive.

Under the term *maſſive* are, likewiſe, frequently comprehended *ruſtic* and *Tuſcan columns*.

Column, *oval*, that whoſe ſhaft has a flatneſs; its plan being made oval, to reduce the projecture.

Column, *paſtoral*, that whoſe ſhaft is formed in imitation of the trunk of a tree, with bark and knots.

This kind of *column*, in the Tuſcan proportion, may be uſed in the gates of parks and gardens; and in the decoration of paſtoral ſcenes, &c.

Column, *polygonous*, has ſeveral ſides, or faces: the moſt regular of theſe have eight faces.

This, with the oval and cylindrical *columns*, Daviler regards as abuſes in architecture.

Column, *ſerpentine*, a *column* formed of three ſerpents, twiſted together; the heads whereof ſerve as a capital.

An inſtance of this is at Conſtantinople, in the ſquare called Atmeidan, anciently the Hippodrome. P. Gyllius calls this the *Delphic column*; as imagining it anciently ſerved for the tripod of Apollo, in the temple at Delphos. It is now ordinarily called the *taliſman*, or *enchanted column*.

Columns, *ſwelled*, are thoſe which have a bulging, or ſwelling, in proportion to the height of the ſhaft.

Authors are much divided on the ſubject of this *ſwelling*. Sir H. Wotton treats it as a moſt ridiculous abuſe: yet the practice obtains among the modern architects; who generally make their *columns* a little bigger at one third of their height, than at the baſe; i. e. they diminiſh the *column* near the baſe; which makes the upper part appear big, and occaſions a ſwelling at about one third of the height.

This ſwelling appears to have been unknown to the ancients. M. Le Clerc obſerves, it ought not to exceed one minute and a half at moſt. He thinks it ought never to be uſed, excepting where there is a particular occaſion for it; as where *columns* are to be placed over one another.

Column, *twiſted*, is that whoſe ſhaft is twiſted round, in manner of a ſcrew, with ſix circumvolutions; being, ordinarily, of the Corinthian order. Vignola firſt found a method of drawing it by rule.

Column, *twiſted fluted*, is that whoſe flutes follow the contour of the ſhaft, in a ſpiral line throughout the whole length; whereof there are ſome antique ones of porphyry, and hard marble.

Column, *twiſted and enriched*, is that, one third of whoſe ſhaft is fluted, and the reſt adorned with foliages and other enrichments: and which, being all of marble, is enriched with ſculpture from bottom to top.

Sometimes, again, the *twiſted column* is formed of two or three ſlender ſhafts, twiſted round, ſo as to leave a cavity in the middle. Sometimes the flutings are ſpiral, yet the ſhaft ſtrait; which ſucceeds very well in the more delicate orders.

Columns *denominated from their diſpoſition.*

Column *inſerted*, or *backed*, is that let into a well, a third or fourth part of its diameter.

Column *niched*, is that whoſe ſhaft enters, with half its diameter, into a wall, which is hollowed for its reception; with its plane parallel to the projecture of the tore. Such is that in the portal of St. Peter at Rome.

Column, *angular*, is an inſulated *column*, placed in the coin, or corner of a portico; or inſerted into the corner of a building: or even a *column* that flanks an angle, either acute or obtuſe, of a figure of many ſides.

Column, *attic*, according to Pliny, is a pilaſter inſulated; having four equal faces, or ſides; and of the higheſt proportion, v. g. Corinthian.

Columns, *cantoned*, are thoſe engaged in the four corners of a ſquare pillar, to ſupport four ſprings of an arch.

Columns, *coupled*, are thoſe diſpoſed, by two and two, ſo as almoſt to touch each other at their baſes, and capitals.

Column, *doubled*, is an aſſemblage of two *columns*, joined in ſuch a manner, as that the two ſhafts penetrate each other with a third of their diameter. Such are thoſe of the four angles in the court of the Louvre.

Column, *flanked*, according to M. Blondel, is a *column* engaged with one half, or at leaſt one third of its diameter, between two demi-pilaſters.

Columns, *grouped*, are thoſe placed on the ſame pedeſtal, or ſocle; either by three and three, or by four and four.

Column, *inſulated*, is that ſtanding free, and detached on all ſides, from any other body.

Columns, *median*. Vitruvius gives the name *columnæ medianæ* to the two *columns* in the middle of a porch, which have their intercolumniation larger than the reſt: that if theſe laſt, for inſtance, be *pycnoſtyle*, the *medianes* are *euſtyle*.

The term may alſo be applied to the middle row of *columns*, in a frontiſpiece adorned with three orders.

Column, *Trajan*, a famous hiſtorical column, erected in Rome, in honour of the emperor Trajan. See Column, *coloſſal*.

Columns *denominated from their uſe.*

Column, *aſtronomical*, is a kind of obſervatory, in form of a very high tower; built hollow, and with a ſpiral aſcent to an armillary ſphere placed at the top, for obſerving the motions of the heavenly bodies.

Such is that, of the Doric order, erected at the Hotel de Soiſſons, at Paris, by Catherine De Medicis, for the obſervations of Orontius Fineus, a celebrated aſtronomer of that time.

Column, *chronological*, that which bears ſome hiſtorical inſcription, digeſted according to the order of time; as by luſtres, olympiads, faſti, epochas, annals, &c. At Athens there were *columns* of this kind, whereon were inſcribed the whole hiſtory of Greece, digeſted into olympiads.

Column, *funeral*, is that which bears an urn, where are ſuppoſed to be incloſed the aſhes of ſome deceaſed hero; and whoſe ſhaft is ſometimes overſpread with tears, or flames; which are ſymbols of grief, and of immortality.

Column, *gnomonic*, is a cylinder, whereon the hour of the day is repreſented by the ſhadow of a ſtyle.

Of theſe there are two kinds: in the one, the ſtyle is fixed, and the hour-lines are no more than the projection of a vertical dial on a cylindrical ſurface.

In the other, the ſtyle is moveable; and the hour-lines are drawn to the different heights of the ſun, in the different ſeaſons of the year. See Dial.

Column, *hiſtorical*, is that whoſe ſhaft is adorned with a baſſo relievo, running in a ſpiral line its whole length, and containing the hiſtory of ſome great perſonage. Such are the Trajan and Antonine *columns* at Rome.

Hiſtorical columns may likewiſe be divided by bands, or tambours, into ſeparate baſſo relievos, containing diſtinct ſubjects; by which means, the ſame *columns* may likewiſe be made to anſwer the end of chronological ones. This manner Vignola prefers to the former; which, he thinks, appears too much confuſed.

Column, *hollow*, that which has a ſpiral ſtaircaſe withinſide, for the convenience of aſcending to the top. As the Trajan *column*, the ſtaircaſe whereof conſiſts of one hundred and eighty-five ſteps, and is illumined by forty-four little windows.—The Antonine *column* has one hundred and ninety-eight ſteps, with fifty-ſix windows; each of theſe is divided by tambours of white marble. The monument or fire-*column* at London, has alſo a ſtaircaſe; but it does not reach to the top. Theſe kind of *columns* are called alſo *columnæ coclides*, or *cochlideæ*. See Monument.

Column, *indicative*, that which ſerves to ſhew the tides, &c. along the ſea-coaſts. Of this kind, there is one at Grand Cairo, of marble, whereon the overflowings of the Nile are expreſſed: by this they form a judgment of the ſucceeding ſeaſon: when the water, for inſtance, aſcends to twenty-three feet, it is a ſign of great fertility in Egypt.

Column, *inſtructive*, that raiſed, according to Joſephus, lib. i. cap. 3. by the ſons of Adam, whereon were engraven the principles of arts and ſciences.

Baudolet tells us, that the ſon of Piſiſtratus raiſed another of this kind, of ſtone; containing the rules and precepts of agriculture.

Column, *itinerary*, a *column* with ſeveral faces, placed in the croſs-ways in large roads; ſerving to ſhew the different routes, by the inſcriptions thereupon.

Column, *lactary*, at Rome, according to Feſtus, was a *column* erected in the herb-market, which is now the place Montanara; which had a cavity in its pedeſtal, wherein young children, abandoned by their parents, out of poverty or inhumanity, were expoſed, to be brought up at the public expence.

Column, *legal.* Among the Lacedæmonians, there were *columns* raiſed in public places, whereon were engraven the fundamental laws of the ſtate.

Column, *limitrophous*, or *boundary*, is that which ſhews the limits of a kingdom, or country conquered. Such was that, which Pliny ſays Alexander the Great erected at the extremities of the Indies.

As to thoſe of Hercules, ordinarily called his *columns*, or *pillars*; they are two very ſteep mountains in the ſtreights of Gades, now Gibraltar.

Column, *luminous*, is a ſort of *column* formed on a cylindrical frame, mounted and covered over with oiled paper, or gauze; ſo that lights being diſpoſed in ranks within, over each other, the whole appears as on fire.

This ſort of *column* is likewiſe made with rows of lamps, or torches running round its ſhaft; either in horizontal belts, or bands; or in a ſpiral line, over a continued feſtoon of flowers.

Column, *manubiary*, from the Latin *manubiæ*, *ſpoils of the enemy*; a *column* adorned with trophies, built in imitation of trees, whereon the ſpoils of enemies were anciently hung.

Column, *memorial*, that raiſed on occaſion of any remarkable event; as the monument in London, built to perpetuate the memory of the burning of that city, in 1666. It is of the Doric order, fluted, hollow, with a winding ſtaircaſe; and terminated at top with waving flames. See Monument.

There is alſo another of the like kind, in form of an obeliſk, on the banks of the Rhine in the Palatinate, in memory of the famous paſſage of that river, by the great Guſtavus Adolphus, and his army.

Column, *menian*, any *column* which ſupports a balcony, or meniana. The origin of this kind of *column*, Suetonius and Aſcanius refer to one Menias; who, having ſold his houſe to Cato and Flaccus, conſuls, to be converted into a public edifice, reſerved to himſelf the right of raiſing a *column* without-ſide, to bear a balcony; whence he might ſee the ſhews.

Column, *miliary*, was a *column* of marble, raiſed by order of Auguſtus, in the middle of the Roman Forum; from whence, as a center, the diſtances of the ſeveral cities, &c. of the empire were reckoned, by other *miliary columns* diſpoſed at equal diſtances, on all the grand roads. This *column* was of white marble; the ſame with that which is now ſeen on the balluſtrade of the perron of the Capitol at Rome. Its proportion is maſſive; being a ſhort cylinder, ſupporting a ſymbol of the globe of the earth.

It was called *milliarium aureum*, as having been gilt, at leaſt the ball, by order of Auguſtus. It was reſtored by the emperors Veſpaſian and Adrian; as appears by the inſcriptions.

Column, *military*, among the Romans, a *column* whereon was engraven a liſt of the forces in the Roman army, ranged by legions, in their proper order; with deſign to preſerve the memory of the number of ſoldiers, and of the order preſerved in any military expedition.

The Romans had another kind of *military column*, which they called *columna bellica*, ſtanding before the temple of Janus; at the foot whereof the conſul declared war, by throwing a javelin towards the enemies countries.

Column, *phoſphorical*, a *light-houſe*; or a hollow *column*, built on a rock, or the tip of a mole, or other eminence, to ſerve as a lantern to a port.

Column, *roſtral*, that adorned with the beaks or prows of ſhips, and gallies, with anchors and grapplers; erected, either in memory of a naval victory; as the Tuſcan *column*, in the Capitol: or, in honour of ſome admiral; as the Doric ones, at the entrance of the caſtle de Richelieu.

Column, *ſepulchral*, anciently, was a *column*, erected on a a tomb or ſepulchre; with an inſcription on its baſe. See Tomb, &c.

Thoſe over the tombs of perſons of diſtinction were very large; thoſe for the common people ſmall: theſe laſt are called *ſtelæ* and *cippi*.

Column, *ſtatuary*, that which ſupports a ſtatue. Such was that erected by pope Paul V. on a pedeſtal before the church of St. Maria Major at Rome; to ſupport a ſtatue of the Virgin, which is of gilt braſs. See Statue.

This *column* was dug up in the temple of Peace; its ſhaft is a ſingle block of white marble, forty-nine feet and an half high, and five feet eight inches diameter; of the Corinthian order, fluted.

The term *ſtatuary column*, may likewiſe be applied to Caryatides, Perſians, Termini, and other human figures; which do the office of *columns*; and which Vitruvius calls *Telamones*, and *Atlantes*.

Column, *ſymbolical*, is a *column* repreſenting ſome particular country, by the attributes proper thereto; as that of the French order, ſet with fleurs-de-lis, in the frontiſpiece of the Jeſuits church at Rouen: or ſome memorable action; as the *Corvinian column*, on which was a crow; erected to Valerius Maximus, ſurnamed Corvinus, in memory of his defeat of a giant in the army of the Gauls, by the aſſiſtance of a crow.

Under the title of *ſymbolic columns*, may alſo be comprehended thoſe which ſerve for ſymbols. Such is that on a medal of Nero, which expreſſes the ſtability of the Roman empire. See Symbol.

Column, *triumphal*, a *column* erected among the ancients in honour of an hero; the joints of the ſtones, or courſes whereof, were covered with as many crowns, as he had made different military expeditions.

Each crown had its particular name: as vallaris, which was beſet with ſpikes, in memory of having forced a paliſade: muralis, adorned with little turrets, or battlements; for having mounted an aſſault: navalis, of prows and beaks of veſſels; for having overcome at ſea: obſidionalis, or graminalis, of graſs; for having raiſed a ſiege: ovans, of myrtle; which expreſſed an ovation or little triumph: and triumphalis, of laurel; for a grand triumph.

Procopius tells us of a *column* of this kind, erected in the place called Auguſteum, before the imperial palace of Conſtantinople, ſupporting an equeſtrian ſtatue of the emperor Juſtinian.

Column, *zoophoric*, a kind of ſtatuary *column*, whereon is placed a figure of ſome animal. Such is one of the two *columns* of the great gate of Venice; whereon is the lion of St. Mark, and the arms of the republic: or that at Sienna, which bears the wolf that ſuckled Romulus and Remus.

Column, *ſcenography of a.* See Scenography.

Column, in *War*, denotes a deep file, or row of troops; or diviſion of an army, which marches at the ſame time, and towards the ſame place, at intervals large enough to avoid confuſion.

An army marches in one, two, three, or more *columns*, according as the ground will allow, and the general ſees expedient.

The word is ſometimes alſo uſed in ſpeaking of veſſels at ſea, following each other in the ſame line.—It is difficult to form *columns* at ſea, unleſs the wind be in ſtern.

Column, among *Printers*, is half a page, when the page is divided into two parts, from top to bottom. See Printing.

COLUMNA *naſi*, is uſed by ſome writers of anatomy, for the fleſhy end of the nose, jutting out over the upper lip.

Columna *oris*, is ſometimes uſed for the uvula.

COLUMNÆ *carneæ*, in *Anatomy*, called alſo *lacertuli*, and *columnæ cordis*, are ſeveral ſmall muſcles in the ventricles of the heart; derived, and, as it were, detached from the parietes of thoſe ventricles, and connected by tendinous extremities to the valves of the heart.

Theſe little *columns*, or pillars, being faſtened to the parietes of the heart on one ſide, and the tricuſpid and mitral valves on the other, do, by their contraction in the ſyſtole of the heart, draw out the valves; and by that means, not only ſhut the orifices of the veins, but more exactly cloſe their ventricles in their ſyſtole.

COLUMNAR *marble.* See Basaltes.

COLUMNARIS, in *Botany*, a name given by ſome to the tall, milky bell-flower; the *campanula lateſcens.* Ger. Emac. Ind. 2.

COLUMNARIUM, in *Roman Antiquity*, a heavy tribute, demanded for every pillar of a houſe. It was firſt laid on by Julius Cæſar, in order to put a ſtop to the extravagant expences laid out on ſumptuous buildings.

COLUMNEA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower hath one petal, of the ringent or grinning kind, with a ſwelling tube, divided above into two lips; the upper erect and entire, the lower divided into three parts which ſpread open: it hath four ſtamina, two longer than the other; theſe are encloſed in the upper lip. In the center is ſituated a roundiſh germen, which afterward becomes a globular berry with two cells ſitting in the empalement, containing ſeveral oblong ſeeds. We know but one ſpecies, which grows naturally in the warmeſt parts of America.

COLUMNELLA, *little column*, in *Botany*, denotes the ſubſtance that paſſes through the capſule, and connects the ſeveral partitions and ſeeds.

COLUMNIATED *winding ſtairs.* See Stairs.

COLUMNIFERI, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

COLURES, in *Geography* and *Aſtronomy*, are two great circles, imagined to interſect each other at right angles, in the poles of the world.

The word is derived from κολος, *mutilus*, or *truncatus*, and ουρα, *tail*; q. d. *appearing with the tail cut off*; becauſe never ſeen entire above the horizon.

The *colures* paſs, one of them through the ſolſtitial, and the other through the equinoctial point of the ecliptic: whence the firſt is denominated the *ſolſtitial*, and the ſecond the *equinoctial colure*.

The equinoctial *colure* determines the equinoxes; and the ſolſtitial, the ſolſtices.

By thus dividing the ecliptic into four equal parts, they alſo mark the four ſeaſons of the year.

It is diſputed over what part of the back of Aries the equinoctial *colure* paſſed in the time of Hipparchus. Sir Iſaac Newton, in his Chronology, takes it to have been over the middle of the conſtellation. Father Souciet inſiſts on its having paſſed over the dodecatemorion of Aries, or midway between the rump and firſt of the tail. We have ſome obſervations, in the Philoſophical Tranſactions, N° 466, concerning the poſition of this *colure* in the ancient ſphere, from a draught of the conſtellation Aries, in the Aratæa publiſhed at Leyden and Amſterdam, 1652, which ſeem to confirm Sir Iſaac's opinion; but the antiquity and authority of the original draught may ſtill remain in queſtion. See CHRONOLOGY.

COLUTEA, in *Botany*. See *Bladder* SENA.

COLYBA, or COLYBUS, a term in the *Greek Liturgy*, ſignifying an offering of corn, and boiled pulſe, made in honour of the ſaints, and for the ſake of the dead.

Balſamon, P. Goar, Leo Allatius, and others, have written on the ſubject of *colybæ*: the ſubſtance of what they have ſaid, is as follows.

The Greeks boil a quantity of wheat, and lay it in little heaps on a plate; adding beaten peas, nuts cut ſmall, and grape-ſtones, which they divide into ſeveral compartments, ſeparated from each other by leaves of parſley. A little heap of wheat, thus ſeaſoned, they call κολυβα.

They have a particular formula for the benediction of the *colybæ*: wherein, praying that the children of Babylon may be fed with pulſe, and that they may be in better condition than other people, they deſire God to bleſs thoſe fruits, and thoſe who eat them, becauſe offered to his glory, to the honour of ſuch a ſaint, and in memory of the faithful deceaſed. Balſamon refers the inſtitution of this ceremony to St. Athanaſius; but the Greek Synaxary to the time of Julian the Apoſtate.

Many of the Latin divines having ſpoken injuriouſly of this ceremony, Gabriel archbiſhop of Philadelphia, has written a diſcourſe in its vindication: wherein he endeavours to ſhew, that the deſign of the *colyba* is only to repreſent the reſurrection of the dead, and to confirm the faithful in the belief thereof. The *colybæ*, he ſays, are ſymbols of a general reſurrection; and the ſeveral ingredients added to the wheat, ſignify ſo many different virtues.

COLYMBIS, in *Zoology*, a name given by Bellonius to a ſpecies of duck, remarkable for a large tuft of feathers behind its head, and thence called by us the tufted duck, and known among authors by its Venetian name CAPO *negro*. See DUCK.

COLYMBUS, the *diver*, in the Linnæan ſyſtem of *Zoology*, the name of a diſtinct genus of birds, of the order of the *anſeres*. See DIVER.

COLYTEA, in *Botany*, is uſed by ſome to denote the *arbor Judæa*, or SILIQUASTRUM.

COMA, in *Medicine*, a ſort of ſleepy diſeaſe, otherwiſe called *cataphora*; always bringing on a violent propenſity to ſleep, whether ſleep enſue, or not.

If ſleep do enſue, the diſeaſe is called *coma ſomnolentum*, wherein the patient continues in a profound ſleep; and when awaked, immediately relapſes, without being able to keep open his eyes. If he does not ſleep, but is continually awaked with frightful dreams, it is called *coma vigil*: in this caſe alſo his eyes are ſhut, and he appears aſleep.

The cauſe of the *coma ſomnolentum* may be any thing that prevents the courſe of the ſpirits; as a cold humid temperature of the brain; hot putrid vapours aſcending into the head, and ſtopping the canals of the animal ſpirits; narcotic vapours, &c. The *coma vigil* is ſuppoſed to ariſe from the conflict, or jarring mixture of bile with pituita; the one urging to ſleep, the other to waking. Hence the patient ſleeps either not at all, or, at moſt, but for a moment; is uneaſy, ſtarts, riſes up, and ſometimes throws himſelf on the perſons near him; his eyes continuing all the time faſt cloſed.

The remedies for a *coma*, are thoſe which occaſion great evacuations, as violent clyſters, or vomitives; medicines that purge, and dry the brain; and thoſe which occaſion revulſion of humours, as veſicatories, cauteries, &c. to which may be added volatile ſpirits, ſalts, and moſt cephalics. See LETHARGY.

The natural proceſs of death is deſcribed by phyſicians by the following words in the following order; *ſingultus, convulſio, coma, mors*.

COMA, in *Botany*, a ſpecies of fulcra, compoſed of large bracteæ in form of a bruſh of hair, which terminates the ſtalk.

COMA AUREA, in *Botany*. See GOLDY *locks*.

COMA BERENICES, *Berenice's Hair*, in *Aſtronomy*, a modern conſtellation of the northern hemiſphere; compoſed of unformed ſtars between the Lion's tail, and Bootes.

This conſtellation is ſaid to have been formed by Conon, an aſtronomer, in order to conſole the queen of Ptolemy Euergetes, for the loſs of a lock of her hair, which was ſtolen out of the temple of Venus, where ſhe had dedicated it on account of a victory obtained by her huſband. Ricciol. Alm. lib. vi. cap. 4.

The ſtars in the conſtellation *Coma Berenices*, in Tycho's Catalogue, are fourteen; in Hevelius's, twenty-one; and in the Britannic Catalogue, forty-three. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude.
			°	′	″	°	′	″	
		♍	16	53	24	20	21	46	7
			17	44	9	20	2	11	6
			21	14	30	16	27	0	6
			7	21	15	24	45	23	6
			19	56	6	19	59	7	6
5.									
			23	16	44	15	13	55	5
Firſt of all in the circle of the hair, to the ſouth.	*b*		19	18	19	23	28	33	4.5
			20	24	1	22	56	57	7
			17	56	28	27	34	35	6
			17	50	59	27	51	56	6
10.									
			3	5	51	18	19	53	4.5
Third of the prec. from the cuſp, or point.	*e*		9	45	29	25	47	32	5
Second of the preced.	*f*		20	2	23	26	11	47	4.5
That preced. in the cuſp.	*b*		19	55	40	27	26	54	4.5
In the cuſp towards the north.	*c*		19	32	24	28	24	2	4.5
15.									
That under this.	*a*		20	16	55	27	6	50	4.5
That following this.	*d*		21	10	29	26	29	11	4.5
Firſt of three contiguous ones behind this.			22	9	44	24	54	50	5
			20	41	32	27	36	36	6
			23	43	26	22	2	38	6
20.									
Middle of the contiguous ones.	*g*		22	18	15	25	29	10	5
Subſequent, and leſs.			23	1	59	25	29	11	7
Another following all theſe, and more ſouth.	*k*		24	7	1	24	7	9	4
That preceding ſeveral under the hair.			26	7	23	20	17	57	5
			27	6	49	19	19	12	6

		♎	2	42	23	21	45	14	6
			2	5	7	25	55	56	5
			1	22	51	27	14	39	6
40.									
Former of two in the extremity of the hair.		♍	29	2	42	31	49	41	5.4
		♎	4	38	35	22	59	12	4.5
Poſterior in the extremity of the hair.			0	6	31	32	28	33	5.6

All theſe ſtars Ptolemy ranks among the *informes* of Leo; and the cluſter of little ſtars, in form of a nebulous one, between the Lion and Bear, he calls ſimply Πλοκαμον; as reſembling an ivy leaf; the pointed part whereof is turned towards the north, and the ſides bounded by the ſeventh and twenty-ſecond ſtars. Bayer, inſtead of hair, gives a ſheaf of corn.

COMARCHIOS, in *Antiquity*, the name of a particular air, or tune, deſigned to be ſung at entertainments.

COMARIS, in *Lithology*, a name given by the Greek writers to the SELENITIS, or *aphroſelene*.

They called this ſtone alſo *cupholithos*.

COMARUM, in *Botany*, a genus of the *icoſandria polygynia* claſs; *marſh cinquefoil.* Its characters are theſe: the flower hath five oblong petals, which are inſerted in the empalement, but are much ſmaller. It hath twenty permanent ſtamina, which are inſerted into the empalement; and a great number of ſmall roundiſh germina collected into a head. The common receptacle afterward becomes a large fleſhy fruit, having many pointed ſeeds adhering to it. We know but one ſpecies of this plant, which grows naturally in bogs.

COMB, in *Huſbandry*, a meaſure of corn, conſiſting of four Wincheſter buſhels: in ſome places the buſhel contains eight gallons and a quart.

Comb, in *Natural Hiſtory*, the creſt, or red fleſhy tuft growing on the head of a cock.

Comb, in a ſhip, a little piece of timber ſet under the lower part of the beak-head, near the middle: it has two holes in it, and ſupplies to the fore-tacks, what the cheſt-trees do to the main-tacks; that is, to bring the main-tacks aboard.

Comb, in the *Manufacture of Tapeſtry*. See Tapestry.

Comb, *Ladies*, or *Venus's* Comb, the name of a diſtinct genus of plants, called by Tournefort *ſcandix*. See Scandix.

Comb-*fiſh*, *pecten*, in *Ichthyology*. See Pecten.

COMBARONES, in *Antiquity*, the fellow-barons or commonalty of the cinque-ports.

COMBAT, in a general ſenſe, denotes an engagement; or a difference decided by means of arms.

Authors ſometimes diſtinguiſh, in an army, between a *combat* and a battle; the latter expreſſing the general action of the whole army; the former only a particular ſkirmiſh, or engagement of a ſingle part: ſo that the *combat* is properly a part of a BATTLE.

Combat, in *Law*, or, *ſingle combat*, denotes a formal trial, between two champions, of ſome doubtful cauſe or quarrel, by the ſword, or batoons.

This form of proceeding was anciently very frequent, particularly among the barbarous nations in their original ſettlements; and obtained not only in criminal, but alſo in civil cauſes: being built on a preſumption, that God would never grant the victory, but to him who had the beſt right. It was originally permitted, in order to determine points reſpecting the reputation of individuals, but afterwards became much more extenſive. See Duel.

The form and ceremony of the *combat*, is deſcribed in the grand Coutumier of Normandy. The accuſer, firſt, ſwore to the truth of his accuſation; the accuſed gave him the lye: upon which, each threw down a gage, or pledge of battle; and the parties were committed priſoners to the day of *combat*. See Champion.

Hiſtorians tell us, that Alphonſus king of Caſtile, in the eleventh century, deſiring to aboliſh the Moſarabic liturgy, and to introduce the Roman office; the people oppoſing it, it was agreed to terminate the difference by *combat*, and to leave the cauſe to the deciſion of Heaven. One of the earlieſt reſtrictions of this practice that occurs in the hiſtory of Europe, is that of Henry I. of England; which was afterwards followed by an edict of Louis VII. of France to the ſame effect. Robertſon's Hiſt. of Charles V. vol. i. p. 61, &c. and 350, &c. 8vo.

Combat is alſo uſed for the ſolemn games of the ancient Greeks and Romans, performed in honour of their gods; as the Olympic games, Pythian, Iſthmian, and Nemæan games; the ludi Actiaci, Circenſes, &c. which ſee in their places, Olympic, Isthmian, &c.

The *combats* here celebrated, were *running*, *wreſtling*, *boxing*, *ceſtus*, &c. The combatants, who were called *athletæ*, prepared themſelves for it from their youth, by conſtant exerciſe, and a very rigid regimen: they only eat certain things, and at certain hours; drank no wine; had no commerce with women; and both their labour and their reſt were regulated.

COMBATANT, in *Heraldry*, a term for two beaſts, as lions or boars, borne in a coat of arms in a fighting poſture, erect on their hinder feet, and affrontee, or with their faces toward each other.

COMBER, in *Ichthyology*, a ſpecies of fiſh in Cornwall, of a ſlender form, with red back-fins, and tail; yellow belly; a ſmooth, even ſtripe from gills to tail, of a ſilvery colour; and a round tail. Ray, Syn. 163. fig. 5.

COMBINATION, is properly underſtood of an aſſemblage of ſeveral things by two and two: but is more particularly uſed in *Mathematics* to denote the variation, or alternation of any number of quantities, letters, ſounds, or the like, in all the different manners poſſible.

P. Merſenne gives us the *combinations* of all the notes and ſounds in muſic, as far as ſixty-four; the ſum whereof amounts to ninety figures, or places.

The number of poſſible *combinations* of the twenty-four letters of the alphabet, taken firſt two by two, then three by three, &c. according to Mr. Preſtet's calculation, amount to 1391724288887252999425128493402200. The words in the following verſe may be combined a thouſand twenty-two ſeveral ways.

Tot tibi ſunt dotes, virgo, quot ſidera cœlo.

F. Truchet, in the Memoirs of the French Academy, ſhews, that two ſquare pieces, each divided diagonally into two colours, may be arranged and *combined* ſixty-four different ways, ſo as to form ſo many different kinds of chequer-work; which appears ſurpriſing enough, when one conſiders that two letters, or figures, can only be combined twice.

This note may be of uſe to maſons, paviours, &c. See Pavement, and Changes.

Combination, *doctrine of.—Any number of quantities being given, together with the number in each* combination; *to find the number of* combinations.

One quantity, we obſerve, admits of no *combination*; two, *a* and *b*, of one; of three, *a*, *b*, *c*, there are three *combinations*, viz. *ab*, *ac*, *bc*; of four, ſix, *ab*, *ac*, *bc*, *ad*, *bd*, *cd*; of five, ten, *ab*, *ac*, *bc*, *ad*, *bd*, *cd*, *ae*, *be*, *ce*, *de*.

Whence it appears, that the numbers of *combinations* proceed as 1, 3, 6, 10, &c. i. e. are triangular numbers, whoſe ſide differs by unity from the number of given quantities: if that, v. gr. be q, the ſide of the number of *combinations* will be $q-1$; and therefore the number of *combinations* $\frac{q-1}{1}\times\frac{q-0}{2}$. See Triangular *number*.

If three quantities are to be combined, and the number in each *combination* be three, there will be only one *combination*, *abc*; if a fourth be added, the *combinations* will be found *abc*, *abd*, *bcd*, *acd*; if a fifth, ten, *abc*, *abd*, *bcd*, *acd*, *abe*, *bde*, *bce*, *ace*, *ade*, *cde*; if a ſixth, twenty, &c. The numbers of *combinations*, therefore, proceed as 1, 4, 10, 20; i. e. they are the firſt pyramidal triangular numbers, whoſe ſides differ by two units from the number of given quantities. See Pyramidal *number*. Hence, if the number of given quantities be q, the ſide will be $q-2$; and therefore, the number of *combinations* $\frac{q-2}{1}\times\frac{q-1}{2}\times\frac{q-0}{3}$.

Hence is eaſily deduced a general rule of determining the number of *combinations* in any caſe: for, ſuppoſe the number of quantities to be combined, q, the exponent of the *combination* n, the number of *combinations* will be $\frac{q-n+1}{1}\times\frac{q-n+2}{2}\times\frac{q-n+3}{3}\times\frac{q-n+4}{4}\times\frac{q-n+5}{5}$, &c. till the number to be added be equal to n.

Suppoſe, v. gr. the number of quantities to be combined $=6$; the exponent of the *combination* 4: the number of *combinations* will be $\frac{6-4+1}{1}\times\frac{6-4+2}{2}\times\frac{6-4+3}{3}\times\frac{6-4+4}{4}=\frac{6-3}{1}\times\frac{6-2}{2}\times\frac{6-1}{3}\times\frac{6-0}{4}=\frac{3}{1}\times\frac{4}{2}\times\frac{5}{3}\times\frac{6}{4}=15$.

Coroll. If it be deſired to have all the poſſible *combinations* of the given quantities beginning with the *combinations* of the ſeveral two's, proceeding to three's, &c. there muſt be added $\frac{q-1}{1}\times\frac{q-0}{2}$, $\frac{q-2}{1}\times\frac{q-1}{2}\times\frac{q-0}{3}$, $\frac{q-3}{1}\times\frac{q-2}{2}\times\frac{q-1}{3}\times\frac{q-0}{4}$, &c.

Whence the number of *combinations* poſſible will be $\frac{q}{1}\times\frac{q-1}{2}+\frac{q}{1}\times\frac{q-1}{2}\times\frac{q-2}{3}+\frac{q}{1}\times\frac{q-1}{2}\times\frac{q-2}{3}\times\frac{q-3}{4}+\frac{q}{1}\times\frac{q-1}{2}\times\frac{q-2}{3}\times\frac{q-3}{4}\times\frac{q-4}{5}$, &c. which is the ſum of the unciæ of the binomial, raiſed to the power q, and abridged of the exponent of the power increaſed by unity, $q+1$. Wherefore, if $1+1=2$ repreſents the binomial to which theſe unciæ belong, 2^q-q-1 is the number of all the poſſible *combinations*. V. gr. If the number of quantities be 5, the number of poſſible *combinations* will be $2^5-6=32-6=26$.

2. *Any number of quantities being given, to find the number of changes and alternations, which theſe quantities, combined in all the manners poſſible, can undergo.*

Suppoſe two quantities, *a* and *b*: their variations will be 2; conſequently, as each of thoſe may be combined, even with itſelf, to theſe there muſt be added two variations. The whole number, therefore, will be $2+2=4$. If there were three quantities, and the exponent of the variation were 2; the *combination* will be 3, and the changes 3; to which if the three *combinations* of each quanity with itſelf *aa*, *bb*, *cc*, be added, we ſhall have the number of changes, $3+3+3=9$.

In like manner it is evident, if the given quantities were 4, and the exponent 2, the number of changes would be 16; if 5, 25, &c. in general, if n, n^2.

Suppoſe the quantities 3, and the exponent of variation 3; the number of changes is found $27=3^3$; viz. *aaa*, *aab*, *aba*, *baa*, *abb*, *aac*, *aca*, *caa*, *abc*, *bac*, *bca*, *acb*, *cab*, *cba*, *acc*, *cac*, *cca*, *bba*, *bab*, *bbb*, *bbc*, *cbb*, *bcb*, *bcc*, *cbc*, *ccb*, *ccc*.

After the ſame manner, it will appear, if the quantities were 4, and the exponent 3; the number of changes would be $64=4^3$: and, in general, if the number of quantities be $=n$, and the exponent 3, the number of changes will be n^3. By thus proceeding, it will be found, that if the number of quantities be n, and the exponent n, the number of changes will be n^n: wherefore, if all the antecedents be added, where the exponent is leſs, the number of poſſible changes will be found $n^n+n^{n-1}+n^{n-2}+n^{n-3}+n^{n-4}+n^{n-5}+n^{n-6}$, &c. Till at length, the number ſubtracted from n leaves 1; becauſe the beginning is from ſingle quantities taken once.

Since then the number of poſſible changes is in a geometrical progreſſion, whoſe firſt or ſmalleſt term is n^1, the greateſt n^n, and the ratio n; it will be $=\dfrac{n^{n+1}-n}{n-1}$.

Suppoſe, v. gr. $n=4$, the number of poſſible changes $\dfrac{4^5-4}{4-1}=\dfrac{1020}{3}=340$. Suppoſe, again, $n=24$, the number of poſſible changes will be $\dfrac{24^{25}-24}{24-1}=$ $32009658644406818986777955348272600 \div 23 =$ $1391724288887252999425128493402200$. In ſo many various manners, therefore, may the twenty-four letters of the alphabet be varied and combined among themſelves.

Combination, in *Chemiſtry*, denotes the union of two bodies of different natures, from which a new compound body reſults. An acid united with an alkali furniſhes an inſtance of *combination*. See AFFINITY.

Combinations, in *Law*. *Combinations* to do unlawful acts, are puniſhable before the unlawful acts are executed: this is to prevent the conſequences of *combinations* and conſpiracies, &c. 9 Rep. 57.

COMBINATORY *diſtillation*. See DISTILLATION.

Combinatory *muſic*, *Muſica combinatoria*, that part of muſic which teaches the manner of combining ſounds variouſly; that is, of changing their place and figure in different manners. See MUSIC.

COMBING *of wool*, in *Commerce*, the drawing, or paſſing wool acroſs the teeth of a kind of card, called a *comb*, to diſpoſe it for ſpinning.

COMBRETUM, in *Botany*, a genus of the *octandria monogynia* claſs; the characters of which are, that the calyx is bell-ſhaped, and ſeparated into four horizontal points; the corolla has four petals inſerted in the calyx; the ſtamina are very long; and the ſeed is ſingle and quadrangular.

COMBS *of bees*. See HONEY-COMB.

COMBURENDO *hæretico*. See HÆRETICO.

COMBUST, in *Aſtronomy*. When a planet is in conjunction with the ſun, or not diſtant from it above half their diſk; it is ſaid to be *combuſt*, or in COMBUSTION.

According to Argol, a planet is *combuſt*, or in *combuſtion*, when not above eight degrees and thirty minutes diſtant from the ſun, either before or after him.

COMBUSTIO *pecuniæ*, the ancient way of trying mixed and corrupt money, by melting it down, upon payments into the Exchequer. In the time of king Henry II. a conſtitution was made, called the trial by *combuſtion*; the practice of which differed little or nothing from the preſent method of aſſaying ſilver. But whether this examination of money by *combuſtion* was to reduce an equation of money only of ſterling, viz. a due proportion of alloy with copper, or to reduce it pure fine ſilver, does not appear. On making the conſtitution of trial it was conſidered, that though the money did anſwer *numero et pondere*, it might be deficient in value; becauſe mixed with copper or braſs, &c. Vide Lowndes's Eſſay upon Coin, p. 5.

COMBUSTION, in *Chemiſtry*, denotes the decompoſition of bodies by the action of fire; or the diſengagement of the phlogiſton or inflammable principle contained in them, from the union of which in larger or leſs quantities, or in various degrees of combination, they are ſaid to be more or leſs *combuſtible*. The more *combuſtible* bodies are either ſuch as poſſeſs a large quantity of phlogiſton in an oily ſtate, and burn with a bright flame, accompanied with ſmoke and ſoot; as wood, dry vegetables, reſins, oils, and fat: or ſuch, in which the inflammable principle is not in an oily ſtate, nor intimately combined, whoſe flame is leſs luminous, and unattended with ſmoke and ſoot; of this kind are ſpirit of wine, ſulphur, phoſphorus, charcoal, ſome metallic ſubſtances, and particularly zinc. The leſs *combuſtible* bodies are thoſe in which a ſmaller quantity of phlogiſton is ſtrongly combined with incombuſtible principles, and which burn with difficulty, and without any ſenſible flame: ſuch are ſome animal coals, ſoot, aſhes of vegetables, and imperfect metals. *Combuſtion* requires free acceſs of air; and the proceſs is more rapid and complete, as the contact of the burning body with air is more immediate and entire. Macquer.

See AIR, CALCINATION, FIRE, and PHLOGISTON.

COME. The ſmall fibres or tails of malt, upon its firſt ſhooting forth, is thus called.

Come *ſopra*, in the *Italian Muſic*, literally ſignifies *as above*, and is uſed when any foregoing part is to be repeated.

COMEDONES, a name given to a ſpecies of worm, with which the children of Miſnia, and ſome other countries, are terribly afflicted; and of which Hoffman, in his Treatiſe of Endemial Diſeaſes, gives this account; children in the country are frequently ſeized with a ſort of tabes, which ſo deſtroys their fleſh, that they appear merely like ſhadows. The common people generally ſuppoſe theſe children to be under the influence of witchcraft; but ſuch as have inquired more narrowly into the diſtemper, have found that it is owing to certain worms, reſembling black hairs, or cords, lodged under the ſkin. When the ſkin is rubbed with honey, in a bath, or any warm place, they will appear and come out; but when it is contracted by cold, they keep concealed within. See AFFECTIO *bovina*, and DRACUNCULI.

COMEDY, in its proper ſenſe, a dramatic piece, repreſenting ſome agreeable and diverting tranſaction: or an allegorical repreſentation of ſomething in private life, for the amuſement and inſtruction of the audience.

There are thoſe who derive the word *comedy* from *comus*, and who ſuppoſe that κωμωδειν is the ſame with *como digna canere*. This etymology appears to be the better founded, in that the firſt farces were exhibited at feaſts, which have been ſince improved to *comedies* in their preſent ſtate.

In this ſenſe, *comedy* is oppoſed to *tragedy*, the ſubjects whereof are grave, and the perſons of higher rank.

Scaliger defines *comedy*, a dramatic poem, very buſy, pleaſant in the concluſion, and written in a popular ſtyle. Ariſtotle calls it an imitation of the worſt, or, rather, of the loweſt claſs of perſons, by way of ridicule. This definition Corneille finds fault with, and maintains, that the actions of kings themſelves may enter *comedy*; provided they be ſuch as are not very momentous, nor attended with any conſiderable danger. He adds, that a poem wherein the greateſt peril is the loſs of a miſtreſs, has no right to any higher appellation than that of *comedy*: but then he makes a diſtinction in *comedies*, and dignifies thoſe where great perſonages are introduced, with the epithet of *heroic comedies*, to diſtinguiſh them from the ordinary ones. Mr. Congreve ſeems pretty much of the ſame ſentiment: he underſtands Ariſtotle's definition as meant of the worſt men; on which foundation it is ſufficient to conſtitute a *comedy*, that the action repreſented be that of ſome ill man brought on the ſtage to be expoſed.

M. Dacier is of a contrary opinion: he maintains, that *comedy* allows of nothing grave, or ſerious, unleſs it be turned to ridicule; and that raillery and ridicule are its only proper and genuine characteriſtics: in which opinion he is warmly ſeconded by Mr. Dennis.

Thus different are critics and comic authors in their ſentiments on the nature of *comedy*: ſome diſtinguiſh it from tragedy by the lowneſs of the ſubject; others by the ridiculous light it is ſet in.

The accurate F. Boſſu fixes the notion of *comedy* much better: according to that critic, *comedy* differs from tragedy in this, that the comic writer invents both the names of his perſons, and the action which he preſents; whereas the tragic writers only invent the latter, the former they are to take from hiſtory. See ACTION.

Upon the whole, *comedy* may be defined an image, or repreſentation of the ordinary life of men: it exhibits their common actions and paſſions; expoſes and ridicules their failings, to preſerve the ſpectators from them, or to correct them. Cicero defines it the imitation of life, the mirror of cuſtom, and the image of truth.

There is a diſpute among critics, whether *comedy* be a poem, or a mere converſation? They who maintain the latter, contend, that a poem is a diſcourſe in verſe: F. Boſſu inſiſts on the former, and ſhews that *comedy* has its fable, or allegory, with every thing eſſential to poetry.

Comedy and tragedy were originally one and the ſame thing: their common origin ſee under TRAGEDY.—M. Boileau ſays, *comedy* took its riſe at Athens, from the happy iſſues or concluſions of tragedies. On this principle, the cataſtrophe ſhould have been the proper criterion, or diſtinguiſhing mark between tragedy and *comedy*; and all other differences only accidental.

After the grave and ſerious became ſeparated from the ridiculous, and tragedy and *comedy* were become two diſtinct arts; people applied themſelves to cultivate the former, and neglected the latter: ſo that *comedy* continued in its infancy, with little improvements, while tragedy grew up to a perfect art: this once arrived at its height, they began to think of cultivating *comedy*.

With regard to the various changes and revolutions *comedy* has undergone, it is commonly diſtinguiſhed into three kinds; viz. the *ancient*, wherein there was nothing feigned; the *middle*, where the ſubject was real, but the names fictitious; the *new*, where both names and things are fictitious.

The *ancient* was that firſt in uſe, when the ſupreme power was in the hands of the people; and when, on that account, the poets were at their full liberty to ſay what they pleaſed, and of whom they pleaſed; by name to rail at people in authority, and openly to charge magiſtrates with crimes; ſparing no age, ſex, or quality.

This is very obſervable in the Frogs, and the Clouds of Ariſtophanes; where it is to be noted, that though the railing part was occaſionally diſtributed among all the actors, yet the chief of it was laid on the chorus.

When the Athenian liberties became ſunk in the tyranny of a few, it was no longer ſafe for the poets to uſe their old licence; men of office being now to be ſcreened from reproach. The chorus, hereupon, became uſeleſs, and was therefore dropped; and thus commenced what we call *comœdia media*, μεσην, or the *middle comedy*. See CHORUS.

Under this, the poets were not allowed to name the perſons; and therefore names were to be invented: but then the perſons were ſo well pointed out, that it was no difficult matter to know them.

At length, however, they were obliged to repreſs even this licence: and this reform gave occaſion to the *new comedy*; which only brought upon the ſtage feigned adventures, and imaginary names.

This laſt kind alone was received among the Romans; who yet made a new ſubdiviſion thereof into *ancient*, *middle*, and *new*; according to the various periods of the commonwealth. Among the *ancient comedies* were ranked thoſe of Livius Andronicus; among the *middle*, thoſe of Pacuvius; and among the *new* ones, thoſe of Terence.

Comedy, as well as tragedy, has its eſſential, and its integrant parts. Its eſſential parts, in the language of the ancients, are the *protaſis*, *epitaſis*, *cataſtaſis*, and *cataſtrophe*.

The *protaſis* is the beginning, or opening; where the ſubject is juſt entered upon, the characters of the perſons ſhewn, and the intereſt, or part each has in the action ſignified.

In the *epitaſis*, the intrigues begin; they are carried on, and heightened, in the *cataſtaſis*; and unravelled in the *cataſtrophe*.

Theſe are called parts of quantity, by way of contradiſtinction from thoſe of quality, which are the fable, the manners, the ſentiments, and the diction; to which may be added the muſic and decoration, pertaining only to the repreſentation.

The integrant parts are the five acts into which the *comedy* is divided, agreeable to that precept of Horace:

Neve minor quinto, neu ſit productior actu.

The acts are divided into ſcenes: the number whereof is not fixed, but depends on the buſineſs to be done in each act, and the number of perſons to be employed. See ACT, SCENE, &c. See alſo HUMOUR, MANNERS, &c.

Among the ancient Romans, *comedies* were diſtinguiſhed according to the quality of the perſons repreſented, and the dreſs they wore, into *togatæ*, *prætextæ*, *trabeatæ*, and *tabernariæ*; which laſt were thoſe where the ſcene lay in colleges, or among people of the loweſt rank, agreeing pretty nearly with our farces.

In the repreſentation, *comedy* was diſtinguiſhed from tragedy by the ſock worn in the former, and the buſkin in the latter. Among us, *comedy* is diſtinguiſhed from farce, in that the former repreſents nature as ſhe is; the other diſtorts or overcharges her. They both paint from life, but with different views: the one to make nature known, the other to make her ridiculous.

COMET, a heavenly body, in the planetary region, appearing ſuddenly, and again diſappearing; and during the time of its appearance moving in a proper, though very eccentric orbit, like a planet.

Comets, popularly called *blazing ſtars*, have this to diſtinguiſh them from the other ſtars, that they are uſually attended with a long train of light, always oppoſite to the ſun, and which is of a fainter luſtre, the farther it is from the body. Hence ariſes a popular diviſion of *comets* into three kinds; viz. *bearded*, *tailed*, and *hairy comets*; though, in effect, this diviſion rather relates to the ſeveral circumſtances of the ſame *comet*, than to the phænomena of ſeveral.

Thus, when the *comet* is eaſtward of the ſun, and moves from it, the *comet* is ſaid to be *bearded*, becauſe the light precedes it, in manner of a beard.

When the *comet* is weſtward of the ſun, and ſets after it, it is ſaid to be *tailed*, becauſe the train follows it, in manner of a tail.

Laſtly, when the *comet* and the ſun are diametrically oppoſite (the earth between them), the train is hid behind the body of the *comet*, excepting a little that appears around it, in form of a border of hair, hence called *hairy*.

COMETS, *nature of*.—As to the nature of *comets*, the unfrequency of their appearing, together with the ſeeming irregularities of their phænomena, have left philoſophers much in the dark. Thoſe who lived before Ariſtotle, accounted for them by ſuppoſing the heavenly ſpaces full of an infinite number of ſtars; and many of them too remote, or too ſmall, to have ever come under the notice of aſtronomers: theſe inviſible ſtars they further ſuppoſed to move by their own proper motion every way; finiſhing their courſes in very unequal times. Now, a *comet*, according to them, was a vaſt heap or aſſemblage of theſe little ſtars meeting together, by reaſon of the inequality of their motions, and uniting into a viſible maſs; which muſt again diſappear, as thoſe ſtars ſeparated, and each proceeded in its courſe.

But how theſe ſtars ſhould thus meet, coaleſce, and form a body, which in all poſitions of the ſun ſhould reſemble a tail, and again ſeparate, is a myſtery.

This opinion, therefore, Ariſtotle eaſily overturned; ſubſtituting another in its ſtead. According to Ariſtotle, *comets* were only a kind of tranſient fires, or meteors, conſiſting of exhalations raiſed to the upper region of the air, and there ſet on fire; far below the moon's courſe.

But neither is this hypotheſis more juſt than the other: for on this principle, the light of the *comet*, being independent of the ſun, would be diſperſed every way alike, without any appearance of a train, or tail, which is contrary to the phænomena. Moreover, they are obſerved at the ſame time in places on the earth very remote from each other. Beſides, the modern aſtronomers, who have meaſured the diſtance between the *comets* and the earth, find that the *comets* have no ſenſible diurnal parallax; which could not be, were they not much more remote than the moon, whoſe parallax is ſenſible: and yet as they have a ſenſible annual PARALLAX, they are not ſo remote as the fixed ſtars. Tycho Brahe was the firſt among the moderns, who, after diligently obſerving the *comet* of 1577, and finding that it had no ſenſible diurnal parallax, aſſigned it its true place in the planetary regions. See his book De Cometa, anni 1577.

Hevelius, from a great number of obſervations, propoſes it as his opinion, that the *comets*, like the ſolar maculæ or ſpots, are formed and condenſed out of the groſſer exhalations of his body. In which notion he agrees nearly with Kepler, who maintains, that *comets* are generated in the æther in vaſt numbers, like fiſhes in the ocean; though they do not at all become viſible; either becauſe of their ſmallneſs, or becauſe they lie a long time under the horizon.

But Sir Iſaac Newton has ſhewn the fallacy of this hypotheſis, by proving that the *comet* of 1680, in its paſſage through the neighbourhood of the ſun, would have been diſſipated, had it conſiſted of exhalations of the ſun and planets: for the heat of the ſun, it is allowed, is as the denſity of his rays, i. e. reciprocally as the ſquares of the diſtances of places from the ſun. Wherefore, ſince the diſtance of that *comet* in its perihelion, December the 8th, was obſerved to be to the diſtance of the earth from the ſun, nearly as 6 to 1000; the ſun's heat in the *comet*, at that time, was to his heat with us at midſummer, as 1000000 to 36, or 28000 to 1.

And again, finding by experiment, that the heat of boiling water is little more than three times the heat of our dry earth, when expoſed to the midſummer's ſun; and aſſuming the heat of red-hot iron to be about three or four times as great as that of boiling water; he thence concludes, that the heat of the dried earth, or body of the *comet* in its perihelion, muſt be near 2000 times as great as that of red-hot iron.

Such an immenſe heat once acquired in its perihelion, the *comet* muſt be a long time in cooling again. The ſame author computes, that a globe of red-hot iron, of the dimenſions of our earth, would ſcarce be cool in

50000 years. If then the *comet* be ſuppoſed to cool 100 times as faſt as red-hot iron; yet ſince its heat was 2000 times greater, ſuppoſing it of the bigneſs of the earth, it would not be cool in a million of years.

James Bernouilli, in his Syſtema Cometarum, ſuppoſes ſome primary planet revolving round the ſun in the ſpace of four years and one hundred and fifty-ſeven days; and at the diſtance, from his body, of 2583 ſemidiameters of the magnus orbis: this planet, he concludes, either from its vaſt diſtance, or ſmallneſs, to be inviſible to us; but, however, to have, at various diſtances from him, ſeveral ſatellites moving round him, and ſometimes deſcending as low as the orbit of Saturn; and that theſe becoming viſible to us, when in their perigæum, are what we call *comets*.

Des Cartes advances another opinion: he conjectures that *comets* are only ſtars, formerly fixed, like the reſt, in the heavens; but which, becoming, by degrees, covered with maculæ, or ſpots, and at length wholly robbed of their light, cannot keep their place, but are carried off by the vortices of the circumjacent ſtars; and, in proportion to their magnitude and ſolidity, moved in ſuch manner, as to be brought nearer the orb of Saturn; and thus coming within reach of the ſun's light, rendered viſible.

But the vanity of all theſe hypotheſes abundantly appears from the phænomena of *comets*; the chief of which we ſhall enumerate: as being the teſt by which all theories are to be tried.

Firſt, then, thoſe *comets* which move according to the order of the ſigns, do all, a little before they diſappear, either advance ſlower than uſual, or elſe go retrograde, if the earth be between them and the ſun; and more ſwiftly, if the earth be ſituate in a contrary part. On the other hand, thoſe which proceed contrary to the order of the ſigns, proceed more ſwiftly than uſual, if the earth be between them and the ſun; and more ſlowly, or go retrograde, when the earth is in a contrary part.

2. So long as their velocity is increaſed, they move, nearly, in great circles; but towards the end of their courſe, they deviate from thoſe circles; and as often as the earth proceeds one way, they go the contrary way.

3. They move in ellipſes, having one of their foci in the center of the ſun; and by radii drawn to the ſun, deſcribe areas proportionable to the times.

4. The light of their bodies, or nuclei, increaſes in their receſs from the earth toward the ſun; and on the contrary, decreaſes in their receſs from the ſun.

5. Their tails appear the largeſt and brighteſt, immediately after their tranſit through the region of the ſun, or after their perihelion.

6. The tails always decline from a juſt oppoſition to the ſun towards thoſe parts which the bodies, or nuclei, paſs over, in their progreſs through their orbits.

7. This declination, *cæteris paribus*, is the ſmalleſt, when the heads, or nuclei, approach neareſt the ſun: and is leſs, ſtill, nearer the nucleus of the *comet*, than towards the extremity of the tail.

8. The tails are ſomewhat brighter, and more diſtinctly defined in their convex, than in their concave part.

9. The tails always appear broader at their upper extreme, than near the center of the *comet*.

10. The tails are always tranſparent, and the ſmalleſt ſtars appear through them.

Theſe are the chief phænomena of *comets*; which, it is evident, cannot eaſily be reconciled with the wild notions of the ancients, and the weak conjectures of many of the moderns. Indeed, there were ſome, Pliny tells us, among the ancients, who "had juſter notions; who took theſe "ſtars to be perpetual, and believed they moved in their "proper orbs; but were never ſeen, unleſs when left "by the ſun." Apollonius Myndius declared, that he took *comets* for regular ſtars; and ventured to foretel, that one day the periods and laws of their motion would be diſcovered. And more fully Seneca, Quæſt. Nat. lib. vii. "I am not of the common opinion, nor do I "take a *comet* to be a ſudden fire, but eſteem it among "the eternal works of nature." *Quid autem miramur cometas, tam rarum mundi ſpectaculum, nondum teneri legibus certis, nec initia illorum fineſque innoteſcere, quorum ex ingentibus intervallis recurſus eſt? Veniet tempus quo iſta quæ nunc latent, in lucem dies extrahat, & longioris ævi diligentia. Veniet tempus quo poſteri noſtri tam aperta nos neſciſſe mirentur. Erit qui demonſtret aliquando, in quibus cometæ partibus errent; cur tam ſe ducti a cæteris errent, quanti qualeſque ſint.*

This prediction we have ſeen accompliſhed in our days, by the great Sir Iſaac Newton; whoſe doctrine is as follows:

The *comets*, he ſays, are compact, ſolid, fixed, and durable bodies: in one word, a kind of planets; which move in very oblique orbits, every way with the greateſt freedom; perſevering in their motions, even againſt the courſe and direction of the planets: and their tail is a very thin, ſlender vapour, emitted by the head, or nucleus of the *comet*, ignited or heated by the ſun.

This at once ſolves all the foregoing phænomena: for, 1. "It is evident, that thoſe which proceed according to "the order of the ſigns, a little before they diſappear, "muſt move more ſlowly, or appear retrograde, if the "earth be betwixt them and the ſun; and ſwifter, if the "earth be in a contrary part. On the contrary, thoſe "proceeding againſt the order of the ſigns," &c. For ſince this courſe is not among the fixed ſtars, but among the planets; as the motion of the earth either conſpires with them, or goes againſt them; their appearance, with regard to the earth, muſt be changed; and, like the planets, they muſt ſometimes appear ſwifter, ſometimes ſlower, and ſometimes retrograde.

2. "When the *comets* move the ſwifteſt, they muſt pro"ceed in ſtrait lines; but in the end of their courſe "decline," &c. Becauſe, in the end of their courſe, when they recede almoſt directly from the ſun, that part of the apparent motion which ariſes from the parallax, muſt bear a greater proportion to the whole apparent motion.

3. "The *comets* muſt move in ellipſes, having one of "their foci in the center of the ſun." Becauſe they do not wander precariouſly from one fictitious vortex to another; but, making a part of the ſolar ſyſtem, return perpetually, and run a conſtant round.

Hence, their elliptic orbits being very long and eccentric, they become inviſible, when in that part moſt remote from the ſun.

From conſidering the curvity of the paths of *comets*, Sir Iſaac concludes, that when they diſappear, they are much beyond the orb of Jupiter; and that in their perihelion they frequently deſcend below the orbits of Mars, and the inferior planets.

4. "The light of their nuclei muſt increaſe in their re"ceſs from the ſun, and *vice verſa*." Becauſe, as they are in the regions of the planets, their acceſs toward the ſun bears a conſiderable proportion to their whole diſtance.

From obſervations of the *comet* of 1680, Sir Iſaac Newton found that the vapour in the extremity of the tail, January 25th, began to aſcend from the head before December 11th; and had therefore ſpent more than forty-five days in its aſcent: but that all the tail which appeared December 10th, aſcended in the ſpace of thoſe two days, then juſt paſt ſince its perihelion. The vapour, therefore, at the beginning, when the *comet* was near the ſun, aſcended prodigiouſly ſwift; and afterwards continued to aſcend with a motion retarded by the gravity of its particles; and by that aſcent increaſed the length of the tail: but the tail, notwithſtanding its length, conſiſted almoſt wholly of vapours, which had aſcended from the time of the perihelion; and the vapour which aſcended firſt, and compoſed the extreme of the tail, did not vaniſh, till it was too far from the ſun to be illumined by him, and from us to be viſible. Hence, alſo, the tails of *comets* that are ſhorter, do not aſcend with a quick and continual motion from the head, and then preſently diſappear; but are permanent columns of vapours and exhalations, gathered from the head by a very gentle motion, and in a great ſpace of time; which yet, by participating of that motion of their heads they had at the beginning, continue eaſily to move along with their heads through the celeſtial regions: whence alſo the vacuity of thoſe regions is argued. See VACUUM.

5. "Their tails muſt appear the largeſt and brighteſt "immediately after their tranſit through the region of "the ſun." Becauſe, then, their heads being the moſt heated, will emit the moſt vapours.

From the light of the nucleus, or apparent ſtar, we infer their vicinity to the earth, and that they are by no means in the region of the fixed ſtars, as ſome have imagined; ſince, in that caſe, their heads would be no more illumined by the ſun, than the planets are by the fixed ſtars.

6. "The tails muſt ſtill decline from a ſtrict oppoſition "to the ſun, towards thoſe parts which the heads paſs "over, in their progreſs through their orbits." Becauſe all ſmoke, or vapour, emitted from a body in motion, tends upwards obliquely, ſtill receding from that part, towards which the ſmoking body proceeds.

7. "That declination will be ſtill the leaſt near the nu"cleus of the *comet*; and when the *comet* is neareſt the "ſun." Becauſe the vapour aſcends more ſwiftly near the head of the *comet*, than in the higher extremity of its tail; and when the *comet* is at a leſs diſtance from the ſun, than when at a greater.

8. "The tail is brighter, and better defined in its con-"vex part, than in its concave." Becauſe the vapour in the convex part, which goes firſt, being ſomewhat nearer and denſer, reflects the light more copiouſly.

9. "The tail muſt appear broader towards the higher "extremity of the *comet*, than towards the head." Becauſe the vapour in a free ſpace perpetually rarefies and dilates.

10. "The tails muſt be tranſparent." Becauſe conſiſting of infinitely thin vapour, &c.

Thus accurately does the hypotheſis tally to the phænomena.

Comets, *phaſes of*.—The nuclei, which we alſo occaſionally call the *heads* and *bodies* of *comets*, viewed through a teleſcope, ſhew a very different face from thoſe of the fixed ſtars, or planets. They are liable to apparent changes, which Sir Iſaac Newton aſcribes to changes in the atmoſphere of *comets*: and this opinion was confirmed by obſervations of the *comet* in 1744. Hiſt. Acad. Scienc. 1744. Sturmius tells us, that, obſerving the *comet* of 1680, with a teleſcope, it appeared like a coal dimly glowing, or a rude maſs of matter illumined with a duſky fumid light, leſs ſenſible at the extremes than in the middle; rather than as a ſtar, which appears with a round diſk, and a vivid light.

Hevelius obſerved of the *comet* of 1661, that its body was of a yellowiſh colour, very bright and conſpicuous, but without any glittering light: in the middle was a denſe ruddy nucleus, almoſt equal to Jupiter, encompaſſed with a much fainter, thinner matter. February 5th, its head was ſomewhat bigger and brighter, of a gold colour; but its light more duſky than the reſt of the ſtars: here, the nucleus appeared divided into ſeveral parts. February 6th, the diſk was leſſened; the nuclei ſtill exiſted, though leſs than before: one of them, on the lower part of the diſk, on the left, much denſer and brighter than the reſt; its body round, and repreſenting a very lucid little ſtar: the nuclei ſtill encompaſſed with another kind of matter. February 10th, the head ſomewhat more obſcure, and the nuclei more confuſed, but brighter at top than bottom. February 13th, the head diminiſhed much, both in magnitude and brightneſs. March 2d, its roundneſs a little impaired, its edges lacerated, &c. March 28th, very pale, and exceeding thin; its matter much diſperſed; and no diſtinct nucleus at all appearing.

Weigelius, who ſaw the *comet* of 1664, the moon, and a little cloud illumined by the ſun at the ſame time, obſerved, that the moon, through the teleſcope, appeared of a continued luminous ſurface; but the *comet* very different; being perfectly like a little cloud in the horizon, illumined by the ſun. From theſe obſervations it was, that Hevelius concluded *comets* to be like maculæ, or ſpots formed out of the ſolar exhalations.

Comets, *magnitude of*.—The eſtimates that have been given by Tycho, Hevelius, and ſome others, of the magnitude of *comets*, are not ſufficiently accurate to be depended upon; for it does not appear, that they diſtinguiſhed between the nucleus and the ſurrounding atmoſphere. Thus Tycho computes that the true diameter of the *comet* in 1577, was in proportion to the diameter of the earth as 3 is to 14. Hevelius made the diameter of the *comet* of 1652 to that of the earth, as 52 to 100. The diameter of the atmoſphere is often ten or fifteen times as great as that of the nucleus: the former, in the *comet* of 1682, was meaſured by Flamſteed, and found to be 2′, but the diameter of the nucleus only 11 or 12″. Some *comets*, from their apparent magnitude and diſtance compared, have been judged to be much larger than the moon, and even equal to ſome of the primary planets. The diameter of that of 1744, when at the diſtance of the ſun from us, meaſured about 1′, and therefore its diameter muſt be about three times the diameter of the earth: at another time the diameter of its nucleus was nearly equal to that of Jupiter.

The lengths of the tails of *comets* are various, and depend on a variety of circumſtances. Longomontanus mentions a *comet* that in 1618, December 10th, had a tail above 100° in length: that of 1680, according to Sturmius, about the 20th of November, was but ſmall; at moſt, not exceeding 20° in length; in a little time it grew to a length of 60°, after which it dwindled very ſenſibly. The *comet* of 1744 had a tail which at one time appeared to extend above 16° from its body; and which, allowing the ſun's parallax 10″, muſt have been above twenty-three millions of miles in length.

Comets, *formation of the tails of*.—Sir Iſaac Newton ſhews, that the atmoſpheres of *comets* will furniſh vapour ſufficient to form their tails: this he argues from that wonderful rarefaction obſerved in our air, at a diſtance from the earth: a cubic inch of common air, at the diſtance of half the earth's diameter, or four thouſand miles, would neceſſarily expand itſelf ſo as to fill a ſpace larger than the whole region of the ſtars. Since then the coma, or atmoſphere of a *comet*, is ten times higher than the ſurface of the nucleus, counting from the center thereof; the tail, aſcending much higher, muſt neceſſarily be immenſely rare: ſo that it is no wonder the ſtars ſhould be viſible through it.

Now, the aſcent of vapours into the tail of the *comet*, he ſuppoſes occaſioned by the rarefaction of the matter of the atmoſphere at the time of the perihelion. Smoke, it is obſerved, aſcends the chimney by the impulſe of the air wherein it floats; and air, rarefied by heat, aſcends by the diminution of its ſpecific gravity, taking up the ſmoke along with it: why then ſhould not the tail of a *comet* be ſuppoſed to be raiſed after the ſame manner by the ſun? for the ſun-beams do not act on the mediums they paſs through, any otherwiſe than by reflexion and rarefaction.

The reflecting particles, then, being warmed by the action, will again warm the æther wherewith they are compounded; and this, rarefied by the heat, will have its ſpecific gravity, whereby it before tended to deſcend, diminiſhed by the rarefaction; ſo as to aſcend, and carry along with it thoſe reflecting particles, whereof the tail of the *comet* is compoſed.

This aſcent of the vapours will be promoted by their circular motion round the ſun; by means whereof, they will endeavour to recede from the ſun, while the ſun's atmoſphere, and the other matters in the celeſtial ſpaces, are either at reſt, or nearly ſo; as having no motion but what they receive from the ſun's circumrotation.

Thus are the vapours raiſed into the tails of *comets* in the neighbourhood of the ſun, where the orbits are moſt curve; and, where the *comets*, being within the denſer atmoſphere of the ſun, have their tails of the greateſt length.

The tails thus produced, by preſerving that motion, and at the ſame time gravitating towards the ſun, will move round his body in ellipſes, in like manner as their heads; and, by this means, will ever accompany, and freely adhere to their head. In effect, the gravitation of the vapours towards the ſun will no more occaſion the tails of the *comets* to forſake their heads, and fall down towards the ſun, than the gravitation of their heads will occaſion them to fall off from their tails: but by their common gravitation, they will either fall down together to the ſun, or be together ſuſpended, or retarded. This gravitation, therefore, does not at all hinder, but that the heads and tails of *comets* may receive and retain any poſition towards each other, which either the above mentioned cauſes, or any other, may occaſion. The tails, therefore, thus produced in the perihelion of *comets*, will go off along with their head into remote regions; and either return thence, together with the *comets*, after a long ſeries of years; or, rather, be there loſt, and vaniſh by little and little, and the *comet* be left bare; till at its return, deſcending towards the ſun, ſome little ſhort tails are gradually and ſlowly produced from the heads; which afterwards, in the perihelion, deſcending down into the ſun's atmoſphere, will be immenſely increaſed.

The vapours, when they are thus dilated, rarefied, and diffuſed through all the celeſtial regions, the ſame author obſerves, may probably, by little and little, by means of their own gravity, be attracted down to the planets, and become intermingled with their atmoſpheres.

He adds, that for the conſervation of the water, and moiſture of the planets, *comets* ſeem abſolutely requiſite; from whoſe condenſed vapours and exhalations, all that moiſture which is ſpent in vegetations and putrefactions, and turned into dry earth, &c. may be reſupplied and recruited. For all vegetables grow and increaſe wholly from fluids; and, again, as to their greateſt part, turn, by putrefaction, into earth again; an earthly ſlime being perpetually precipitated to the bottom of putrefying liquors. Hence, the quantity of dry earth muſt continually increaſe, and the moiſture of the globe decreaſe, and at laſt be quite evaporated, if it has not a continual ſupply from ſome part or other of the univerſe. And I ſuſpect, adds our great author, that the ſpirit, which makes the fineſt, ſubtileſt, and beſt part of our air, and which is abſolutely requiſite for the life and being of all things, comes principally from the *comets*.

On this principle, there ſeems to be ſome foundation for the popular opinion of preſages from *comets*; ſince the tail of a *comet* thus intermingled with our atmoſphere, may produce changes very ſenſible in animal and vegetable bodies. See Medium, and Spirit.

But the tranſmutation of water into earth is now juſtly exploded: Woodward, Boerhaave, and others, having obſerved that water is only an agent in conveying the nutritious matter to vegetable bodies, and not that matter itſelf.

Another uſe which he conjectures *comets* may be deſigned to ſerve, is that of recruiting the ſun with freſh fewel, and repairing the conſumption of his light by the ſtreams continually ſent forth in every direction from that luminary. In ſupport of this conjecture he obſerves, that *comets* in their perihelion may ſuffer a diminution of their projectile force, by the reſiſtance of the ſolar atmoſphere; ſo that by degrees their gravitation towards the ſun may be ſo far increaſed, as to precipitate their fall into his body.

There have been various conjectures about the generation of the tails of *comets*. Apian, Tycho Brahe, and ſome others, apprehended that they were produced by the ſun's rays tranſmitted through the nucleus of the *comet*, which they ſuppoſed to be tranſparent, and there refracted as in a lens of glaſs, ſo as to form a beam of light behind the *comet*. Des Cartes accounted for the phænomenon of the tail by the refraction of light from the head of the *comet* to the eye of the ſpectator. Mairan ſuppoſes that the tails are formed out of the luminous matter that compoſes the ſun's atmoſphere; M. De la Lande combines this hypotheſis with that of Newton above recited. Mr. Rowning, who is not ſatisfied with Sir Iſaac's opinion, accounts for the tails of *comets* in the following manner. It is well known, ſays he, that when the light of the ſun paſſes through the atmoſphere of any body, as the earth, that which paſſes on one ſide, is by the refraction thereof made to converge toward that which paſſes on the oppoſite one; and this convergency is not wholly effected either at the entrance of the light into the atmoſphere, or at its going out; but beginning at its entrance, it increaſes in every point of its progreſs. It is alſo agreed that the atmoſpheres of the *comets* are very large and denſe. He therefore ſuppoſes that by ſuch time as the light of the ſun has paſſed through a conſiderable part of the atmoſphere of a *comet*, the rays thereof are ſo far refracted toward each other, that they then begin ſenſibly to illuminate it, or rather the vapours floating therein; and ſo render that part they have yet to paſs through, viſible to us: and that this portion of the atmoſphere of a *comet* thus illuminated, appears to us in form of a beam of the ſun's light, and paſſes under the denomination of a *comet*'s tail. Rowning's Natural Philoſophy, part iv. chap. 11.

We have an inquiry into the cauſe of the tails of *comets*, by Mr. Euler, in the Mem. de l'Acad. de Berlin, tom. ii. p. 117, ſeq. He thinks there is a great affinity between theſe tails, the zodiacal light, and the Aurora borealis; and that the common cauſe of them all, is the action of the ſun's light on the atmoſpheres of the *comets*, of the ſun, and of the earth. He ſuppoſes that the impulſe of the rays of light on the atmoſphere of *comets*, may drive ſome of the finer particles of that atmoſphere far beyond its limits; and that this force of impulſe combined with that of gravity towards the *comet*, would produce a tail, which would always be in oppoſition to the ſun, if the *comet* did not move. But the motion of the *comet* in its orbit, and about an axis, muſt vary the poſition and figure of the tail, giving it a curvature, and deviation from a line drawn from the center of the ſun to that of the *comet*; and that this deviation will be greater, as the orbit of the *comet* has the greater curvature, and that the motion of the *comet* is more rapid. It may even happen, that the velocity of the *comet*, in its perihelion, may be ſo great, that the force of the ſun's rays may produce a new tail, before the old one can follow; in which caſe the *comet* might have two or more tails. The poſſibility of this is confirmed by the *comet* of 1744, which was obſerved to have ſeveral tails while it was in its perihelion. See Aurora *borealis*, and Zodiacal *light*.

Dr. Hamilton urges ſeveral objections againſt the Newtonian hypotheſis; and concludes that the tail of a *comet* is formed of matter which has not the power of refracting or reflecting the rays of light; but that it is a lucid or ſelf-ſhining ſubſtance: and from its ſimilarity to the Aurora *borealis*, produced by the ſame cauſe, and a proper electrical phenomenon. Dr. Halley ſeemed inclined to this hypotheſis, when he ſaid, that the ſtreams of light in an Aurora borealis ſo much reſembled the long tails of *comets*, that at firſt ſight they might well be taken for ſuch: that this light ſeems to have a great affinity to that which the effluvia of electric bodies emit in the dark. Phil. Tranſ. N° 347. Hamilton's Philoſophical Eſſays, p. 91, &c.

M. Fatio has ſuggeſted, that ſome of the *comets* have their nodes ſo very near the annual orbit of the earth; that if the earth ſhould happen to be found in that part next the node, at the time of a *comet*'s paſſing by; as the apparent motion of the *comet* will be incredibly ſwift, ſo its parallax will become very ſenſible; and the proportion thereof to that of the ſun will be given: whence, ſuch tranſits of *comets* will afford the beſt means of determining the diſtance of the earth and ſun.

The *comet* of 1472, *v. gr.* had a parallax above twenty times greater than the ſun's: and if that of 1618, had come down in the beginning of March to its deſcending node, it would have been much nearer the earth, and its parallax much more notable. But, hitherto, none has threatened the earth with a nearer appulſe than that of 1680: for, by calculation, Dr. Halley finds, that November 11th, 1 h. 6 min. P. M. that *comet* was not above one ſemidiameter of the earth, to the northward of the way of the earth; at which time, had the earth been in that part of its orbit, the *comet* would have had a parallax equal to that of the moon: what might have been the conſequence of ſo near an appulſe, a contact, or, laſtly, a ſhock of the celeſtial bodies? Mr. Whiſton ſays, a DELUGE!

Comets, *motion of.*—If the paths of *comets* be ſuppoſed directly parabolical, as ſome have imagined, it would follow, that being impelled towards the ſun by a centripetal force, they deſcend as from ſpaces infinitely diſtant; and by their falls acquire ſuch a velocity, as that they may again run off into the remoteſt regions; ſtill moving upwards, with ſuch a perpetual tendency as never to return. But the frequency of their appearance, and their degree of velocity, which does not exceed what they might acquire by their gravity towards the ſun, ſeem to put it paſt doubt that they move, planet-like, in elliptic orbits, though exceedingly eccentric; and ſo return again, though after very long periods. See Elliptic.

The apparent velocity of the *comet* of 1472, as obſerved by Regiomontanus, was ſuch as to carry it through 40° of a great circle in 24 hours: and that of 1770 was obſerved to move through more than 45° in the laſt 25 hours.

Newton, Flamſteed, Halley, and the Engliſh aſtronomers, &c. ſeem ſatisfied of the return of *comets*: Caſſini, and others of the French, think it highly probable; but De la Hire, and others, oppoſe it.

Thoſe on the affirmative ſide ſuppoſe the *comets* to deſcribe orbits prodigiouſly eccentric, inſomuch that we can only ſee them in a very ſmall part of their revolution: out of this, they are loſt in the immenſe ſpaces; hid not only from our eyes, but our teleſcopes. That little part of their orbit next us, M. Caſſini, &c. have found to paſs between the orbits of Venus and Mars.

For the reaſons of the return of *comets*, M. Caſſini gives theſe which follow. 1. In conſidering the courſe of the *comets*, with regard to the fixed ſtars, they are found to keep a conſiderable time in the arch of a great circle, i. e. a circle whoſe plane paſſes through the center of the earth: indeed, they deviate a little from it, chiefly towards the end of their appearance; but this deviation is common to them with the planets.

2. *Comets*, as well as planets, appear to move ſo much the faſter as they are nearer the earth; and when they are at equal diſtances from their perigee, their velocities are nearly the ſame.

By ſubtracting from their motion the apparent inequality of velocity occaſioned by their different diſtance from the earth, their equal motion might be found: but we ſhould not be certain this motion were their true one; becauſe they might have conſiderable inequalities, not diſtinguiſhable in that ſmall part of their orbit viſible to us. It is, indeed, probable, their real motion, as well as that of the planets, is unequal in itſelf; and hence we have a reaſon why the obſervations made during the appearance of a *comet*, cannot give the juſt period of their revolution. See Period.

3. There are no two different planets whoſe orbits cut the ecliptic in the ſame angle, whoſe nodes are in the ſame points of the ecliptic, and whoſe apparent velocity in their perigee is the ſame: conſequently, two *comets* ſeen at different times, yet agreeing in all thoſe three circumſtances, can only be one and the ſame *comet*.

And this were the *comets* of 1577 and 1680 obſerved to do; and thoſe of 1652 and 1698: not that this exact agreement, in theſe circumſtances, is abſolutely neceſſary to determine them the ſame *comet*. M. Caſſini finds the moon herſelf irregular in them all: accordingly, he is of opinion, there are ſeveral which diſagree herein, and yet may be accounted the ſame.

The great objections againſt the return of *comets*, are, the rarity of their appearance, with regard to the number of revolutions aſſigned to them.

In 1702, there was a *comet*, or rather the tail of one, ſeen at Rome, which M. Caſſini takes to be the ſame with that obſerved by Ariſtotle, and that ſince ſeen in 1668, which would imply its period to be thirty-four years. Now, it may ſeem ſtrange, that a ſtar which has ſo ſhort a revolution, and of conſequence ſuch frequent returns, ſhould be ſo ſeldom ſeen.—Again, in April, of the ſame year, 1702, a *comet* was obſerved by Meſſ. Bianchini, and Maraldi, ſuppoſed by the latter to be the ſame with that of 1664, both by reaſon of its motion, velocity, and direction. M. De la Hire took it to have ſome relation to another he had obſerved in 1698, which M. Caſſini refers to that of 1652. On this ſuppoſition, its period appears to be forty-three months; and the number of revolutions between 1652 and 1698, fourteen: but it is hard to ſuppoſe, that in this age, wherein the heavens are ſo narrowly watched, a ſtar ſhould make fourteen appearances unperceived; eſpecially ſuch a ſtar as this, which might appear above a month together; and of conſequence be frequently diſengaged from the crepuſcula.

For this reaſon M. Caſſini is very reſerved in maintaining the hypotheſis of the return of *comets*, and only propoſes thoſe for planets, where the motions are eaſy and ſimple, and are ſolved without ſtraining, or allowing many irregularities.

M. De la Hire propoſes one general difficulty againſt the whole ſyſtem of the return of *comets*, which would ſeem to hinder any *comet* from being a planet: and it is this; that by the diſpoſition neceſſarily given to their courſes, they ought to appear as ſmall at firſt as at laſt; and always increaſe, till they arrive at their greateſt proximity to the earth: or, if they ſhould chance not to be obſerved, as ſoon as they become viſible, for want of attention thereto, at leaſt it is impoſſible but they muſt frequently ſhew themſelves before they have arrived at their full magnitude and brightneſs. But he adds, that none were ever yet obſerved till they had arrived at it.

But the appearance of a *comet* in the month of October, 1723, while at a great diſtance, ſo as to be too ſmall and dim to be viewed without a teleſcope, may ſerve to remove this obſtacle, and ſet the *comets*, ſtill, on the ſame footing with the planets.

Sir Iſaac Newton ſuppoſes, that as thoſe planets which are neareſt the ſun, and revolve in the leaſt orbits, are the ſmalleſt; ſo among the *comets*, ſuch as in their perihelion come neareſt the ſun, are the ſmalleſt, and revolve in leſſer orbits.

Dr. Halley has given us a table of the aſtronomical elements of all the *comets* that have been yet obſerved with due care; whereby, whenever a new *comet* ſhall appear, it may be determined, by comparing it therewith, whether it be any of thoſe which have yet appeared; and conſequently its period, and the axis of its orbit, be determined, and its return foretold. This table contains the aſtronomical elements of twenty-four *comets*, on the ſuppoſition that they moved in parabolas; though he thought it extremely probable that they really moved in very eccentric ellipſes, and conſequently returned after long periods of time. This table commences with the year 1337, and cloſes with 1698. See his Synopſis of the Aſtronomy of *Comets*, annexed to Gregory's Aſtronomy.

There are many things in the *comet* of 1532, obſerved by Peter Apian, which intimate its being the ſame with that of 1607, obſerved by Kepler and Longomontanus; and which Dr. Halley himſelf again obſerved in 1682. All the elements agree, and there is nothing contradicts the opinion, but that inequality in the periodic revolution; which, however, he thinks is no more than may be accounted for from phyſical cauſes: no more, in effect, than is obſerved in Saturn; the motion of which planet is ſo diſturbed by the reſt, eſpecially Jupiter, that its period is uncertain for ſeveral days together: to what errors then may not a *comet* be liable, which riſes to almoſt four times the height of Saturn; and whoſe velocity, if but a little increaſed, would change its elliptic orb into a parabolic one?

What further confirms the identity, is the appearance of another *comet* in the ſummer of 1456, which, though obſerved by none with accuracy, yet, by its period, and the manner of its tranſit, he concludes to be the ſame; and thence ventures to foretel its return in the year 1758, or the beginning of the next year: and time has verified the prediction. The *comet* of 1661 ſeems to be the ſame with that of 1532, and to have its period in one hundred and twenty-nine years: and Halley alſo thought that the *comet* of 1680 was the ſame that was obſerved in 1106, 1531, and in the forty-fourth year before Chriſt, when Julius Cæſar was murdered; and that its period was five hundred and ſeventy-five years. Mr. Dunthorne, in the Phil. Tranſ. vol. xlvii. has endeavoured to ſhew from a MS. in Pembroke-hall library, that the *comet* of 1106 could not be the ſame with that of 1680. But M. De la Lande adopts the opinion of Dr. Halley.

Another table has ſince been computed, from obſervations contained in the Philoſophical Tranſactions, De la Caille's Aſtronomy, and De la Lande's Hiſtoire de la Comete de 1759, & Connoiſſance des Movemens Celeſtes 1762 & 1764. In this table are ſeen the elements of twenty-five other *comets*, from the year 1264 to 1762.

By comparing theſe tables, it will be found that none of theſe *comets*, except that of 1759, appears to be the ſame with any other in either of the tables; unleſs we admit thoſe of 1264 and 1556, and thoſe of 1596 and 1699, to be the ſame. See the elements of the *comet* of 1770, and the trajectory of its path, in the Tranſactions of the American Philoſophical Society, vol. i.

See Whiſton's Solar Syſtem, where the orbits of the ſeveral *comets* are delineated, and the periods of as many of them as are known, expreſſed.

To determine the place and courſe of a COMET.—Obſerve the diſtance of the *comet* from two fixed ſtars, whoſe longitudes and latitudes are known: from the diſtances thus found, calculate the place of the *comet* by trigonometry, after the manner delivered under PLANET. By repeating the obſervations and operations for ſeveral days ſucceſſively, the courſe of the *comet* will be had.

To determine the courſe of a COMET *mechanically, and without any apparatus of inſtruments.*—The following ingenious method, by a thread, we owe to Longomontanus: Obſerve four ſtars round the *comet*, ſuch, as that the *comet* may be in the interſection of the right lines that join the two oppoſite ſtars; which is eaſily found by means of a thread placed before the eye, and extended over-againſt the ſtars and *comet*.

Suppoſe, v. gr. the *comet*'s place in the heavens A (*Tab. Aſtronomy, fig.* 23.) between the four ſtars, B, C, D, E; where the line joining the ſtars B and D paſſes through the body of the *comet*; and the like does the line paſſing through C and E.

On a globe, whereon theſe four ſtars are found, extend a thread through B and D, and another through C and E; the point of interſection will give the place of the *comet*. This practice being repeated for ſeveral days, the *comet*'s courſe will be had on the globe; which courſe will be found to be a great circle: from any two points whereof, it will be eaſy to find its inclination to the ecliptic, and the place of the nodes; only by obſerving where a thread ſtretched through the two points cuts the eliptic.

To determine the parallax of a COMET. See PARALLAX.

COMET, *trajectory of a*. See TRAJECTORY.

COMETARIUM, a curious machine, exhibiting an idea of the revolution of a *comet* about the ſun. It is contrived in ſuch a manner, as by elliptical wheels to ſhew the unequal motion of a *comet* in every part of its orbit. The *comet* is repreſented by a ſmall braſs ball, carried by a radius vector, or wire, in an elliptic groove about the ſun in one of its foci; and the years of its period are ſhewn by an index moving with an equable motion over a graduated ſilver circle. See a particular deſcription, with a cut, in Ferguſon's Aſtronomy, 4to. p. 288.

COMETIS, in *Botany*, a genus of the *tetrandria monogynia* claſs, of which there is only one known ſpecies. The involucrum is formed of three leaves and three flowers; the calyx has four leaves; and the capſule contains three berries.

COMETITES, in *Natural Hiſtory*, a name given by ſome writers to a kind of aſtroites, which has ſtars much larger than thoſe of the common kind, and therefore called *comets*.

COMEUS, in *Mythology*, a ſurname of Apollo, under which title he was worſhipped at Seleucia, whence his ſtatue was carried to Rome, and placed in the temple of Apollo Palatine.

COMFREY, *ſymphytum*, in *Botany*, a genus of plants, of the *pentandria monogynia* claſs; the characters of which are theſe: the flower has a five-cornered, erect, permanent empalement, cut into five acute parts: it has one petal with a ſhort tube, above which the limb has a ſwelling belly and thicker tube. The brim is indented in five obtuſe parts, which are reflexed; the chaps are armed with five awl-ſhaped rays, which are connected in a cone; it has five awl-ſhaped ſtamina, which are alternate with the rays of the chaps, terminated by erect acute ſummits; and four germina, ſupporting a ſlender ſtyle the length of the petal, crowned by a ſingle ſtigma. The germina afterwards turn to four gibbous, acute, pointed ſeeds, which ripen in the empalement. There are ſeveral ſpecies; but only three are to be found in the Engliſh gardens; which are cultivated either by ſeed, or by parting the roots, which latter is the more expeditious way. They are extremely hardy, and will grow on almoſt any ſoil, and in any ſituation.

Comfrey-root has been extolled as a famous vulnerary, both externally and internally; and as a noble balſamic and agglutinant; and given with ſucceſs in diarrhœas from dyſenteries, and ſpittings of blood. The beſt way of taking it is in decoction, or ſyrup; but the decoction muſt not be too ſtrong. A conſerve of them is found of excellent uſe in hæmorrhages of all kinds. They have been alſo recommended in the gout and ſciatica, as of great virtues in mitigating the pain, and ſhortening the paroxyſms. It is now rarely employed in practice, though it may be deemed ſuperior to the althea roots. The mucilage derived from the root is its only medicinal principle.

Symphytum was a name given among the ancients to ſeveral different plants, which had the common virtues of agglutinators. We have appropriated the word to *comfrey*; but Dioſcorides plainly uſes it ſometimes as the name of elecampane, and ſometimes as that of the common horſe-tail. Pliny has collected the virtues and characters of the *ſymphytum* from all the authors he had, in whom the word occurred, and therefore he has given a liſt of virtues that belong to no one plant.

Comfrey, *ſpotted*, in *Botany*. See Lung-*wort*.

COMIOLA, in *Botany*, a name given by ſome of the old Roman authors to the plant commonly called luteola, or dyer's weed. See Dyer's *weed*.

COMITATU *commiſſo*, in *Law*, a writ, or commiſſion, by which a ſheriff is authoriſed to take upon him the charge of the county.

Comitatu *et caſtro commiſſo*, a writ by which the charge of a county, together with the keeping of a caſtle, is committed to the ſheriff.

COMITATUS, in *Law*, a county. Ingulphus tells us, that England was firſt divided into counties by king Alfred; and the counties into hundreds, and theſe again into tythings: and Forteſcue writes, that *regnum Angliæ per* comitatus, *ut regnum Franciæ per ballivatus diſtinguitur*.

Sometimes it is taken for a territory or juriſdiction of a particular place; as in Mat. Paris, anno 1234. See County.

Comitatus *poſſe*. See Posse.

COMITIA, an aſſembly of the Roman people, either in the Comitium, or Campus Martius, i. e. Field *of Mars*; meeting for the election of magiſtrates, or for conſulting on the important affairs of the republic.

The word comes from the verb *coeo*, or *comeo*, *to go together*.

There were certain days fixed for theſe aſſemblies, called *dies comitiales*; marked with a C in the calendar of Julius Cæſar. *Comitial* aſſemblies, held for the election of conſuls, were called *conſular comitia*: in like manner, the other *comitia* took names from the officer to be created; whether a tribune, a pontiff, ædile, or the like.

There were three kinds of theſe *comitia*, viz. *curiata*, *centuriata*, and *tributa*; ſo diſtinguiſhed, from the manner wherein the people voted, and gave their ſuffrages, viz. by curiæ, or pariſhes, tribes, or centuries.

The power of calling theſe aſſemblies pertained to moſt of the chief magiſtrates, and ſometimes to the ſovereign pontiff.

Authors make the difference between *comitia*, and *concilia*, to conſiſt in this; that in the former the whole people were called together, in the latter only a part.

Comitia *curiata*. Romulus inſtituted the *comitia curiata*, or the public aſſemblies of the people, called to vote in their ſeveral curiæ; and it is agreed by all, that the matters ſubjected to their deciſion, were the choice of all the magiſtrates, and the right of making laws, war, and peace: an ample juriſdiction, and in the moſt important articles of government, yet not wholly abſolute, according to Dionyſius, unleſs the ſenate concurred with them. This method of tranſacting all the greater affairs by the people, aſſembled in their curiæ, after it had ſubſiſted through five ſucceſſive reigns, was found to be inconvenient.

Servius Tullius, the ſixth king of Rome, in order to correct the inconvenience of the *comitia curiata*, inſtituted a new diviſion of the people into ſix claſſes, according to a cenſus, or valuation of their eſtates; whence proceeded the *comitia centuriata*: then he ſubdivided theſe claſſes into one hundred and ninety-three centuries, and contrived to throw a majority of theſe centuries, that is, ninety-eight of them, into the firſt claſs of the richeſt citizens. By which regulation, though every man voted now in his century, as before in his curia; yet, as all matters were decided by a majority of the centuries, ſo the balance of power was wholly transferred into the hands of the rich; and the poorer ſort deprived of their former weight and influence in the affairs of ſtate: which wiſe inſtitution was ever after obſerved, through all ſucceeding ages, in the elections of the principal magiſtrates, and the determination of all the principal tranſactions of the republic.

COMITIAL *days*. Paulus Manutius is of opinion, that there were certain days on which the Roman ſenate might regularly be aſſembled; and others, on which it could not: and that theſe laſt were called *comitial* days, and marked under that name in the calendars, as days wholly deſtined, and ſet apart by law, for the aſſemblies of the people. But Sigonius contends, that the ſenate might meet on any of thoſe days, unleſs when the people were actually aſſembled, and tranſacting buſineſs on them; and conſequently that the title of *comitial* denoted ſuch days only, on which the people might be legally aſſembled, not ſuch on which they were of courſe to be aſſembled. Middlet. of Rom. Senat. p. 138, ſeq.

The truth of the matter ſeems to be this, that though the days called *comitial* were regularly deſtined to the aſſemblies of the people, yet the ſenate alſo might not only be convened on the ſame, after the popular aſſemblies were diſſolved; but had the power likewiſe, whenever they found it expedient, to ſuperſede and poſtpone the aſſemblies of the people to another day; and, by a particular decree, to authoriſe their own meetings upon them, for the diſpatch of ſome important affair, therein ſpecified.

COMITIALIS *morbus*, an ancient term for the epilepsy, or falling-ſickneſs; ſo called, becauſe if any perſon was ſeized with it in the Roman *comitia*, the aſſembly was immediately diſſolved; this being eſteemed an unlucky omen; or, rather, becauſe thoſe liable to it were chiefly ſeized in the *comitia*, or great aſſemblies.

COMITIUM, the place where the *comitia* were ordinarily held, was a large hall in the Roman Forum: it was a long time open at top; on which account, the aſſemblies were often interrupted by bad weather: it was firſt covered over in the time of the ſecond Punic war. See Forum.

Roſinus obſerves, that the conſuls and tribunes were not created in the *Comitium*, but in the Campus Martius.

It was in this place that the roſtra were placed. See Comitia.

COMMA, in *Grammar*, a point, or character, formed thus [,]; ſerving to mark a ſhort ſtop, or pauſe; and to divide the members of a period.

The word is formed of κοπτω, *ſeco*, *I cut*.

It is very difficult to fix the preciſe uſe of the *comma*; different authors define, and uſe it differently: the ordinary doctrine is, that the *comma* ſerves to diſtinguiſh nouns, verbs, adverbs, and the ſeveral parts of a period that are not neceſſarily joined together. But this conveys no clear, preciſe idea; for what is it *to diſtinguiſh the parts of a period not neceſſarily joined together?* F. Buffier has carried the doctrine of the *comma* farther: according to him, the *comma* ſerves to diſtinguiſh thoſe members of a period, in each whereof is a verb, and the nominative caſe of the verb. Thus, *That ſo many people are pleaſed with trifles, is owing to a weakneſs of mind, which makes them love things eaſy to be comprehended.*

Beſides this, the *comma* is uſed to diſtinguiſh, in the ſame member of a period, ſeveral nouns ſubſtantives, or nouns adjectives, or verbs, not united by a conjunction. Thus, *Virtue*, *wit*, *knowlege*, *are the chief advantages of a man*: or, *A man never becomes learned without ſtudying conſtantly*, *methodically*, *with a guſt*, *application*, *&c.*

If thoſe words be united in the ſame phraſe by a conjunction, the *comma* is omitted: thus, *The imagination and the judgment do not always agree.* The *comma* may alſo be omitted between the phraſes that are very ſhort, eſpecially if they depend on the ſame regimen, and are united by a conjunction: thus, *Alexander conquered Aſia and eſtabliſhed the monarchy of the Greeks.*

The ingenious author of the tract De Ratione Interpungendi, printed with Voſſius's Element. Rhetor. Lond. 1724, lays down the uſe of a *comma* to be, to *diſtinguiſh the ſimple members of a period, or ſentence*; i. e. ſuch as only conſiſt of one ſubject, and one definite verb. Thus Cicero, *Venio nunc ad voluptates agricolarum, quibus ego incredibiliter delector, quæ nec ulla impediuntur ſenectute, & mihi ad ſapientis vitam proxime accedere videntur.* See Sentence.

But this rule does not go throughout; the ſame author inſtancing many particular caſes, not included herein, where yet the *comma* is adviſable.

Sometimes, e. gr. a propoſition includes another, which may be called *partitive*, as being only a part of the entire phraſe; in which caſe, the two are to be divided from each other by *commas*. Thus, *He always ſays, as he tells us, the fineſt things in the world.*

The points, or pauſes in diſcourſe, it is obſerved, are in a kind of muſical proportion: the *comma* ſtops the reader's voice while he may privately tell one; the ſemicolon, two; the colon, three; and the period, or full-ſtop, four. Others make the ſtop at the colon, four; and at the period, ſix. Profeſſor Ward obſerves, that the ſuſpenſion of the voice ſhould be twice as long for a *comma* as between words ſeparated by no mark of diſtinction; thrice for the ſemicolon; and ſo on in the ſame proportion. Biſhop Lowth aſſigns to the period a pauſe in duration double to the colon; to the colon, double of the ſemicolon; and to the ſemicolon, double of the *comma*: ſo that they are in the ſame proportion to one another as the ſemibreve, the minim, the crotchet, and the quaver, in muſic. But, whatever be the duration of the ſeveral pauſes, the proportion between them would be ever invariable, if the doctrine of punctuation were exact. Introd. to Engliſh Grammar, ed. 1772. p. 197.

The ancients only made uſe of two kinds of points, or pauſes, in a period; the larger they called *members*, the Greeks *cola*, marked thus [:]; the ſmaller *inciſa*, the Greeks *commata*, thus [,].

The moderns, refining on their predeceſſors, have ſubdivided the firſt into a colon, and ſemicolon; ſome ſay, without any good foundation in nature; though others maintain the uſefulneſs of the diviſion.

As the member, or colon, divides the period into two parts, each containing a ſenſe, though that imperfect: thus, *Antequam de republica, patres conſcripti, dicam ea quæ dicenda hoc tempore arbitror*; where the ſenſe does not reſt, nor is the period or ſentence perfect, without the addition of, *exponam vobis breviter & profectionis & reverſionis meæ:* the *comma* ſubdivides each member into intermediate diviſions, which, of themſelves, have no preciſe meaning at all: v. gr. *Nihil eſt, mihi crede, virtute formoſius, nihil pulchrius, nihil amabilius.*

Frequent *commas*, as on other occaſions they promote perſpicuity and diſtinctneſs, and eaſe the reader, both in the rehearſal and comprehenſion of his author; ſo, in oratory, are of eſpecial uſe and effect; particularly where an adverſary is to be cloſely and pointedly attacked, upbraided, reprehended, wounded, &c. Witneſs that of Cicero againſt Verres: *Non enim nos color iſte ſervilis, non piloſæ genæ, non dentes putridi deceperunt: oculi, ſupercilia, frons, vultus denique totus, qui ſermo quidam tacitus mentis eſt, hic in fraudem, homines impulit: hic, eos, quibus erat ignotus, decepit, fefellit, in fraudem induxit: pauci tua iſta lutulenta vitia novimus; pauci tarditatem ingenii, ſtuporem, debilitatemque linguæ, &c.*

Comma, in *Muſic*, is the ſmalleſt of all the ſenſible intervals of tone. Ptolemy conſidered it as inſenſible; but Salinas aſſerts, that he was capable of diſtinguiſhing it. Muſical writers have enumerated three kinds of *comma.* The greater *comma*, or the interval of two ſounds, having the ratio of 81 to 80, which is the difference of the major and minor tones. To this the term is commonly applied. It is ſeldom in uſe, except in the theory of muſic, to ſhew the juſtneſs of the concords; for in the practice, the diviſion is drowned and loſt.—The ſmaller *comma* is the difference between the greater and leſſer ſemitones; and the proportion expreſſing it is that of 2048 to 2025.—The *comma* of Pythagoras is expreſſed by the ratio of 531441 to 524288: or, it is the difference between ſix tones major and an octave. The tone, in the diſtribution aſcribed by Boetius and others to Philolaus, contained nine *commas.* See Tone, &c.

COMMAND, in the *Royal Navy*, implies the rank or power of an officer, who has the management of a ſhip of war of any kind under twenty guns. He ranks with a major in the army.

COMMANDER, is a name given to a large wooden mallet uſed in a ſhip.

COMMANDING *Ground*, in *Fortification*, an eminence, or riſing ground, which overlooks any poſt, or ſtrong place.

Of this they reckon three ſorts: 1°, *A front commanding ground*; which is an height oppoſite to the face of the poſt, which plays upon its front.

2°, *A reverſe commanding ground*, which is an eminence that can play upon the back of any place or poſt.

3°, *An enfilade commanding ground*, or *curtin commanding ground*; which is an high place, that can with its ſhot ſcour all the length of a ſtrait line.

COMMANDMENT, in a *Legal Senſe*, has various uſes: as, *Commandment of the King*, when, on his own mere motion, and from his own mouth, he caſts a man into priſon.

Commandment of the juſtices, is either *abſolute*, or *ordinary*; *abſolute*, as when, on their own authority, and their own diſcretion, they commit a man to priſon for puniſhment. *Ordinary*, as when they commit him rather for ſafe cuſtody, than puniſhment.—A man committed to an ordinary *commandment* is repleviable.

Commandment is alſo uſed for the offence of him who directs or wills another to tranſgreſs the law; as by murder, theft, and the like.

He that *commandeth* any one to do an unlawful act, is acceſſary to it and all the conſequences, if it be executed in the ſame manner as *commanded:* but if the *commander* revoke the *command*; or if the execution varies from it, or in the nature of the offence; in ſuch caſe he will not be acceſſary. 3 Inſt. 51, 57. 2. Inſt. 182.

In another ſenſe of this word, magiſtrates may *command* others to aſſiſt them in the execution of their offices, for the doing of juſtice; and ſo may a juſtice of peace, to ſuppreſs riots, apprehend felons; or any officer to keep the king's peace, &c. Bro. 3.

In treſpaſs, &c. the maſter ſhall be accountable for the act of the ſervant done by his *command*; but ſervants ſhall not be excuſed for committing any crime, when they act by *command* of their maſter, who have no authority to enforce ſuch *command.* The *command* of infants and feme coverts are void.

Commandments, *Ten.* See Decalogue.

COMMANDRY, a kind of benefice, or fixed revenue belonging to a military order, and conferred on ancient knights, who had done conſiderable ſervice to the order.

There are *ſtrict*, or *regular commandries*, obtained in order, and by merit: there are others of *grace* or *favour*, conferred at the pleaſure of the grand maſter.

There are alſo *commandries* for the religious in the orders of St. Bernard and St. Antony.—The kings of France have converted ſeveral of the hoſpitals for lepers into *commandries* of the order of St. Lazarus.

The commandries of Malta are of different kinds; for as the order conſiſts of knights, chaplains, and brother ſervitors, there are peculiar *commandries*, or revenues, attached to each.

The knight to whom one of theſe benefices or *commandries* is given, is called *commander:* which agrees pretty nearly with the *præpoſitus* ſet over the monks in places at a diſtance from the monaſtery, whoſe adminiſtration was called *obedientia:* becauſe depending entirely on the abbot who gave him his commiſſion. Thus it is with the ſimple *commanders* of Malta, who are rather farmers of the order, than beneficiaries; paying a certain tribute, or rent, called *reſponſio*, to the common treaſure of the order.

The *commandries* belonging to the priory of St. John of Jeruſalem in England, conſiſting of manors, lands, &c. ſuch was that of New Eagle in Lincolnſhire, were given to Henry VIII. by ſtatute 32 Hen. VIII.

COMMELINA, in *Botany*, a genus of the *triandria monogynia* claſs; ſo named by F. Plumier, in compliment to Dr. Commeline, a famous profeſſor of botany at Amſterdam. Its characters are theſe: It hath a permanent heart-ſhaped ſpatha, the flower hath ſix concave petals, three of which are ſmall and oval, the other large roundiſh and coloured. It hath three nectariums, (which hath been ſuppoſed to be ſtamina) and three awl-ſhaped ſtamina which recline: in the center is ſituated a roundiſh germen, which afterward becomes a naked globular capſule with three furrows, having three cells, each containing two angular ſeeds. There are five ſpecies, natives of Africa and America. Miller's Gard. Dict.

No medicinal properties are attributed to this plant.

COMMEMORATION, the remembrance of any one; or ſomething done in honour of a perſon's memory.

Among the Romaniſts, it is a practice for dying perſons to leave a legacy to the church, for the rehearſing ſo many maſſes in *commemoration* of them.

The euchariſt is a *commemoration* of the ſufferings of Jeſus Chriſt.

Commemoration is alſo the name of two religious feaſts. otherwiſe called All-saints, and All-souls. The occaſion of their inſtitution is variouſly related.

COMMENDAM, in the *Canon Law*, expreſſes the charge, truſt, and adminiſtration of the revenues of a benefice, given to a layman to enjoy, by way of depoſitum, for the ſpace of ſix months, in order to its being repaired, &c. or to another biſhop, or eccleſiaſtic, to perform the paſtoral offices thereof, till ſuch time as the benefice is provided of a regular incumbent.

Anciently, the adminiſtration of vacant biſhopricks belonged to the neareſt neighbouring biſhop; which is ſtill practiſed between the archbiſhoprick of Lyons, and the biſhoprick of Autun: on this account they were called *commendatory biſhops.*

This cuſtom appears to be very ancient: St. Athanaſius ſays of himſelf, according to Nicephorus, that there had been given him in *commendam*, i. e. in adminiſtration, another church beſides that of Alexandria, whereof he was ſtated biſhop.

The care of churches, it ſeems, which had no paſtor, was committed to a biſhop, till they were provided with an ordinary: the regiſter of pope Gregory I. is full of theſe commiſſions, or *commendams*, granted during the abſence or ſickneſs of a biſhop, or the vacancy of a ſee. Some ſay, that pope Leo IV. firſt ſet the modern *commendams* on foot, in favour of eccleſiaſtics who had been expelled their benefices by the Saracens; to whom the adminiſtration of the vacant churches was committed for a time, in expectation of their being reſtored: though St. Gregory is ſaid alſo to have uſed the ſame, while the Lombards deſolated Italy.

In a little time, the practice of *commendams* became exceedingly abuſed; and the revenues of monaſteries were given to laymen for their ſubſiſtence. The biſhops alſo procured ſeveral benefices, or even biſhopricks, *in commendam*, which ſerved for a pretext for holding them all without directly violating the canons. Part of the abuſe has been retrenched; but the uſe of *commendams* is ſtill retained, as an expedient to take off the incompatibility of the perſon, by the nature of the benefice.

When a parſon is made biſhop, his parſonage becomes vacant; but if the king give him power, he may ſtill hold it *in commendam*; but this muſt be done before conſecration. There are ſeveral ſorts of *commendams* founded on the ſtat. 25 Hen. VIII. cap. 21. as a *commendam ſemiſtus*, which is a proviſionary act of the ordinary, and only implies a ſequeſtration of the cure and fruits till the patron preſents his clerk: a *commendam retinere*, by means of which a biſhop retains benefices on his preferment, which has operated for a certain number of years, or even as long as the *commendatory* lived, and continued biſhop: a *commendam recipere*, which is to take a benefice *de novo*, in the biſhop's own gift, or of ſome other patron, whoſe conſent is obtained; and for life.

A benefice cannot be *commended* by parts, any more than it may be preſented unto by parts; ſo that one ſhall have the glebe, another the tythes, &c. Nor can a commendatory have a *juris utrum*, or take to him and his ſucceſſors, ſue or be ſued, in a writ of annuity, &c. But a *commenda perpetua* may be admitted to do it, 11 Hen. IV. Compl. Incumb. 360. See 1 Nelſ. Abr. 454.

Commendam, in popiſh countries, is a real title of a regular benefice; as an abbey, or priory given by the pope to a ſecular clerk, or even to a layman, with power to diſpoſe of the fruits thereof during his life.

No benefice that has a cure of ſouls, i. e. no parſonage, or biſhoprick, can be given *in commendam*. This practice being entirely contrary to the canons, none but the pope, who has a power of diſpenſing with the canons, can confer it.

When the *commendam* becomes vacant by the death of the *commendatory*, it is not eſteemed vacant by his death; but as it was before the *commendam* was granted; that making no alteration in the thing: yet the pope gives the ſame benefice *in commendam* again, by a privilege which he ſtill continues.

By the pope's bulls, a *commendatory* abbot has the full authority of the regular abbot to whom he is ſubſtituted. For this reaſon, the bulls expreſly require, that he be a prieſt; or, that if he have not yet attained the age of prieſthood, he ſhall take orders as ſoon as he has. But this is a mere formality, or matter of ſtyle; the thing is never executed.

Indeed, the ſpiritual direction of the abbey, while it is *in commendam*, is lodged wholly in the clauſtral prior. The *commendatory* abbots have not any authority over the religious *in ſpiritualibus*: they even cannot either appoint or ſet aſide the clauſtral priors, who are nominated in the bulls the adminiſtrators of the ſpiritualities; in which, however, this reſtriction is added, viz. till the abbot arrive at the age of twenty-five years, to aſſume the prieſthood.

The pope grants benefices *in commendam*, not only to clerks, by diſpenſing with their age, and other qualifications required; but they alſo diſpenſe with the clericate even in children yet in the cradle, till they become of age to take the tonſure: it being ſufficient to obtain a bull, that it be repreſented at Rome, that the child is deſtined for the eccleſiaſtic ſtate.

In this caſe there is an Oeconomus, or ſteward, appointed to take care of the temporal concerns.

COMMENDATORY *Abbot*. See Abbot *in commendam*.

Commendatory *Letters*, are ſuch as are written by one biſhop to another, in behalf of any of the clergy, or others of his dioceſe travelling thither; that they may be received among the faithful: or that the clerk may be promoted; or neceſſaries may be adminiſtered to others, &c. Several forms of theſe letters may be ſeen in our hiſtorians; as in Bede, lib. ii. cap. 18.

COMMENDATUS, one that lives under the protection of a great man.

Commendati homines, were perſons who by voluntary homage, put themſelves under the protection of any ſuperior lords. For ancient homage was either predial, due for ſome tenure, or perſonal, which was by compulſion, as a ſign of neceſſary ſubjection; or voluntary, with a deſire of protection. And thoſe who by voluntary homage put themſelves under the protection of any men of power, were ſometimes called *homines ejus commendati*; ſometimes only *commendati*, as often occurs in Domeſday. *Commendati dimidii*, were thoſe who depended on two ſeveral lords, and paid one half of their homage to each; and *ſub commendati*, were like under tenants, under the command of perſons who were dependents themſelves on a ſuperior lord. There were alſo *dimidii ſub commendati*, who bore a double relation to ſuch depending lords. Domeſday. This phraſe ſeems to be ſtill in uſe, in the uſual compliment, *commend* me to ſuch a friend, &c. which is to let him know I am his humble ſervant. Spelm. of Feuds, cap. 20.

COMMENSURABLE *quantities*, in *Geometry*, are ſuch as have ſome common aliquot part, or which may be meaſured by ſome common meaſure, ſo as to leave no remainder in either. Thus, a foot and a yard are *commenſurable*; there being a third quantity which will meaſure each, viz. an *inch*; which taken 12 times makes a *foot*, and 36 times a *yard*.

Commenſurables are to each other, either as units to a rational whole number; or as one rational whole number to another. In *incommenſurables* it is otherwiſe. The ratio of *commenſurables* therefore is rational; that of *incommenſurables* irrational: hence, alſo, the exponent of the ratio of *commenſurables* is a rational number.

Commensurable *numbers*, whether integers or fractions, are ſuch as have ſome other number which will meaſure or divide them without any remainder.

Thus, 6 and 8, $\frac{8}{12}$, and $\frac{3}{4}$, are reſpectively *commenſurable* numbers.

Commensurable *in power*. Right lines are ſaid to be *commenſurable in power*, when their ſquares are meaſured by one and the ſame ſpace, or ſuperficies.

Commensurable *ſurds*, are ſuch ſurds as, being reduced to their leaſt terms, become true figurative quantities of their kind; and are therefore as a rational quantity to a rational: ſuch are $3\sqrt{2}$ and $2\sqrt{2}$.

COMMENTACULA, among the Romans, the rod which the flamens carried in their hands when going to ſacrifice.

COMMENTARIENSIS, among the Romans, an officer who had the keeping of the priſon, and was to obey the *triumviri capitales*.

COMMENTARY, or **Comment**, a gloſs, or interpretation, affixed to ſome ancient, obſcure, or difficult author, to render him more intelligible, or to ſupply what he has left undone.

Commentary is alſo uſed for a ſort of hiſtory, written by a perſon who had a chief hand in the tranſactions related.

Such are the *commentaries* of Cæſar, of Sleidan, of Montluc, &c.

The word is alſo uſed for certain books written on ſome particular ſubject: Kepler has an excellent book of *commentaries on Mars*, containing obſervations on the motion of that planet.

COMMERCE, the exchange of commodities; or, the buying, ſelling, or trafficking of merchandize, money, or even paper, in order to profit by the ſame.

There is no doubt but *commerce* is nearly as ancient as the world itſelf: neceſſity ſet it on foot; the deſire of conveniency improved it; and vanity, luxury, and avarice, have brought it to its preſent pitch. At firſt it could only conſiſt in the exchange of things neceſſary for life: the plowman gave his corn and his pulſe to the ſhepherd, and received milk and wool in exchange: which method of *commerce* by exchange ſubſiſts ſtill in many places; as about the coaſts of Siberia, and the Daniſh, and Muſcovite Lapland; among ſeveral nations on the coaſts of Africa; among ſome of thoſe of America, and many of Aſia. See Exchange.

It is not preciſely known when the *commerce* by buying and ſelling firſt began; nor when coins, and the ſeveral ſpecies of gold, ſilver, and copper, had their riſe. The firſt moneys were wood, leather, and iron; and even at this day, it is the cuſtom in ſome places of both Indies, to give a certain value in ſea-ſhells and coco-nuts, for merchandizes, drugs, &c. See Money, and Coin.

The firſt inſtance of this kind of *commerce* in the ſacred writing, is in the time of the patriarch Abraham. As for prophane authors, they uſually fix its epocha to the reign of Saturn and Janus in Italy; and the ancient authors, according to Cæſar, attribute its invention to the god Mercury.

The Egyptians, Phœnicians, and Carthaginians, who were a Tyrian colony, were the firſt, the moſt daring, and expert traders of all antiquity: at leaſt, it is evident they were the firſt who ran the hazard of long voyages; and who ſet on foot a traffic by ſea between coaſts very remote.

Among the ancients, *commerce* did not appear unworthy the application of perſons of the firſt rank: Solomon, we are told, frequently joined his merchant-fleets with thoſe of the king of Tyre, for their voyage to Ophir; and by this means rendered himſelf, though in a little kingdom, the richeſt king of his time in the univerſe. Under the Aſiatic and Grecian empires, ancient hiſtory gives us from time to time the traces of a *commerce* cultivated by ſeveral nations: but it flouriſhed more conſiderably under the dominion of the Romans; as appears from that vaſt number of colleges and companies of merchants in the ſeveral cities mentioned in hiſtorians, and ancient inſcriptions.

The deſtruction of the Roman empire by the irruptions of the barbarians, brought that of *commerce* along with it; or at leaſt ſuſpended its ordinary operation for ſome time: by degrees it began to recover itſelf, and made a new progreſs; eſpecially in Italy. Hence, the Piſans, Florentines, Genoeſe, and Venetians, who, abounding in ſhipping, took occaſion to ſpread themſelves through all the ports of the Levant and Egypt; bringing thence ſilk, ſpices, and other merchandiſes; and furniſhing the greateſt part of Europe therewith. And thus was the modern *commerce* founded on the ruins of that of the ancient Greeks and Romans to the ſame places: and thus did thoſe famous republics acquire their luſtre and power; which were conſiderably increaſed by the commercial effects of the cruſades. Theſe republics furniſhed the cruſaders with tranſports, military ſtores and proviſions, and obtained charters very favourable to the eſtabliſhment and extenſion of their *commerce*. When Conſtantinople was taken under the banner of the holy croſs, many valuable branches of trade, which formerly centered in that city, were transferred to Venice, Genoa, or Piſa. Robertſon's Hiſt. vol. i. chap. v. p. 34, &c. 8vo.

The Germans, however, had a long time carried on a ſeparate *commerce*; which was not borrowed from the Romans, nor did it fall with theirs. Towards the end of the twelfth century, the German cities ſituate on the coaſt of the Baltic, and the rivers that run into it, got into a conſiderable traffic with the neighbouring ſtates. As their *commerce* was much interrupted by pirates, ſeventy-two of them united together for their mutual defence; and were thence called *Hanſeatic*, or *Hans towns*. See Hans *Towns*.

Thus they flouriſhed till the beginning of the ſixteenth or the end of the fifteenth century; when a diviſion ariſing among them, and about the ſame time a new paſſage to the Indies, by the Cape of Good Hope, being diſcovered by the Portugueſe; and ſettlements made on the coaſt of Africa, Arabia, and the Indies; the ancient Italian and Hanſeatic *commerce* ſunk; and the chief trade came into the hands of the Portugueſe.

The Portugueſe had not poſſeſſed thoſe different trades above an hundred years, when, about the beginning of the ſeventeenth century, the Dutch began to ſhare it with them; and in a little time diſpoſſeſſed them of almoſt the whole. The Engliſh, French, Danes, and Hamburghers, excited by their ſucceſs, have likewiſe made ſettlements in the Indies, and on the coaſts of Africa; though much leſs conſiderable ones, excepting thoſe of the Engliſh.

Laſtly, America, diſcovered by Columbus in 1492, in favour of the Spaniards, ſoon after the Portugueſe had diſcovered the new way to the Indies, likewiſe became the object of a new, vaſt, and moſt important *commerce*, for all the nations of Europe; whereof Cadiz and Seville were made the centre.

It is true, the firſt conquerors of this new world ſtill poſſeſs the greateſt and richeſt part of it; and preſerve the *commerce* thereof to themſelves with great jealouſy: yet, beſides that the Engliſh, French, Portugueſe, and Dutch, have ſeveral rich and flouriſhing colonies, both in the iſlands and the continent; it is certain, that it is as much for other nations as themſelves that the Spaniards every year ſend their flotas for the treaſures of Peru and Mexico.

The trade of Europe was no ſufferer by this new one of America; the north and ſouth have ſtill the ſame mutual occaſion for each other as before.

The navigation from the Baltic to the Mediterranean was tedious and difficult: the ſituation of Flanders, and the manufactures which there flouriſhed from the tenth century, together with the free fairs of that country, engaged the merchants, both of the north and ſouth, to eſtabliſh their magazines firſt in Bruges, and then in Antwerp.

The eſtabliſhment of the republic of Holland, the favourable reception it gave to ſtrangers, and the refuge it afforded to religionaries, drew ſtore of manufacturers to it, as well as manufactures; and ſoon ſunk the *commerce* of Antwerp.

And the ſame reaſons, the convenience and multitude of the ports of England, the goodneſs of the wools, and the induſtry of the workmen, have brought hither a conſiderable part of the *commerce* of Europe.

In France, the nobles are allowed to exerciſe *commerce* without derogating from their nobility: by an ordonnance of Louis XIII. merchants are allowed to take on them the quality of nobles; and by another of Louis XIV. they are declared capable of being ſecretaries of ſtate, without laying aſide their *commerce*. It may be added, for the honour of trade, that ſome of the Italian princes, looking on themſelves as the chief merchants of their ſtates, do not diſdain to make their own palaces ſerve as magazines: and there are ſeveral kings in Aſia, as well as moſt of thoſe on the coaſts of Africa and Guinea, who negotiate with the Europeans by their factors, and frequently in perſon.

Commerce, on the foot it now ſtands, is divided into *commerce by land*, and *by ſea*; *inland* or *domeſtic*, and *foreign*; and by *wholeſale* and *retail*.

With reſpect to domeſtic *commerce*, we may obſerve, that the king is the arbiter of it; as it pertains to his prerogative to eſtabliſh public marts, as markets and fairs, to regulate weights and meaſures, and to give money, which is the univerſal medium of *commerce*, authority and currency.

A great part of the foreign *commerce* of England is now carried on by collective companies: ſome incorporated by the king's charters, with an excluſive privilege, as the Eaſt India company; others only private aſſociations, as the Turky and Hamburgh companies. See Company.

Commerce, *Chambers of.* See Chamber.

Commerce, *Characters in.* See Character.

COMMINATORY, a clauſe inſerted in a law, edict, patent, &c. importing a puniſhment wherewith delinquents are menaced; which, however, is not to be executed in its rigour.

Thus, in France, when an exile is enjoined not to return on pain of death, it is deemed a *comminatory* penalty; ſince, if he do return, it is not ſtrictly executed; but a ſecond injunction is then laid on him, which is more than *comminatory*, and from the day of the date thereof, imports death without remedy.

COMMINUTION, the act of grinding, or breaking any matter into ſmaller particles.—The effect of chewing, or maſticating our food, is the *comminution* thereof.

COMMISSARY, an officer of the biſhop, who exerciſes eccleſiaſtical juriſdiction in thoſe parts of the dioceſe, which are ſo remote from the ſee, that the chancellor cannot call the ſubjects thereof to the biſhop's principal conſiſtory, without their too great moleſtation.

This officer, called by the canoniſts *commiſſarius*, or *officialis foraneus*, is appointed to ſupply the biſhop's office in the out-parts of the dioceſe, and in ſuch parts as are peculiar to the biſhop, and exempted from the juriſdiction of the archdeacon: for where the archdeacons have juriſdiction, as in moſt places they have, either by preſcription or compoſition, the *commiſſary* is ſuperfluous, and frequently vexatious.

Commissary, in an *army*.—There are ſeveral ſorts of *commiſſaries*:

Commissary *of horſes*, an officer in the artillery, appointed to have the inſpection of the artillery-horſes, to ſee them muſtered, and to ſend ſuch orders as he receives from the commanding officer of the artillery, by ſome of the conductors of horſes, of which he has a certain number for his aſſiſtants.

Commissary-General *of the muſters*, or muſter-maſter general, takes an account of the ſtrength of every regiment, reviews them, ſees that the horſe be well mounted, and all the men well armed and accoutred.

Commissary *of proviſions*, is he who has the inſpection of the bread and proviſions of the army.

Commissary *of ſtores*, an officer in the artillery who has the charge of all the ſtores, for which he is accountable to the office of ordnance; he is allowed an aſſiſtant, clerks, and conductors, under him.

COMMISSION, in *Common Law*, is the ſame with *delegation* among the civilians; and is taken for the warrant, or patent, which any man exerciſing juriſdiction, either ordinary or extraordinary, hath to authoriſe him to hear or determine any cauſe or action.

The term, however, is ſometimes extended farther than to matters of judgment; as in the *commiſſion* of purveyors, which ſeems to be null by the ſtatute for taking away purveyance, 12 Car. II. and the high *commiſſion court*, which was founded on the ſtatute 1 Eliz. and is alſo aboliſhed by act of parliamen 16 Car. I. The perſons charged with a *commiſſion* are hence called *commiſſioners*; ſometimes *committees*.

Commission *of anticipation*, was anciently a *commiſſion* given under the great-ſeal, to collect a ſubſidy before the day. See Anticipation.

Commission *of aſſociation*, is a *commiſſion* under the great-ſeal to aſſociate two, or more learned perſons, with the ſeveral juſtices, in the ſeveral circuits and counties in Wales.

Commission *of bankruptcy*, a *commiſſion* under the great-ſeal, directed to five or more commiſſioners, to enquire into the particulars of a man's circumſtances, who hath failed, or broke; and to act according to certain ſtatutes made in that behalf. See Bankrupt.

Commissions *of charitable uſes* go out of the chancery to the biſhop and others, where any lands given to charitable uſes are miſemployed, or there are any fraud or diſputes concerning them, to enquire of and redreſs the abuſe, &c. 43 Eliz. cap. 4.

Commission *of Delegates*. See Delegates and Court.

Commission *of lunacy*, a commiſſion out of chancery to enquire whether a perſon repreſented to be lunatic, be ſo or not; that, if lunatic, the king may have the care of his eſtate, &c. 17 Edw. II. cap. 10.

Commission *of peace*. See Justice *of peace*.

Commiſſion *of rebellion*, or *writ of rebellion*, is iſſued out when a man, after proclamation iſſued out of the chancery, or the exchequer, and made by the ſheriff, to preſent himſelf, under pain of his allegiance, to the court by a certain day, does not appear. See Rebellion.

This *commiſſion* is directed, by way of command, to certain perſons; three, two, or one of them; to apprehend, or cauſe to be apprehended, the party as a rebel; and to bring him to the court on a day aſſigned.

This writ or *commiſſion* goes forth after an attachment returned, *non eſt inventus*, &c.

Commiſſion *of ſewers*, is directed to certain perſons to ſee drains and ditches well kept, and maintained, in the marſhy and fenny parts of England, for the better conveyance of water into the ſea, and preſerving the graſs upon the land. Stat. 23 Hen. VIII. cap. 5. 13 Eliz. cap. 9.

Commiſſion *to examine witneſſes*, is ſometimes appointed by the court of equity in caſes that require it, as when the cauſe ariſes in a foreign country, and the witneſſes are at home, or when the witneſſes are abroad, or ſoon to leave the kingdom; or again, when they are aged and infirm. This *commiſſion* is impowered to exerciſe the ſame juriſdiction as would have been exerciſed if the witneſſes had attended.

Commiſſion-*Officers*. See Officer.

Book of Commiſſions. See Book.

Commiſſion, in *Commerce*. See Factorage.

COMMISSIONER, he who has a commiſſion, e. gr. a patent, or other legal warrant, to execute any public office. See Warrant, &c.

Such are, *commiſſioners* of hawkers and pedlars, *commiſſioners* of alienation, *commiſſioners* of the ſtamps, &c.

Commiſſioners *of the Cuſtoms*. See Customs.

Commiſſioners *of the Dock-yards*. See Dock-*yards*.

Commiſſioners *of Exciſe*. See Excise.

Commiſſioners *of the Navy*. See Navy.

Lords Commiſſioners *of the Treaſury*. See Treasury, and Exchequer.

Commiſſioners *of Trade*, &c. See Board.

COMMISUM *Fidei*. See Fidei.

COMMISSURE, Commiſſura, a term uſed by ſome authors, for the junctures, or for the ſmall interſtices of bodies; or the little clefts between the particles; eſpecially when thoſe particles are broadiſh and flat, and lie contiguous to one another, like thin plates, or lamellæ. See Pore.

The word literally ſignifies *a joining*, or connecting of one thing to another.

Commiſſure, in *Architecture*, &c. denotes the joint of two ſtones; or, the application of the ſurface of the one to that of the other.

Among anatomiſts, *commiſſure* is ſometimes alſo uſed for a ſuture of the cranium, or ſkull.

COMMITMENT, in *Law*, the ſending of a perſon to priſon by warrant or order, who hath been guilty of any offence not bailable, or for which bail is refuſed. It may be by the king and council, by the judges of the law, juſtices of peace, and other magiſtrates, who have authority by the laws and ſtatutes of the realm to do it, which muſt be exactly purſued. Every *commitment* to priſon ought generally to be made by warrant, under the hand and ſeal of him who commits the party, and the cauſe of *commitment* to be expreſſed in the warrant, &c. And where a man is committed as a criminal, it muſt be until he is diſcharged by due courſe of law; but if it be for contumacy, then it is only until he comply and perform the thing required. Carthew's Rep. 153. If the words of a ſtatute are not purſued in a *commitment*, the party ſhall be diſcharged by *habeas corpus*. Ib. 291. See Bail, Impriſonment, Mittimus, &c.

COMMITTEE, in *Law*, one or more perſons, to whom the conſideration of any matter is referred, either by a court, or by conſent of the parties concerned.

Committee *of Parliament*, is a board conſiſting of a certain number of members, appointed by the whole houſe, for the examining of a bill, or making report of an inquiry, or proceſs of the houſe, &c.

Sometimes, the whole houſe is reſolved into a *committee*; on which occaſion each perſon has a right to ſpeak, and reply as much, and as often as he pleaſes: an expedient they uſually have recourſe to in extraordinary caſes, and where any thing is to be thoroughly canvaſſed.—When the houſe is not in a *committee*, each gives his opinion regularly, and is only allowed to ſpeak once, unleſs to explain himſelf.

The ſtanding *committees*, appointed by every new parliament, are thoſe of *privileges* and *elections*, of *religion*, of *grievances*; of *courts of juſtice*, and of *trade*: though only the former act.

Commitee *of the king*, is uſed for a widow of one of the king's tenants: thus called, as being by the ancient law of the realm *committed* to the king's care and protection. See Widow.

COMMODATE, Commodatum, in the *Civil Juriſprudence*, the loan, or free conceſſion of any thing moveable or immoveable, for a certain time, on condition of reſtoring again the ſame individual after a certain term.

The *commodate* is a kind of loan: there is this difference, however, between a loan and a *commodate*, that the latter is gratis, and does not transfer the property: the thing muſt be returned in eſſence, and without impairment: ſo that things which conſume by uſe, or time, cannot be objects of a *commodate*, but of a loan; in regard they may be returned in kind, though not in identity.

COMMODAVIENSIS, an appellation given by ſome authors to a ſpecies of *lapis calaminaris* found in Bohemia. But as it yields no zink, Mr. Marggraf denies it to be true calamine.

COMMODITIES *Staple*. See Staple.

COMMODORE, in the *Britiſh Marine*, a general officer, inveſted with the command of a detachment of ſhips of war deſtined on any particular enterprize: during which time he bears the rank of a brigadier-general in the army, and his ſhip is diſtinguiſhed by a broad red pendant tapering towards the outer end, and ſometimes forked.

Commodore is alſo a name given to a ſelect ſhip in a fleet of merchantmen, which leads the van in time of war, bearing a light in her top to conduct the reſt.

COMMOIGNE, in *Law*, a word ſignifying a fellow-monk, that lives in the ſame convent. 3 Inſt. 15.

COMMON, Communis, ſomething that belongs to all alike; is owned or allowed by all; and is not confined to this more than that.

In which ſenſe, *common* ſtands oppoſed to *proper*, *peculiar*, &c. Thus, the earth is ſaid to be our *common* mother; in the firſt, or golden age, all things were in *common*, as well as the ſun and elements: the name animal is *common* to man and beaſt; that of ſubſtance to body and ſpirit.

Philoſophers diſpute whether there be any ſuch thing as *common* notions, innate, or impreſſed on the mind by nature herſelf; or whether our ideas are all adventitious.

Common, *communia*; (i. e. *quod ad omnes pertinet*) ſignifies that ſoil, the uſe whereof is *common* to a particular town or lordſhip: or it is a profit that a man hath in the land of another perſon, uſually in common with others; or a right which a perſon hath to put his cattle to paſture into ground that is not his own. And there is not only *common* of pasture, but alſo *common* of piscary, *common* of estovers, *common* of turbary, &c. And in all caſes of *common*, the law doth much reſpect the cuſtom of the place: for there the rule is, *conſuetudo loci eſt obſervanda*. 7 Rep. 5. *Common* of paſture is divided into *common* in groſs, *common* appendant, *common* appurtenant, and *common per cauſe de vicinage*.

Common *in groſs*, is a liberty to have *common* alone, that is, without any land or tenement in another man's land, granted either to a perſon for life, or to him and his heirs. This is commonly paſſed by deed, or ſpecialty, and claimed by preſcriptive right.

Common *appendant*, and Common *appurtenant*, are uſually confounded; both being defined to be a liberty of *common* appertaining to, or depending on, ſuch or ſuch a freehold; which *common* muſt be taken with beaſts *commonable*; as horſes, oxen, &c. being accounted fitteſt for the plowman; and not with goats, geeſe, and hogs.

Others diſtinguiſh between the two, thus; *common appurtenant* may be ſevered from the land whereto it appertains; and is where the owner of land has a right to put in other beaſts not *commonable*; as hogs, goats, &c. which neither plough nor manure the land. Whereas *common appendant*, according to my lord Coke, had its original in the following manner:

> “When a lord enfeoffed another in arable lands to hold of him in ſoccage; the feoffee, to maintain the ſervice of his plow, had at firſt, by courteſy of his landlord, *common* in his waſtes, for neceſſary beaſts, to eat and compoſt his lands: and that for two cauſes; 1°. Becauſe it was tacitly implied in the feoffment; by reaſon the feoffee could not till, or compoſt his paſture: by conſequence, therefore, the feoffee had, as a thing neceſſary, or incident, *common* in the waſtes, or lands of the lord. 2°. For the maintenance and advancement of tillage.”

Common *per Cauſe de Vicinage*, i. e. by reaſon of neighbourhood; is a liberty that the tenants of one lord in one town, have to *common* with the tenants of another lord in another town.

But it is to be obſerved, that thoſe who claim this kind of *common* (which is uſually called intercommoning) may not put their cattle into the *common* of the other two, for then they are deſtrainable; but, turning them into their own fields, if they ſtray into their neighbours *common*, they muſt be ſuffered.

COMMON, in *Geometry*, is applied to an angle, line or the like, which belongs equally to two figures, or makes a neceſſary part of both.

COMMON, in *Grammar*, denotes the gender of nouns which is equally applicable to both ſexes, male and female.

Such is that of *parens* parent; which is either maſculine, or feminine, as it is uſed to ſignify either father, or mother.

The Latin Grammarians, beſides this, which they call the *common of two*, alſo make a *common of three*; which extends to maſculine, feminine, and neuter.

COMMON, *communis*, in *Ancient Muſic*, was an appellation given to the ſeventh ſpecies of the diapaſon. See DIAPASON.

COMMON *Bail*. See BAIL.

COMMON *Baretry*. See BARETRY.

COMMON *bench*. The court of *common* PLEAS was anciently called *common bench*.

In law books and references, the court of *common* pleas is writ C. B. from *communi banco*: and the juſtices of that court are ſtyled *juſticiarii de banco*.

COMMON *Center of Gravity*. See CENTER *of Gravity*.

COMMON *Chords*, in *Muſic*, is ſometimes uſed to denote the third, fifth, and octave of any note, conſidered as a baſs.

COMMON *Clerk*. See TOWN *Clerk*.

COMMON *Crier*. See CRIER.

COMMON *Council*. See *Mayor's* COURTS.

COMMON *day*, in plea of land, ſignifies an ordinary day in court, as *octabis Hilarii, quindena Paſchæ*, &c. It is mentioned in 13 Rich. II. ſtat. i. cap. 17. and in the ſtatute 51 Hen. III. concerning general days in bank. *Blount* and *Cowel*.

COMMON *Duct*, in *Anatomy*. See DUCTUS *Communis*.

COMMON *Fine*, in *Law*, a certain ſum of money, which the reſiants within the liberty of ſome leets pay to the lord thereof; called, in ſome places, *head-ſilver*; in others, *cert-money*, or *certum letæ*, and *head-pence*.

It was firſt granted to the lord towards the charge of his purchaſe of the court-leet; whereby the reſiants have now the conveniency of doing their ſuit-royal near home, without being compelled to go to the ſheriff's turn.

COMMON *Hunt*, the chief huntſman belonging to the lord mayor and aldermen of London.

COMMON *Intendment*, in *Law*, the *common* underſtanding, meaning, or conſtruction of any thing; without ſtraining it to any foreign, remote, or particular ſenſe.

Bar to COMMON *Intendment*, is an ordinary or general BAR, which commonly diſables the declaration of the plaintiff. See INTENDMENT.

COMMON *Law*, that body of rules generally received, and held as law in this nation, in contradiſtinction to the ſtatute, or written law, and to particular cuſtoms and uſages.

After the decay of the Roman empire, Britain became invaded by three kinds of German people, viz. the Saxons, Angles, and Jutes. From the Jutes deſcended the men of Kent, and thoſe of the Iſle of Wight; from the Saxons came the people called the Eaſt, South, and Weſt Saxons; and from the Angles came the Eaſt Angles, Mercians, and Northumbrians.

Now, as each people had its peculiar cuſtoms, ſo each inclined to different laws; whereof, thoſe of the Weſt Saxons, and Mercians, who inhabited the midland countries, were, upon the diſſolution of the heptarchy, and eſtabliſhment of a monarchy, preferred to the reſt, and acquired the common appellation of *Jus Anglorum*. Their particular names were *Weſt Saxon-lage*, and *Merchen-lage*.

The firſt Saxon laws publiſhed in England, were thoſe of king Ethelbert, in the ſixth century. Three hundred years after, king Alfred, whom our hiſtorians call *magnus juris Anglicani conditor*, having united the heptarchy, and rendered himſelf maſter of the whole nation, made a collection from among the ſeveral laws of the ſeveral provinces of his domains; and commanded them to be obſerved throughout his kingdom. This collection was denominated *folk-right*, and ſoon after, the *common law*; as being *common* to the whole nation.

This was written in Alfred's *dome-book*, or *liber judicialis*, which was deſigned for the general uſe of the whole kingdom.

By theſe laws the nation was governed for a conſiderable time, till, being at length ſubdued by the Danes, the cuſtoms of thoſe people were introduced, and incorporated with the reſt; and thus a new form of *common* law aroſe, called *Danelage*.

The three ſyſtems of law above recited, viz. the *Danelage*, the *Weſt Saxon-lage*, which was the ſame with the code compiled by Alfred, and the *Merchen-lage*, were in uſe about the beginning of the eleventh century, in different counties of the realm. In proceſs of time king Edgar begun what his grandſon Edward the Confeſſor, on this account called *legum Anglicanarum inſtitutor*, completed; viz. to form one digeſt or body of laws to be obſerved hroughout the whole kingdom. This ſeems to have been only a new edition, or freſh promulgation of Alfred's *dome-book*, with ſuch additions and improvements as the experience of a century and a half had ſuggeſted.

The Danes being afterwards, in their turn, overcome by the Normans; the Conqueror, on a review of the ſeveral laws and cuſtoms that then obtained, abrogated ſome, and aboliſhed others; adding ſome of his own country laws.

His ſon, William Rufus, broke through the ancient laws and cuſtoms which his father had eſtabliſhed; but his next ſon, Henry I. excluded the civil cuſtoms which his brother had introduced, and reſtored the laws of Edward the Confeſſor, with thoſe amendments made by his father, under the advice of his barons. Theſe were afterwards confirmed in ſucceeding reigns.

Hence is derived that ſyſtem of maxims and unwritten cuſtoms, now known by the name of the *common law*, which is of Saxon parentage; though the cuſtoms and maxims themſelves are of higher antiquity than memory or hiſtory reach; many of them being as old as the primitive Britons.

The *common law* of England is, properly, the common cuſtoms of this kingdom; which, by length of time, have obtained the force of laws.

It is called *lex non ſcripta*, the *unwritten law*: not but that we have moſt of it written in the old Norman dialect, and the monuments and evidences of our legal cuſtoms are contained in the records of the ſeveral courts of juſtice, in books of reports and judicial deciſions, and in the treatiſes of learned ſages of the profeſſion, preſerved and tranſmitted from times of the higheſt antiquity; but becauſe it does not appear to be made by charter, or parliament; for thoſe are always matters of record. Its original inſtitution and authority are not ſet down in writing, but it receives its binding power and the force of law, by long and immemorial uſage, and by univerſal reception through the kingdom. See AUTHORITIES and REPORTS.

Beſide the common *law* of England in general, there are in divers parts of the nation particular cuſtoms, and common uſages, which have the force of *common law* among thoſe people who have retained them: ſuch as the Borough-Engliſh, Gavelkind, &c.—Where the *common law* is ſilent, there the STATUTE-*law* ſpeaks. See STATUTE.

All TRIALS at *common law* are by a JURY of twelve men.

COMMON *meaſure diviſor*, in *Arithmetic*, a number that exactly meaſures two other numbers, without a remainder.

And the greateſt number that can meaſure any two other numbers, is called their greateſt *common meaſure*; thus 4 is the greateſt *common meaſure* of 8 and 12.

To find the greateſt *common meaſure* of two numbers; divide the greater by the leſs, and if there be no remainder, the leſs number is the meaſure required. If there be a remainder, divide the laſt diviſor by it, and thus proceed, till there be no remainder left, and the laſt diviſor is the greateſt *common meaſure*. For algebraic quantities, the remainders are to be divided by their ſimple diviſors, and the quotients will be the quantities required. And if FRACTIONS are divided by their greateſt *common meaſure*, they will thus be reduced to their loweſt terms.

COMMON *mouth*, *motion*, and *object*. See the ſubſtantives.

COMMON-PLACE *Book*, *Adverſaria*, among the learned, denotes a regiſter, or orderly collection of things which occur worthy to be noted, and retained in the courſe of a man's reading, or ſtudy; ſo diſpoſed, as that among a multiplicity of ſubjects, any one may be eaſily found.

Common-place-books are of great ſervice: they are a kind of promptuaries or ſtorehouſes, wherein to repoſit the moſt valuable parts of authors, to be ready at hand when wanted. Several perſons have their ſeveral methods of ordering them: but that which comes beſt recommended, is the method of that great maſter of order Mr. Locke. He has thought fit to publiſh it in a letter to M. Toiſnard; determined thereto, by the great conveniency and advantage he had found from it in twenty years experience; as well as by the recommendations and intreaties of many of his friends, who had likewiſe proved it.

The ſubſtance of this method we ſhall here give the reader; whereby he will be eaſily enabled to execute it himſelf.

The firſt page of the book you intend to take down the *common-places* in, is to ſerve as a kind of index to the whole; and to contain references to every place, or matter, therein: in the commodious contrivance of which index, ſo as it may admit of a ſufficient copia, or variety of materials, without any confuſion, all the ſecret of the method conſiſts.

In order to this, the firſt page, as already mentioned, or, for more room, the two firſt pages that front each other, are to be divided, by parallel lines, into twenty-five equal parts; whereof, every fifth line is to be diſtinguiſhed, by its colour, or ſome other circumſtance. Theſe lines are to be cut perpendicularly by others, drawn from top to bottom; and in the ſeveral ſpaces thereof, the ſeveral letters of the alphabet, both capital and minuſcule, are to be duly written. The form of the lines and diviſions, both horizontal and perpendicular, with the manner of writing the letters therein, will be conceived from the following ſpecimen; wherein what is to be done in the book for all the letters of the alphabet, is here ſhewn in the firſt four, *A*, *B*, *C*, and *D*.

A	*a*		*C*	*a*	
	e			*e*	
	i			*i*	
	o			*o*	
	u			*u*	
B	*a*		*D*	*a*	
	e	2. 3.		*e*	
	i			*i*	
	o			*o*	
	u			*u*	

The index of the *common-place* book being thus formed, matters are ready for the taking down any thing therein.

In order to this, conſider to what head, the thing you would enter is moſt naturally referred; in this head, or word, regard is had to the initial letter, and the firſt vowel that follows it; which are the characteriſtic letters whereon all the uſe of the index depends.

Suppoſe, e. gr. I would enter down a paſſage that refers to the head *beauty*; *B*, I conſider, is the initial letter, and *e* the firſt vowel: then looking upon the index for the partition *B*, and therein the line *e* (which is the place for all words whoſe firſt letter is *B*, and firſt vowel *e*; as *Beauty*, *Beneficence*, *Bread*, *Bleeding*, *Blemiſhes*, &c.), and finding no numbers already down to direct me to any page of the book where words of this characteriſtic have been entered, I turn forward to the firſt blank page I find, which in a freſh book, as this is ſuppoſed to be, will be page 2, and here I now write what I have occaſion for on the head *beauty*; beginning the head in the margin, and indenting all the other ſubſervient lines, that the head may ſtand out, and ſhew itſelf: this done, I enter the page where it is written, viz. 2, in the index, in the ſpace *B e*; from which time, the claſs *B e* becomes wholly in the poſſeſſion of the 2d and 3d pages, which are conſigned to letters of this characteriſtic.

Had I found any page or number already entered in the ſpace *B e*, I muſt have turned to the page, and have written my matter in what room was left therein: ſo, if after entering the paſſage on beauty, I ſhould have occaſion for *benevolence*, or the like, finding the number 2 already poſſeſſed of the ſpace of this characteriſtic, I begin the paſſage on benevolence in the remainder of the page; which not containing the whole, I carry it on to page 3, which is alſo for *B e* and add the number 3 in the index.

When the two pages deſtined for one claſs are full, look forwards for the next backſide that is blank; if it be that which immediately follows, write at the bottom of the margin of the page filled, the letter *v* for *verte*, turn over; and the ſame at the top of the next page; and continue from this new page as before. If the pages immediately following be already filled with other claſſes; then write at the botom of the page laſt filled the letter *v*. with the number of the next blank page; and at the top of that page, the number of the page laſt filled: then entering that head in this new page, proceed as before. By theſe two numbers of reference, the one at the top, and the other at the bottom of the page, the diſcontinued matters are again connected. It may not be amiſs, every time you put a number at the bottom of a page, to put it likewiſe in the index. Note, if the head be a monoſyllable beginning with a vowel, the vowel is at the ſame time both the initial letter, and the characteriſtic vowel: thus the word *art* is to be wrote in *A a*. Mr. Locke omits three letters of the alphabet in his index, viz. *K*, *Y*, and *W*; which are ſupplied by *C*, *I*, *U*, equivalent to them: and as for *Q*, ſince it is always followed by an *u*, he puts it in the fifth place of Z; and ſo has no Z *u*, which is a characteriſtic that very rarely occurs. By thus making *Q* the laſt in the index, its regularity is preſerved, without diminiſhing its extent. Others chooſe to retain the claſs Z *u*, and aſſign a place for *Q u* below the index.

If any imagine, that thoſe hundred claſſes are not ſufficient to comprehend all kinds of ſubjects without confuſion. he may follow the ſame method, and yet augment the number to five hundred, by taking in one more characteriſtic to them.

But the inventor aſſures us, that in all his collections, for a long ſeries of years, he never found any deficiency in the index, as above laid down.

COMMON *Places*, in *Rhetoric*. See ARGUMENTS and TOPICS.

COMMON-PLEAS. See COURT *of Common Pleas*.

COMMON *Prayer*, is the liturgy in the church of England. Clergymen are obliged to uſe this liturgy in the ſervice of the church; and refuſing to do ſo, or uſing any other public prayers, is puniſhable by 1 Eliz. cap. 2. and every incumbent, reſident on his living, is obliged, once every month at leaſt, to read the *common prayer* in his pariſh church, in his own perſon, under a forfeiture of 5 *l.* for every failure, by 14 Car. II. cap. 4. and by the ſame ſtat. every church is to be provided with a book of *common prayer*, under the penalty of 3 *l.* a month. Every miniſter who ſpeaks any thing in derogation of this book is liable to ſix months impriſonment, and the forfeiture of a year's value of his benefice, and for the ſecond offence to deprivation: and any perſon, convicted of reviling it, ſhall forfeit for the firſt offence an hundred marks, four hundred for the ſecond; and for the third offence all his goods and chattels, and ſuffer impriſonment for life, Stat. 1 Eliz. cap. 2.

COMMON *ray*. See RAY.

Tenants in COMMON. See TENANT.

COMMON *receptacle*. See RECEPTACULUM.

COMMON *Recovery*. See RECOVERY.

COMMON *Senſe*. See SENSE.

COMMON *Senſory*. See SENSORY.

COMMON *Serjeant*. See SERJEANT.

COMMON *Time*. See TIME.

COMMON *Year*. See YEAR.

COMMONER, is uſed for a ſtudent in ſome univerſities, entered in a particular rank.

The word is alſo applied to a member of the houſe of *commons*; in contradiſtinction to a *peer*.

COMMONS, in parliament, are the lower houſe, conſiſting of knights elected by the counties, and of citizens and burgeſſes by the cities and borough towns.

In theſe elections, anciently, all the people had votes; but king Henry VI. to avoid tumults, firſt appointed, that none ſhould vote for knights but ſuch as were freeholders, did reſide in the county, and had forty ſhillings yearly revenue: the perſons elected for counties to be *milites notabiles*, at leaſt eſquires, or gentlemen fit for knighthood; native Engliſhmen, at leaſt naturalized; and twenty-one years of age: no judge, ſheriff, or eccleſiaſtical perſon, to ſit in the houſe for county, city, or borough.

The *houſe of commons*, in Forteſcue's time, who wrote during the reign of Henry VI. conſiſted of upwards of three hundred members: in Sir Edward Coke's time their number amounted to four hundred and ninety-three. At the time of the union, there were five hundred and thirteen members for England and Wales, to which forty-five repreſentatives for Scotland were added; ſo that the whole number of members is at this day five hundred and fifty-eight.

All members of either houſe, with their menial ſervants, and neceſſary goods brought with them, are privileged by the common law from all attachments and impriſonments; except for treaſon, felony, or breach of peace, all the time of the ſeſſion, and till they arrive at home, *eundo, morando, ad propria redeundo.*

By 12 and 13 W. cap. 3. and 11 G. II. cap. 24. actions may be brought againſt members of parliament and their ſervants immediately after the diſſolution or prorogation, or any adjournment for more than fourteen days, till they are reaſſembled: and in the mean while the courts may give judgment and award execution. By 4 G. III. cap. 33. the petitioners, in a caſe of bankruptcy, where the debtor is a trader within the ſtatutes, may ſue out a ſummons or an original bill and ſummons, and ſerve a member with a copy of it: and if the debt with coſts be not paid within two months, the creditors may proceed, as againſt other bankrupts: arreſt during the time of privilege excepted. And by 10 G. III. cap. 50. action may be proſecuted in any court of record, of equity, of admiralty, or ſuch as have cognizance of cauſes matrimonial and teſtamentary, againſt any peer or member of the *houſe of commons*, or any of their ſervants, or any other perſon intitled to privilege of parliament, provided that the perſon of any member of the *commons* is exempted from arreſt or impriſonment.

The *commons* ſit in their houſe promiſcuouſly; only the *ſpeaker* has a chair, or ſeat, fixed towards the upper end; and the clerk, with his aſſiſtant, ſits near him.

The members have no robes, as the lords ever had; excepting the ſpeaker and clerks; and ſometimes the profeſſors of law in term-time, and the members of the city of London.

On the firſt day of the new parliament, before any affair is meddled with, all the members take the oaths; uſually before the lord ſteward, and in the court of wards. They then proceed to the choice of a ſpeaker. And after the election of a SPEAKER, they take the oaths a ſecond time.

Privileges of the COMMONS. All bills for levying money on the ſubject, begin in the houſe of *commons*; in regard, it is from them the greateſt part of the moneys ariſe: nor will they allow the lords to make any alteration in a money-bill. They have the privilege to propoſe laws, and are, in effect, the grand inqueſt of the realm; preſent public grievances; impeach public delinquents, even the higheſt officers of the kingdom; and proſecute them before the houſe of lords, which is a court of judicature, though the *commons* are not.

The *commons* were formerly allowed their expences during parliament time, *rationabiles expenſas*, as the words of the writ are; i. e. ſuch allowance as the king, conſidering the prices of things, ſhall think proper to impoſe on the people they repreſent. In 17 Edward II. the allowance was ten groats for knights, and five for burgeſſes, per day; afterwards it was raiſed to four ſhillings a day for dubbed knights, and two ſhillings for all the reſt: but all allowance is now grown into diſuſe; and conſiderable ſums are too often expended in order to obtain the honour or advantage accruing from a ſeat in PARLIAMENT. See BRIBERY.

COMMONS is alſo uſed in oppoſition to *nobles*, or *peers*, viz. for all ſorts of perſons under the degree of a baron; including the orders of knights, eſquires, gentlemen, the ſons of the nobility, and yeomen. See each under its proper Article, ESQUIRE, GENTLEMAN, YEOMAN, &c.

Doctors COMMONS. See COLLEGE *of Civilians*.

Proctor of the COMMONS. See PROCTOR.

COMMONS is alſo uſed for the ſtated and ordinary diet, or eating, of a college, inn of court, or other ſociety. See INN, &c.

COMMONWEALTH. See REPUBLIC.

COMMOTE, an ancient term in Wales, denoting half a cantred, or HUNDRED; containing fifty villages.

Wales was anciently divided into three provinces; each of theſe ſubdivided into cantreds; and every cantred into two *commotes*, or half-hundreds.

Silveſter Girald, however, tells us, in his Itinerary, that a *commote* is but a quarter of a hundred.

COMMOTION, an inteſtine motion, or luctation in the parts of any thing.

In medicine, the term is chiefly uſed for a blow, or ſhake of the brain. A convulſion is a *commotion* of the fine medullary fibres of the brain. A fall occaſions a *commotion*, whence frequently ariſes a counterſtroke on the oppoſite part; which occaſions ſometimes a contrafiſſure, and at other times a rupture of the veſſels, and an impoſthume, by ſhaking the whole maſs of the brain.

COMMUNAM *appropriare*. See APPROPRIARE.

COMMUNE *rectum*. See RECTUM.

COMMUNEM *legem*, *Writ of Entry ad*. See LEGEM.

COMMUNIBUS *locis*, a Latin term, in frequent uſe among philoſophical, &c. writers; implying ſome medium, or mean relation, between ſeveral places.

Dr. Keil ſuppoſes the ocean to be one quarter of a mile deep, *communibus locis*, q. d. at a medium, or taking one place with another.

COMMUNIBUS *annis*, has the ſame import with regard to years, that *communibus locis* has with regard to places.

Mr. Derham obſerves, that the depth of rain, *communibus annis*, i. e. one year with another, were it to ſtagnate on the earth, would amount to, at Townly in Lancaſhire, $42\frac{1}{2}$ inches; at Upminſter in Eſſex $19\frac{1}{4}$; at Zurick, $32\frac{1}{4}$; at Piſa, $43\frac{1}{4}$; and at Paris, to 19 inches.

COMMUNICATING, in *Theology*, the act of receiving the ſacrament of the EUCHARIST.

Thoſe of the *reformed*, and of the Greek church *communicate* under both kinds; thoſe of the Romiſh only under one.

The oriental communicants receive the ſpecies of wine by a ſpoon; and anciently they ſucked it through a pipe, as has been obſerved by Beat. Rheanus on Tertullian.

COMMUNICATION, the act of imparting a thing to another, or making him a ſharer with us therein.

The uſe of ſpeech is for the *communicating* of our ideas and ſentiments to each other.

COMMUNICATION is alſo uſed for the connexion of one thing with another; or the paſſage from one place to another.

Anciently, it was frequent to have ſubterraneous *communications* between one place and another.

Bridge of COMMUNICATION. See BRIDGE.

Lines of COMMUNICATION, in war, called alſo ſimply *lines*; are trenches ſix or ſeven feet deep, and twelve broad, made between one fort, or work, and another; deſigned for a ſafe paſſage between one quarter and another; eſpecially in ſieges. See *Tab. Fortification*, *fig.* 21, 22, &c.

COMMUNICATION *of idioms*, in *Theology*, the act of imparting the attributes of one of the natures in Jeſus Chriſt to the other.

The *communication of idioms* is founded on the ſuppoſed union of two natures in the perſon of Chriſt: by this *communication of idioms* it is, that ſome divines ſay, God ſuffered, died, &c. which is ſtrictly underſtood of the human nature; and ſignifies that God ſuffered in his humanity, that he died as to his human nature, &c.

The Lutherans carry the *communication of idioms* ſo far, as to ſay, that Jeſus Chriſt is not only in his divine nature, and by reaſon of his divine perſon, but alſo really and properly in his humanity, immortal, immenſe, &c.

COMMUNICATION *of motion*, that act of a moving body, whereby another body at reſt is put by it in motion, or a body already in motion is accelerated.

F. Malebranche looks on the *communication of motion* as ſomething metaphyſical; i. e. as not neceſſarily ariſing from any phyſical principles, or any properties of bodies, but flowing from the immediate agency of God: there being, according to him, no more connexion, or dependence, between the motion or reſt of one body, and that of another, than between the form, colour, magnitude, &c. of one body, and thoſe of another. The motion of one body, therefore, on his principle, is not any phyſical cauſe of that of another. See CAUSE.

The *communication of motion* reſults from, and is an evidence of the impenetrability and inertia of matter as ſuch: unleſs we admit the hypotheſis of penetrable matter, advanced by M. Boſcovich and Mr Michell, and aſcribe to the powers of repulſion thoſe effects which have been uſually aſcribed to its ſolidity and actual reſiſtance. See MATTER.

Laws of the COMMUNICATION *of motion*.—Action, and reaction, Sir Iſaac Newton demonſtrates, are equal and oppoſite; ſo that one body ſtriking againſt another, and thereby occaſioning a change in its motion, does itſelf undergo the very ſame change in its own motion, the contrary way. See MOTION.

Hence, a moving body ſtriking directly againſt another at reſt, the one loſes juſt as much of its motion as it *communicates* to the other; and they will proceed with the ſame velocity as if united into one maſs.

If, therefore, the body in motion be triple that at reſt againſt which it ſtrikes, it will loſe a fourth part of its motion; and whereas, before, it would have run over (v. g.) a line of twenty feet, in a given time, it will now only run over fifteen; i. e. it will loſe a fourth part of its velocity.

If the moving body ſtrike on another already in motion, the firſt will augment the velocity of the latter; but will loſe leſs of its own motion, than had the latter been abſolutely at reſt. Thus, v. gr. if a body in motion be triple of another at reſt, and ſtrike againſt it with thirty-two degrees of motion; it will *communicate* eight degrees of its motion to the other, and retain twenty-four to itſelf. If the other body had already four degrees of motion, the firſt would only *communicate* five, and retain twenty-ſeven; ſince thoſe five were ſufficient, on account of the inequality of the bodies, to make them proceed with equal velocity.

After the ſame manner may the other laws of *communication* of motion in bodies perfectly hard, and void of all elaſticity, be determined. But all hard bodies, that we know of, have an elaſtic power; and in elaſtic bodies, the laws are different, and much more intricate. See

Elasticity; and the laws of percuſſion in elaſtic bodies, ſee under Percussion.

If a body, when moved by another, happen to decline out of the way, ſo as to leave a free paſſage to the body whereby it was moved; yet, that will only proceed with the velocity which it had after its *communication* to the other, not with that it had before: it being a rule, that every thing endeavours to perſevere, not in the ſtate wherein it was formerly, but in that wherein it is at that juncture: therefore, a body which has already loſt part of its motion, by its meeting with another, may loſe ſtill more by a ſecond and a third, ſo as at length to become perfectly quieſcent.

Hence, firſt, if two unequal homogeneous bodies move in a right line with the ſame velocity, in a reſiſting medium, the greater muſt perſevere in motion longer than the ſmaller: for the motions of both bodies are as their maſſes; but each *communicates* of its motion to the circumjacent bodies which touch its ſurface, in proportion to the magnitude of its ſurface; the larger body, therefore, though it has more ſurface than the ſmaller, yet having leſs, in proportion to its maſs or quantity of matter, than the ſmaller, will loſe a leſs portion of its motion every moment than a ſmaller.

Suppoſe, e. gr. a cube, A, to be two feet every way, and another B, one foot: the ſurfaces here will be as four to one, but their maſſes as eight to one. If therefore thoſe bodies move with the ſame velocity, the cube A will have eight times as much motion as the cube B (the quantity of motion being ever as the quantity of matter). That each of them, therefore, may become quieſcent at the ſame time, the cube A muſt loſe eight times as much motion every moment as the cube B: but that is impoſſible, becauſe as their ſurfaces are to each other as four to one; the bodies againſt which they ſtrike, will only be as four to one: therefore, when the cube B is become perfectly quieſcent, A will have half its motion.

Hence, ſecondly, we ſee the reaſon why any long body, as a dart, thrown lengthwiſe, continues its motion longer than when thrown tranſverſly: it meeting fewer bodies in the way to *communicate* its motion to in the one caſe than in the other.

Hence alſo, thirdly, if a body be moved almoſt wholly within itſelf, ſo as to *communicate* little of its motion to the ambient bodies, it muſt continue its motion a long time. Thus, a ſmooth braſs ball of half a foot diameter, ſupported on a ſlender ſmooth axis, with a very weak impulſe, is found to revolve, for the ſpace of three or four hours.

Communication, *communicatio*, in *Rhetoric*. See Anacoinosis.

COMMUNION, in *Theology*, an uniform belief in ſeveral perſons; whereby they are united under one head, in one church. See Unity, Uniformity, &c.

In this ſenſe, the Lutherans, Calviniſts, &c. are ſaid to have been cut off from the Romiſh *communion*.

This is the primitive uſe of the word *communion*, as appears from the canons of the council of Elvira.

Though the term has been more extenſively applied to denote a general agreement in matters of doctrine, diſcipline, and worſhip. And unleſs the term be underſtood in this large ſenſe, ſo various are the opinions of men, there could be no *communion* among the members of any one church on earth.

Communion is alſo uſed for the act of *communicating* in, or participating of, the ſacrament of the eucharist.

The ſourth council of Lateran decrees, that every believer ſhall receive the *communion*, at leaſt, at Eaſter; which ſeems to import a tacit deſire, that they ſhould do it oftener; as, in effect, they did it much oſtener in the primitive days. Gratian, and the maſter of the ſentences, preſcribe it as a rule for the laity, to *communicate* three times a year, at Eaſter, Whitſuntide, and Chriſtmas. But in the thirteenth century, the practice was got on foot, never to approach the euchariſt except at Eaſter; and the council thought fit to injoin it then by a law, leſt their coldneſs and remiſſneſs ſhould go farther ſtill.

And the council of Trent renewed the ſame injunction, and recommended frequent *communion* without enforcing it by an expreſs decree.

In the ninth century, the *communion* was ſtill received by the laity in both kinds; or, rather, the ſpecies of bread was dipped in the wine, as is owned by the Romaniſts themſelves. Acta SS. Benedict. Sæc. III. M. de Marca obſerves, that they received it at firſt in their hands, Hiſt. de Bearn. and believes the *communion* under one kind alone to have had its riſe in the Weſt under pope Urban II. in 1096. at the time of the conqueſt of the Holy Land. And it was more ſolemnly enjoined by the council of Conſtance in 1414. The twenty-eighth canon of the council of Clermont injoins the *communion* to be received under both kinds, diſtinctly: adding, however, two exceptions; the one of neceſſity, the other of caution, *niſi per neceſſitatem, & cautelam*; the firſt in favour of the ſick, the ſecond of the abſtemious, or thoſe who had an averſion for wine.

It was formerly a kind of canonical puniſhment, for clerks guilty of any crime, to be reduced to *lay communion*, i. e. only to receive it as the laity did, viz. under one kind.

They had another puniſhment of the ſame nature, though under a different name, called *foreign communion*; to which the canons frequently condemned their biſhops, and other clerks. This puniſhment was not any excommunication, or depoſition; but a kind of ſuſpenſion from the function of the order, and a degradation from the rank they held in the church.

It had its name becauſe the *communion* was only granted to the criminal on the foot of a foreign clerk, i. e. being reduced to the loweſt of his order, he took place after all thoſe of his rank, as all clerks, &c. did in the churches to which they did not belong. The ſecond council of Agda orders every clerk that abſents himſelf from the church, to be reduced to foreign *communion*.

Infant **Communion**. Some inſtances occur in the early ages of the church, of the practice of adminiſtering the euchariſt to infants: and ſome few have imitated this practice in more modern times. Mr. Peirce pleads the uſe of it even to this day among the Greeks, and in the Bohemian churches till near the time of the Reformation; and he refers to the uſage of the ancient churches, recorded by Photius, Auguſtin, and Cyprian. He urges from Scripture the right which children have to all the privileges of which they are capable, as well as the Jewiſh children under the law, who were allowed to eat of the paſſover, and other ſacrifices. To which it has been anſwered, that the ſacrifices, of which they were allowed to partake, were chiefly peace-offerings, which became the common food of the family, and were not conſidered as acts of devotion in ſuch a degree as our euchariſt. He replies to the objection founded on the incapacity of infants to examine themſelves and diſcern the Lord's body, by obſerving, that the precept extends only to thoſe who were capable of underſtanding and complying with it; on the ſame ground that faith is required previous to baptiſm. Biſhop Bedell ſuggeſts the following enquiry relative to this ſubject: what neceſſity of baptiſing infants, if their baptiſm produces no effect till they come to years of diſcretion? To which he replies, though the moſt principal effect be not attained preſently, the leſs principal are not to be refuſed: ſo children were circumciſed, who could not underſtand the reaſon of it; and the ſame alſo did eat the paſſover: and ſo did children baptiſed, in the primitive church, communicate in the Lord's ſupper: which I know not why it ſhould not be ſo ſtill; *de quo alias.* It has been alleged, that the foundation of this practice was a miſtaken apprehenſion of the abſolute neceſſity of this ordinance in order to ſalvation, reſulting from an erroneous interpretation of John vi. 53. See Biſhop Bedell's Letter to Dr. Ward, in p. 442 of Archbiſhop Uſher's Life by Parr. Peirce's Eſſay on the Euchariſt. Wall's Hiſt. of Infant Baptiſm, part ii. cap. 9. § 15 and 16. Waterland's Review of the Doctrine of the Euchariſt, and preface to his two volumes of Poſthumous Sermons, p. 32, &c. and Inquiry concerning Infant Communion, vol. ii. p. 75, &c.

Communion *Service*, denotes that part of the liturgy of the church of England which relates to the adminiſtration of the ſacrament.

Communion-*table*. See Altar.

COMMUNIS *capſula*. See Capsula.

Communis *ductus choledochus*. See Ductus.

Communis *digitorum manus extenſor*. See Extensor.

Communis *labiorum depreſſor*. See Depressor.

Communis *labiorum elevator*. See Elevator.

Communis *miſericordia*. See Misericordia.

COMMUNITY, a ſociety or body of men united together under certain common laws, agreed on among themſelves, or impoſed by a ſuperior.

The Romans, who ſeem to have given the firſt hint of *communities* to the ſeveral nations into which their empire was divided, doubtleſs borrowed it from ſome rules of their neighbours: they called them *colleges*; which term, among them, had nearly the ſame ſignification with *community* among us.

Communities now are of two kinds, *eccleſiaſtic*, and *laic*: the firſt are either *ſecular*, as chapters of cathedral and collegiate churches; or *regular*, as convents, monaſteries, &c.

Lay communities are of various kinds; ſome contracted by a fixed abode of a year and a day in the ſame place;

others formed by the diſcharge of the ſame office, the profeſſion of the ſame art, or attending the ſame place of worſhip; as thoſe of pariſhes, fraternities, &c.

Accordingly, the word is commonly underſtood of pious foundations for the ſupport of ſeveral perſons, either in a ſecular or regular life; as *colleges*, *abbies*, *convents*, *priories*, *ſeminaries*, *hoſpitals*, *inns*, &c.

Community is more particularly uſed in the French law, for the joint property in goods between the huſband and the wife: the reſult of which is, that during marriage they are equally intitled to all effects, and liable to all debts, contracted either before or under marriage.

Community is a ſpecies of ſucceſſion, and the acceptance of *community* reſembles an *additio hæreditatis.*

Community was ſet on foot in favour of the wives, to enter them as ſharers in their huſbands effects.

In countries where the civil law obtains, this *community* has no place; nor even in ſeveral cuſtomary countries; as being reputed a burden on the man.

Anciently, the woman's ſhare in the *community* was only one third: and this appears ſtill the ſenſe of the law among us; the widow, at the deceaſe of her huſband, being only intitled to one third part of the moveables.

COMMUNITY *continued*, in the *French Law*, is that which ſubſiſts between the ſurvivor of two perſons joined in marriage, and the minor children of that marriage; when the ſurvivor has not made an inventory of the effects in poſſeſſion during marriage. The widow may either renounce *community* with her children, or continue it.

COMMUNITY *tacit*, is a *community* contracted between a man and woman, by the mere mingling of their effects; provided they have lived together the ſpace of a year and a day: this *community*, being odious, is now aboliſhed.

COMMUTATION, in *Aſtronomy*. *Angle of* COMMUTATION, is the diſtance between the ſun's true place ſeen from the earth, and the place of a planet reduced to the ecliptic. See PLACE.

Thus the angle ESR (*Tab. Aſtronomy*, *fig.* 25), ſubtended between the ſun's true place E, viewed from the earth at S, and that of a planet reduced to the ecliptic, R, is the *angle of commutation.*

The *angle of commutation*, therefore, is found by ſubtracting the ſun's longitude from the heliocentric longitude of the planet R; or contrarily.

COMMUTATION, in *Law*, a change of a penalty, or puniſhment, viz. of a greater for a leſs, &c. as when death is commuted for, by baniſhment or perpetual impriſonment, &c.

Some doubt whether the word be properly applied to any change but that of puniſhment: others will have it indifferently ſerve for the exchanging, or trucking of any thing.

COMORTH, in our *Statutes*, is uſed for a contribution or ſubſidy. It is ſaid to be derived from the Britiſh *cymorth*, *ſubſidium.*

The ſtat. 4 Hen. IV. cap. 27. and Hen. VIII. cap. 6. prohibit the levying any ſuch in Wales, or the Marches.

It is ſaid this *comorth* was gathered at marriages, and when young prieſts ſaid their firſt maſſes, and ſometimes for redemption of murders or felonies.

COMOSANDALOS, in *Antiquity*, a crown of flowers worn in the feſtival CHTHONIA.

COMPACT, in *Phyſics*, is a relative term, denoting a body to be cloſe, denſe, and heavy; having few pores, and thoſe ſmall ones.

The heavieſt metals, as gold and ſilver, are the moſt *compact.* See GRAVITY.

COMPACT, in a *Legal Senſe*, ſignifies an agreement, or a contract, ſtipulated between ſeveral parties. See CONTRACT.

COMPACT is alſo the name of a celebrated bull, confirmed by pope Paul IV. relating to the cardinals.

In virtue of the bull of *compacts*, cardinals can only confer benefices in their natural ſtate; i. e. regular benefices on regulars.

COMPAGES *circularis montium*, a term deviſed by Kircher to expreſs what he in other places calls the annularity, or annular diſpoſition of MOUNTAINS, which he ſays run in continued chains, forming belts or ridges in the manner of ſpines, all round the globe of the earth, from north to ſouth, and ſo on from that point to north again, and in the ſame manner from eaſt to weſt, and from weſt to eaſt again.

COMPAGUS, in *Antiquity*, a kind of ſummer-ſhoe worn by the Roman ſenators, conſiſting only of a ſole at the bottom; it was faſtened with leathern ſtraps, croſſing one another many times about the leg.

Rubenius makes the *compagi* to have been a ſort of caligæ worn by the Roman generals as well as ſenators. Under the later emperors, in the middle age, we read of the ſame worn by popes, biſhops, and abbots.

COMPANY, a collective term, underſtood of ſeveral perſons aſſembled together in the ſame place, or with the ſame deſign. See SOCIETY.

The word is formed of the French *compagnie*, and that of *companio*, or *companies*, which, Chifflet obſerves, are found in the Salic law, tit. 66. and are properly military words, underſtood of ſoldiers, who, according to the modern phraſe, are comrades, or meſs-mates, i. e. lodge together, eat together, &c. of the Latin *cum*, *with*, and *panis*, *bread.* It may be added, that in ſome Greek authors under the Weſtern empire, the word κυμπανια occurs in the ſenſe of *ſociety.*

COMPANY, in *Commerce*, is an aſſociation of ſeveral merchants, or others, who unite in one common intereſt, and contribute by their ſtock, their counſel, and ſtudy, to the ſetting on foot, or ſupporting, of ſome lucrative eſtabliſhment.

Though *company* and ſociety, or fellowſhip, be, in effect, the ſame thing, yet cuſtom has made a difference between them; ſociety, or partnerſhip, being underſtood of two, or three dealers, or not many more; and *company* uſually of a greater number. See SOCIETY.

A ſecond difference between *companies* and ſocieties is, that the firſt, eſpecially when they have excluſive privileges, cannot be eſtabliſhed without the conceſſion of the prince; and need letters patent, charters, &c.

Whereas, for the latter, the conſent of the members, fixed and certified by acts and contracts; and authorized by bye-laws, is ſufficient.

The ſeveral profeſſions and trades exerciſed in the city of London, being incorporated into diſtinct fraternities, governed by their particular laws, a tabular view of them may not be unacceptable.

The abſtract of their incorporations, and particular privileges, is taken from the records of the Tower, &c. and from the Firma-Burgi of Madox, the king's hiſtoriographer; the account of their charities from thoſe eminent hiſtorians Stow and Strype; and the number of the liverymen, with their fines on admiſſion, is taken from the returns to the clerk of the parliament, and the ſcrutiny-books made after the ſeveral polls for the magiſtrates and repreſentatives of the city.

The companies are here placed according to their precedence, beginning with the twelve principal ones, of one or other of which the lord mayors have generally made themſelves free at their election, if they were not ſo before; for they are not only the oldeſt, but the richeſt, many of them having had the honour of kings and princes to be their members, and the apartments of their halls being fit to entertain a monarch.

47 Stationers ††	Ludgate-ſtreet	Phil. & Mary	1557	294	20	0	0		†† This company, which alſo includes bookſellers, letter-founders, printers, and bookbinders, have a ſtock which is employed in printing almanacks, primers, pſalters, ſchool-books, &c. of which they have the ſole privilege, by virtue of a grant from the crown. This ſtock conſiſts of ſhares, which are diſtributed in different proportions among thoſe who have fined for, or ſerved the office of renter-wardens: whoſe ſhares, if they die married, devolve to their widows. They pay above 200 l. a year in penſions and other charities. They are likewiſe truſtees for the diſpoſal of the conſiderable legacies of Mr. William Bowyer, a learned printer, (who died Nov. 18, 1778) conſiſting of 30 l. a year to the moſt learned journeyman that can be met with; and 180 l. a year in annuities of 20 l. each to nine neceſſitous printers of ſixty-three years of age or upwards.
48 Broderers	Gutter-lane	Q. Elizabeth	1591	115	5	0	0		
49 Upholders	No hall	Charles I.	1627	131	4	10	0		
50 Muſicians	No hall	James I.	1604	308	10	0	0		
51 Turners	College-hill	James I.	1604	144	8	0	0		
52 Baſket-makers	No hall	No charter		No livery; yet a company by preſcription, governed by 2 wardens and 48 aſſiſtants, with this motto to its arms, *Let us love one another.*					
53 Glaſiers ‖	No hall	Charles I.	1637	91	3	0	0		‖ The glaſs-painters are incorporated with them.
54 Horners	No hall	Charles I.	1638	No livery; yet they have a maſter, 2 wardens, and 9 aſſiſtants, with a warehouſe in Spital-fields; where they divide in lots, among themſelves, ſuch horns as are bought up by their members in Leadenhall and other markets: And in 1465, they obtained an act of parliament that none ſhould be exported, but ſuch as they refuſed.					
55 Farriers	No hall	Charles II.	1673	76	5	0	0		
56 Paviours	No hall	No charter		No livery; yet it is a fellowſhip by preſcription, with 3 wardens, and 25 aſſiſtants.					
57 Loriners	London-wall	Q. Anne	1712	69	10	0	0		
58 Apothecaries	Blackfryars	James I.	1617	144	16	0	0		They are exempt from ward and pariſh-offices, and have a ſpacious phyſic-garden at Chelſea; which in 1721 was granted to the company for ever by Sir Hans Sloane, Bart. the lord of the manor, on condition of their paying a quit-rent of 5 l. and continue it always as a phyſic-garden, and of preſenting every year to the Royal Society fifty ſamples of different ſorts of plants, there grown, till they amount to two thouſand.—The latter of theſe conditions hath been long ſince more than completed.
59 Shipwrights	No hall	James I.	1605	No livery; yet they have a maſter, 2 wardens, and 16 aſſiſtants.					
60 Spectacle-makers	No hall	Charles I.		No livery; yet have a maſter, 2 wardens, and 15 aſſiſtants.					
61 Clock-makers	No hall	Charles I.	1632	50	10	0	0		
62 Glovers	No hall	Charles I.	1638	130	5	17	4		
63 Comb-makers	No hall	Charles I.	1636	No livery; yet have a maſter, 2 wardens, and 13 aſſiſtants.					
64 Felt-makers	No hall	James I.	1604	60	5	0	0		
65 Framework-knitters	Red croſs-ſtreet	Charles II.	1663	58	10	0	0		
66 Silk-throwers	No hall	Charles I.	1630	No livery; yet have a maſter, 2 wardens, and 20 aſſiſtants.					
67 Silkmen	No hall	Charles I.	1631	No livery; yet have a governor, and 20 aſſiſtants.					
68 Carmen, have no hall, nor charter, nor livery; but are a fellowſhip by act of common council, with the title of Free Carmen of the city of London, and have a maſter, 2 wardens, and 41 aſſiſtants, under the direction of the lord mayor and aldermen. The carts that belong to this fellowſhip, which are betwixt 4 and 500, are, by an act of common council, ſubjected to the rule of the preſident and governors of Chriſt's Hoſpital; to whom the owners of every cart pay 17 s. 4 d. a year for a licence to work it, and every cart is brought to the hoſpital to have a number in braſs put upon it.									
69 Pin-makers	No hall	Charles I.	1636	No livery; yet have a maſter, 2 wardens, and 18 aſſiſtants.					
70 Needle-makers	No hall	O. Cromwell	1656	110	5	5	0

78	Glaſs-ſellers and looking-glaſs-makers	No hall	Charles II.	1664	44	5 0 0	
79	Tobacco pipe-makers	No hall	Charles II.	1663			No livery; yet have a maſter, 2 wardens, and 18 aſſiſtants.
80	Coach and harneſs-makers	Noble-ſtreet	Charles II.	1677	104	10 0 0	
81	Gun-ſmiths	No hall	Charles I.	1638	100	10 0 0	
82	Gold and ſilver wire-drawers	No hall	James I.	1623			No livery; yet have a maſter, 2 wardens, and 18 aſſiſtants.
83	Long bow-ſtring-makers	No hall	No charter				No livery; yet a company by preſcription, and have 2 wardens, and 19 aſſiſtants.
84	Card-makers	No hall	Charles I.	1629			No livery; yet have a maſter, 2 wardens, and 18 aſſiſtants.
85	Fan-makers	No hall	Q. Anne	1709			No livery; yet have a maſter, 2 wardens, and 20 aſſiſtants.
86	Woodmongers, were a company incorporated with the carmen by K. James I. 1605, but ſurrendered their charter in 1668; yet by an act of common council in 1694, they obtained a privilege of keeping 120 carts, excluſive of the number kept by the carmen, *extinct*						
87	Starch-makers, *extinct*	No hall	James I.	1622			
88	Fiſhermen, *extinct*	No hall	James II.	1687			
89	Pariſh-clerks	Woodſtreet	Henry III.	1233			By a decree of the Star-chamber court in 1625, they obtained a privilege to keep a preſs in their hall, for printing the weekly bills of mortality, by a perſon appointed by the archbiſhop of Canterbury They are, by their charter, to make a report of all the weekly chriſtenings and burials in their ſeveral pariſhes every Tueſday; and they have a maſter, 2 wardens, and 17 aſſiſtants.

90 Porters, are another fellowſhip, without hall, or livery; conſiſting of tackle and ticket-porters. They were conſtituted a fraternity by act of common council in 1646, with a power of annually chuſing from among themſelves twelve rulers, being ſix of each denomination. However, the court of lord mayor and aldermen, have reſerved to themſelves a power of appointing one of their own body, as the chief judge in all controverſy. One very laudable cuſtom of the maſter tackle-porters is, that ſuch of their brethren as happen to be diſabled from working, receive their ſhare of all profits, as if actually in buſineſs, during life.

91 The watermen, wherrymen, and lightermen of this city and neighbouring places, were by act of K. William III. conſtituted a ſociety, or company, under the direction of the lord mayor and aldermen. They are to furniſh 1000 men for the navy, upon demand by the admiralty. They have a hall at Coal Harbour, near the Thames; and pay to their poor about 800l. a year; chiefly raiſed by ferries over the Thames on Sunday.

N. B. The company of Surgeons, Pariſh-clerks, Porters, and Watermen have not the privilege of making their members freemen of the city of London.

From the foregoing liſt, it appears on the whole, that there are ninety-one *companies*, forty-eight halls, and that the number of liverymen, according to the moſt exact account that could be procured, in 1779, is 8954. The ſums of money yearly diſtributed in charity by only twenty-three of the *companies*, amounts to 23655 l. and if but forty pounds each be annually given by the remaining ſixty-eight *companies* the whole will be no leſs than 26,375 l. *per annum*.

COMPANY, *New-River*. This corporation conſiſts of a governor, deputy-governor, treaſurer, and twenty-ſix directors, who hold a weekly board for appointing officers, granting leaſes, and redreſſing grievances. The projector of this CANAL for bringing water to London, with the aſſiſtance of king James I. and the corporation of London, is ſuppoſed to have expended 50,000 l. upon it; the profits, which are divided into ſeventy-two ſhares, for the firſt thirty years admitted of little more than five pounds to each ſhare: but their value is much increaſed, and now eſtimated at four or five thouſand pounds each. This *company* ſupplies more than thirty thouſand houſes with water.

COMPANY ſeems more peculiarly appropriated to thoſe grand aſſociations, ſet on foot for the commerce of the remote parts of the world; as the Engliſh and Dutch Eaſt India *company*, South Sea *company*, Miſſiſſippi *company*, &c. The riſe and eſtabliſhment whereof, we ſhall here ſet before the reader.

However injurious *companies* with joint ſtock, and incorporated with excluſive privileges, may, at this time be reckoned to the nation in general; it is yet certain that they were the general parent of all our foreign commerce: private traders being diſcouraged from hazarding their fortunes in foreign countries, until the method of traffic had been firſt ſettled by joint-ſtock *companies*. From this principle it is, that we find ſeveral nations that are now endeavouring to improve their trade, and to eſtabliſh or increaſe maritime power, by the means of joint-ſtock *companies*.

But ſince the trade of this kingdom, and the number of traders have increaſed, and the methods of aſſurance of ſhipping and merchandiſe, and the navigation to all parts of the known world have become familiar to us; theſe companies, in the opinions of moſt men, have been looked upon in the light of monopolies: their privileges have therefore been leſſened from time to time, in order to favour a free and general trade; and experience has ſhewn, that the trade of the nation has advanced, in proportion as monopolies have been diſcouraged.

COMPANIES *Engliſh*.—*Eaſt India* COMPANY was formed towards the latter end of the reign of queen Elizabeth; their charter being dated in 1600, and renewed by James I. in 1610.

Their firſt fleet, ſent out in 1600, brought back ſo rich a cargo, that in a few years they numbered twenty ſhips. King James I. to ſhew how much he had its intereſt at heart, ſent ſeveral embaſſies to the great Mogul, the kings of Perſia, Japan, and other princes, to make treaties of commerce in his name, and that of the *company*; ſome of which ſubſiſt ſtill: the king of Perſia, in particular, granted the *company* ſeveral extraordinary favours, in recompence for the ſervice the Engliſh had done him, in aſſiſting him to expel the Portugueſe from Ormus; who, by means of their lodgment there, uſurped the whole commerce of the Perſian gulph.

But its chief favours the *company* received at the hands of king Charles II. who, by a charter granted in 1668, granted them the port and iſland of Bombay, with all the rights thereof as ſurrendered to him by the Portugueſe: only reſerving to himſelf the ſovereignty and homage thereof, with a yearly acknowlegement of ten pounds *per ann.* in gold. Another charter, confirming preceding ones, was granted in 1676. In 1673 he alſo granted them, in like manner, the iſland of St. Helena, belonging to him by right of conqueſt from the Dutch, who had before taken it from the Engliſh. By a fifth charter, purpoſely deſigned againſt interlopers, in 1683, he granted them a power to erect a court of judicature, compoſed of a lawyer, and two merchants, in all their places, ſettlements, factories, &c. to judge of ſeizures, and all marine diſputes; as alſo about bargains, exchanges, &c. and even of all crimes committed on the high ſeas, or in the countries and territories of the *company*, in Aſia, Africa, and America; the whole, however, agreeable to the uſages and cuſtoms of merchants, and the laws of England. In 1671, the ſame prince granted the *company* a charter, which contained a confirmation of the ancient ones of king James I. and queen Elizabeth; or rather, a new charter, granting them abundance of privileges, which they had not before enjoyed: this charter is properly the baſis of the *company*, and that whereon are founded all the rights, and the policy of the *new company*, afterwards eſtabliſhed in 1698.

All theſe five charters of king Charles II. were confirmed by king James II. in 1686, eſpecially the laſt, which was enforced with new ſanctions; particularly, the article of excluſion; which, in the time of king Charles, had been but little regarded, but was now enforced with ſuch rigorous prohibitions, that all interlopers ſeemed for ever excluded.

No perſon may trade thither, until ſufficient ſecurity be given to the commiſſioners of the cuſtoms, that all the goods cauſed by them to be there laden, ſhall be brought, without breaking bulk, to ſome port in England: which ſecurity the Engliſh Eaſt India *company* are to give under their common ſeal, after the rate of 2500*l.* for every hundred tons they are let at, for every ſhip by them ſent out, according to the form preſcribed, 9 and 10 W. III. cap. 44. ſect. 68. 6 Anne, cap. 3. ſect. 1.

The ſhares, or ſubſcriptions of the *company*, were originally only of 50*l.* ſterling: but the directors, having a conſiderable dividend to make in 1676, it was agreed to join the profit to the original, inſtead of withdrawing it; and thus the ſhares were doubled, and became of 100*l.* ſterling.

The firſt capital was only 369,891*l.* ſterling, and 5*s.* which, being thus doubled, amounted to 739,782*l.* ſterling, and 10*s.* to which, if the profits of the *company* to the year 1685, viz. 963,639*l.* ſterling be added, the whole ſtock will be 1,703,422*l.* ſterling.

The *company* had, from time to time, undergone great loſſes; firſt, in 1682, by the loſs of Bantam, out of which they were driven, and had their magazines plundered by the Dutch; under pretence of aſſiſting ſultan Agui againſt ſultan Agom, his father. Secondly, about the ſame time, when the great numbers of interlopers, to whom king Charles II. too eaſily granted permiſſions, lowered their ſhares *cent. per cent.* Thirdly, by the war, which the *company* maintained in the Indies, againſt the great Mogul; wherein it was obliged to abandon the factory of Surat, and to retire to Bombay; on which occaſion king James II. granted them a new charter in 1686, being their ſixth ſince the Reſtoration. But ſtill ſhe repaired her ſtock, and ſupported the reputation of her commerce, till the revolution which happened ſoon after: when the war, and the incredible loſſes the *company* ſuſtained by the French privateers, &c. put it into ſo deſperate a condition, that appearing ſcarce poſſible to be ſupported, a new one was erected.

The charter of the new Eaſt-India *company* was of the year 1698. Its ſtock was ſo conſiderable, and the ſubſcriptions ſo very ready, that, in two years time, the *company* had forty veſſels equipped in its ſervice; which was double of what the old one ever had; and ſent to the Indies (*communibus annis*) at leaſt a million ſterling in ſilver; whereas the former had never ſent above 500,000*l.*

After the two *companies* had ſubſiſted a few years in a ſeparate ſtate, means were contrived to unite them, which was effected by an indenture tripartite, between the queen and the two *companies*, in 1702, and they were perfectly conſolidated in 1708, when a new charter of union was granted them, under the name of the *United Company of Merchants of England trading to the Eaſt-Indies*; their whole capital conſiſting of 3,200,000*l.* which being ſince expired, another charter, with new powers, was granted them in 1726, and their excluſive privileges prolonged for thirty-three years, in 1730, viz. to 1769; and it was continued, in the 17th year of Geo. II. to the year 1780, in which year another million was advanced by this *company* to the public.

The cargo which the *company* ſends to the Eaſt-Indies, is chiefly ſilver, bullion, and pieces of eight; with cloth, either ſcarlet or blue; they alſo ſend ſome iron, and lead.

The returns from the Indies are chiefly ſilks, both raw and manufactured, cottons, callicoes, muſlins, drugs, tea, coffee, china-ware, rice, ſago, red wood, ſalt-petre, pepper, Carmania wool, indigo, &c.

For the œconomy and policy of the *United Company*, all perſons, without exception, are admitted members of it, natives and foreigners, men and women; with this circumſtance, that 1000*l.* in the ſtock of the *company* gives the owner a vote in the general courts; and 2000*l.* qualifies him to be choſen a director.

The directors are twenty-four in number, including the chairman and deputy-chairman, but may be re-elected for four years ſucceſſively. They have a ſalary of 150*l.* *per ann.* and the chairman and deputy-chairman of 200*l.* The meetings, or courts of directors, are to be held, at leaſt, once a week, but are commonly oftener; and they are ſummoned as occaſions require.

Out of the body of directors are choſen divers committees, who have the peculiar inſpection of certain particular branches of the *company's* buſineſs; as, the committee of correſpondence, committee of buying, committee of treaſury, committee of warehouſes, committee of ſhipping, committee of accounts, committee of private trade, committee of houſe, committee of law-ſuits, committee of military fund, and committee to prevent the growth of private trade.

No perſons are allowed to have any private trade, except the *company's* officers, and ſeamen ſent to India on board their ſhips; who are regularly licenſed to carry out, and bring back commodities to a certain value, greater or leſs, according to their rank. But at their return, their cargoes are to be conſigned to the *company*, and ſold by them at their next ſale. The Jews alſo, and others dealing in diamonds, are allowed to trade for themſelves by the *company's* ſhips, on allowing ſo much *per cent.* to the *company* for freight.

The *company* has three principal ſettlements, viz. Fort William in Bengal; Fort St. George, on the coaſt of Coromandel; and the iſland of Bombay; each of which has ſeveral ſubordinate factories.

The factories dependent on Fort William, are Caſſimbuzar, Patna, Dacca, Ballaſore, and Jugdea.—Thoſe on Fort St. George, are Fort Marlborough, Fort St. David, Vizagapatam, Ingeram, and Madipollam.—Thoſe on the iſland of Bombay, are Gombroon, Surat, Anjingo, and Tellicherry.

COMPANY, *Royal African*, eſtabliſhed for the commerce of the coaſts of Guinea, is governed much like that of the Eaſt-Indies. Its privilege is excluſive: it ſends out yearly, ten or a dozen ſhips, of about 150 tons, loaden with old and new draperies, and with iron-works, ſciſſars, knives, muſquets, cottons, and other leſs conſiderable merchandizes.

The returns are in gold-duſt, elephants teeth, wax, and leathers: but the beſt article of its commerce is NEGROES, which it ſends to Jamaica, Barbadoes, and other Engliſh iſles in America; frequently, even to the ports of New Spain. See ASSIENTO, &c.

Though England began to trade to Africa as early as the year 1536, and ſeveral voyages were made to Guinea in 1588, and ſome following years, for the importation of gold and elephants teeth, nothing like a *company* was formed till the year 1588, when queen Elizabeth granted a patent of excluſive privilege to certain perſons for ten years. In 1618, king James I. eſtabliſhed a *company* by charter, which was ſoon diſſolved. Another *company* was erected by charter of Charles I. in 1631, which met with little ſucceſs; but the demand for negroes in the Engliſh American plantations increaſing, a third *company* was eſtabliſhed by a charter granted 1662, in favour of the duke of York; ſecuring to him the commerce of all the country, coaſts, iſlands, &c. belonging to the crown of England, or not poſſeſſed by any other Chriſtian prince; from Cape Blanco in 20° N. lat. to the Cape of Good Hope in 34° 30′ S. lat. The charter was ſoon after returned into the king's hands by the duke, and revoked, by conſent of the parties aſſociated with him in the enterprize; in conſequence of which, the fourth and laſt excluſive *company* was eſtabliſhed and incorporated by letters patent in 1672. A capital was ſoon raiſed of 111,000*l.* and this new *company* improved their trade, and increaſed their forts; but after the Revolution in 1689, this trade was laid open. In 1698, all private traders to Africa were obliged by ſtat. 9 and 10 Will. to pay ten *per cent.* in order to aſſiſt the *company* in maintaining their forts and factories. However, this aſſiſtance proving ineffectual, an annual ſum of 10,000*l.* was granted by the Britiſh parliament in 1730, for this purpoſe. In 1758, parliament eſtabliſhed an African *company* under new regulations; and in 1752, abſolutely, the old *company*, having given them a pecuniary ſatisfaction for their charter, lands, forts, ſlaves, &c. and veſted their forts and factories, &c. in the new *company*, which is impowered to arm and train military forces at their forts, and to puniſh offences, ſo as not to extend to life or limbs, and to erect courts of judicature for mercantile and maritime bargains, &c.

The direction of the affairs of this *company* is referred to a committee of nine perſons, choſen annually by the freemen at London, Briſtol, and Liverpool, who purchaſe their freedom, and right of election, by the payment of 40*s.* and accountable to the board of trade and plantations.

For the incorporation of this *company*, and the regulations concerning it, ſee 23 Geo. II. cap. 31—25 Geo. II. cap. 40.

COMPANY, *Hamburgh*, is the oldeſt trading eſtabliſhment in the kingdom; though not always known by that name, nor reſtrained to thoſe narrow bounds under which it is now confined. It was firſt called, the *Company of Merchants trading to Calais, Holland, Zealand, Brabant, and Flanders:* then it acquired the general title of *Merchant-adventurers of* England; as being compoſed of all the Engliſh merchants who traded to the Low Countries, the Baltic, and the German ocean. Laſtly, it was called the *Company of Merchant-adventurers of England trading to Hamburgh.*

This *company*, as well as ſome others in England, built on its model, is very different from thoſe above mentioned; and differs widely from the ordinary plan and ſyſtem of ſuch ſocieties. In effect, this is not a ſociety of dealers, each furniſhing a part of the ſum to conſtitute the capital ſtock of the *company*; but a mere aſſociation, or body of merchants, who have nothing in common, but the grant and privilege of trading to Hamburgh, and ſome other cities of Germany; each managing his own commerce, and trading on his own foundation: only obſerving a certain diſcipline, and ſome regulations, which none but the *company* can eſtabliſh, or change.

This *company* was firſt incorporated by Edward I. in 1296; and eſtabliſhed again, by charter, in 1406, under the reign of king Henry IV. It was afterwards confirmed, and augmented with divers privileges, by many of his ſucceſſors; among the reſt, by Henry V. in 1413; Henry VI. in 1422; Henry VII. in 1493, 1505, and 1506; Henry VIII. in 1509, 1517, and 1536; Edward VI. in 1547; queen Mary, in 1553; Elizabeth, in 1564, and 1586; James I. in 1605; and Charles II. in 1661. But of all theſe charters, there are, properly, none but thoſe of Henry IV. Henry VII. Elizabeth, James, and Charles, that are of any importance, or that give the *company* any thing new; the reſt being only confirmations. Before the charter of Henry IV. all the Engliſh merchants, who trafficked out of the realm, were left to their own diſcretion, and managed their affairs with foreigners, as might be moſt for their reſpective intereſts; without any regard to the general commerce of the nation.

Henry, obſerving this diſorder, endeavoured to remedy it, by uniting all the merchants in his dominions into one body; wherein, without loſing the liberty of trading each for himſelf, they might be governed by a *company* ſtill ſubſiſting; and be ſubject to regulations, which ſhould ſecure the general intereſt of the national commerce, without prejudice to the intereſt of particulars. With this view, he granted all the merchants of his ſtates, particularly thoſe of Calais, then in his hands, a power of aſſociating themſelves into a body politic, with directors and governors, both in England and abroad; to hold aſſemblies, both for the direction of buſineſs, and the deciding of controverſies among merchants; make laws; puniſh delinquents; and impoſe moderate duties and taxes on merchandizes, and merchants, to be employed in the ſervice of the corporation.

Theſe few articles of the charter of Henry IV. were afterwards much augmented by Henry VII. who firſt gave them the title of *Merchant-adventurers to Calais, Holland,* &c. gave them a power of proclaiming and continuing free fairs at Calais; and ordered, that to be reputed a member of the ſociety, each perſon pay twenty marks ſterling; and that the ſeveral members ſhould attend the general meetings, or courts, appointed by the directors, whether at London, Calais, or elſewhere.

The inexecution of this laſt article, and contempt of ſome of the reſt, occaſioning great inconveniences to the *company's* affairs, another charter was procured; whereby the pain of impriſonment was menaced, for thoſe who ſhould abſent themſelves from the meetings without lawful cauſe, or ſhould diſobey the laws. A petition being made to queen Elizabeth, in 1564, for an explanation of certain articles in the charter of Henry VII. and a confirmation of the reſt granted by other kings; that princeſs, by a charter of the ſame year, declares, that to end all diſputes, they ſhall be incorporated anew, under the title of the *Company of Merchant-adventurers of England*; that all who were members of the former *company* ſhould, if they deſired it, be admitted members of this; that they ſhould have a common ſeal; that they ſhould admit into their ſociety what other perſons, and on what terms, they pleaſed; and expel them again on miſbehaviour; that the city of Hamburgh, and neighbouring cities, ſhould be reputed within their grant, together with thoſe of the Low Countries, &c. in that of the former *company*; that no member ſhould marry out of the kingdom, nor purchaſe lands, &c. in any city beyond ſea; and that thoſe who do, ſhall be, *ipſo facto*, excluded for ever.

Twenty-two years after this firſt charter, queen Elizabeth granted them a ſecond; confirming the former, and further granting them a privilege of excluſion; with a power of erecting in each city within their grant, a ſtanding council.

The woollen manufacture being the principal object of their application, they met with great oppoſition; firſt, from the Hanſe, who forced them frequently to change their mart, or ſtaple; and afterwards under king James I. who having erected a corporation in 1616, in favour of ſome private perſons, who offered to ſet up a manufacture for dying and preſſing cloths, &c. under pretence thereof, the *company* of merchant-adventurers were prohibited dealing therein. But that project not ſucceeding, and the charter being revoked two years afterwards, the merchant-adventurers, whoſe *company* had been diſſolved two years before, were reſtored in 1617, to their ancient privileges, and a new charter was given them, confirming their excluſive rights; and allowing them to have officers in the ſeveral cuſtom-houſes, to have an eye that they were not prejudiced in their woollens, under pretence of the like merchandizes, which others were allowed to ſend to other parts. This charter of king James, is the laſt of thoſe confirmed by Charles II. in the grand charter of 1661.

The revolutions which had happened in the Low Countries towards the end of the ſixteenth century, and which laid the foundation of the republic of Holland, having hindered the *company* from continuing their commerce with their ancient freedom; it was obliged to turn it almoſt wholly to the ſide of Hamburgh, and the cities on the German ocean: from which change, ſome people took occaſion to change its name to that of the *Hamburgh Company*; though the ancient title of *Merchant-adventurers* is ſtill retained in all their writings.

This ſociety was greatly reduced, when its trade was laid open by William III.

Company *of Merchants of the Staple* was incorporated by Edward III. Their factory was at Middleburgh, in Zealand; but the ſtaple being removed in 1389 to Calais, it was ſoon after, viz. in 1390, removed from thence to England.

Company, *Ruſſia*. This was firſt projected towards the end of the reign of king Edward VI. executed in the firſt and ſecond years of Philip and Mary; but had not its perfection, till its charter was confirmed by act of parliament, under queen Elizabeth, in 1566. It had its riſe from certain adventurers, who were ſent in three veſſels on the diſcovery of new countries; and to find out a north-eaſt paſſage to China: theſe, falling into the White Sea, and making up to the port of Archangel, were exceedingly well received by the Muſcovites; and, at their return, ſollicited letters patent to ſecure to themſelves the commerce of Ruſſia, for which they had formed an aſſociation.

The charter was promiſed them by Edward VI. but he dying, was firſt diſpatched by queen Mary, in 1555. By this charter, the aſſociation was declared a body politic, under the name of the *Company of Merchant-adventurers of England, for the diſcovery of lands, territories, iſlands,* &c. *unknown, or unfrequented.* Their privileges were, to have a governor, four conſuls, and twenty-four aſſiſtants, for their commerce; for their policy, to make laws, inflict penalties, ſend out ſhips to make diſcoveries, take poſſeſſion of them in the king's name, ſet up the banner royal of England, plant them; and laſtly, the excluſive privilege of trading to Archangel, and other ports of Muſcovy, not yet frequented by the Engliſh.

This charter, not being ſufficiently guarded, was confirmed by parliament in the eighth year of queen Elizabeth; wherein it was enacted, that in regard the former name was too long, they ſhould now be called *Company of Engliſh Merchants for diſcovering new trades*; under which name, they ſhould be capable of acquiring and holding all kinds of lands, manors, rents, &c. not exceeding a hundred marks *per ann.* and not held of her majeſty; that no part of the continent, iſland, harbour, &c. not known or frequented before the firſt enterprize of the merchants of their *company*, ſituate to the north, or north-weſt, or north-eaſt of London; nor any part of the continent, iſlands, &c. under the obedience of the emperor of Ruſſia, or in the countries of Armenia, Media, Hyrcania, Perſia, or the Caſpian ſea, ſhould be viſited by any ſubjects of England, to exerciſe any commerce, without the conſent of the ſaid *company*, on pain of confiſcation. The ſaid *company* ſhall uſe no ſhips in her new commerce, but thoſe of the nation; nor tranſport any cloths, ſerges, or other woollen ſtuffs, till they have been dyed and preſſed. That in caſe the *company* diſcontinue of itſelf to unload commodities in the road of the abbey of S. Nicolas, in Ruſſia, or ſome other port, on the north coaſts of Ruſſia, for the ſpace of three years, the other ſubjects of England ſhall be allowed to traffick to Narva, while the ſaid *company* diſcontinues its commerce into Ruſſia, only uſing Engliſh veſſels.

This *company* ſubſiſted with reputation almoſt a whole century, till the time of the civil wars. It is ſaid, the czar then reigning, hearing of the murder of king Charles I. ordered all the Engliſh in his ſtates to be expelled; which the Dutch taking the advantage of, ſettled in their room. After the Reſtoration, the remains of the *company* re-eſtabliſhed part of their commerce at Archangel, but never with the ſame ſucceſs as before; the Ruſſians being now well accuſtomed to the Dutch merchants, and merchandize.

This *company* ſubſiſts ſtill, nearly on the foot of that of Hamburgh, and the northern and Turky *companies*; i. e. each member thereof trafficks for himſelf, and on his own foundation; only paying an acknowlegement of 12 or 13*l.* ſterling, beſides ſome other dues impoſed, from time to time, for the occaſions of the *company*, and the commerce in general. It is under the direction of a governor, four conſuls, and aſſiſtants.

Company, *North Sea*, or as ſome, more agreeably to its charter, call it *Eaſtland Company*, is eſtabliſhed on ſimilar ground with that of Hamburgh; from whence it appears to have been diſmembered.

Its charter is dated in the year 1579. By the firſt article the *company* is erected into a body politic, under the title of the *Company of Merchants of the Eaſt*; to conſiſt of Engliſhmen, all real merchants, who have exerciſed the buſineſs thereof, and trafficked through the Sound, before the year 1568, into Norway, Sweden, Poland, Livonia, Pruſſia, Pomerania, &c. as alſo Revel, Coningſberg, Dantzick, Copenhagen, &c. excepting Narva, Muſcovy, and its dependencies. Moſt of the following articles grant them the uſual prerogatives of ſuch *companies*; as a ſeal, governor, courts, laws, &c.

The privileges peculiar to this *company* are, that none ſhall be admitted a member, who is already a member of any other *company*; nor any retail-dealer at all. That no merchant qualified, be admitted without paying ſix pounds thirteen ſhillings and ſix-pence. That a member of another *company*, deſiring to renounce the privileges thereof, and to be received into that of the Eaſt, ſhall be admitted *gratis*; provided he procures the ſame favour for a merchant of the Eaſt, willing to fill his place. That the merchant-adventurers who never dealt in the Eaſt, in the places expreſſed in the charter, may be received as members of the *company* on paying forty marks; that, notwithſtanding this union of the *Adventurers of England* with the *Company of the Eaſt*, each ſhall retain its rights and privileges. That they ſhall export no cloths but what are dyed and preſſed, except a hundred pieces *per annum*, which are allowed them *gratis*.

This charter was confirmed by Charles II. in 1629, with this addition; that no perſon, of what quality ſoever, living in London, ſhould be admitted a member, unleſs he were free of the city.

This *company* was complained of as a monopoly, and firſt curtailed by legal authority in 1672; and ſince the declaration of rights in 1689, exiſt only in name; but ſtill continue to elect their annual officers, who are a governor, a deputy, and twenty-four aſſiſtants.

COMPANY, *Turky*, or *Levant* COMPANY. This *company* is eſtabliſhed on ſimilar ground with that of the *Hamburgh Company*, i. e. there is no common fund, wherein the adventurers depoſit their ſtock to make one ſingle commerce; but the commerce thither is free, each member trafficking for himſelf; but obſerving the rules and orders of the *company*; and all contributing, occaſionally, towards the common expences.

This flouriſhing body had its riſe under queen Elizabeth, in 1581. James I. confirmed its charter in 1605, adding new privileges. During the civil wars, there happened ſome innovations in the government of the *company*; many perſons having been admitted members, not qualified by the charters of queen Elizabeth and king James, or that did not conform to the regulations preſcribed. Charles II. upon his reſtoration, endeavoured to ſet it upon its ancient baſis; to which end, he gave them a charter, containing not only a confirmation of their old one, but alſo ſeveral new articles of reformation.

By this, the *company* is erected into a body politic, capable of making laws, &c. under the title of the *Company of Merchants of England trading to the ſeas of the Levant*. The number of members is not limited, but is ordinarily about three hundred. The principal qualification required is, that the candidate be a freeman of London, and a wholeſale merchant, either by family, or by ſerving an apprenticeſhip of ſeven years. Thoſe under twenty-five years of age pay 25*l.* ſterling at their admiſſion; thoſe above, twice as much. This fine was reduced by act of parliament, in 1753, to 20*l.* and the privilege of admiſſion extended to every Britiſh ſubject. Each makes oath, at his entrance, not to ſend any merchandizes to the Levant, but on his own account; and not to conſign them to any but the *company's* agents or factors. This reſtriction is likewiſe enlarged by the above mentioned ſtatute.

The *company* has a court, or board, at London, which is compoſed of a governor, deputy-governor, and fifteen directors, or aſſiſtants; who are all actually to live in London, or the ſuburbs. They have alſo a deputy-governor in every city, and port, where there are any members of the *company*. The aſſembly at London ſends out the veſſels, regulates the tariff for the price at which the European merchandizes ſent to the Levant are to be ſold; and for the quality of thoſe returned. It raiſes taxes on merchandizes, to defray impoſitions, and the common expences of the *company*; preſents the embaſſador which the king is to keep at the Porte, elects two conſuls for Smyrna and Conſtantinople, &c.

One of the beſt regulations of the *company* is, not to leave the conſuls, or even embaſſador, to fix the impoſition on veſſels for defraying the common expences (a thing fatal to the *companies* of moſt other nations); but to allow a penſion to the ambaſſador, and conſuls, and even to the chief officers; as ſecretary, chaplain, interpreters, and janizaries; that there may not be any pretence for their raiſing any ſum at all on the merchants, or merchandizes.

In extraordinary caſes, the conſuls, and even the ambaſſador, have recourſe to two deputies of the *company*, reſiding in the Levant: or, if the affair be very important, they aſſemble the whole body. Here are regulated the preſents to be given, the voyages to be made, and every thing to be deliberated; and on the reſolutions here taken, the deputies appoint the treaſurer to furniſh the moneys, &c. required.

It is true, the ambaſſador and conſul may act alone on theſe occaſions; but the penſion being allowed them on condition of declining them, they chooſe rather to ſit ſtill.

The ordinary commerce of this *company* employs from twenty to twenty-five veſſels, carrying from twenty-five to thirty pieces of cannon.

The merchandizes exported thither are, cloths of all kinds and colours, pewter, lead, pepper, cochineal, and a great deal of ſilver, which they take up at Cadiz: the returns are in raw ſilk, galls, camlets, wools, cottons, Morocco leather, aſhes for making glaſs and ſoap, and ſeveral gums, and medicinal drugs.

The commerce of this *company* to Smyrna, Conſtantinople, and Scanderoon, is not eſteemed much leſs conſiderable than that of the Eaſt-India *company*; but is, doubtleſs, more advantageous to England; becauſe it takes off much more of the Engliſh manufactures than the other, which is chiefly carried on in money.

The places reſerved for the commerce of this *company* are, all the ſtates of Venice, in the gulph of Venice; the ſtate of Raguſa; all the ſtates of the grand ſeignior, and the ports of the Levant and Mediterranean; excepting Carthagena, Alicant, Barcelona, Valencia, Marſeilles, Toulon, Genoa, Leghorn, Civita Vecchia, Palermo, Meſſina, Malta, Majorca, Minorca, and Corſica; and other places on the coaſts of France, Spain, and Italy.

COMPANY, *South-Sea*. Many take this *company*, eſtabliſhed by ſtat. 9 Anne, 1711, to have been originally intended, rather as a political contrivance for raiſing a fund of money, to ſerve in the preſſing occaſions of the ſtate, than as a real eſtabliſhment for the ſake of commerce. For the nation being exhauſted of money by the long wars with France, it is no wonder the phantom of a new *company* ſhould be raiſed, to bring in the ſubſcriptions of the monied men; as the only expedient to be ſupplied with money, without diſſatisfying the people, already worn out with ſubſidies, &c.

The total capital of this *company* was at firſt 9,177,967*l.* 15*s.* 4*d.* but in 1715 it was enlarged to ten millions, at an intereſt of 6 *per cent.* reduced in 1717 to 5 *per cent.* The capital was increaſed again in 1719 to 11,746,844*l.* 8*s.* 10*d.* And if the plan of 1720 had perfectly ſucceeded, the amount of the capital would have been 43,411,399*l.* 6*s.* 11*d.* ¼. See FUND.

Be this as it will, it is certain, the miniſtry never thought ſeriouſly, during the whole courſe of the war, about making any ſettlement on the coaſts of South America; which was the thing wherewith the people were firſt flattered: beſides, that the fund having been apparently perverted to defray the expences of the war, its value was ſo lowered, that it muſt, in all probability, have ſunk outright, but for the unexpected help it met with in 1713.

By the treaty of Utrecht, the buſineſs of the French Aſſiento *company*, which was to furniſh the Spaniſh Weſt-Indies with negroes, was reſigned to the Engliſh, in favour of the *South-Sea Company*; which, by this turn, relieved itſelf from its languiſhing ſituation, and became in a condition to vie with the moſt flouriſhing *companies* of commerce in England. See ASSIENTO.

The *South-Sea company*, who, without changing their name, took on them the Aſſiento, or farm of negroes, preſerved the ſame eſtabliſhment, until the peace of Aix-la-Chapelle, in 1748; and their veſſels diſembarked their negroes, which they had purchaſed through all the coaſts of Africa within their grant, at Buenos Ayres.

The *company*, it is certain, ſet out with good ſucceſs; and there was room to hope ſtill better; ſince, beſides that the value of their ſtock, the firſt five years, roſe faſter, in proportion, than that of any other *company*; his majeſty, after purchaſing 10,000*l.* ſterling therein, was pleaſed to condeſcend to be their governor, or firſt director. This *company* is under the management of a ſub-governor, deputy-governor, and twenty-one directors, choſen every three years; for which a qualification of 2000*l.* ſtock is ſufficient, and for an elector 500*l.* For what remains of the hiſtory of this *company*, with that fatal train of romantic *companies* it drew after it, ſee BUBBLE.

COMPANY, *Greenland*. See GREENLAND.

COMPANIES, *Weſt-India*, or thoſe of the Engliſh colonies in North America, are of a lower claſs than thoſe above mentioned; and too numerous to be here deſcribed.

Their names are, the *Virginia Company*, *New England*, *New York*, *Penſylvania*, *New Scotland*, *Maſſachuſet*, *Connecticut*, *Bermudas*, *Tobago*, and *Carolina Companies*. To theſe may be added the *Hudſon's Bay Company*, incorporated by charter in 1670. This *company*, by a joint ſtock, carries on a conſiderable trade to the factories eſtabliſhed in Hudſon's Bay and Straits, whither the natives repair with their fine beaver, furs, &c. It is under the direction of a governor, deputy-governor, and ſeven aſſiſtants.

Company, *Scotch Darien*. This was eſtabliſhed with good proſpect at Edinburgh, in 1695, for the commerce of South America. In 1698, they ſent an armament and a colony, which they endeavoured to eſtabliſh in the iſthmus of Darien, which parts North and South America; but the Engliſh miniſtry not thinking proper to avow and ſupport the firſt ſucceſſes of the *company*, which had alarmed Spain, ever jealous of this part of her territories, the Scotch colony was diſperſed by the Spaniards in 1699, and thus vaniſhed the beſt project, that ever was formed, for diſputing with that nation the poſſeſſion of thoſe countries, from which ſhe pretends to exclude all other nations.

Company, *Dutch Eaſt-India*, had its riſe in the midſt of the ſtruggle which that people had for their liberty: for the Spaniards having forbid all commerce with them, and ſhut up all their ports; neceſſity inſpired ſome Zealanders to ſeek a new north-eaſt paſſage to China.

This enterprize proving unſucceſsful to three ſeveral armaments in 1594, 1595, and 1596, a ſecond *company* was formed, under the name of the *Company of remote Parts*; which, in 1595, took the ordinary route of the Portugueze to the Indies, and returned, in two years and a half's time, with little gain, but good hopes.

This *company*, and a new one juſt eſtabliſhed at Amſterdam, being united, equipped other fleets; and theſe occaſioned other *companies* at Amſterdam, Rotterdam, in Zealand, &c. inſomuch that the ſtates ſoon began to apprehend they might be prejudicial to each other. Under this concern, they called all the directors of the ſeveral *companies* together, who all conſented to an union, the treaty whereof was confirmed by the ſtates in 1602, a very remarkable epocha, as being that of the moſt ſolid and celebrated eſtabliſhment of commerce that ever was in the world.

Its firſt capital was ſix millions ſix hundred thouſand guilders. It had ſixty directors, divided into ſeveral chambers; twenty in that of Amſterdam, twelve in that of Zealand, fourteen in that of Delft and Rotterdam, and a like number in thoſe at Sluys and Horn. As each grant expires, the *company* is obliged to procure a new one, which it has already done four times ſince the firſt; viz. one in 1623, for twenty-one years, like the firſt; another for twenty-one years, commencing in 1643; and a third in 1665, for forty years; a fourth in advance, commencing in 1698, to end in 1740. Each grant coſts the *company* a conſiderable ſum: that of 1647, coſt 1,600,000 guilders, and the two following ones more: that of 1698, was confirmed by a placard of the ſtates-general, granting them an excluſive privilege, which was prolonged in 1761 for thirty years more.

Their factories, reſidences, &c. in the Eaſt-Indies, are very numerous; reaching from the Perſian gulph to the coaſt of China: the principal is that of Batavia, the center of their commerce: here reſides their general, with the ſtate and ſplendor of a ſovereign prince; making war and peace with the eaſtern kings and emperors at pleaſure.

The other more conſiderable factories are, Taiouam on the coaſt of China, Nangiſac in Japan, Malacca, Surat, Amboyna, Banda, Siam, Moluccos, &c. ſeveral on the coaſt of Coromandel, and at Iſpahan, Cape of Good Hope, &c. in all, they number forty factories, and twenty-five fortreſſes. They have the whole trade of the ſpicery in their own hands.

Company, *Dutch Weſt-India*, eſtabliſhed in 1621, with an excluſive privilege to trade twenty-four years along the coaſts of Africa, between the tropic of Cancer, and the Cape of Good Hope; and in America, from the ſouth point of Newfoundland, through the ſtraits of Magellan, that of Le Maire, or others, to the ſtraits of Anian, both in the North and South ſea.

The directors are divided into five chambers (as in the Eaſt-India *company*), out of which, nineteen are choſen for the general direction of affairs. In 1647, the *company* renewed its grant for twenty-five years; but it was ſcarce able to hold out the term, on account of its great loſſes and expences in taking the bay of Todos los Santos, Fernambuc, and the greateſt part of Braſil from the Portugueſe. The weakneſs of this *company*, which had ſeveral times in vain attempted to be joined to that of the Eaſt-Indies, occaſioned its diſſolution at the expiration of its grant.

In 1674, a new *company*, compoſed of the ancient proprietors and their creditors, was ſettled in the ſame rights and eſtabliſhment with the former; and ſtill ſubſiſts, though conſiderably decayed. Their firſt capital was about ſix millions of florins. Its principal eſtabliſhments are, one at Cape Verd, another on the Gold Coaſt of Africa, at Tobago, Curaſſao, &c. in America.

Company, *Dutch North*, has no excluſive privilege; the advantage of its patent being of another kind, and very inconſiderable.

There are alſo, in Holland, *companies* for the Baltic ſea, the fiſhery of Nova Zembla, Davis's Straits, and Greenland: yet none of their fiſheries are interdicted to private traders; all the difference between theſe and the *companies* conſiſting in this, that the former may not go aſhore to cut their fiſh in pieces, and melt their lard; but muſt bring their luggage to Holland.

Company, *Dutch Levant*. In ſtrictneſs, there is no Levant *company* in Holland: but the commerce of the private traders is ſo conſiderable, that the ſtate has taken the regulation thereof on itſelf.

To this end, they have eſtabliſhed a chamber of direction at Amſterdam, compoſed of ſix deputies, and a regiſter; who, under the burgomaſters, take care of every thing relating to the commerce of the Mediterranean; eſpecially that of Smyrna and Conſtantinople.

This *company* names the conſuls, appoints the number and ſtrength of convoys, terminates differences among the traders, and has alſo a right, on occaſion, to add new regulations to the old ones; though thoſe be of no force, till confirmed by the ſtates-general.

Company, *French Eaſt-India*, was eſtabliſhed in 1664, with an excluſive privilege, to trade for fifty years in all the ſeas of the Eaſt-Indies and South-ſea; no adventurer to be admitted without a thouſand livres in ſtock; and foreigners, who have twenty thouſand livres in ſtock, to be reputed regnicoles.

The patent grants them the iſland of Madagaſcar; and the king to be at one fifth of the expence of the three firſt armaments, without intereſt; the principal to be refunded in ten years; or, if the *company* find it loſes on the whole, the loſs to fall on the king's ſide.

The capital fund of the *company*, which was moſtly furniſhed by the king, was ſeven or eight millions of livres, but was to have been fifteen millions.

In effect, though no means were wanting to ſupport the *company*, yet it ſtill drooped, and ſtill ſtruggled; till, having ſubſiſted ten years without any change in its form, and being no longer able to diſcharge its engagements, there were new regulations concerted, but to little purpoſe. At length, things not being diſpoſed for a new Eaſt-India *company*, nor much good to be expected from the old one, in 1708, the miniſtry allowed the directors to treat with the rich traders of St. Malo, and reſign to them their privilege, under certain conditions. In the hands of theſe laſt, the *company* began to flouriſh.

Its chief factory is at Pondicherry, on the coaſt of Coromandel: this is the reſidence of the director-general; the other factories are inconſiderable. The merchandizes which the *company* brings into France are, ſilks, cottons, ſpices, coffee, rice, ſalt-petre; ſeveral kinds of gums and drugs, wood, wax, printed callicoes, muſlins, &c.

Company, *French Weſt-India*, was eſtabliſhed in 1664. Their charter gave them the property and ſeigniory of Canada, Acadia, the Antilles iſlands, iſle of Cayenne, and the Terra Firma of America, from the river of the Amazons to that of Oroonoko; with an excluſive privilege for the commerce of thoſe places, as alſo of Senegal, and the coaſts of Guinea, for forty years, only paying half the duties.

The ſtock of the *company* was ſo conſiderable, that, in leſs than ſix months, forty-five veſſels were equipped; wherewith they took poſſeſſion of all the places in their grant, and ſettled a commerce: yet this only ſubſiſted nine years. In 1674, the grant was revoked, and the countries above reunited to the king's dominions, as before; the king reimburſing the actions of the adventurers. This revocation was owing partly to the poverty of the *company*, occaſioned by its loſſes in the wars with England, which had neceſſitated it to borrow above a million; and even to alienate its excluſive privilege for the coaſts of Guinea: but alſo to its having in good meaſure anſwered its end; which was to recover the commerce of the Weſt-Indies from the Dutch, who had torn it from them: for the French merchants, being now accuſtomed to traffic to the Antilles, by permiſſion of the *company*, were ſo attached to it, that it was not doubted they would ſupport the commerce after the diſſolution of the *company*.

Company, *French Miſſiſſippi*, was firſt eſtabliſhed in 1684, in favour of the chevalier De la Salle; who having projected it in 1660, and being appointed governor of the fort of Frontignac, at the mouth of that river, travelled over the country in the year 1683, and returned to France to ſolicit the eſtabliſhment. This obtained, he ſet ſail for his new colony, with four veſſels loaden with inhabitants, &c. but entering the gulph of Mexico, he did not, it ſeems, know the river that had coſt him ſo much fatigue; but ſettled on another river, unknown; where his colony periſhed by degrees; ſo that, in 1685, there were not a hundred perſons remaining. Making ſeveral expeditions to find the Miſſiſſippi, he was killed in one of them by a party who mutinied againſt him; whereupon the colony was diſperſed and loſt. M. Hiberville afterwards ſucceeded better: he found the Miſſiſſippi, built a fort, and ſettled a French colony there; but he being poiſoned, it is ſaid, by the intrigues of the Spaniards, who feared ſuch a neighbour, in 1712, M. Crozat had the whole property of trading to the French territories, called Louiſiana, granted him for fifteen years.

Company *of the Weſt*. In 1717, the ſieur Crozat ſurrendered his grant; and in the ſame year a new *company* was erected, under the title of *Company of the Weſt*: to which, beſides every thing granted to the former *company*, was added the commerce of beaver, enjoyed by the Canada *company* from the year 1706, but expiring in 1717. In this eſtabliſhment, an equal view was had to the finances, and the commerce of the nation; and, accordingly, part of the conditions of its eſtabliſhment regarded the ſettling a colony, a trade, &c. the other the vending part of the bills, called *bills of ſtate*; which could no longer ſubſiſt on their preſent footing. The former are no more than are uſual in ſuch eſtabliſhments: for the latter, the actions are fixed at five hundred livres; each payable in bills of ſtate; the actions to be eſteemed as merchandize, and in that quality to be bought, ſold, and trafficked. The bills of ſtate, which make the fund of the actions, to be converted into yearly revenue. To put the finiſhing hand to the *company*, in 1717, its fund was fixed at an hundred millions of livres; which being filled, the caſh was ſhut up.

Company, *India*. The junction of the former *company* with that of Canada, was immediately followed by its union with that of Senegal; both in the year 1718, by an arret of council, which at the ſame time granted the new *company* the commerce of beavers, and made it miſtreſs of the negro, or Guinea trade, to the French colonies in America.

Nothing was now wanting to its perfection, but an union with the Eaſt-India *company*, and with thoſe of China and St. Domingo, which was effected; with the two firſt in 1719, and with the third in 1720. This union of the Eaſt-India and China *company* with the *company* of the Weſt, occaſioned an alteration of the name; and it was henceforth called the *India company*.

The reaſons of the union were the inability of the two former to carry on their commerce, the immenſe debts they had contracted in the Indies, eſpecially the *Eaſt Company*; complaints whereof had been ſent to court by the Indians, which diſcredited the *company* ſo that they durſt not appear any longer at Surat: laſtly, the little care they took to diſcharge their engagements; and their having transferred their privilege to the private traders of St. Malo, in conſideration of a tenth in the profits of the returns of their ſhips.

The ancient actions of the *company* of the Weſt, which were not at par when this engraftment was projected, before it was completed, were riſen to 300 *per cent.* which unexpected ſucceſs gave occaſion to conclude the new actions of the united *companies* would not bear leſs credit. The concourſe of ſubſcribers was ſo great, that in a month's time there were above fifty millions ſubſcribed for: the firſt twenty-five million actions which were granted to the India *company*, beyond the hundred millions of ſtock allowed the *company* of the Weſt, being filled as ſoon as the books were opened; to ſatiſfy the earneſtneſs of the ſubſcribers, the ſtock was increaſed by ſeveral arrets to three hundred millions. Credit ſtill increaſing, the new actions roſe to 1200 *per cent.* and thoſe of the ancient *company* of the Weſt to 1900 *per cent.* an exorbitant price, to which no other *company* ever roſe.

Its condition was now ſo flouriſhing, that in 1719 it offered the king to take a leaſe of all his farms for nine years, at the rate of three millions five hundred thouſand livres *per ann.* more than had been given before; and alſo to lend his majeſty twelve hundred millions of livres to pay the debts of the ſtate. Theſe offers were accepted; and the king, in conſideration hereof, granted them all the privileges of the ſeveral grants of the *companies* united to that *company*, to the year 1770, on condition, however, of diſcharging all the debts of the old Eaſt-India *company*, without any deduction at all. The loan of twelve hundred millions not being ſufficient for the occaſions of the ſtate, was augmented, three months afterwards, with three hundred millions more; which, with the former loan, and another of one hundred millions before, made ſixteen hundred millions; for which the king was to pay intereſt at the rate of three *per cent.*

The duke of Orleans, in February 1720, did the *company* the honour to preſide in their aſſembly, where he made ſeveral propoſals to them on the part of the king: the principal of theſe was, that they ſhould take on them the charge and adminiſtration of the royal bank. This was accepted of; and Mr. Law, comptroller-general of the finances, was named by the king *Inſpector-General of the India Company and Bank united.*

This union, which, it was propoſed, ſhould have been a mutual help to both thoſe famous eſtabliſhments, proved the fatal point from whence the fall of both commenced: from this time, both the bank-bills and the actions of the *company* began to fall: in effect, the firſt periſhed abſolutely, and the other had been drawn along with it, but for the prudent precautions taken for its ſupport.

The firſt precaution was the revoking the office of inſpector-general, and the obliging Mr. Law to quit the kingdom: the ancient directors were diſcarded, and new ones ſubſtituted; and, to find the bottom of the *company's* affairs, it was ordered, they ſhould give an account of what they had received, and diſburſed, both on the account of the *company*, and of the bank, which they had had the management of near a year. Another precaution to come at the ſtate of the *company*, was by endeavouring to diſtinguiſh the lawful actionaries from the Miſſiſſippi extortioners; whoſe immenſe riches, as well as their criminal addreſs in realizing their actions, either into ſpecies or merchandize, were become ſo fatal to the ſtate; in order, if poſſible, to ſecure the honeſt adventurers in their ſtock. To this end, an inquiſition was made into their books, &c. by perſons appointed by the king; and the new directors, or, as they were called, *regiſſeurs*, began ſeriouſly to look about for their commerce abroad. The French have had ſeveral other *companies*; ſome whereof have fallen of themſelves, the reſt upon the expiration of their grants: as, the

Baſtion **Company** *of France*, which was, at firſt, only a ſimple aſſociation of two merchants of Marſeilles in the fifteenth century, for fiſhing of coral in the gulph of Stora-Courcoury on the coaſt of Barbary, on the frontiers of Algiers and Tunis. Having obtained leave of the ſultan Solyman II. to make an eſtabliſhment, and having likewiſe treated with the Mooriſh princes of the country; in 1561 they built a little fort, called the *Baſtion of France*, whence the *company* took its name.

The firſt undertakers not being ſucceſsful, a new grant was obtained of Mahomet III. in 1604, to new undertakers: in 1628, it began to flouriſh, and the colony conſiſted of eight hundred people: but the death of their governor in 1633, gave them a blow they never recovered.

Several of the *companies* have ſince endeavoured to ſet the fiſhing of coral on its ancient footing, but hitherto in vain.

Company, *Guinea*, was eſtabliſhed in 1685. Its grant expired in 1705; but it continued its trade of negroes, by the king's permiſſion, under the name of Aſſiento *company*, to the year 1713; when, by the treaty of Utrecht, that trade was ſurrendered to the Engliſh South-ſea *company*; which ſee.

Company, *Aſſiento*. See *Guinea* Company, and Assiento.

Company, *Cape Verd*, the ſame with that of Senegal, under another name: it was eſtabliſhed in 1664, before the *company* of the Weſt; but the coaſts of Africa being included in the grant of this laſt, we hear no more of the Cape Verd *company* till the year 1675, when it roſe afreſh under the title of *Company of Senegal*. It was farther confirmed in 1681; but, being unable to pay its debts, was diſſolved in 1696.

Company, *French South-Sea*, is the ſame with the Aſſiento *company*. See Assiento.

Company, *Canada*, eſtabliſhed in 1628, for the commerce of caſtor-ſkins, &c. Its grant expiring in 1717, it was united to the *company* of the Weſt; which ſee.

Company, *Acadia*, eſtabliſhed in 1683. Its grant expiring in 1703, and the war, &c. preventing a new one, the colony was neglected; and was taken by the Engliſh in 1710, and confirmed to them by the treaty of Utrecht.

Company, *French Levant*, eſtabliſhed in 1670; but its privilege revoked in 1684.

Company, *French North*, eſtabliſhed in 1669, and expiring with its grant in 1690.

Company, *St. Domingo*, eſtabliſhed in 1698, for fifty years; carried on with honour to the year 1720, and then united to the India *company*.

Company, *Daniſh North*; was eſtabliſhed at Copenhagen in 1647. Its eſtabliſhments are very conſiderable in Norway; beſides which, it ſends veſſels to Warangar, whence they

they convey their merchandizes by land into the Daniſh Lapland; and by ſledges drawn by rein-deer, into the Muſcovite Lapland. It alſo ſends others for Borandai and Siberia; where its agents take them up, and convey them, in like manner, on ſledges, to Panigorod, the capital of this part of the Muſcovite empire.

The commodities it ſends thither are rixdollars, tobacco, and linens; it returns nothing but furs and ſkins.

Company, *Daniſh Iceland*, eſtabliſhed in the ſame year with the North *company:* its chief factory is Kirkebar, a large town in that iſland.

Company, *Daniſh Eaſt-India*, eſtabliſhed about the year 1617; their chief factory is at Tranquebar, whither they ſend two or three veſſels every year.

Company, *Levant*, *of the Genoeſe*, eſtabliſhed in 1664, and confirmed by the Porte; notwithſtanding the oppoſition of the French.

Its chief commerce was to be in pieces of five ſols, which the Genoeſe had before furniſhed the Turks withal, though in the French name, and under their banner: they were now to do it under their own banner; and accordingly, while the humour of theſe pieces laſted, as they ſerved not only for money, but were likewiſe uſed by the Greek and Turkiſh women of the iſlands, as ornaments in their head-dreſs, at the bottom of their veſts or petticoats, which were covered with them, the *company* ſucceeded well enough: but that money being afterwards decried in 1670, the *company* has languiſhed ever ſince; and can now ſcarce ſupport a miſerable commerce.

For a more particular account of the riſe and progreſs of moſt of the above mentioned *companies*, ſee Anderſon's Hiſt. of Commerce.

Company, in *Sea-Language*, denotes the whole crew of a ſhip, including her officers.

Company *of ſhips*, is uſed for a fleet of merchant-veſſels, who make a kind of charter-party among themſelves; whereby, under ſeveral clauſes and conditions tending to their common ſafety, they engage not to quit one another, but to defend each other reciprocally, during their voyage.

Theſe aſſociates, in the Mediterranean, are called *conſerves*. The chief conditions of the charter-party are, that ſuch and ſuch ſhall be owned admiral, vice-admiral, and rear-admiral; that thoſe which bear no guns, ſhall pay ſo much *per cent.* of their cargo, for the expences of the admiral; that ſuch and ſuch ſignals ſhall be obſerved; that if they be attacked, the damages ſhall be reimburſed by the *company* in general, &c.

Company, *Rule of*, or *Fellowſhip*, in *Arithmetic*, is a rule whereby we diſcover, or aſcertain, the ſhare of the profits, or loſſes, belonging to the ſeveral partners, or aſſociates, in any enterprize, in proportion to the ſtock each contributed thereto, and the time that ſtock was in bank. See Fellowship.

Company, in *War*, denotes a little body of infantry, commanded by a captain.

The French uſe the word indifferently for the horſe, or foot; but the Engliſh appropriate the term troop to a *company* of horſe. See Troop.

Companies of foot on the Britiſh eſtabliſhment commonly uſed to conſiſt of one captain, one lieutenant, one enſign, three ſerjeants, three corporals, two drums, and forty-nine private centinels; in all ſixty. But, of late years, *companies* have been increaſed, by the addition of twenty centinels, to eighty men. Ten, and ſometimes twelve *companies*, make a regiment.

A *company* in the guards is eighty private men. See Regiment, and Guards.

In the French guards the *company* is a hundred and twenty; in the Swiſs guards two hundred.

Companies not embodied into regiments are called *independent companies.*—The French alſo have their *free companies*, who never enter the body of any regiment; and *companies of ordonnance*, who in like manner never enter the body of a regiment, but conſiſt of the gendarmes and light-horſe. They were inſtituted by Charles VII. who choſe out fiſteen captains, under each of whom were to be a hundred lances, or men at arms, each man at arms to receive pay for ſix perſons, himſelf among the number; the reſt to be three archers on horſeback, a cutler, and a ſervant.

Company, *artillery*. See Artillery.

COMPARATES, Comparata, in *Logic*, the terms or ſubjects of a comparison; or the two things compared to each other.

COMPARATIONE—*Punctum ex* Comparatione. See Punctum.

COMPARATIONIS *Homogeneum*. See Homogeneum.

COMPARATIVE *Anatomy*. See Anatomy.

Comparative *Degree*, in *Grammar*, is an inflexion between poſitive and ſuperlative degrees; whoſe effect is, to ſet a thing above or beneath the level of another.

The Latins expreſſed their *comparative degree* by a particular termination of their adjectives, and participles; wherein they are followed by the Engliſh, though by few others of the modern languages.

The French form moſt of their *comparatives*, by adding the participles *plus*, *moins*, and *auſſi*; the Italians, by *più*, *meno*, &c. as the thing is to be raiſed, lowered, or equalled to another.

COMPARISON, the relation of two perſons or things, conſidered as oppoſed, or ſet againſt each other, in order to find wherein they agree or differ; or wherein one has the advantage of the other.

Comparison *of Ideas*, an act of the mind, whereby it *compares* its ideas one with another, in reſpect of extent, degree, time, place, or any other circumſtances.

This operation of the mind is the ground of relations.

Brutes ſeem not to have this faculty in any great degree: they have, probably, ſeveral ideas diſtinct enough; but cannot compare them farther than as to ſome ſenſible circumſtances annexed to the objects themſelves: the power of *comparing* general ideas, which we obſerve in men, they have not, as we may probably conjecture.

Comparison, in *Rhetoric*, is a figure, or rather place, in ſpeech, whereby two things are conſidered with regard to ſome third, which is common to them both.

Thus, Cicer. Topic. *Catoni licuit ſequi bellum civile, igitur & Ciceroni licebit. It was allowed Cato to engage in the civil wars, therefore it may be allowed Cicero:* where, to engage in the civil wars, is common to both.

There are three kinds of *compariſon*; the firſt *à majori*, i. e. from the major to the minor, as that of Cicero againſt Antony, *Quid feceris domi tuæ, cum alienæ tam ſis inſolens?* Or that of Terence, *Quem feret, ſi parentem non fert ſuum?* From the ſame place, Ovid endeavours to appeaſe Cæſar.

> *Cur ego poſſe negem leniri Cæſaris iram,*
> *Cum videam mites hoſtibus eſſe Deos?*

The ſecond, *à minori*, i. e. from the minor to the major: thus Cicero, *Majores noſtri ſæpe mercatoribus, ac naviculatoribus injurioſius tractatis, bella geſſerunt; vos tot civium Romanorum millibus uno nuntio atque uno tempore necatis, quo tandem animo eſſe debetis?*

The third *à pari*; as when we contend, that what obtains in one thing, ought to obtain in another of the ſame kind: thus, *It was a law, that he who killed his father ſhould be ſewed up in a ſack, and thrown into a river; therefore, he who killed his mother deſerves the ſame puniſhment.*

> *Capto tuam, pudet heu, ſed capto, Maxime, cænam:*
> *Tu capis alterius; jam ſumus ergo pares.*
> *Mane ſalutatum venio, tu diceris iſſe,*
> *Ante ſalutatum: jam ſumus ergo pares. &c.*
> Mart. lib. ii.

COMPARTIMENT, or Compartment, a deſign compoſed of ſeveral different figures, diſpoſed with ſymmetry; to adorn a parterre, a ceiling, panel of joinery, or the like.

Compartments, in *Gardening*, are beds, plats, borders, and walks, laid out according to the form of the ground, and depend more on a good fancy, than on any ſet of rules, for their conſtruction. They are alſo ſometimes merely diverſities or knots of flower-gardens or parterres, of which there is an infinite variety, according to the fancy of the deſigner. Plain *compartments*, are pieces of ground divided into equal ſquares and flower-beds, marked out by lines, and made of regularly equal length and breadth. Some allow to theſe ſquares borders of two feet broad, if the plot of ground be ſmall, and, if larger, of three feet, and edge the borders with box, or with upright hardy thyme: the alleys up between are to be laid with ſand or gravel, and kept clean weeded.

A **Compartment** *of tiles*, is an arrangement of white and red tiles varniſhed, for the decoration of the covering of a roof.

The term of *compartiment* is alſo uſed in painting. The Turkiſh and Mooriſh paintings are only *compartiments:* the fine bindings of books are in *compartiments*, &c.

Compartiment, *alley of*. See Alley.

Compartiment, in *Heraldry*. See Quartering.

COMPARTITION, in *Architecture*, the uſeful and graceful diſtribution of the whole ground-plot of an edifice, into rooms of office, and of reception, or entertainment. *Compartition* makes one of the great diviſions of the art of building.

COMPASS. The mariners, or nautical *compaſs*, is an inſtrument uſed by pilots, to direct the courſe of their ſhips.

It conſiſts of a box which includes a magnetical needle, that always turns to the north; allowing for a little declination, which is various in various places, and even, at various times, in the ſame place. See Variation.

In the middle of the box is fixed a perpendicular pivot, which bears a card, or paſteboard, on whoſe upper ſurface are deſcribed ſeveral concentric circles; the outmoſt of which is divided into 360 degrees; the other into 32 points, anſwering to the 32 winds; each point being 11° 15′: the four principal, viz. N. S. E. and W. are called cardinal points, and the names of the others are compounded of theſe.

In the center of this card is fitted a braſs cone, or cap, a little concave, which plays at liberty on the pivot; and along, in the thickneſs of the card, is fitted the needle, which is covered over with a glaſs, that its motions may be obſerved: the whole is incloſed in another box, where it is ſuſtained by braſs hoops, to keep the needle horizontal. See DIP. See it repreſented, *Tab. Navigation, fig.* 1.

The needle is made of a thin plate of ſteel, in form of a lozenge: the middle being cut out, ſo as to leave nothing but the extremities and an axis in the middle, to which the cap is fitted. See NEEDLE.

The *compaſs* has been ſometimes obſerved to be diſturbed by the electricity of its glaſs cover, and this from ſo ſlight an application of the finger as was barely neceſſary to wipe off a little duſt. The ſame glaſs, rubbed a little more with the finger, a bit of muſlin, or of paper, would attract either end of the needle, ſo as to hold it to the glaſs for ſeveral minutes, far out of the due direction, according to that part of the glaſs which was moſt excited. And when the needle, after adhering to the glaſs, has dropt looſe, and made vibrations, thoſe would not be biſected, as uſual, by that point where the needle ſhould reſt, but either be made all on one ſide, or be very unequally divided, by means of ſome remains of electrical virtue in that part of the glaſs which had attracted the needle, until at length, after fifteen minutes or more, all the electricity being diſcharged, the magnetical power took place. Phil. Tranſ. N° 480. p. 243.

The remedy for this inconvenience, is to moiſten the ſurface of the glaſs: a wet finger will do it immediately and effectually. Phil. Tranſ. N° 480. p. 244.

There is reaſon to believe, that glaſs does at times become in ſome degree attractive, without any friction at all, and may poſſibly be excited by great concuſſions in the air; ſuch as thunder, or the diſcharge of great ordnance, and ſo may diſturb the *compaſs*.

The effect of ELECTRICITY and LIGHTENING in giving polarity to *magnetic* NEEDLES, and likewiſe in reverſing them, has been long ſince, and frequently, obſerved by Dr. Franklin, S. Beccaria, and others. See AURORA BOREALIS, MAGNETS, &c.

The mariner's *compaſs*, with a chart, is much leſs dangerouſly moved than the common *compaſs* with a bare needle. And the deeper or farther diſtant the needle hangs below the glaſs, the leſs diſturbance it is likely to receive.

The minute, irregular, reciprocating variations, which have been obſerved in the directions of dipping and horizontal needles, and mentioned in the Philoſophical Tranſactions, may probably have been cauſed by the glaſſes which covered the inſtruments made uſe of. Phil. Tranſ. N° 425. N° 480. p. 245.

The invention of the *compaſs* is uſually aſcribed to Flavio de Melfi, or Flavio Gioia, a Neapolitan, about the year 1302; and hence it is, that the territory of Principato, which makes a part of the kingdom of Naples, where he was born, bears a *compaſs* for its arms.

Others ſay, that Marcus Paulus, a Venetian, making a journey to China, brought back the invention with him in 1260. What confirms this conjecture is, that at firſt they uſed the *compaſs* in the ſame manner as the Chineſe ſtill do; i. e. they let it float on a little piece of cork, inſtead of ſuſpending it on a pivot. It is added, that their emperor Chiningus, a celebrated aſtrologer, had a knowlege of it 1120 years before Chriſt. The Chineſe only divide their *compaſs* into twenty-four points.

Fauchet relates ſome verſes of Guyot de Provence, who lived in France about the year 1200, which ſeem to make mention of the *compaſs* under the name of *marinette*, or *mariner's ſtone*; which ſhews it to have been uſed in France near a hundred years before either the Melphite or Venetian. The French even lay claim to the invention, from the fleur de lys, wherewith all nations ſtill diſtinguiſh the north point of the card.

With as much reaſon Dr. Wallis aſcribes it to the Engliſh, from its name *compaſs*, whereby moſt nations call it; and which he obſerves is uſed in many parts of England to ſignify a circle.

Though the mariner's *compaſs* has been long in uſe, the beſt conſtruction of it was attended with many inconveniences, till the late improvement which it has received from the invention and experiments of Dr. Gowin Knight, and the farther emendation of Mr. Smeaton. This chiefly conſiſts in the ſhape and temper of the NEEDLE; in the diſcovery of proper means for reſtoring the loſs of magnetiſm in a voyage, and of contrivances to hinder the card from being greatly affected by the various motions of the ſhip. However, theſe contrivances have been found too delicate to encounter the ſhocks of a tempeſtuous ſea. See *Tab. Navigation, fig.* 2.

AB repreſents the outer wooden box; C and D are two milled nuts, by means of which the axis of the inner box GH, and ring EF, by which it is ſupported, are lifted up from their edges on which they move, in order to increaſe the friction, and prevent the too great vibrations occaſioned by the motion of the ſhip in a high ſea. I is one of the axes of the inner box, by which it is ſuſpended on the ring EF; KL is the magnet, or needle, of a regular parallelopiped ſhape, and M a ſmall beam of ivory, beſt ſeen in *fig.* 3. that confines the cap to its place. The cap is ivory, ſo turned, as to be capable of receiving a ſmall bit of agate, which is ground concave, and poliſhed on that ſide, where it forms the apex of the hollow cone in the cap: the under part of it is repreſented by C, *fig.* 4. The card, *fig.* 3. is a ſingle varniſhed paper, reaching as far as the outer circle of figures, which is made of thin braſs, with its edge turned down at right angles, as in A and B, *fig.* 4. to the plane of the card, to make it more ſtiff; F and G are two braſs ſcrews that fix the braſs edge, &c. to the needle. This braſs ring is deſigned to ſupport the card, and to throw the weight of it as near the circumference as poſſible, for preventing the effect of the friction at the center; and is divided into degrees and half-degrees; which diviſions are determined by means of a cat-gut line O, *fig.* 2. ſtretched perpendicularly about the inſide of the box, and as near the braſs edge as poſſible. The braſs ring, by being placed below the card, and the needle above it, ſeems to bring the center of gravity low enough to admit of the cap being put under the needle, ſo that a hole in the needle is unneceſſary; and the needle, being above the card, is more eaſily touched with a pair of bars. Underneath the card are two ſmall weights, D and E, *fig.* 4. which repreſents the back ſide of the card, ſliding on two wires, placed at right angles to each other, which by being moved nearer to, or farther from the center, counterbalance the dipping of the card in different latitudes, and ſerve to reſtore the equilibrium of it, when by any other means it happens to be got too much out of level. The pedeſtal, that ſupports the card, is repreſented in *fig.* 5. It contains a ſewing needle fixed in two ſmall grooves to receive it, by means of the collet C; and at D the ſtem of the pedeſtal is filed into an octagon, that it may be the more eaſily unſcrewed. P Q R S, *fig.* 2. repreſents an index, which may be occaſionally added at the top of the inner box, and will ſerve for all altitudes of the object. It conſiſts of a bar, equal in length to the diameter of the inner box, and at each end is furniſhed with a perpendicular ſtyle, having a ſlit parallel to its ſides. One ſlit, to which the eye is applied, is narrow, and the other is wider, with a ſmall cat-gut ſtretched up the middle of it, and continued horizontally from the top of one ſtile to that of the other; and there is alſo a line drawn along the upper ſurface of the bar. This line, the narrow ſlit, the horizontal cat-gut, and the perpendicular one, are in the ſame plane, perpendicular to the horizon, when the inner box is at reſt, and hangs freely. The index does not move round, but is always placed on ſo as to anſwer the ſame ſide of the box. When the index is not wanted for uſe, it may be taken off, and placed in two pieces, T and V, properly notched to receive it. W repreſents the handle of the box. The inſtrument thus conſtructed ſerves the purpoſes of an azimuth and amplitude *compaſs*. If the ſun's azimuth is deſired, turn the wooden box, till the ſhadow of the horizontal thread, or that of the perpendicular thread in one ſtile, or the light through the ſlit in the other, falls upon the line on the index bar, or vibrates to an equal diſtance on each ſide of it; then obſerve the degree for the azimuth, marked on the braſs edge by the cat-gut line, reckoned on the outward circle of figures; and the ſituation of the index bar, with regard to the card and needle, will ſhew on what quarter of the *compaſs* the object is placed. If the rays of the ſun are not ſtrong enough to caſt a ſhadow, place the eye behind the narrow ſlit in one of the ſtyles, and turn the box till ſome part of the horizontal or perpendicular thread appears either to interſect the center of the ſun, or to vibrate to an equal diſtance on each ſide of it, and let the degree cut by the nonius be obſerved. If the ſun's amplitude were to be obſerved, the general proceſs is the ſame; excepting that the degrees are to be numbered on the inner circle of figures on the card, which are the complements of the outer, to 90. Phil. Tranſ. vol. xlvi. art. 18 and 19. p. 505—517.

Knight's *compaſſes* are now generally uſed in the royal navy; and it may be reaſonably expected that they ſhould be provided for merchant ſhips as well as others.

The uſe of the Sea-Compass *is obvious.* For, the courſe a ſhip is to ſail in, being known by the chart; and the *compaſs* ſo placed, as that the two parallel ſides of the ſquare box be diſpoſed according to the length of the ſhip, i. e. parallel to a line drawn from the head to the ſtern; the rudder is to be directed accordingly; v. gr. if the courſe be found on the chart between the ſouth-weſt and ſouth-ſouth-weſt, i. e. ſouth-weſt $\frac{1}{4}$ to the ſouth; turn the ſtern ſo as that a line from the ſouth-weſt, $\frac{1}{4}$ ſouth, exactly anſwer the mark on the middle of the ſide of the box. This is all that is required.

The azimuth Compass differs from the common ſea *compaſs* in this; that there is faſtened, on the round box wherein the card is, a broad circle AB (*Tab. Navigation, fig.* 6.) one half whereof is divided into 90 degrees, and thoſe ſubdivided diagonally into minutes: *bc* is an index moveable on *b*, having a ſight, *ba*, erected thereon, and moving on a hinge. From the upper part of the ſight, to the middle of the index, is faſtened a fine hypothenuſal luteſtring *ae*, to give a ſhadow on a line in the middle of the index. The circle AB is croſſed at right angles with two threads, from the extremities whereof are drawn four lines on the inſide of the round box: there are alſo four lines drawn at right angles to each other on the card. The round box fitted with its card, graduated circle, and index, is hung in the braſs hoops BB, and thoſe hoops faſtened to the ſquare box CC.

Captain Middleton mentions an *azimuth compaſs* of his own contrivance, by which the variation may be determined with greater eaſe and exactneſs than by any others in uſe before the year 1738. He has given no particular deſcription of it, but only ſhews the manner of uſing it. It carries a teleſcope with a vertical hair in it, and may be conveniently uſed for taking the ſun's altitude by reflection. Phil. Tranſ. abr. vol. viii. p. 374.

The uſe of the azimuth Compass is for finding the ſun's magnetical azimuth, or amplitude; and thence the variation of the *compaſs*. If the obſervation be for an amplitude at ſun-riſing, or for an azimuth before noon, apply the center of the index *bc* on the weſt point of the card, within the box; ſo that the four lines on the edge of the card, and thoſe on the inſide of the box, may meet. If the obſervation be for the ſun's amplitude ſetting, or an azimuth in the afternoon, turn the center of the index right againſt the eaſt point of the card, and make the lines within the box concur with thoſe on the card: the inſtrument thus fitted for obſervation, turn the index *bc* towards the ſun, till the ſhadow of the thread *ae* fall directly on the ſlit of the ſight, and on the line that is along the middle of the index: then will the inner edge of the index cut the degree and minute of the ſun's magnetical azimuth from the north or ſouth. But note, that if, when the *compaſs* is thus placed, the azimuth is leſs than 45° from the ſouth, and the index *bc* turned towards the ſun, it will paſs off the diviſions of the limb: the inſtrument, therefore, in this caſe, muſt be turned juſt a quarter of the *compaſs*, i. e. the center of the index muſt be placed on the north or ſouth point of the card, according as the ſun is from you; and then the edge will cut the degree of the magnetic azimuth, or the ſun's azimuth from the north, as before. See Amplitude, and the article Compass, above.

The ſun's magnetical amplitude thus found, the variation of the needle is thus determined.

Being out at ſea the fifteenth of May, 1717, in 45° north latitude, the tables give me the ſun's latitude 19° north, and his eaſt amplitude 27° 25′ north: by the *azimuth compaſs*, I find the ſun's magnetical amplitude at his riſing and ſetting; and find he riſes, v. gr. between the 62d and 63d degree, reckoning from the north towards the eaſt point of the *compaſs*, i. e. between the 27th and 28th degree, reckoning from the eaſt.

The magnetical amplitude, therefore, being here equal to the true one, the needle has no variation: but if the ſun at his riſing ſhould have appeared between the 52d and 53d degree from the north towards the eaſt; his magnetical amplitude would then have been between 37 and 38 degrees, i. e. about 10 degrees greater than the true amplitude: therefore, the needle would vary about 10 degrees north-eaſterly.

If the magnetical eaſt amplitude found by the inſtrument ſhould be leſs than the true amplitude, their difference would ſhew the variation of the needle eaſterly.

If the true eaſt amplitude be ſouthward, as alſo the magnetical amplitude, and this laſt be the greater; the variation of the needle will be north-weſt; and *vice verſa*.

What has been ſaid of north-eaſt amplitudes, holds alſo of ſouth-weſt amplitudes. And what of ſouth-eaſt amplitudes, holds of north-weſt amplitudes.

Laſtly, if amplitudes be found of different denominations, v. gr. if the true amplitude be ſix degrees north, and the magnetical amplitude five degrees ſouth; the variation, which in this caſe is north-weſt, will be equal to the ſum of the magnetical and true amplitudes: underſtand the ſame for weſt amplitudes.

The variation may likewiſe be found from the azimuth: but in that caſe, the ſun's declination, latitude of the place, and his altitude, muſt be given, that his true azimuth may be found.

This inſtrument is alſo uſeful in ſettling the ſhip's wake, in order to find the Lee-*way*; and alſo to find the bearings of head-lands, and other objects.

Compass is alſo an inſtrument of conſiderable uſe in Surveying land, Dialling, &c.

Its ſtructure, in the main, is the ſame with that of the *mariner's compaſs*; conſiſting, like that, of a box and needle: the principal difference conſiſts in this, that inſtead of the needle's being fitted into the card, and playing with it on a pivot, it here plays alone; the card being drawn on the bottom of the box, and a circle divided in 360 degrees on the limb. See *Tab. Surveying, fig.* 5.

This inſtrument is of obvious uſe to travellers, to direct them in their road; and to miners, to ſhew them what way to dig, with other conſiderable uſes.

1. *To take the declination of a wall by the* Compass. Apply that ſide of the *compaſs* whereon the north is marked along the ſide of the wall; the number of degrees over which the north end of the needle fixes, will be the declination of the wall, and on that ſide: v. gr. if the north point of the needle tends towards the north, that wall may be ſhone on by the ſun at noon; if it fix over fifty degrees, counting from the north towards the eaſt, the declination is ſo many degrees from north towards eaſt.

But ſince the needle itſelf declines from the north towards the weſt, with us, 13°; it muſt be noted, that to retrieve the irregularity, 13° are always to be added to the degrees ſhewn by the needle, when the declination of the wall is towards the eaſt: on the contrary, when the declination is towards the weſt, the declination of the needle to be ſubtracted.

2. *To take an angle with the* Compass. Suppoſe the angle required be DAE (*Tab. Surveying, fig.* 4.) apply that ſide of the *compaſs* whereon the north is marked to one of the lines, AD; when the needle reſts, obſerve the degrees at which its north point ſtands, which ſuppoſe 80: ſo many degrees does the line decline from the meridian. In the ſame manner take the declination of the line AE, which ſuppoſe 215°; ſubtract 80° from 215, the remainder is 135; which ſubtracted from 180, there will remain 45°; the quantity of the angle required.

But if the difference between the declination of the two lines exceed 180°; in that caſe, 180° muſt be ſubtracted from that difference: the remainder then is the angle required.

For the method of laying this down on paper, ſee Plotting.

Note, In meaſuring angles by the *compaſs*, there needs not any regard be had to the variation; that being ſuppoſed the ſame in all the lines of the angles.

3. *To take a plot of a field by the* Compass. Suppoſe the field A, B, C, D, E, (*Tab. II. Surveying, fig.* 1.) for the greater accuracy let there be two ſights fitted to the meridian line of the *compaſs*, place it horizontal, and through the ſights look along the ſide AB, or a line parallel to it; applying the eye to the ſight at the ſouth point of the *compaſs*. Draw a rough ſketch of the field by the eye, and on the correſponding line enter down the degree to which the needle points, which ſuppoſe 90; meaſure the length of the ſide, and enter that too, which ſuppoſe 10 chains.

In this manner proceed with all the reſt of the ſides and angles of the field; the ſides, which ſuppoſe 70, 65, 70, 44, 50 fathom; and the angles, which ſuppoſe 30, 100, 130, 240, 300 degrees. To protract the field, ſet down the ſeveral angles obſerved, one after another, and ſubtract the leſſer from the next greater: thus will you have the quantity of the ſeveral angles, and the length of the lines that include them. For the reſt, ſee Plotting, and Protracting.

Note, All the angles of the figure taken together, muſt make twice as many right angles; abating two, if no miſtake have been committed.

Compass *of proportion.* See Sector and Proportion.

Compass *dials* are ſmall dials, fitted in boxes, for the pocket, to ſhew the hour of the day by direction of the needle; which indicates how to place them right by turning the dial about, till the cock or ſtyle ſtand directly over the needle, and point to the northward: but theſe can never be very exact, becauſe of the variation of the needle itſelf. See Dial.

Compass *ſaw.* See Saw.

COMPASSES, or *pair of* Compasses, a mathematical inſtrument, uſed for the deſcribing of circles, meaſuring lines, &c. The common *compaſſes* conſiſt of two branches, or legs, of iron, braſs, or other metal, pointed at bottom; and joined by a rivet, whereon they move, as on a center. Thoſe are reckoned the beſt, part of whoſe joint is ſteel, and where the pin on which the joint turns is a ſteel ſcrew. The points ſhould alſo be made of hardened and poliſhed ſteel. In ſome the points are fixed; in others they may be taken off, and a drawing-pen, pencil, or dotting wheel, ſubſtituted in their room.

The invention of *compaſſes* is aſcribed to Talaus, nephew of Dædalus by his ſiſter, whom, the poets ſay, Dædalus killed out of envy. We have *compaſſes* now of various kinds and contrivances, accommodated to the various uſes they are intended for: as,

COMPASSES *of three legs.* Their ſtructure is like that of the common *compaſſes*, ſetting aſide the exceſs of a leg, which has a motion every way: their uſe is to take three points at once, and ſo to form triangles; to lay down three poſitions of a map to be copied at once, &c.

COMPASSES, *Beam*, conſiſt of a long branch, or beam, carrying two braſs curſors; the one fixed at one end, the other ſliding along the beam, with a ſcrew to faſten it, on occaſion. To the curſors may be ſcrewed points of any kind; whether ſteel, for pencils, or the like. It is uſed to draw large circles, to take great extents, &c.

Bow-COMPASSES, or BOWS, are a ſmall ſort of *compaſſes*, that ſhut up in a hoop, which ſerves for a handle. Their uſe is to deſcribe arcs, or circumferences of circles of very ſmall radius.

COMPASSES, *Caliber.* See CALIBER.

COMPASSES, *Clock-makers*, are very ſubſtantial, ſerving to cut paſtboard, braſs, &c. jointed like the common *compaſſes* with a quadrant, or bow, as the *ſpring compaſſes*, only its uſe different; as ſerving here to keep the inſtrument firm at any opening.

COMPASSES, *cylindrical and ſpherical*, uſed in taking the diameter, thickneſs, or caliber of round, or cylindric bodies; ſuch as canons, pipes, &c. They conſiſt of four branches joined in a center; two of them circular, and two flat, a little bent at the ends.

To uſe them, one of the flat points is put within the cannon, the other without: the two oppoſite points ſhew the thickneſs. See CALIBER *Compaſſes.*

There are alſo *ſpherical compaſſes*, differing in nothing from the common ones, but that their legs are arched; ſerving to take the diameters of round bodies, &c.

COMPASSES, *Elliptic.* Their uſe is to draw ellipſes, or ovals of any kind: they conſiſt of a beam AB (*Tab. Geometry, fig.* 2.) about a foot long, bearing three curſors; to one of which may be ſcrewed points of any kind: to the bottom of the other two are rivetted two ſliding dove-tails, adjuſted in grooves made in the croſs branches of the beam. The dove-tails having a motion every way, by turning about the long branch, go backwards and forwords along the croſs: ſo that when the beam has gone half-way about, one of theſe will have moved the whole length of one of the branches; and when the beam has got quite round, the ſame dove-tail has got back the whole length of the branch. Underſtand the ſame of the other dove-tail.

Note, the diſtance between the two ſliding dove-tails is the diſtance between the two foci of the ellipſis; ſo that by changing that diſtance, the ellipſis will be rounder or ſlenderer. Under the ends of the branches of the croſs are placed four ſteel points to keep it faſt.

The uſe of this *compaſs* is eaſy; by turning round the long branch, the ink, pencil, or other point, will draw the ellipſis required. Its figure ſhews both its uſe and conſtruction.

COMPASSES, *German*, whoſe legs are a little bent outwards towards the top; ſo that, when ſhut, only the points meet.

COMPASSES, *Hair*, ſo contrived within ſide, as to take an extent to a hair's breadth.

COMPASSES, *Lapidary's*, a piece of wood in form of the ſhaft of a plane, cleft a-top, as far as half its length; wherewith they meaſure the angles, &c. of the precious ſtones, as they cut them. In the cleft is a little braſs rule, faſtened there, at one end, by a pin; but ſo that it may be moved in manner of a bevel: with this kind of ſquare they take the angles of the ſtones, laying them on the ſhaft as they cut them.

COMPASSES, *Proportional*, are thoſe whoſe joint lies between the points terminating each leg: they are either *ſimple* or *compound.* In the former ſort the center is fixed, ſo that one pair of theſe ſerves only for one proportion. *Compound proportional compaſſes* conſiſt of two branches (*Tab. Geometry, fig.* 3.) each pointed at either end with ſteel: the length of the branches is cut through, for a curſor to ſlide up and down; in the middle of which curſor is a ſcrew, ſerving to join the branches, and to fix them at any point required.

On the one leg are diviſions, ſerving to divide lines into any number of equal parts, for reducing of figures, &c. On the other are numbers, for inſcribing any regular polygon in a circle propoſed.

The uſe of the firſt is eaſy: Suppoſe, v. gr. a right line required to be divided into three equal parts; puſh the curſor till the ſcrew be juſt on the figure 3; where fixing it, take the length of the given line between the longeſt parts of the legs: the diſtance between the two ſhorteſt will be one third of the given line. In the ſame manner may the line be divided into any other number of parts.

For the uſe of the line of polygons: Suppoſe, v. gr. a pentagon required to be inſcribed in a circle; puſh the curſor till the middle of the ſcrew be againſt 5, the number of ſides in a pentagon; between the ſhorteſt parts of the legs take the ſemidiameter of the circle: the legs thus opened, the diſtance between the points of the longeſt parts will be the ſide of the pentagon to be inſcribed in the circle. And thus for a figure of any other number of ſides.

Proportional COMPASSES *with the ſector lines.* The ſtructure of theſe is ſo like that of the common *proportional compaſſes*, only a little nicer, that it needs no particular deſcription. See *Tab. Geometry, fig.* 4.

The lines on the firſt face are the line of lines, marked *lines:* it is divided into 100 equal parts, every tenth numbered: and the line of chords, which goes to 60°, is marked *chords.*

On the other face are a line of ſines to 90°, and a line of tangents to 45°. On the other ſide are the tangents from 45° to 71° 34′; on the other, ſecants from 0° to 70° 30′.

For the uſe of theſe compaſſes: 1. To divide a line into any number of equal parts, leſs than 100: divide 100 by the number of parts required; ſlip the curſor till the line on the ſliding dove-tail be againſt the quotient on the line of lines: then, the whole line being taken between the points of the *compaſſes* moſt remote from the center; the aperture of the other will ſhew the diviſion required. 2. A right line given, ſuppoſed to be divided into 100 parts, to take any number of thoſe parts: ſlip the line on the ſliding dove-tail to the number of parts required: the whole line being taken between the points fartheſt from the center, the aperture of the other two will include the number of diviſions required. 3. The radius being given, to find the chord of any arch under 60°: ſlip the line on the ſliding dove-tail to the degrees required on the line of chords: the radius being taken between the points fartheſt from the center of the curſor; the aperture of the other line will be the chord required, provided the number of degrees be greater than 29: if it be leſs, the aperture taken from the radius will leave the chord required. 4. If the chord of an arch under 60° be given, and the radius required; ſlip the line on the dove-tail to the degrees given on the line of chords: the given chord being taken between the two points next the curſor, the aperture of the other will be the radius required. 5. The radius being given, to find the ſine of any number of degrees. Slip the line on the dove-tail to the degree on the line of ſines whoſe ſine is required: the radius taken between the points furtheſt from the curſor, the aperture of the other will give the ſine of the angle required. But if the ſine ſought be leſs than 30°, the difference of the apertures of the oppoſite points will be the ſine required. 6. The radius being given, to find the tangent of any number of degrees under 71: if the tangent required be under 26° 30′, then ſlip the line on the dove-tail to the degree propoſed on the tangent line; the radius taken between the points fartheſt from the curſor, the aperture of the others will be the tangent of the degrees required: if the tangent required be above 26° 30′, but under 45°; the line on the curſor muſt be ſlipped to the degrees given on the tangent line: then the radius being taken between the points furtheſt from the curſor; the aperture of the others will be the tangent. If the tangent required be greater than 45°, but leſs than 56° 20′, ſlip the notch on the tangent ſide of the turned cheek to the degree 0 in the tangent line on the ſide of the *compaſs:* the radius taken between the points fartheſt from the curſor; the difference between the aperture of the other, and theſe, added together, will be the tangent required. Thus, for the tangents of other degrees under 71.—After the like manner may the ſecant of any number of degrees under 71 be found.

Mr. Heath, a mathematical inſtrument maker in London, conſtructed a pair of *proportional compaſſes*, in 1746, with a curious and uſeful contrivance for preventing the ſhorter legs from changing their poſition, when theſe *compaſſes* were uſed. It conſiſted of a ſmall beam ſoldered to a ſcrew, and running parallel to the leg of the *compaſſes*, nearly of the length of the groove; in this beam a ſlit was made, which admitted of a ſliding-nut, the other end of which fell into a hole in the bottom of the ſcrew, belonging to the great nut of the *compaſſes*. The ſcrew-pin of the beam paſſed through an adjuſter, by means of which the mark on the ſlider might be brought exactly to any diviſion. But the *proportional compaſſes* have been much out of uſe ſince the invention of the SECTOR.

COMPASSES, *Spring*, or *Dividers*, are made of hardened ſteel, the head arched: which, by its ſpring, opens the *compaſſes*; the opening being directed by a circular ſcrew, faſtened to one leg, and let through the other, worked with a nut.

COMPASSES, *Triangular*. See COMPASSES *of three legs*, and TRIANGULAR.

COMPASSES, *Triſecting*, the invention of M. Tarragon, for the triſection of angles, geometrically.

The inſtrument conſiſts of two central rules, and an arch of a circle of 120 degrees, immoveable, with its radius: the radius is faſtened with one of the central rules, like the two legs of a ſector, that the central rule may be carried through all the points of the circumference of the arch. The radius and rule muſt be as thin as poſſible, and the rule faſtened to the radius hammered cold, to acquire an elaſticity: the breadth of the other central rule muſt be triple the breadth of the radius. In this rule there is a groove, with a dove-tail, to be faſtened on it, for its motion: in the center of each rule muſt likewiſe be a hole. See the Journ. des Sçavans, Sept. 1688.

COMPASSES, *Turn-up*, a late contrivance to ſave the trouble of changing the points: the body is like the common *compaſſes*; towards the bottom of the legs, without-ſide, are added two other points, beſide the uſual ones; the one carrying a drawing pen-point, the other a port-crayon; both adjuſted ſo as to turn round, and ſo be in the way of uſe, or out of it, as occaſion requires.

The points of ſmall *compaſſes* are tempered by a lamp and blow-pipe, heating them red-hot; when cold, they are hard: the larger are tempered by a charcoal-fire and a blow-pipe, heating them to a cherry-colour, then plunging them in water.

See M. Bion's Conſtruction and Uſes of Mathematical Inſtruments, by Stone; and Robertſon's Treatiſe on the ſame ſubject.

COMPASSING, in *Naval Architecture*, a term uſed to denote ſuch pieces of timber as are incurvated into the figure of an arch.

COMPASSING *the king's death*, in *Law*. See TREASON.

COMPASSION, or COMMISERATION, in *Ethics*, a mixed paſſion, compounded of love and ſorrow, and excited by the ſight or recital of diſtreſs. Hobbs makes this a merely ſelfiſh paſſion, and defines it, as being fear for ourſelves; Hutcheſon reſolves it into INSTINCT; but Dr. Butler much more properly conſiders *compaſſion* as an original, diſtinct, particular affection in human nature. Hobbs of Human Nature, cap. ix. ſect. 10. Hutcheſon's Enquiry into Moral Good and Evil. Butler's Sermons, vol. v. and vi.

COMPATIBLE, ſomething that may ſuit, or conſiſt with another. See INCOMPATIBLE.

COMPENDIUM, an abſtract, EPITOME, or reduction of a large matter into a little compaſs.

COMPENSATION, an action whereby any thing is admitted as an equivalent to another.

COMPENSATION, in the *Civil Law*, is a kind of right, whereby a debtor purſued by his creditor, for the payment of a debt, demands that the debt may be *compenſated* with what is owing him by the creditor.—*Compenſation* is equivalent to payment, and anſwers to that which is called SET-*off*, in common law.

COMPERTORIUM, in the *Civil Law*, denotes a judicial inqueſt made by delegates, or commiſſioners, to find out, and relate the truth of a cauſe.

COMPETENCE, or COMPETENCY, in *Law*, the authority, or right, of a judge, for taking cognizance of any matter. See JURISDICTION.

COMPETENT *witneſſes*. See WITNESS.

COMPETENTES, in *Church Hiſtory*, an appellation given to the *catechumens*, when, being ſufficiently inſtructed in the Chriſtian religion, they required BAPTISM.

COMPITA, in *Zoology*, a name by which ſome have called the *colymbus major*, or FISANELLE, the great Venetian *diver*.

COMPITALIA, or COMPITALITIA, feaſts held among the ancients in honour of the *lares*.

The word comes from *compitum*, a *croſs-way*; becauſe the feaſt was held in the meeting of ſeveral roads.

The *compitalia* are more ancient than the building of Rome. Dionyſius Halicarnaſſeus, and Pliny, indeed, ſay, that they were inſtituted by Servius Tullius; but this only ſignifies, that they were then introduced into Rome.

Notwithſtanding what Dion relates, that the *compitalia* were celebrated a little after the Saturnalia, and that the Roman calendar fixes them on the twelfth of January, it appears that they had not fixed any day; at leaſt, not in the time of Varro, as is obſerved by Caſaubon.

The feaſt being thus moveable, the day whereon it was to be obſerved, was proclaimed every year. It was ordinarily held on the fourth of the nones of February, i. e. on the ſecond of that month. Macrobius obſerves, that they were held not only in honour of the *lares*, but alſo of *mania*, *madneſs*. The prieſts who officiated at them were ſlaves and liberti; and the ſacrifice was a ſow. They were re-eſtabliſhed, after a long neglect, by Tarquin the Proud, on occaſion of an anſwer of the oracle, *That they ſhould ſacrifice heads for heads*, i. e. that for the health and proſperity of each family, children were to be ſacrificed: but Brutus, after expelling the kings, in lieu of thoſe barbarous victims, ſubſtituted the heads of garlick and poppy; thus ſatisfying the oracle, which had enjoined *capita*, *heads*, at an eaſier rate.

During the celebration of this feaſt, each family placed at the door of their houſe, the ſtatue of the goddeſs *Mania*: they alſo hung up at their doors figures of wool, repreſenting men and women; accompanying them with ſupplications that the *Lares* and *Mania* would be contented with thoſe figures, and ſpare the people of the houſe.

As for ſlaves, in lieu of the figures of men, they offered balls or fleeces of wool. Servius Tullus ordered, that the ſlaves who aſſiſted at the *compitalia*, ſhould be free during the whole time of the feaſt. Auguſtus ordered the ſtatues of the *Lares*, placed in the croſs-ways, to be adorned with flowers twice a year.

COMPLAINANT, in *Law*, a PLAINTIFF, or one who prefers a *complaint* againſt another, to be relieved by juſtice or equity.

COMPLEMENT, *Arithmetical*. See ARITHMETICAL.

COMPLEMENT, in *Aſtronomy*, is uſed for the diſtance of a ſtar from the zenith; or the arch comprehended between the place of the ſtar above the horizon, and the zenith.

COMPLEMENT *of the courſe*, in *Navigation*, is the number of points the courſe wants of 90 degrees, or eight points; viz. of a quarter of the compaſs.

COMPLEMENT *of the curtin*, in *Fortification*, that part of the anterior ſide of the CURTIN, which makes the DEMI-GORGE.

COMPLEMENT *of the line of defence*, is the remainder of the line of DEFENCE, after you have taken away the ANGLE of the flank.

COMPLEMENT, in *Geometry*, is what remains of a quadrant of a circle, or of ninety degrees, after any certain arch has been retrenched from it.

Thus, if an arch or angle be 30 degrees, we ſay its *complement* is 60 degrees, ſince $60+30=90$.

The arch and its *complement* are relatives; and are only uſed with regard to each other.

The ſine of the *complement* of an arch is called the *co-ſine*; of a tangent, the *co-tangent*, &c.

We ſometimes alſo ſay the *complement of an angle*; meaning ſo much as it wants of a right angle, or of 90 degrees.

COMPLEMENTS *of a parallelogram*, are the two leſſer parallelograms, made by drawing two right lines parallel to each ſide of a parallelogram, through a given point in the diagonal.

Such are the parallelograms C and M (*Tab. Geometry*, *fig.* 1.)—It is demonſtrated, that in every parallelogram, the *complements* C and M are equal: for $Z+C+o=R+M+x$; as making up on each ſide the great triangles, made equal by the diagonal; of which, $Z=R$, and $o=x$ (becauſe the diagonal makes them ſo); whereſore the remaining PARALLELOGRAM $C=M$.

COMPLEMENT *of Life*, in the *Doctrine of Life-Annuities*, is the number of years which a given life wants of 86. Thus 56 is the *complement* of 30, 36 of 50, &c. Mr. De Moivre ſuppoſes an equal decrement of life through all its ſtages till the age of 86, which he conſidered as the utmoſt probable extent of life. Thus, if there be 56 perſons alive at 30 years of age, it is ſuppoſed that one will die every year, till, in 56 years, they will be all dead. The ſame will happen to 46 at 40, in 46 years, and thus for all ages. This hypotheſis is ſo conformable to Dr. Halley's table, formed from his obſervations at Breſlaw, that the value of lives deduced either from the hypotheſis, or the table, need not be diſtinguiſhed; and it very much eaſes the labour of calculating them. De Moivre's Treatiſe on Annuities, annexed to his Doctrine of Chances, p. 265. Price's Obſervations on Reverſionary Payments, p. 2. See LIFE-*Annuities*.

COMPLEMENT *of an interval*, in *Muſic*, is the quantity which it wants of an OCTAVE. See INTERVAL.

COMPLEX, a term ordinarily uſed as ſynonymous with *compound*; though, ſtrictly ſpeaking, there is ſome difference between them.

Complex is properly applied where a thing contains divers others; or conſiſts of divers parts, not really diſtinct from one another; but only imaginarily, or in our conception.

In *Logic*, *complex* is oppoſed to ſimple, and *compound* to ſingle.

COMPLEX *object.* See OBJECT.

COMPLEX *oppoſition.* See OPPOSITION.

COMPLEX *term*, or *idea*, is a TERM or IDEA compounded of ſeveral ſimple, or incomplex ones.

Thus, in the propoſition, *A juſt God cannot leave crimes unpuniſhed*; the ſubject of this propoſition, viz. *a juſt God*, is a *complex term*, or ſtands for a *complex idea*, compoſed of two ſimple, or *incomplex* ones, viz. *God* and *Juſt*.

Mr. Locke obſerves, that though the mind be perfectly paſſive in the formation of ſimple ideas; yet it exerts ſeveral actions of its own about them, when once formed: and that by this means it is, that they become the materials and foundation out of which all our knowlege is framed.

Theſe acts are chiefly three, viz. 1. The combining of ſeveral ſimple ideas into one compound one: and thus it is that all *complex* ideas are made.

2. The bringing two ideas, whether ſimple or *complex*, together; ſetting them by each other, and ſo viewing them, without uniting them into one; by which it gets its ideas of RELATION.

3. The ſeparating ſeveral ideas from all other ideas that accompany them in their real exiſtence: and thus all its general ideas are formed.

As ſimple ideas are obſerved to exiſt in ſeveral combinations united together; ſo the mind may conſider them as united, not only as they are really united in external objects, but as itſelf has joined them: ideas thus made up of ſeveral ſimple ones put together, we call *complex*; as man, beauty, army, gratitude, &c.

Complex ideas, however compounded and decompounded, though their number be infinite, and their variety endleſs, may be all reduced under theſe three heads, viz. *modes*, *ſubſtances*, and *relations*; which ſee under their proper heads, MODE, SUBSTANCE, and RELATION.

Complex ideas are often conſidered as ſingle and diſtinct beings, though made up of ſeveral ſimple ideas; as body, ſpirit, &c.

COMPLEX *propoſition*, in *Logic*, is that in which the ſubject, or predicate, or both, are made up of *complex* terms: and if the term added to the ſubject be eſſential or neceſſary to it, then it is called *explicative*; otherwiſe it is *determinative*, the adjoined term limiting the ſubject to a particular part of its extenſion. Some logical writers aſcribe the *complexion* of a propoſition, in ſome caſes, to the copula, as in modal propoſitions; but this rather pertains to the predicate. See *Compound* and *Modal* PROPOSITION.

COMPLEX *ſyllogiſm*, is that, in which the middle term is not connected with the whole ſubject, or the whole predicate in two diſtinct propoſitions, but is intermingled and compared with them by parts: e. g. The ſun is a ſenſeleſs being, the Perſians worſhipped the ſun, therefore the Perſians worſhipped a ſenſeleſs being.

COMPLEXI *pars*, in *Anatomy*, a name given by Riolanus, and others, to a muſcle called by Albinus *biventer cervicis*, and by ſome the *complexus*.

COMPLEXIO, COMPLEXION, in *Metaphyſics*, the union, or coalition of ſeveral things different from each other; either really, or only in our conception. See COMPLEX.

COMPLEXIO, in *Logics*, is ſometimes applied to the ſecond operation of the mind, viz. the judgment; conſidered as it affirms or denies any thing; ſuch affirmation, &c. neceſſarily importing a combination of ſeveral things.

Complexio is ſometimes alſo uſed by logicians in the ſenſe of dilemma.

COMPLEXIO, in *Rhetoric*, &c. is a figure including a repetition, and a converſation at the ſame time; the ſentence both beginning, and ending, with the ſame word.

Thus Tully: *Quis legem tulit? Rullus. Quis majorem partem populi ſuffragiis privavit? Rullus. Quis comitiis præfuit? Rullus.*

COMPLEXION, in *Phyſics*, is uſed for the temperature, habitude, or natural diſpoſition of the body.

Some philoſophers diſtinguiſh four general and principal *complexions* in man, viz. the *ſanguine complexion*, which, according to them, anſwers to the air; having the qualities thereof, as being hot, and moiſt. It takes its name from *ſanguis*; becauſe the blood is there ſuppoſed to be predominant.

The *phlegmatic complexion* takes its name from the pituita, or phlegm, in which it abounds; and correſponds to water; being cold and moiſt.

The *bilious*, or *choleric complexion*, takes its name from the bile, or choler: it is ſuppoſed of the nature of fire, hot and dry.

Laſtly, the *melancholic complexion* partakes of the nature of earth, being cold and dry. But this ſort of reaſoning is now not much regarded.

COMPLEXUS, or *Par* COMPLEXUM, in *Anatomy*, is a pair of muſcles, ariſing with ſix thin ſmall tendons from the tranſverſe proceſſes of the vertebræ of the neck and thorax, growing fleſhy in its aſcent; again becoming tendinous about the middle; and again fleſhy, where it is inſerted laterally into the poſterior part of the upper tranſverſe line of the *os occipitis*, and the hind part of the *proceſſus maſtoides*. See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 5.

The former is called *complexus major*, and the latter *complexus minor*, or *maſtoidæus lateralis*. Winſlow.

This laſt is often miſtaken for a portion of the *longiſſimus dorſi*. Some anatomiſts have reckoned four of theſe muſcles inſtead of two.

When they act together, they pull the head directly backwards; but either of them acting alone, it draws it obliquely back.

COMPLICATION *of diſeaſes*, a mixture, or combination of ſeveral diſeaſes; eſpecially where they have any affinity to one another; as the dropſy, aſthma, and jaundice, happening together.

What much perplexes the phyſicians is, when with a fever there is a *complication* of ſome other diſorder.

COMPLUTENSIAN *Bible*. See *Greek* BIBLES.

COMPONE, or COMPONED, or *Gobony*, in *Heraldry*.—A bordure *compone*, is that formed or compoſed of a row of angular parts, or chequers of two colours. See *Tab. Heraldry*, *fig.* 19.

COMPONED, or COMPOSED, is alſo uſed in general for a bordure, a pale, or a feſs, compoſed of two different colours, or metals, diſpoſed alternately, ſeparated and divided by fillets, excepting at the corners; where the junctures are made in form of a goat's foot.

COMPOS *Mentis*. See NON-COMPOS.

COMPOSED *Baſtion*. See BASTION.

COMPOSITE *Numbers*, thoſe that can be meaſured by ſome number, beſides itſelf, above unity; as 12, by 2, 3, 4, and 6.

Compoſite numbers between themſelves, are the ſame with COMMENSURABLE *numbers*.

COMPOSITE *Order*, in *Architecture*, the laſt of the five orders of columns; ſo called, becauſe its capital is *compoſed* out of thoſe of the other orders. See *Tab. Architecture*, *fig.* 28.

It borrows a quarter-round from the Tuſcan and Doric; a double row of leaves from the Corinthian; and volutes from the Ionic: its cornice has ſingle modillions, or dentils.

The *compoſite* is alſo called the Roman and the Italic order, as having been invented by the Romans; conformably to the reſt, which are denominated from the people among whom they had their riſe.

Moſt authors rank this after the Corinthian; either as being the richeſt, or as the laſt that was invented: Scamozzi alone places it between the IONIC and CORINTHIAN; out of a view to its delicacy and richneſs, which he eſteems inferior to that of the Corinthian; and therefore makes no ſcruple to uſe it under the Corinthian: wherein he is followed by M. le Clerc.

The proportions of this order are not fixed by Vitruvius; he only marks its general character, by obſerving that its CAPITAL is compoſed of ſeveral parts taken from the Doric, Ionic, and Corinthian: he does not ſeem to regard it as a particular order; nor does he vary it at all from the Corinthian, except in its capital. In effect, it was Serlio who firſt added the *compoſite* order to the four of Vitruvius, forming it from the remains of the temple of Bacchus, the arches of Titus, Septimius, and the goldſmiths: till then, this order was eſteemed a ſpecies of the Corinthian, only differing in its capital.

The order being thus left undetermined by the ancients, the moderns have a kind of right to differ about its proportions, &c. Accordingly Scamozzi, and after him M. le Clerc, makes its column nineteen modules and an half; which is leſs by half a module than that of the Corinthian: as, in effect, the order is leſs delicate than the Corinthian. Vignola makes it twenty; which is the ſame with that of his Corinthian: but Serlio, who firſt formed it into an order, by giving it a proper ENTABLATURE and BASE, and after him M. Perrault, raiſe it ſtill higher than the Corinthian.

This laſt does not think different ornaments and characters ſufficient to conſtitute a different order, unleſs it have a different height too: agreeably, therefore, to his rule of augmenting the heights of the ſeveral columns by a ſeries of two modules in each; he makes the *compoſite* twenty modules, and the Corinthian eighteen; which, it ſeems, is a medium between the arches of Titus and the temple of Bacchus.

For the parts of the order, ſee COLUMN, FREEZE, PEDESTAL, &c.

M. Perrault, in his Vitruvius, diſtinguiſhes between *compoſite* and *compoſed* order. The latter, he ſays, denotes any compoſition whoſe parts and ornaments are extraordinary, and unuſual; but have, withal, ſomewhat of beauty; both on account of their novelty, and in reſpect of the matter, or genius of the architect: ſo that a *compoſed* order is an arbitrary, humorous compoſition, whether regular or irregular.

The ſame author adds, that the Corinthian order is the firſt *compoſite* order, as being compoſed of the Doric and Ionic; which is the obſervation of Vitruvius himſelf, lib. iv. cap. 1.

Composite *ſtalk*. See Stalk.

COMPOSITIO *menſurarum*, the title of an ancient ordinance for meaſures, not printed; it is mentioned in the ſtatute of 23 Hen. VIII. cap. 4.

COMPOSITION, in a general ſenſe, is the uniting or joining of ſeveral different things, ſo as to form one whole, called a *compound*.

The ſchoolmen diſtinguiſh two kinds of *compoſition*; the one *entitative*, which is between things of the ſame nature, e. gr. two or more drops of water: the other *eſſential*, when things of different kinds are joined, and thus conſtitute new things, or eſſences, different from any of the parts: and thus, ſay they, from the matter and the form of wood, ariſes wood; whoſe eſſence is very different from either of thoſe ingredients taken ſeparately.

Composition *of bodies*, in *Chemiſtry*. See Combination and Affinity.

Composition, in *Commerce*, a contract between an inſolvent debtor and his creditors; whereby the latter agree to accept of a part of the debt, in compenſation for the whole, and give a general acquittance accordingly.

Composition, in *Grammar*, denotes the joining of two words together; or prefixing a particle to another word, to augment, diminiſh, or change its ſignification. See Word, &c.

Composition *of ideas*, is an operation of the mind, whereby it combines ſeveral of its simple ideas into complex ones.

Under the ſame operation may likewiſe be reckoned that of enlarging; whereby we put ſeveral ideas together of the ſame kind, as ſeveral units to make a dozen.

In this, as in others, brutes come far ſhort of men; for though they take in and retain ſeveral combinations of ſimple ideas; as poſſibly, a dog does the ſhape, ſmell, and voice of his maſter; yet theſe are rather ſo many diſtinct marks whereby he knows him, than one complex idea, made out of thoſe ſimple ones.

Composition, in *Law*. See Modus.

Compoſitions were anciently allowed for crimes and offences, even for murder. By this expedient it was propoſed to reſtrain the violence of private revenge. The cuſtom may be traced back to the ancient Germans, and prevailed in other uncivilized nations. Tavernier relates, that in Perſia a murderer is ſtill delivered to the relations of the perſon whom he has ſlain, who put him to death with their own hands; and if they refuſe a ſum of money as a compenſation, the ſovereign cannot pardon the murderer. Robertſon's Hiſt. vol. i. chap. v. p. 363.

Composition, in *Logic*, is a method of reaſoning, wherein we proceed from ſome general ſelf-evident truth, to other particular and ſingular ones.

The method of *compoſition*, called alſo *ſyntheſis*, is juſt the reverſe of that of *reſolution*, or *analyſis*.

Reſolution is the method whereby we ordinarily ſearch after truth; *compoſition*, that whereby a truth found, is diſcovered and demonſtrated to others: reſolution is the method of inveſtigation; *compoſition*, of demonſtration.

The method of *compoſition* is that uſed by Euclid, and other geometricians; reſolution, that uſed by algebraiſts and philoſophers. The two methods differ, juſt as the methods of ſearching a genealogy; which are either by deſcending from the anceſtors to the poſterity, or by aſcending from the poſterity to their anceſtors: each have this in common, that their progreſſion is from a thing known, to another unknown.

The method of *compoſition* is beſt obſerved by the mathematicians: the rules hereof are, 1. To offer nothing but what is couched in clear expreſs terms; and to that end, to begin with definition. 2. To build only on evident and clear principles; to that end, to proceed from axioms or maxims. 3. To prove demonſtratively all the concluſions that are drawn hence; and to this purpoſe, to make uſe of no arguments or proofs, but definitions already laid down, axioms already granted, and propoſitions already proved; which ſerve as principles to things that follow.

Composition, in *Muſic*, is the art of diſpoſing muſical ſounds into airs, ſongs, &c. either into one, or more parts; to be ſung with the voice, or played on inſtruments.

Zarlini defines *compoſition* to be the art of joining and combining concords together, which are the matter of muſic: but this definition is too ſcanty; becauſe, discords are always uſed with concords in the *compoſition* of parts.

Under *compoſition* are comprehended the rules, 1. of *melody*, or the art of making a ſingle part; i. e. of contriving and diſpoſing the ſimple ſounds, ſo as that their ſucceſſion and progreſs may be agreeable. 2. Of *harmony*, or the art of diſpoſing and concerting ſeveral ſingle parts ſo together, that they make one agreeable whole.

It may be here obſerved, that melody being chiefly the buſineſs of the imagination, the rules of *compoſition* ſerve only to preſcribe certain limits to it; beyond which, the imagination, in ſearching out the variety and beauty of airs, ought not to go: but harmony being the work of judgment, its rules are more certain, extenſive, and more difficult in practice.

In the variety and elegance of the melody, the invention labours a great deal more than the judgment; ſo that method has but little place: but in harmony it is otherwiſe; the invention, here, has nothing to do; and the *compoſition* is conducted from a nice obſervation of the rules of harmony, without any aſſiſtance from the imagination at all,

Composition *of motion*, is an aſſemblage of ſeveral directions of motion, reſulting from powers acting in different, though not oppoſite lines.

If a point move or flow according to one and the ſame direction; whether that motion be equable or not, yet it will ſtill keep the ſame right line; the celerity alone being changed, i. e. increaſed, or diminiſhed, according to the forces with which it is impelled. If the directions be oppoſite, as one, e. gr. directly downward, the other upward, &c. yet ſtill the line of motion will be the ſame.

But if the compounding motions be not according to the ſame line of direction, the compound motion will not be according to the line of direction of any of them, but in a different one from them all; and this either ſtrait or crooked, according as the direction or celerities ſhall require.

If two compounding motions be each of them equable, the line of the compound motion will ſtill be a ſtrait line; and this, though the motions be neither at right angles one to another, nor equally ſwift, nor (each to itſelf) equable; provided that they be but ſimilar; that is, both accelerated and retarded alike.

Thus, if the point *a* (*Tab. Mechanics*, *fig.* 4.) be impelled equally with two forces; viz. upwards, towards *b*, and forwards, towards *d*; it is plain, that when it is gone forwards as far as *a c*, it muſt of neceſſity be gone upwards as far as *c e*; ſo that were the motions both equable, it would always go on in the diagonal *a e c*.

Nay, ſuppoſe the motions unequal as to celerity. ſo, v. gr. as that the body move twice as faſt upwards as forwards, &c. yet ſtill it muſt go on in the diagonal *a c*; becauſe the triangles *a e c*, *a e c*, &c. and *a c d* will ſtill be ſimilar, being as the motions are: and it will have deſcribed the diagonal in the ſame time which it would have required to deſcribe either of the ſides ſingly.

But, if the motions be diſſimilar, then the *compound* motion muſt be a curve.

And, if a body, as *b* (*fig.* 5.) be impelled or drawn by three different forces, in the three different directions *b a*, *b c*, and *b d*, ſo that it yields to none of them, but continues *in æquilibrio*; then will thoſe three powers or forces be to one another, as three right lines drawn parallel to thoſe lines, expreſſing the three different directions, and terminated by their mutual concourſes.

Let *b e* repreſent the force by which the body *b* is impelled from *b* to *a*; then will the ſame right line *b e* repreſent alſo the contrary equal force, by which it is impelled from *b* to *e*: but by what hath been ſaid before, the force *b e* is reſolvable into the two forces acting according to the two directions *b d* and *b c*, to which the other impelling from *b* to *e*, is as *b e* to *b d*, and *b c* or *d e*, reſpectively.

So likewiſe two forces, acting without the directions *b d*, *b c*, and being equipollent to the force acting without the direction *b e*, from *b* to *e*; will be to the force acting according to the direction *b e*, from *b* to *e*, as *b d*, *b c*, to *b e*: and therefore, the forces acting in the directions *b d*, *b c*, and equipollent to the force acting in the direction *b e*, are to the force acting in the direction *b e*, as *b d*, *b c*, or *d e*, to *b e*: that is, if a body be urged by three different equipollent powers in the directions *b a*, *b d*, and *b c*; theſe three forces ſhall be to one another as *b e*, *b d*, and *d e*, reſpectively.

This theorem, with its corollaries, Dr. Keill obſerves, is the foundation of all the new mechanics of M. Varignon: by help hereof, may the force of the muſcles be computed, and moſt of the mechanic theorems in Borelli,

relli, De Motu Animalium, be immediately deduced. See Motion.

Composition *of numbers and quantities.* See Combination.

Composition, in *Oratory*, the order and coherence of the parts of a diſcourſe.

As a part of general ELOCUTION, it regards the turn and harmony of the periods: and therefore to *compoſition* belong, both the artful joining of the words, whereof the ſtyle is formed, and whereby it is rendered ſoft and ſmooth, gentle and flowing, full and ſonorous; or the contrary: and the order, which requires things firſt in nature and dignity, to be put before thoſe of inferior conſideration.

Compoſition conſiſts of four parts; which rhetoricians call PERIOD, ORDER, JUNCTURE, and NUMBER. Ward's Oratory, vol. i. p. 340.

Composition, in *Painting*, includes the invention as well as diſpoſition of the figures, the choice of attitudes, &c. *Compoſition*, therefore, conſiſts of two parts; one of which finds out, by means of hiſtory, proper objects for a picture; and the other diſpoſes them to advantage.

Composition, in Pharmacy, the art, or act, of mixing divers ingredients together into a medicine; ſo that they may aſſiſt each other's virtues, ſupply each other's defects, or correct any ill qualities thereof.

Composition, in Printing, ordinarily called *compoſing*, is the arranging of ſeveral types or letters in the compoſing-ſtick, in order to form a line; and of ſeveral lines ranged in order in the galley, to make a page; and of ſeveral of thoſe to make a form.

The *compoſing-ſtick* is made of iron generally, ſometimes braſs, or wood; of greater or leſs length or depth, according to the page to be compoſed, or the compoſitor's fancy: it hath two ſliding pieces, to be faſtened by means of a nut and ſcrew, which are ſlipped forwards or backwards, at the pleaſure of the compoſitor, and according to the ſpace which the lines, notes, &c. are to take up. See *Tab. Miſcellany, fig.* 5.

The *compoſing-ſtick* ordinarily contains ſeven or eight lines of a middle-ſized letter; theſe, when ſet, are taken out, by help of a thin ſlip of braſs, termed a rule, and diſpoſed in the galley; and others compoſed, till a page be formed. The page being compoſed, is tied up, and ſet by; and the reſt of the pages of the ſheet prepared in the ſame manner: when done, they are carried to the impoſing or correcting-ſtone; there ranged in order, and diſpoſed in a chaſe, or iron-frame, fitted with wooden furniture; then, the quoins being ſtruck in, it is carried to the preſs to be printed.

Composition *of proportion.*—If there be two ratios, wherein the antecedent of the firſt is to its conſequent, as the antecedent of the other is to its conſequent: then, by *compoſition* of proportion; as the ſum of the antecedent and conſequent of the firſt ratio, are to the antecedent, or the conſequent, of the firſt; ſo is the ſum of the antecedent and conſequent of the ſecond ratio, to the antecedent, or the conſequent, of the ſecond.

E. gr. If $A : B :: C : D$; then by *compoſition*, $A + B : A$ or $(B) :: C + D : C$ or (D).

Composition *of ratios*, in *Arithmetic* and *Algebra*, is performed by multiplying the quantities or exponents of two or more ratios together; the produce is then ſaid to be compounded of the ratios whoſe components were multiplied. Thus if the quantities or exponents of the ratios a to b, c to d, e to f, be multiplied, we ſhall have $\frac{a}{b} \times \frac{c}{d} \times \frac{e}{f} = \frac{ace}{bdf}$. And the ratio ace to bdf, is then ſaid to be compounded of the ſeveral ratios a to b, c to d, e to f, &c. Thus alſo the ratio of 10 to 12, is compounded of the ratio 2 to 3, and of 5 to 4; for $\frac{2}{3} \times \frac{5}{4} = \frac{10}{12}$.

This operation is by ſome called *addition* of ratios.

COMPOSSIBLES, Compossibilia, in *Logic*, ſuch things as are COMPATIBLE, or capable of ſubſiſting together.

COMPOST, in *Agriculture* and *Gardening*, a compound, or mixture of earths, dungs, &c. applied, by way of MANURE, for the meliorating and improving of ſoils, and aſſiſting the natural earth in the work of vegetation.

The gardeners have magazines, or layſtalls of *compoſts*, adapted to the different ſorts of SOIL. Light looſe land requires a *compoſt* of a heavy nature; ſuch as the ſcouring of ditches, ponds, &c. mixed with earth, dung, &c. A heavy, clayey, or cloddy land, requires a *compoſt* of a more ſprightly and active kind, to inſinuate into the heavy, lumpy clods; as dungs, ſand, aſhes, and natural mould.

Mr. Bradley preſcribes ſeveral different ſorts of *compoſts*, to forward the growth of trees; viz. a quantity of ſtiff ſoil, broken and mixed with ſharp ſand, and aſhes of burnt furzes, weeds, &c. or ſtiff ſoil with ſand and burnt graſs-turf, and rotten-wood; or ſtiff ſoil with ſand and rape-ſeed, after the oil is preſſed out, with burnt turf; or ſtiff ſoil with ſand and malt-grains; or ſheeps dung, with wood-aſhes and loam, or mother-earth.

The ſame author recommends a mixture or preparation of ſoils anſwering to loam, or mother-earth, as greatly preferable for planting or ſowing foreſt-trees in, to any of theſe richer *compoſts*; which, though they haſten the growth of the tree, will not make the timber near ſo firm and durable.

COMPOUND, the reſult or effect of a compoſition of different things; or that which ariſes from them.

Strictly ſpeaking, every new *compoſition* does not produce a new *compound*; but only that from which a new eſſence ariſes. Thus, when one drop of water is added to another, there does not ariſe a new phyſical *compound*; the eſſence being the ſame now, as before the union.

Compound differs from COMPLEX, and ſtands oppoſed to SIMPLE.

We ſay, the ingredients of a *compound*; apothecaries are great dealers in *compounds*.

Compound *Flower*. See Flower.

Compound *Force, Forms, Foſſils, Fractions, Fracture, Gland, Harmony.* See the ſubſtantives.

Compound *intereſt*, called alſo *intereſt upon intereſt*, is that which is reckoned not only upon the principal, but upon the INTEREST itſelf forborn; which hereby becomes a ſort of ſecondary principal.

Compound *Machine, Maſonry.* See the ſubſtantives.

Compound *motion*, that motion which is effected by ſeveral conſpiring powers.

Powers are ſaid to conſpire, if the direction of the one be not directly oppoſite to that of the other; as when the radius of a circle is conceived to revolve about a center; and at the ſame time a point to move ſtrait along it.

All curvilinear motion is *compound*.

It is a popular theorem, in *Mechanics*, that in an uniform *compound* motion, the velocity produced by the conſpiring powers, is to that of either of the powers ſeparately, as the diagonal of a parallelogram, according to the direction of whoſe ſides they act ſeparately, to either of the ſides.

Compound *numbers.* See Composite.

Compound *pendulum*, in *Mechanics*, that which conſiſts of ſeveral weights conſtantly keeping the ſame diſtance, both from each other, and from the center about which they oſcillate. See Pendulum.

Compound *propoſition.* See Proposition.

Compound *quantities*, in *Algebra*, are ſuch as are connected together by the ſigns + and −: thus, $a + b - c$, and $bb - b$ are *compound* quantities.

Compound *ratio* is that which the product of the antecedents of two or more ratios has to the product of their conſequents.

Thus 6 to 72 is a ratio *compounded* of 2 to 6, and 3 to 12. See Proportion, and Composition *of ratios.*

Compound *Sounds, Surd, Taſte, Ulcer, Words.* See the ſubſtantives.

COMPOUNDED *idea*, in *Logic*, unites ſeveral ideas of a different kind, which are uſually conſidered as diſtinct ſingle beings, whether thoſe united ideas be SIMPLE or COMPLEX. See Collective *idea*.

COMPOUNDING *felony*, in *Law*. See Theft-Bote.

COMPREHENSION, in *Engliſh Church-Hiſtory*, denotes a ſcheme propoſed by Sir Orlando Bridgman in 1667-8, for relaxing the terms of conformity in behalf of proteſtant diſſenters, and admitting them into the communion of the church. A bill for this purpoſe was drawn up by lord chief baron Hale, but diſallowed. The attempt was renewed by Tillotſon and Stillingfleet in 1674, and the terms were ſettled to the ſatisfaction of the non-conformiſts, but the biſhops refuſed their aſſent. This ſcheme was likewiſe revived again immediately after the Revolution; the king and queen expreſſed their deſire of an union: however the deſign failed after two attempts; and the act of TOLERATION was obtained. Birch's Life of Tillotſon, p. 42. 167, &c.

Comprehension, in *Metaphyſics*, is that act of the mind, whereby it apprehends, or knows, any object preſented to it, on all the ſides, whereon it is capable of being apprehended, or known.

To *comprehend* a thing, is defined by the ſchoolmen, *rem aliquam totam & totaliter cognoſcere.* See Apprehension.

Comprehension, in *Rhetoric*, a trope, or figure, whereby the name of a whole is put for a part; or that of a part for a whole: or a definite number of any thing for an indefinite.

COMPRESS, in *Surgery*, a bolſter of linen cloth, folded in ſeveral doubles, and laid under the bandage, to prevent a wound from bleeding or ſwelling; or to retain the medicines applied thereto.

The word comes from *comprimere, to preſs hard.*

Scultetus, in his Arſenal of Chirurgery, obſerves that the

Ancients compoſed their *compreſſes* of carded flax, or of feathers, ſewed between two linens; and called them pillows, or plumages, *pulvini*, or *pulvilli*, &c.

It is frequently the cuſtom among ſurgeons, after the plaſter and other dreſſings are applied, to cover all with a *compreſs*, which is made of the ſofteſt old linen, four, ſix, or eight times doubled. Theſe are of ſervice, not only by preſerving the parts from the injuries of the external air, but alſo for ſecuring and fixing the plaſters, and other dreſſings.

Compreſſes are alſo frequently applied where no plaſter is made uſe of; and that ſometimes dry, ſometimes wetted with certain liquors, which are ſuppoſed to be ſtrengthening, emollient, reſolving, lenient, cooling, &c. They are frequently dipped in the decoctions of certain herbs, into wine, ſpirit of wine, vinegar, or oxycrate, and ſometimes into lime-water, and are adminiſtered either cold or hot, as the nature of the caſe requires.

Compreſſes are of various forms, ſuited to different occaſions.

Compreſſes of all kinds are intended for theſe purpoſes: 1. To preſerve and cheriſh the natural heat of the body. 2. To ſecure the dreſſings that are laid under them. 3. To convey liquid remedies to parts wounded, or otherwiſe diſordered, and to prolong the uſe of them. 4. To fill up any cavities or depreſſions of the parts, that the dreſſings (eſpecially in fractures) may be applied with greater ſecurity: and laſtly to prevent bandages from bringing on a troubleſome itching, or other pain or uneaſineſs on the ſkin. Heiſter.

COMPRESSION, the act of preſſing, or ſqueezing ſomething, ſo as to ſet its parts nearer to each other, and make it poſſeſs leſs ſpace.

Compreſſion properly differs from *condenſation*, in that the latter is performed by the action of cold, the former by ſome external violence: or, more ſtrictly ſpeaking, *compreſſion* is the action of any force on a body, without regarding its effect; whereas *condenſation* denotes the ſtate of a body that is actually reduced into a leſs bulk.

Pumps, which the ancients imagined to act by ſuction, do, in reality, act by *compreſſion*; the *embolus*, or ſucker, in going and returning in the narrow pipe, *compreſſes* the air incloſed, ſo as to enable it by the force of its elaſticity to raiſe the valve, and make its eſcape: upon which, the balance being deſtroyed, the preſſure of the atmoſphere on the ſtagnant ſurface, drives up the water in the pipe thus evacuated of its air. See PUMP.

Water was thought incapable of *compreſſion*: and it was believed till lately, that after the air had been purged out of it, no art or violence is able to bring its parts cloſer, or to make it take up leſs compaſs. In an experiment made by the academy del Cimento, water, when violently ſqueezed, made its way through the infinitely fine pores of a ball of gold, rather than undergo any *compreſſion*.

The ingenious Mr. Canton, F. R. S. attentively conſidering this experiment, found that it was not ſufficiently accurate to juſtify the concluſion, which had been univerſally drawn from it; ſince the Florentine philoſophers had no method of determining that the alteration of figure in their globe of gold, occaſioned ſuch a diminution of its internal ſpace, as was exactly equal to the quantity of water forced into its pores. In order to bring this matter to a more accurate and deciſive trial, he procured a ſmall glaſs tube of about two feet in length, with a ball at one end of an inch and a quarter in diameter. Having filled the ball and part of the tube with mercury, and brought it exactly to the heat of 50° by Fahrenheit's thermometer, he marked the place where the mercury ſtood in the tube, which was about ſix inches and a half above the ball; and then raiſed the mercury by heat to the top of the tube, and ſealed the tube hermetically; and when the mercury was brought to the ſame degree of heat as before, it ſtood in the tube $\frac{32}{100}$ of an inch higher than the mark. The ſame experiment was repeated with water exhauſted of air, inſtead of mercury, and the water ſtood in the tube $\frac{43}{100}$ of an inch above the mark. Since the weight of the atmoſphere on the outſide of the ball, without any counterbalance from within, will compreſs the ball, and equally raiſe both the mercury and water, it appears that the water expands $\frac{11}{100}$ of an inch more than the mercury, by removing the weight of the atmoſphere. Having thus determined that water is really *compreſſible*, he proceeded to eſtimate the degree of *compreſſion* correſponding to any given weight. For this purpoſe he prepared another ball, with a tube joined to it; and finding that the mercury in $\frac{21}{7}$ of an inch of the tube was the hundred-thouſandth part of that contained in the ball, he divided the tube accordingly. He then filled the ball and part of the tube with water exhauſted of air; and leaving the tube open, placed this apparatus under the receiver of an air-pump, and obſerved the degree of expanſion of the water anſwering to any degree of rarefaction of the air: and again by putting it into the glaſs receiver of a condenſing engine, he noted the degree of *compreſſion* of the water correſponding to any degree of condenſation of the air. He thus found, by repeated trials, that, in a temperature of 50°, and when the mercury has been at its mean height in the barometer, the water expands one part in 21740, and is as much *compreſſed* by the weight of an additional atmoſphere, or the *compreſſion* of water by twice the weight of the atmoſphere, is one part in 10870 of its whole bulk. Should it be objected, that the *compreſſibility* of the water was owing to any air which it might be ſuppoſed to contain, he anſwers, that more air would make it more *compreſſible*; he therefore let into the ball a bubble of air, and found that the water was not more *compreſſed* by the ſame weight than before.

In ſome farther experiments of the ſame kind, Mr. Canton found that water is more *compreſſible* in winter than in ſummer; and he obſerved the contrary in ſpirit of wine, and oil of olives.

The following table was formed, when the barometer was at twenty-nine inches and a half, and the thermometer at fifty degrees.

		Millionth parts.	Spec. grav.
Campreſſion of	ſpirit of wine	66	846
	Oil of olives	48	918
	Rain water	46	1000
	Sea-water	40	1028
	Mercury	3	13595

He infers that theſe fluids are not only *compreſſible*, but elaſtic; and that the *compreſſions* of them, by the ſame weight, are not in the inverſe ratio of their denſities, or ſpecific gravities, as might be ſuppoſed. Phil. Tranſ. vol. lii. 1762. art. 103. and vol. liv. 1764. art. 47.

The *compreſſion* of the air, by its own weight, is ſurpriſingly great: but the air may be ſtill further *compreſſed* by art. See *Elaſticity of* AIR.

This immenſe *compreſſion* and dilatation, Sir Iſaac Newton obſerves, cannot be accounted for in any other way, but by a repelling force, wherewith the particles of air are endued; by virtue whereof, when at liberty, they mutually fly each other.

This repelling power, he adds, is ſtronger and more ſenſible in air, than in other bodies; becauſe air is generated out of very fixed bodies, but not without great difficulty, and the help of fermentation: now thoſe particles always recede from each other with the greateſt violence, and are *compreſſed* with the greateſt difficulty, which, when contiguous, cohere the moſt ſtrongly. See AIR, ATTRACTION, COHESION, DILATATION, and REPULSION.

COMPRESSOR *naris*, in *Anatomy*, a name given by Albinus, and ſome others, to one of the muſcles of the face, called by Winſlow the *tranſverſalis naſi*, and *inferior naſi*; and by Cowper, the ELEVATOR *alæ naſi*.

COMPRISE *nient*. See NIENT.

COMPROMISE, a treaty, or contract, whereby two contending parties eſtabliſh one or more arbitrators, to judge of and terminate their differences in an amicable way.

The regular way of appointing a *compromiſe* is by a writing, expreſſing the names of the arbitrators, the power of chooſing an umpire, or ſuper-arbitrator, in caſe of need, a time limited for the arbitrage, and a penalty on the party who does not abide by the deciſion.

By the civil law, a ſlave cannot make a *compromiſe* without the leave of his maſter, nor can a pupil without the authority of his guardian, or a wife without that of her huſband. So a ſlave, a deaf or dumb man, a minor, and the perſon who is a party in the cauſe, are incapable of being choſen arbitrators in a *compromiſe*.

The occaſions on which a *compromiſe* is not allowed of, are reſtitutions, marriage-cauſes, criminal affairs, queſtions of ſtate; and, generally, any thing wherein the public intereſt is more concerned than that of private perſons.

In our law, a *compromiſe* is not of ſo much extent. Weſt defines it the faculty, or power of pronouncing ſentence between perſons at controverſy, given to arbitrators by the parties mutual private conſent, without public authority.

COMPROMISE is alſo uſed in beneficiary matters; where it ſignifies an act, whereby thoſe who have the right of election, transfer it to one or more perſons, to elect a perſon capable of the office or dignity.

We have ſeen members of parliament elected by *compromiſe*; when the electors, not being able to agree among themſelves, give the power of electing, at leaſt of nominating, to two perſons; obliging them by oath, or otherwiſe, to chooſe ſuch as they think the moſt capable, and beſt diſpoſed.

COMPTING, or COUNTING-HOUSE, an office in the king's houſhold, under the direction of the lord ſteward; ſo called, becauſe the accompts for all expences of the king's houſhold are there taken daily by the lord ſteward, comptroller, cofferer, maſter of the houſhold, the clerks of the green-cloth, and the clerks comptrollers. They alſo there make proviſion for the houſhold, and make payments, and orders, for the good government thereof.

In the *compting-houſe* is the board of GREEN-CLOTH.

COMPTROL, or Controle, is, properly, a double REGISTER, kept of acts, iſſues, &c. of the officers or commiſſioners in the revenue, army, &c. in order to perceive the true ſtate thereof, and to certify the truth, and the due keeping of the acts ſubject to that enregiſterment.

COMPTROLLER, an officer eſtabliſhed to *comptrol*, or over-ſee public accounts, and to certify, on occaſion, whether things have been *comptrolled*, and examined, or not. Thus, we have a *comptroller of the king's houſhold*, or of the accounts of the board of green cloth. *Comptroller-general* of the cuſtoms; *comptroller* of the navy; *comptroller* of the mint; *comptroller* of the exciſe; *comptrollers* of the accounts of the army; of the CHAMBER, &c.

Comptroller *of the artillery*, is an officer whoſe duty it is to inſpect the muſters of the artillery, to make the pay-liſt, and take the acconnts and remains of ſtores. He is accountable to the office of ordnance.

Comptroller *of the hanaper*, is an officer in chancery, attending the lord chancellor daily in term and ſeal time. This officer is to take all things ſealed from the clerk of the hanaper, incloſed in bags of leather, and to note the juſt number and effect thereof; to enter them in a book, with all the duties belonging to the king and other officers for the ſame, and ſo charge the clerk of the HANAPER with them.

Comptrollers *of the pells*, are officers of the EXCHEQUER, whereof there are two, viz. two chamberlains clerks, who keep a *comptrol* of the pell of receipts, and goings-out: originally they took notes of other officers accompts, in order to diſcover if they did amiſs.

Comptroller *of the pipe*, an officer of the EXCHEQUER, who writes out ſummons twice a-year, to levy the farms and debts of the PIPE.

He was anciently called *duplex ingroſſator*.

COMPULSOR, an officer under the Roman emperors, diſpatched from court into the provinces, to compel the payment of taxes, &c. not paid within the time preſcribed.

The word is formed of the verb *compellere, to oblige, conſtrain.*

Theſe were charged with ſo many exactions, under colour of their office, that Honorius caſhiered them by a law in 412.

The laws of the Viſigoths mention military *compulſors*; which were officers among the Goths, whoſe buſineſs was to oblige the tardy ſoldiers to go into the fight, or to run to an attack, &c.

Caſſian mentions a kind of monaſtic *compulſors*, whoſe buſineſs was to declare the hours of canonical office, and to take care the monks went to church at thoſe hours.

COMPUNCTION, in *Theology*, an inward grief in the mind for having offended God.

The word comes from *compungere*, of *pungere, to prick.*

The Romaniſts own their confeſſion inſignificant, unleſs attended with *compunction*, or pricking of heart. See Confession.

Among ſpiritualiſts, *compunction* bears a more extenſive ſignification; and implies not only a grief for having offended God, but alſo a pious ſenſation of grief, ſorrow, and diſpleaſure, on other motives. Thus, the miſeries of life, the danger of being loſt in the world, the blindneſs of the wicked, &c. are to pious people motives of *compunction*.

COMPURGATOR, in *Law*, one that by oath juſtifies, or clears, another's innocence. They were introduced in the juriſprudence of the middle ages, and their number varied according to the importance of the ſubject in diſpute, or the nature of the crime with which a perſon was charged. See Oath, and Wager *of Law.*

COMPUTATION, the manner of accounting and eſtimating time, weights, meaſures, and money.

The word is ſometimes alſo uſed among mathematicians in the like ſenſe as CALCULATION.

Computation *of a planet's motion.* See Planet.

Computation is particularly uſed in law in reſpect of the true account, or conſtruction of time, ſo underſtood, as that neither party do wrong to the other, nor the determination of time be left at large, or be taken otherwiſe than according to the judgment and intention of law.

If indentures of demiſe be ingroſſed, bearing date May 11, 1769, to have and to hold the land in S. for three years from henceforth; and the indentures be delivered the 4th of June following: in this caſe, *from henceforth* ſhall be computed from the day of the delivery, and not from the date. And if the indentures be delivered at four of the clock in the afternoon, the ſaid fourth of June, the leaſe ſhall end the third day of June in the third year: the law, in ſuch *computation*, rejecting all fractions or diviſions of the day, on account of that uncertainty which is the mother of contention. In writings, ordered by the ſtat. 27 Hen. VIII. to be inrolled within ſix months; if ſuch writings have date, the ſix months ſhall be accounted from the date, and not from the delivery: if they want date, it ſhall be accounted from the delivery. Coke, lib. 5.

If a deed be ſhewn to a court at Weſtminſter, it ſhall remain in court (by judgment of law) all the term in which it is ſhewn: for all the term is but as one day in law. Coke, ibid.—If a church be void, and the patron does not preſent within ſix months, the biſhop of the dioceſe may collate his chaplain: but theſe ſix months ſhall be computed according to twenty-eight days of the month; and not according to the calendar.

COMPUTO, a writ thus called from its effect, which is to compel a bailiff, chamberlain, or receiver, to yield his accompts. See Account.

The ſame lies for executors of executors; and againſt the guardian in ſocage, for waſte made in the minority of the heir.

Computo *vicecomitis habendo reſpectu.* See Respectu.

COMUS, in *Mythology*, the god of jollity or feſtivity. There is great reaſon to believe he was the Chamos of the Moabites; Beel-Phegor, Baal-Peor, Priapus, and Bacchus. He is repreſented under the appearance of a young man, with an inflamed red countenance, his head inclined, and crowned with flowers; his air drowſy; leaning on a huntſman's ſpear in his left hand, and holding an inverted torch in his right. His ſtatue was placed at the chamber doors of new married perſons; his pedeſtal crowned with flowers.

CONARION, or Conoides, a name for the *pineal gland*; a ſmall gland, about the bigneſs of a pea, placed in the upper part of that hole in the third ventricle of the brain called the *anus*; and tied by ſome fibres to the nates.

It is compoſed of the ſame ſubſtance as the reſt of the brain; and has this peculiar to it, that it is ſingle; whereas all the other parts are double. Hence, Des Cartes takes occaſion to ſuppoſe it the immediate place, or ſeat of the ſoul.

CONATUS, *endeavour*, a term frequently uſed by philoſophical and mathematical writers; nearly equivalent to *niſus*.

Conatus ſeems to be the ſame, with reſpect to motion, that a point is with reſpect to a line; at leaſt, the two have this in common, that as the point is inceptive of the line, or the term from which it commences; ſo is the beginning of all motion called the *conatus*. Add, that as in mathematical demonſtrations, the extenſion of the point is conceived as if it were nothing at all; ſo, in the *conatus* of motion, there is no regard to the time wherein, or the length which, it advances. See *Laws of* Nature.

Hence, ſome define *conatus* to be a quantity of motion not capable of being expreſſed by any time or length. Accordingly, all motion tends preciſely the ſame way wherein the moveable is acted on, or determined by the moving power. See Motion.

CONCAMERATED, among *Builders*, an appellation given to ſuch roofs as are arched in the vaults.

CONCAMERATIO was an arched room in our ancient churches, between the eaſt end of the church, and the high altar; ſo formed, that in proceſſions they might ſurround it.

CONCATENATION, in *Philoſophy*, a connexion of things, in manner of a *chain*.

The *concatenation* of ſecond cauſes is an effect of PROVIDENCE. See Cause.

CONCAVE is applied to the inner ſurface of a hollow body; particularly if it be circular.

Concave is particularly underſtood of mirrors and lenſes: *concave lenſes* are either *concave* on both ſides, called *concavo-concave*; or *concave* on one ſide, and plane on the other, called *plano concave*; or *concave* on one ſide, and convex on the other, called *concavo-convex*, or *convexo-concave*, as the one or the other ſurface is a portion of a leſs ſphere.

The property of all *concave* lenſes is, that the rays of light, in paſſing through them, are deflected, or made to recede from one another; as in convex lenſes they are inflected towards each other; and that the more, as the concavity and convexity pertain to leſs circles.

Hence, parallel rays, as thoſe of the ſun, by paſſing through a *concave* lens, become diverging; diverging rays are made to diverge the more, and converging rays are either made to converge leſs, or become parallel, or go out diverging.

Hence, objects viewed through *concave* lenſes appear diminiſhed; and the more ſo, as they are portions of leſs ſpheres; and this in oblique, as well as in direct rays.

Concave mirrors have the contrary effect to lenſes: they reflect the rays which fall on them, ſo as to make them approach more to, or recede from, each other than before, according to the ſituation of the object; and that the more as the concavity is greater, or the ſpheres whereof they are ſegments, leſs. See MIRROUR.

Hence, *concave* mirrors magnify objects preſented to them; and that in a greater proportion, as they are portions of greater ſpheres.

Hence alſo, *concave* mirrors have the effect of burning objects, when placed in their focus. See BURNING-GLASS.

CONCAVITY. An arch of a curve has its *concavity* turned one way, when the right lines that join any two of its points are all on the ſame ſide of the arch.

Archimedes, intending to include ſuch lines as have rectilinear parts, in his definition, ſays, a line has its *concavity* turned one way, when the right lines that join any two of its points are either all upon one ſide of it, or while ſome fall upon the line itſelf, none fall upon the oppoſite ſide. Archim. de Sphær. and Cyl. Def. 2. Mac Laurin's Fluxions, art. 180.

When two lines, having their *concavity* turned the ſame way, have the ſame terms, and the one includes the other, or has its *concavity* towards it, the perimeter of that which includes, is greater than the perimeter of that which is included. Archim. ib. ax. 2.

CONCEALERS, in *Law*, ſuch as find out concealed lands, i. e. lands kept privily from the king, by common perſons, having nothing to ſhew for their title, or eſtate therein.

They are thus called *per antiphraſin, a concelando*; as *mons* is *a movendo*, &c. Lord Coke calls them *turbidum hominum genus*. See MISPRISION.

CONCENTRATED *parting*, in *Chemiſtry*. See CÆMENTATION.

CONCENTRATION, in general, denotes the retiring, or withdrawing of a thing inwards, towards the center, or middle.

External cold is ſaid to *concentrate* the heat within bodies: after meals, the natural warmth retires, and as it were *concentrates*, to promote the digeſtion.

CONCENTRATION is alſo uſed by Dr. Grew for the higheſt degree of mixture, viz. that wherein two or more atoms or particles touch, by a reception, and intruſion of the one within the other. See MIXTION.

This he takes to be the caſe of all fixed bodies without taſte or ſmell; their conſtitution being ſo firm, that till the particles be detached from each other by ſome extraordinary means, they cannot affect thoſe ſenſes.

CONCENTRATION, in *Chemiſtry*, conſiſts in approximating the proper and integrant parts of a body, by taking away ſome ſubſtance interpoſed between theſe parts, and which is extraneous and ſuperabundant to the body to be *concentrated*. Thus, a ſolution of any ſaline ſubſtance in water may be concentrated by expelling part of the water of the ſolution.

But cuſtom has applied the word *concentration* to the DEPHLEGMATION of acids, and particularly of vitriolic acid, by DISTILLATION, and of vinegar by CONGELLATION.

CONCENTRATION, or *rectification*, of vitriolic acid by *diſtillation*, is performed, in order to purify it from the water, by which it is weakened, or from the inflammable matter, which renders it black and ſulphureous. When the quantity of water with which it is diluted is very conſiderable, a great part of it may be diſcharged in ſtone or glaſs bottles, without diſtillation. The water will exhale, and the acid be to a great degree *concentrated*. But as the quantity of remaining water is diminiſhed, it adheres ſo much the more ſtrongly to the acid, and the heat muſt be increaſed to ſuch a degree as would raiſe the acid with the water, and diſſipate it in open veſſels. And beſides, the acid, when it is become very ſtrong, attracts the moiſture of the air, and combines with it; thus imbibing as much water from the air as it loſes by evaporation. The *concentration*, therefore, muſt be completed by diſtillation. For this purpoſe, a retort of good glaſs, capable of reſiſting acids, muſt be half filled with the acid, and ſet in a ſand-bath entirely covered with ſand. When a receiver has been adapted to it, heat muſt be applied, and very gradually augmented, till drops are diſtilled. The heat muſt be increaſed in proportion to the degree of *concentration*, but not ſo as to make the acid boil, which might be attended with pernicious conſequences. The duration of this proceſs depends on the quality and ſtrength of the acid. The vitriolic acid formerly kept by druggiſts required, that one half of it ſhould be diſtilled, in order to make the remaining part twice as heavy as water. At preſent, it is much ſtronger and cheaper. That which is uſually manufactured for ſale is more or leſs combined with inflammable matter, which may be diſcharged from it by a diſtillation ſimilar to that above deſcribed. When the phlogiſticated vitriolic acid acquires a ſtrong heat, and becomes conſiderably *concentrated*, it acts upon the inflammable matter, diſſipating or burning it: in conſequence of which the liquor becomes perfectly white and tranſparent, which is a ſign that the operation is finiſhed. The retort muſt be left in the ſand-bath till it is cold, and then the acid is to be poured into a clean, dry, cryſtal-glaſs bottle, cloſed by a glaſs ſtopper, and covered with leather. The phlegmatic, or ſulphureous liquor, which paſſed over into the receiver, is called *ſpirit of* VITRIOL. See ACID *vitriolic*, and VITRIOL.

CONCENTRATION *of vinegar by congelation*. This method was firſt employed by Stahl. M. Geoffroy has ſince made many experiments on the ſubject, an account of which is given in the Memoirs of the Academy at Paris for 1739. Acids reſiſt congelation much more than water; but if vinegar be expoſed to a cold marked by 8 or 10 below 0 in Reaumur's THERMOMETER, a conſiderable quantity of ice will be formed. This ice conſiſts chiefly of pure water, and the remaining unfrozen liquor is a much ſtronger vinegar. If this vinegar be again expoſed to a ſtronger degree of cold, a kind of ſnowy ice, containing a quantity of unfrozen acid, will be produced, and the remaining acid will hereby acquire a conſiderable degree of additional ſtrength, which may be again increaſed by repeating the congelation with greater cold. Wines may be well *concentrated* in the ſame way; and they thus acquire a thick conſiſtence, and are preſerved from injury in the viciſſitude of climates and ſeaſons. Cold may be likewiſe ſucceſsfully employed in northern countries to *concentrate* ſea-water, and to approximate the particles of ſalt, by ſeparating the ice, which is little elſe than pure water, as ſoon as it is formed. The mineral acids might probably be *concentrated* by congelation, though in a very low degree. Other methods, beſides that above deſcribed, have been uſed for *concentrating* vinegar: ſuch as ſimple diſtillation; and the combination of this acid with fixed alkalies and metals, and afterwards diſtilling the ſalts reſulting from ſuch combinations, whence a very ſtrong acid of vinegar is obtained, called *radical vinegar*. See Macquer's Dict. Chem. art. CONCENTRATION. See VINEGAR.

CONCENTRATION, in *Diſtillery*. Dr. Shaw, in his Eſſay on the Diſtillery, is for introducing a method of concentrating the fermentable parts of vegetables, from which their ſpirits are to be drawn by diſtillation; which, if it can be brought to be practiſed in the large way, will prove of very great uſe to the Britiſh diſtillery, as it will greatly ſhorten the diſtiller's buſineſs, which at preſent, including the brewing, fermenting, &c. is much too long. He propoſes only to evaporate carefully the wort, or other tinctures or decoctions of vegetables made for the diſtilling of their ſpirits, to the conſiſtence of treacle: in this form they might be ſold to the diſtiller, who might keep them by him as long as he pleaſed, and occaſionally uſe them, by the eaſy method of reducing them into wort, by mixing warm water with them.

CONCENTRATION, in *Medicine*, when by an addition of earthy, dry, and abſorbent ſubſtances, the acid of any liquor is attracted and imbibed, whilſt the aqueous parts are left, and the acid as it were conveyed into another body, this is called *concentration*. The uſe of this ſpecies of *concentration* is obvious, in caſes where acidities are to be ſubdued or corrected: hence abſorbents are called *concentrating* medicines. To this belongs that ſpecies of *concentration*, in which by an acid any body is corroded, and remains combined with it. Thus vinegar firſt combined with, and then diſtilled from, verdegriſe, is much ſtronger than it was before, and for that reaſon is called *concentrated*. There is another ſpecies of *concentration*, which is, when alkaline ſalts are ſaturated with acid ſpirits, which are ſo retained in them, that both in conjunction conſtitute neither an acid nor an alkaline, but a neutral ſalt. The uſe of this ſpecies of *concentration* is obvious, that is, to procure neutral ſalts. Laſtly, *concentration*, in an extenſive ſenſe, denotes an union or combination of a ſpirit, a ſalt, or a ſulphur, with any body: thus, in ſublimate mercury, which is formed of quickſilver, and the acid of ſea-ſalt united together, the ſpirit of ſalt is ſaid to be *concentrated*.

CONCENTRIC, in *Geometry* and *Aſtronomy*, ſomething that has the ſame common center with another.

The word is principally uſed in ſpeaking of round bodies and figures, viz. circular, elliptical ones, &c. but may be likewiſe uſed for polygons, drawn parallel to each other, upon the ſame center.

Concentric ſtands oppoſite to EXCENTRIC.

Nonius's method of graduating inſtruments conſiſts in deſcribing with the ſame quadrant 45 *concentric arches*, dividing the outermoſt into 90 equal parts, the next into 89, &c.

CONCEPTACULUM, among *Botaniſts*, a kind of PERICARPIUM, compoſed of ſoft and leſs rigid valves, and containing one cavity.

CONCEPTION, in *Logic*, the ſimple apprehenſion, or perception, which we have of any thing, without proceeding to affirm, or deny, any thing about it.

Some writers diſtinguiſh between *conception* and perception; making the latter to denote the conſciouſneſs of an object when preſent, or to include the reality of its object; whereas *conception* expreſſes the forming an idea of an object whether preſent or abſent, or without any conviction of its reality. See Lord Kaims's El. Criticiſm, vol. ii. p. 508.

The ſchoolmen uſually make two kinds of *conception*; the one *formal*, the other *objective*.

The *firſt* is defined to be the immediate and actual repreſentation of any thing propoſed to the mind: on which footing, it ſhould be the ſame thing to the underſtanding, that a word or voice is to the ear; whence ſome alſo call it *verbum mentis*.

The *ſecond* is the thing itſelf repreſented by a formal *conception*. But others explode the notion of an *objective conception*, as being, in reality, no *conception* at all; excepting where the mind contemplates its own acts, &c.

Formal, or *proper conceptions*, are ſubdivided into *univocal*, where ſeveral things are diſtinctly repreſented as under ſome common ratio, or in the ſame degree of perfection; *analogous*, where ſeveral things are repreſented as under ſome proportional likeneſs; and *equivocal*, where they are repreſented immediately as ſuch, without regard to any common ratio or likeneſs.

Conception, in *Medicine*, denotes the firſt formation of the embryo, or fœtus, in the womb.

Conception is no other than ſuch a concourſe and commixture of the prolific ſeed of the male with that of the female, in the cavity of the uterus, as immediately produces an EMBRYO.

The ſymptoms of *conception*, or PREGNANCY are, when in a few days after the conjugal act, a ſmall pain is perceived about the navel, and is attended with ſome gentle commotions in the bottom of the abdomen; and within one two, three, or even four months, the menſes ceaſe to flow, or prove in leſs quantity than uſual. Upon the firſt failure of this kind, the woman begins to count the ſeries of her weeks, without taking any notice of the time before elapſed; after this, or between the ſecond or third months, but generally about the third, the motions of the embryo become perceivable to the mother; who hereupon becomes troubled with a nauſea, vomiting, loathing, longing, &c. About this time the breaſts begin to ſwell, grow hard and painful, and contain a little milk; the nipples alſo become larger, firmer, and darker coloured, a livid circle appearing round them: the eyes ſeem ſunk and hollow. During the two firſt months pregnancy, the woman grows thinner, and ſlenderer; the abdomen being alſo depreſſed; though it afterwards diſtends, and grows gradually larger.

The manner wherein *conception* is effected is thus laid down by the modern writers: in the ſuperficies of the ovaries of women, there are found little pellucid ſpherules, conſiſting of two concentric membranes, filled with a lymphatic humour, and connected to the ſurface of the ovaria, underneath the tegument, by a thick calix, contiguous to the extremities of the minute ramifications of the Fallopian tubes.

Theſe ſpherules, by the uſe of venery, grow, ſwell, raiſe, and dilate the membrane of the ovary into the form of papillæ; till, the head propending from the ſtalk, it is at length ſeparated from it; leaving behind it a hollow cicatrix, in the broken membrane of the ovary; which, however, ſoon grows up again.

Now, in theſe ſpherules, while ſtill adhering to the ovary, fœtuſes have been frequently found: whence it appears, that theſe are a kind of ova, or eggs, deriving their ſtructure from the veſſels of the ovary, and their liquor from the humours prepared therein.

Hence, alſo, it appears, that the Fallopian tubes being ſwelled, and ſtiffened by the act of venery, with their muſcular fimbriæ, like fingers, may embrace the ovaries, compreſs them, and by that compreſſion expand their own mouths: and thus the eggs, now mature, and detached as before, may be forced into their cavities; and thence conveyed into the cavity of the uterus; where they may either be cheriſhed and retained, as when they meet with the male ſeed; or, if they want that, again expelled.

Hence the phænomena of falſe *conceptions*, abortions, fœtuſes found in the cavity of the abdomen, the Fallopian tubes, &c. For, in coition, the male ſeed, abounding with living animalcules, agitated with a great force, a briſk heat, and, probably, with a great quantity of animal ſpirits, is violently impelled through the mouth of the uterus, which on this occaſion is opener, and through the valves of the neck of the uterus, which on this occaſion are laxer than ordinary, into the uterus itſelf; which now, in like manner, becomes more active, turgid, hot, inflamed, and moiſtened with the flux of its lymph and ſpirits, by means of the titillation excited in the nervous papillæ by the attrition againſt the rugæ of the vagina.

The ſemen thus diſpoſed in the uterus, is retained, heated, and agitated, by the convulſive conſtriction of the uterus itſelf; till meeting with the ova, the fineſt and moſt animated part enters through the dilated pores of the membranula of the ovum, now become glandulous, is there retained, nouriſhed, dilated, grows to its umbilicus, or navel; ſtifles the other leſs lively animalcules; and thus is *conception* effected.

Hence it appears, that *conception* may happen in any part where the ſemen meets with an ovum: thus, whether it be carried through the Fallopian tube to the ovary, and there caſt upon the ovum; or whether it meet with it in ſome receſs of the tube itſelf; or, laſtly, whether it join it in the cavity of the uterus, it may ſtill have the ſame effect, as it appears from obſervation actually to have. But it is probable, that *conception* is then moſt perfect, when the two, viz. the ſemen and ovum, are carried at the ſame time into the uterus, and there mixed, &c.

Other anatomiſts chooſe to ſuppoſe the male ſeed taken up, before it arrives in the uterus, by the veins which open into the vagina, &c. and thus mixed with the blood; by which, in the courſe of circulation, it is carried, duly prepared, into the ovary, to impregnate the eggs. See GENERATION.

It has been advanced by ſeveral writers, that women may poſſibly *conceive* in their ſleep, and be with child, without any knowlege of the occaſion of it.

As ridiculous and abſurd as this doctrine may appear to the generality of the world, no leſs an author than Genſili has thought it worthy a particular diſſertation. Act. Erud. ann. 1715. p. 122. See PREGNANCY.

Conception, *immaculate*, of the Holy Virgin, is a feaſt eſtabliſhed in honour of the Holy Virgin; particularly with regard to her having been conceived and born *immaculate*; i. e. without original ſin; held in the Romiſh church on the eighth of December.

Allatius, in his Prolegomena on Damaſcenus, endeavours to prove this feaſt to have been celebrated by ſeveral churches in the Eaſt, as early as the eighth century. It was firſt eſtabliſhed in France about the year 1140; but it had been obſerved in England, in conſequence of the zeal of archbiſhop Anſelm, before this period.

The *immaculate conception* is the great ſubject of controverſy between the Scotiſts and Thomiſts; the former maintaining, and the latter impugning it.

The Dominicans eſpouſed the party of St. Thomas, and held out a long time in defence of the Virgin's being conceived in original ſin: they were condemned by pope Clement VII. in 1308, at the proſecution of the univerſity of Paris, and were obliged to retract. The council of Trent, ſeſſ. v. in the decree of *original ſin*, declares it not to be the intention of the council to include the Virgin under it; her *conception* it calls *immaculate*; and appoints the conſtitutions of Sixtus IV. to be obſerved with regard to it.

This controverſy between the Dominicans and Franciſcans was revived in the ſeventeenth century; and a feſtival was appointed by Clement XI. in 1708, to be celebrated throughout the Romiſh church: however, the Dominicans perſiſt in denying the obligation of this law, and in maintaining their ancient doctrines.

In the three Spaniſh military orders of St. James of the Sword, Calatrava, and Alcantara, the knights take a vow, at their admiſſion, to defend the *immaculate conception*. This reſolution was firſt taken in 1652.

Peter d'Alva and Aſtorga have publiſhed forty-eight huge volumes in folio, on the myſteries of the *conception*.

Conception, *religious of the order of*. See THEATINES.

CONCERT, or CONCERTO, a number, or company of muſicians, playing, or ſinging the ſame ſong, or piece of muſic, together.

The deſignation of a full *concert* for violins is two principal, and two ſecond violins, a tenor violin, and a violoncello, with a thorough baſs for the harpſichord.

The word *concert* may be applied where the muſic is only melody, i. e. where the performers are all either in uniſon, or only at the interval of an octave; but it is more properly, as well as more uſually, underſtood of harmony, or where the muſic conſiſts of divers parts, as baſs, tenor, &c.

CONCERTANTE, in *Italian Muſic*, is uſed for the reciting parts of a piece in muſic, to diſtinguiſh them from thoſe which ſing only in the grand chorus. Graſſineau makes *concertante* ſignify thoſe parts that ſing or play throughout the whole piece. Broſſ. Dict. Muſ. in voc. Muſ. Dict. p. 35.

CONCERTATO, in *Italian Muſic*, is uſed for a piece compoſed in ſuch a manner, as that all the parts may have their recitals, be it for two, three, four, or more voices, or inſtruments: thus they ſay *meſſe concertate*, *ſalmi concertati*, a 2, a 3, a 4. *voci*, &c. Broſſ. Dict. Muſ. in voc.

CONCERTO *groſſo*, in *Italian Muſic*, is uſed to denote the grand chorus of a concert, or thoſe places where all the ſeveral parts perform or play together. Broſſ. Dict. Muſ. in voc.

CONCESSI, a term much uſed in conveyances, &c. Its effect is to create a COVENANT, as *dedi* does a warranty.

CONCESSION, in *Rhetoric*, a figure whereby ſomething is granted, or allowed to the adverſary, either to prevent being detained by unneceſſary incidents, or to make ſome advantage of. *I will not conteſt with you the reality of the contract; what I plead for, is relief againſt the injuſtice of it. True, ſhe is fair; but ought ſhe not to ſhew her acknowlegements to heaven for the favour, by making a virtuous uſe of her beauty?*

CONCESSIT, *ſur*, in *Law*, a ſpecies of FINE.

CONCHA, in *Natural Hiſtory*, a genus of bivalve ſhells, the animal inhabiting which is called *tethys*. This is a very comprehenſive genus, compriſing the OYSTER, CHAMA, MUSCLE, HEART-*ſhell*, PECTEN, SOLEN, &c.

Concha, in *Anatomy*, a name given the ſecond, or inward cavity of the auricle, or external EAR; reaching to the entrance of the auditory duct.

The word has its origin from a reſemblance this cavity bears to a *ſea-ſhell*, called in Latin *concha*.

Some alſo give the ſame name to the firſt cavity of the inward ear, which others call the *drum*; and others to the veſtibulum of the labyrinth, which is the ſecond cavity of the internal ear.

Concha, Χόγκη, in *Antiquity*, a liquid meaſure among the Athenians, which contained two *myſtra*, or half an ounce. As much oil as it was capable of holding, weighed five drams one ſcruple and twenty grains, according to Gor. Defin. Pitiſci Lex. & Eiſenchom. Others think that the *concha* contained three ſpoonfuls, ninety-ſix of which filled a pint veſſel (*ſextarius*); a *ſextarius* was therefore equivalent to thirty-two *conchæ*, and ſix *ſextarii* made one *congius*, a meaſure equivalent to our three quarts, according to Salmaſ. Exerc. Plinian. and Bodæus, in Theophraſt. According to Fernelius, the *concha* was equivalent to two *myſtra*, or five ſpoonfuls; which, according to Jacobus Sylvius, are equivalent to ſix drams. According to Galen, in his work De Ponderibus & Menſuris, cap. xi. the *concha magna* contained the ſame quantity with the *acetabulum*, which in liquid meaſure was an ounce and a half, and in weight fifteen drams. The *concha minor* was in liquid meaſure half an ounce, and in weight five drams.

Concha *anatifera*, in the hiſtory of ſhell-fiſh. See ANATIFERA *concha*.

Conchæ *anomiæ*, in *Natural Hiſtory*, the name of a foſſile ſhell-fiſh, found in great abundance, and in a great variety of ſpecies, but not known in any of them living, on the ſhores or in the ſeas of our own or other countries. In Glouceſterſhire, and ſome other of our counties, theſe are found as common as pebbles on the ploughed lands in other places. They are a ſort of bivalve ſhell, the valves of which are of unequal extent, both of them convex, and the head or beak of the longer valve crooked, and falling over the head of the other. See *Tab. of Foſſ. Claſs* 9.

The great general diſtinction of this numerous claſs of bodies, is into thoſe which are of a ſmooth ſurface, and thoſe which are of a ſtriated or rough one.

Others alſo of the ſame claſs, or of one very nearly allied to it, are found in many of our inland counties, ſome very long from the cardo, or hinge, to the margin; and others very ſhort, and very long the contrary way. They are found indifferently in all ſorts of ſtrata, in earth, in ſtone, in ſand, and among gravel.

Concha *fortificata*, in *Natural Hiſtory*, a name given by ſome authors to the genus of ſhells, called by others the MUREX.

Concha *globoſa*, in *Natural Hiſtory*, the name of a large genus of ſhells, called by authors the DOLIUM, and in French the *tonne*.

Conchæ *latitans muſculus*, a name given by Riolanus, and others, to one of the muſcles of the EAR, called by Cowper *internus auris*, and by Albinus, very properly, the *tenſor tympani*.

Conchæ *margaritiferæ*, a name ſometimes uſed for thoſe *mytuli* which produce pearls. See MUSCLE.

Conchæ *narium*, *inferiores*, in *Anatomy*, or inferior ſhells of the noſtrils, are two in number, ſituated in the naſal *foſſa*, under the openings of the maxillary ſinus, and immediately above the lower orifices of the lachrymal ducts. They cover theſe orifices much in the ſame manner as the ſuperior *conchæ* of the ethmoidal bone cover the maxillary openings. They are connected with the *oſſa maxillaria*, *palati*, and *unguis*, and ſometimes with the *os ethmoides*. They complete the bony ſtructure of the noſe, augment its ſurface, and render it proportionable to the extent of the organ of ſmell, and of the pituitary membrane. Winſlow.

Conchæ *proprius muſculus novus*, a name given by Santorini to a muſcle of the EAR, called by Albinus, and the French writers, *aurus alæ anterior*.

Concha *ſpectrorum*, the *ſpectre ſhell*, a name given by authors to a ſpecies of voluta, from ſome odd figures deſcribed on its ſurface, repreſenting rough draughts of terrible phantoms. It is an elegant ſhell, of a middle ſize, and is of a white ground, and the figures are reddiſh; theſe form three large and broad bands, ſurrounding the ſhell at top and bottom, and in the middle; and between theſe there are ſeveral ſeries of ſmall ſpots. It is a ſcarce ſhell, and uſually ſells at a large price.

Concha *Veneris*, in *Natural Hiſtory*, the name by which ſeveral ſpecies of CHAMA are called. The ſhell is univalve, wreathed, and has a ſmall longitudinal and denticulated chink, or aperture, in it. It is alſo called *concha porcellana*, from its aperture in ſome meaſure reſembling the mouth of a hog; and *concha Erythræa*, from its being found in the Red Sea, called *Erythræum*. It is alſo called *concha Cytheriaca*, from Venus, who received the epithet *Cytheræa*, from Cythera, a Grecian iſland. That this fiſh was uſed by the ancients as an aliment, we read in Seneca, Ep. 95. Mundius aſſerts that they prove a ſtimulus to venery, and provoke urine. Rondeletius informs us, that theſe ſhells are an ingredient in the *pillulæ de bdellio*, for removing fluxes, and curing ulcers in the uterus. But inſtead of the *concha venerea*, the apothecaries generally uſe cockles. Excellent dentrifices are prepared from this ſhell, which is alſo uſed for curing ulcers in the canthus of the eye, and the *fiſtula lachrymalis*. It is remarkably drying, without exciting any heat.

The powder of theſe ſhells muſt be owned to poſſeſs an abſorbent drying quality; but that on account of their beauty, or any other circumſtance, their powder is preferable to that of other ſhells, is by no means probable.

CONCHITES *marmor*, a name given by the ancients to a ſpecies of marble dug near Megara, and remarkable for containing a great number of ſea-ſhells, and other marine bodies immerſed in it.

CONCHOID, or **Conchilis**, in *Geometry*, a curve line which always approaches nearer a ſtrait line to which it is inclined, but never meets it.

It is deſcribed thus: draw a right line BD (*Tab. Analyſis*, *fig.* 1.) and another AC, perpendicular to it in E; draw any number of right lines, as CM, CM, cutting BD in Q; make $QM=QN=AE=EF$; the curve wherein the points MM are found, is the *conchilis*, or *conchois prima*; ſo called by its inventor Nicomedes. The other, wherein the points NN are found, is the *conchois ſecunda*; the right line BD the *rule*, the point C the *pole*. The inventor alſo contrived an inſtrument, whereby the firſt *conchois* may be deſcribed mechanically: thus, in the rule AD (*Tab. Analyſis*, *fig.* 2.) is a channel or groove cut, ſo that a ſmooth nail, firmly fixed in the moveable rule CB, in the point F, may ſlide freely within it: into the rule EG is fixed another nail in K, for the moveable rule CB to ſlide upon.

If then the rule BC be ſo moved, as that the nail F paſſes along the canal AD; the ſtyle, or point in C, will deſcribe the firſt *conchoid*.

Now let $AP=x$ (*fig.* 1.); $AE=a$; $PE=MR=a-x$; wherefore, as x increaſes, $a-x$, or MR will decreaſe; and therefore the curve continually approaches nearer to the rule BD.

In the ſame manner it appears, that the right line NO muſt continually decreaſe; and therefore that the ſecond *conchoid*, alſo, muſt continually approach nearer the rule. But inaſmuch as between each *conchoid* and the right line BD, there will be the right line QM or QN, equal to AE; neither of the *conchoids* can concur with the right line BD: conſequently, B is an aſymptote of each *conchoid*. See ASYMPTOTE.

There will be other kinds of *conchoids* produced, if $CE : CQ :: QM : AE$; or indefinitely, if $CE^m : CQ^m :: QM^m : AE^m$: wherefore, if $CE=b$, $EA=a$, $CQ=x$, $QM=y$; then $ab=xy$; and for infinite *conchoids*, $a^m b^m=x^m y^m$.

CONCHYLIA. See SHELL-*fiſh*.

CONCIATOR, in the *Glaſs Art*, is for the cryſtal glaſs what the founder is at the green glaſs-houſes. He is the perſon that weighs and proportions the ſalt on aſhes and ſand, and works them with a ſtrong fire, till they run into lumps, and become white; and if the metal be too hard, and conſequently brittle, he adds ſalt, or aſhes; and if too ſoft, ſand; ſtill mixing them to a fit temper, which is only known by the working.

CONCILIO—*Querela coram rege & Concilio.* See QUERELA.

CONCINNOUS *intervals*, in *Muſic*. See INTERVALS.

CONCLAMATIO, in *Antiquity*, a ſhout raiſed by thoſe preſent at burning the dead, before they ſet fire to the funeral pile. See SHOUT. The word was alſo applied to the ſignal given to the Roman ſoldiers to decamp, whence the expreſſion *conclamare vaſa*; and *conclamari arma*, was a ſignal for battle. It was likewiſe uſed for a practice of calling to a perſon deceaſed three times by his name, and when no reply was returned, they thus expreſſed his deceaſe, *conclamatum eſt*. Whence the ſame term was afterwards applied to the ceſſation of the Roman empire.

CONCLAVE, an aſſembly, or meeting of all the cardinals that are at Rome, ſhut up for the ELECTION of a POPE.

The *conclave* had its riſe in the year 1270, and on this occaſion: Clement IV. being dead at Viterbo, in 1268, the cardinals were two years without being able to agree on the election of a ſucceſſor: in effect, things were carried to ſuch paſs, that they were upon the point of breaking up, without coming to any concluſion at all.

The inhabitants of Viterbo, then, being appriſed of their deſign, by the advice of St. Bonaventure, then at Viterbo, ſhut the gates of their city, and locked up the cardinals in the pontifical palace adjoining to the cathedral, till they were brought to a better underſtanding.

Hence aroſe the cuſtom which has ſince prevailed, of ſhutting up the cardinals in a ſingle palace, till they have elected the pope.

Such was the origin of the *conclave*, as related by Onuph. Panvinius, Ciaconius, and Papebroch.

CONCLAVE is alſo uſed for the place wherein the election of the pope is performed; which is, now, at St. Peter's in the Vatican; though Gregory X. and Clement V. appointed it ſhould always be held in the place where the laſt pope ſhould die.

While the affair is in hand, if it be in winter, the walls and windows are all mured up, excepting only a ſingle pane, to give a little light: in ſummer the windows are not cloſed; but the great door of the hall is ſecured with four locks, and four bolts; an aperture being, however, left, through which to ſupply the impriſoned prelates with victuals.

In the hall, which is very ample, there are cells or ſtalls erected for as many cardinals as are to be preſent at the election; the cells being only ſeparated by deal boards.

The cells are marked with letters of the alphabet, and are diſtributed to the cardinals by lot: each cardinal puts his arms on the cell that falls to his ſhare.

After the aſſembly has continued three days, they are only allowed one diſh for a meal; and after fifteen days more, only bread and water: though this rule is not very ſtrictly regarded.

Each cardinal is allowed two *conclaviſts*, or ſervants to attend him, and to be ſhut up with him.

The election is begun ten days after the pope's deceaſe, and decided by a majority of two parts in three of the cardinals preſent.

Theſe regulations were principally eſtabliſhed by Gregory X. in 1274, and Clement VI. in 1351.

Matthew Paris ſays, the word *conclave* anciently ſignified the pope's wardrobe.

It is a popular proverb in Italy, *chi entra papa, eſce cardinale*; he who enters pope, comes out cardinal; q. d. he who according to common report will be elected pope, ordinarily is not.

CONCLUSION, in *Law*, is where a man by his own act upon record hath charged himſelf with a duty or other thing, or confeſſed any matter whereby he ſhall be *concluded*: as if a ſheriff returns that he hath taken the body upon a *capias*, and hath not the body in court, at the day of the return of the writ; by the return, the ſheriff is concluded from plea of eſcape, &c. *Terms de Ley*, 153, &c. In another ſenſe the word *concluſion* ſignifies the end of any plea, replication, &c. and a plea to the writ, is to *conclude* to the writ; a plea in bar, to *conclude* to the action, &c. *Concluſion* of plea in bar ſhall be, *et hoc paratus eſt verificare*:—of other pleas *et de hoc ponit ſe ſuper patriam.* Kitch. 219, 220.

CONCLUSION, in *Logic*, the laſt part of an argument; or the conſequence drawn from ſomething either aſſumed or proved before.

The *concluſion* of an argument contains two parts: the *conſequent*, which is the matter of it; and the *conſequence*, which is its form, and which, of a ſimple abſolute propoſition, renders the *concluſion* relative to the premiſes whence it is drawn.

The queſtion, and *concluſion*, ſay the ſchoolmen, are the ſame ideas, only conſidered in different views, or relations: in the queſtion they are conſidered as doubtful; in the *concluſion* as void of doubt.

CONCLUSION, in oratory, conſiſts of two parts; the RECAPITULATION, or ENUMERATION, and the PASSIONS.

CONCLUSIVE *Conjunctions*. See CONJUNCTION.

CONCOCTION, in *Medicine*, the change which the food undergoes in the ſtomach, &c. to become chyle.

This change conſiſts in deſtroying the texture and coheſion of the parts of the food; preparing part of it for ſome particular ſervice of the animal frame, and the reſt to be carried off as excrements, by proper emunctories.

The ancients gave the term COCTION, or *concoction*, to what we now ordinarily call *digeſtion*; from a notion of the food's being, as it were, boiled in the ſtomach; and its nutritious juice expreſſed by the heat of the adjacent parts.

They aſſigned two *concoctions*, viz. one in the ſtomach, and a ſecond in the ſmall inteſtines, &c. which latter they attributed to the admixture of the bile and pancreatic juice.

The *concoction* of the aliments in the ſtomach, is their DIGESTION, or reduction to a ſort of emulſion or chyle.

By the *concoction* of the humours, the writers of inſtitutes mean, the reduction of the chyle to blood, which is called the ſecond *concoction*; and alſo the ſeparation of any fluid from the blood, by means of glands deſtined for this uſe, which is called the third *concoction*.

It is commonly ſaid that the faults ariſing from any defect in the firſt *concoction*, are not mended in the ſecond, nor thoſe from the ſecond by the third; that is when the aliment is not ſufficiently comminuted in the organs of digeſtion, the particles of the chyle are not ſmall enough to circulate regularly through the minute veſſels of the lungs, and be converted into good blood: it not being poſſible for the organs of ſanguification to diſſolve farther the particles they receive from the ſtomach. Hence theſe particles being too large to circulate through the capillary arteries, obſtructions and all their conſequences proceed. And the third *concoction*, that is in the glands, is not better adapted to the farther diſſolution of theſe particles, than the ſecond. James's Medical Dict. art. Coction.

The ſeveral *concoctions* in the body, with regard to the propagation of the ſpecies, and the preſervation of the individual, have been ſince reduced to five: thoſe are CHYLOSIS for chyle, CHYMOSIS for chyme, HÆMATOSIS for blood, PNEUMATOSIS for ſpirits, and SPERMATOSIS for ſeed.

CONCOMITANT, in *Theology*, ſomething that accompanies, or goes along with, another.

Concomitant grace, is that which God affords us during the courſe of our actions to enable us to perform them; and as the Roman ſchoolmen ſay, to render them meritorious.

CONCOMITANT *Neceſſity*. See NECESSITY.

CONCORD, *Form of*, in *Eccleſiaſtical Hiſtory*, a ſtandard-book among the Lutherans, compoſed at Torgaw, in 1576, and thence called the Book of Torgaw, and reviewed at Berg, by ſix Lutheran doctors of Germany, the principal of whom was James Andreæ. This book contains in two parts, a ſyſtem of doctrine, the ſubſcription of which was a condition of communion, and a formal and very ſevere condemnation of all who differed from the compilers of it, particularly with reſpect to the majeſty and omnipreſence of Chriſt's body, and the real manducation of his fleſh and blood in the euchariſt. It was firſt impoſed on the Saxons by Auguſtus, and occaſioned great oppoſition and diſturbance, both among the Lutherans and reformed. The diſpute about it was revived in Switzerland in 1718, when the magiſtrates of Bern publiſhed an order for adopting it as the rule of faith; the conſequence of which was a conteſt, that reduced its credit and authority. Moſheim's Eccl. Hiſt. by Dr. Maclaine, vol. iv. p. 53, &c. and vol. v. p. 98.

CONCORD, in *Grammar*, that part of ſyntax, or conſtruction, whereby the words of a ſentence agree among themſelves, i. e. whereby nouns are put in the ſame caſe, number, gender, &c. and verbs in the ſame number and perſon, with nouns and pronouns.

The rules of *concord* are generally the ſame in all languages, as being of the nature of what is in uſe almoſt every-where, for the better diſtinguiſhing of diſcourſe.

Thus, the diſtinction of the two numbers ſingular and plural, obliges us to make the adjective agree with the ſubſtantive in number; that is, to put the one either in this or that number, according as the other is: for the ſubſtantive being the thing confuſedly, though directly, marked by the adjective; if the ſubſtantive word mark ſeveral, there are ſeveral ſubjects of the form marked by the adjective, and of conſequence this ſhould be in the plural; as *homines docti*, &c.

Again, the diſtinction of maſculine, and feminine, renders it neceſſary to put the ſubſtantive and adjective in the ſame degree.

And verbs ſhould have *concord* or agreement with nouns and pronouns in number and perſon.

If any thing occur apparently contrary to thoſe rules, it is by a figure; i. e. ſomething is implied, or the ideas are conſidered more than the words themſelves.

Concord, in *Law*, is the agreement between two parties who intend the levying a fine of lands to one another, how and in what manner it ſhall paſs.

Concord is alſo an agreement made upon any treſpaſs committed (betwixt two, or more); and is divided into *concord executory*, and *concord executed.*

Plowden obſerves, that the firſt binds not, being imperfect; but the latter is perfect, and binds the party.

Others are of opinion, that *concords* executory are perfect, and bind no leſs than thoſe executed.

Concord, in *Muſic*, denotes the relation of two ſounds which are always agreeable to the ear, whether applied in ſucceſſion or conſonance.

If two ſingle ſounds be in ſuch a relation, or have ſuch a difference of tune, as that, being ſounded together, they make a mixture, or compound ſound, which affects the ear with pleaſure; that relation is called *concord:* and whatever two ſounds make an agreeable compound in conſonance, thoſe ſame will always be pleaſing, in ſucceſſion, or will follow each other agreeably.

The reverſe of CONCORD, is what we call a DISCORD; which is a denomination of all the relations or differences of tune that have a diſpleaſing effect.

Concord and harmony are, in effect, the ſame thing; though cuſtom has applied them differently. As *concord* expreſſes the agreeable effect of two ſounds in conſonance: ſo harmony expreſſes the ſame ſort of agreement in a great number of ſounds in conſonance: add, that harmony always implies conſonance; but *concord* is ſometimes applied to ſucceſſion: though never but when the terms will make an agreeable conſonance: whence it is that Dr. Holder, and ſome other writers, uſe the word *conſonance* for what we call *concord.*

Uniſonance, then, being the relation of equality between the tunes of two ſounds, all the uniſons are *concords*, and in the firſt degree: but an interval being a difference of tune, or a relation of inequality between two ſounds, becomes a *concord* or diſcord, according to the circumſtances of that particular relation. Indeed, ſome reſtrain *concord* to intervals, and make a difference of tune eſſential thereto; but that is precarious: and Mr. Malcolm thinks, that as the word implies *agreement*, it is applicable to uniſon in the firſt degree.

It is not eaſy to affirm the reaſon or foundation of *concordance:* the difference of tune, we have elſewhere obſerved, take their riſe from the different proportions of the vibrations of the ſonorous body, i. e of the velocity of thoſe vibrations in their recourſes; the more frequent thoſe recourſes are, the more acute will be the tune, and *vice verſa.*

But the eſſential difference between *concord* and diſcord lies deeper: there does not appear any natural aptitude in the two ſounds of a *concord*, to determine it to give us a pleaſing ſenſation, more than in the two ſounds of a diſcord: theſe different effects are merely arbitrary, and muſt be reſolved into the divine pleaſure.

We know by experience what proportions and relations of tune afford pleaſure, and what do not; and we know alſo how to expreſs the difference of tune by the proportion of numbers; we know what it is pleaſes us, though we do not know why: we know, v. gr. that the ratio of 1 : 2 conſtitutes *concord*, and 6 : 7 diſcord; but on what original grounds agreeable or diſagreeable ideas are connected with thoſe relations, and the proper influence of the one on the other, is above our reach.

By experience we know, that the following ratios of the lengths of chords are all *concord*; viz. 2 : 1, 3 : 2, 4 : 3, 5 : 4, 6 : 5, 5 : 3, 8 : 5; that is, take any chord for a fundamental, which ſhall be repreſented by the number 1, and the following diviſions thereof will be all *concord* with the whole; viz. $\frac{1.2.3.4.5.3.5}{2.3.4.5.6.5.8}$

So that the diſtinguiſhing character between *concords* and diſcords muſt be looked for in theſe numbers, expreſſing the intervals of ſound; not abſtractedly, and in themſelves, but as expreſſing the number of vibrations. Now, uniſons are in the firſt degree of *concord*, or they have the moſt perfect likeneſs or agreement in tune; and therefore have ſomething in them acceſſory to that agreement which is found, leſs or more, in every *concord:* but it is not true, that the nearer two ſounds come to an equality of tune, the more agreement they have; therefore, it is not in the equality or inequality of the numbers that this agreement lies.

Further, if we conſider the number of vibrations made in any given time by two chords of equal tune; on the principle laid down, they are equal: and therefore the vibrations of the two chords coincide, or commence together as frequently as poſſible, i. e. they coincide at every vibration; in the frequency of which coincidence, or united mixture of the motions of the two chords, and of the undulations of the air occaſioned thereby, it is, that the difference of *concord* and diſcord muſt be ſought. Now, the nearer the vibrations of two ſtrings approach to a coincidence as frequent as poſſible, the nearer they ſhould approach that condition, and conſequently the agreement, of uniſons; which is confirmed by experience.

For if we take the natural ſeries 1, 2, 3, 4, 5, 6, and compare each number to the next, as expreſſing the number of vibrations in the ſame time of two chords, whoſe lengths are reciprocally as thoſe numbers; the rule will be found exact, for 1 : 2 is beſt, then 2 : 3; after 6 the conſonance is unſufferable; the coincidences being too rare: though there are other ratios that are agreeable, beſides thoſe found in that continued order, viz. 3 : 5, and 5 : 8, which, with the preceding five, are all the *concording* intervals within, or leſs than an octave, or 1 : 2; that is, whoſe acuteſt term is greater than half the fundamental.

On this principle, 3 : 5 will be preferable to 4 : 5; becauſe thoſe being equal in the number of vibrations of the acuter term, there is an advantage on the ſide of the fundamental in the ratio 3 : 5, where the coincidence is made at every third vibration of the fundamental, and every fifth of the acute term: ſo alſo the ratio 5 : 8 is leſs perfect than 5 : 6; becauſe, though the vibrations of each fundamental that go to one coincidence are equal; yet in the ratio 5 : 6, the coincidence is at every ſixth of the acute term, and only at every eighth in the other caſe.

Thus, we have a rule for judging of the preference of *concords*, from the coincidence of their vibrations: agreeable to which rule, they are diſpoſed into the order of the following table; to which the names of the *concords* in practice, the ratio of their vibrations, the lengths of the chords, and the number of coincidences in the ſame, are expreſſed.

Ratios, or vibrations.

	Grave Term.		Acute Term.	Coincid.
Uniſon	1	:	1	
Octave, 8ve	2	:	1	60
Fifth, 5th	3	:	2	30
Fourth, 4th	4	:	3	20
Sixth, gr.	5	:	3	20
Third, gr.	5	:	4	15
Third, leſſer	6	:	5	12
Sixth, leſſer	8	:	5	12
	Grave		Acute	
	Lengths.			

Though this order be ſettled by reaſon, yet it is confirmed by the ear. On this foundation, *concords* muſt ſtill be the more perfect, as they have the greateſt number of coincidences, with regard to the number of vibrations in both the chords; and where the coincidences are equal, the preference will fall on that interval, whoſe acuteſt term has feweſt vibrations to each coincidence: which rule, however, is in ſome caſes contrary to experience; and yet it is the only rule hitherto diſcovered.

F. Merſenne, indeed, after Kircher, gives us another ſtandard for ſettling the comparative perfection of intervals with regard to the agreement of their extremes in tune: and it is this.

The perception of *concordance*, ſay they, is nothing but the comparing two or more different motions which in the ſame time affect the auditory nerve: now we cannot make a certain judgment of any conſonance, till the air be as oft ſtruck in the ſame time by two chords, as there are units in each member expreſſing the ratio of that *concord*; v. gr. we cannot perceive a fifth, till two vibrations of the one chord, and three of the other, are accompliſhed together; which chords are in length as 3 to 2: the rule then is, that thoſe *concords* are the moſt ſimple and agreeable, which are generated in the leaſt time; and thoſe, on the contrary, the moſt compound and harſh, which are generated in the longeſt time.

For inſtance, let 1, 2, 3, be the lengths of 3 chords, 1 : 2 is an octave; 2 : 3 a fifth; and 1 : 3 an octave and fifth compounded, or a twelfth. The vibrations of chords being reciprocally as their lengths, the chord 2 will neceſſarily vibrate once, while the chord 1 vibrates twice, and then exiſts an octave; but the twelfth does not yet exiſt, becauſe the chord 3 has not vibrated once, nor the chord 1 thrice, which is neceſſary to form a twelfth.

Again, for generating a fifth, the chord 2 muſt vibrate thrice, and the chord 3 twice; in which time, the chord 1 will have vibrated 6 times; and thus the octave will be thrice produced, while the twelfth is only produced twice; the chord 2 uniting its vibrations ſooner with the chord 1, than with the chord 3; and they being ſooner conſonant than the chord 1 or 2 with that 3. Whence, that author obſerves, many of the myſteries of harmony, relating to the performance of harmonious intervals, and their ſucceſſion, are eaſily deduced.

But this rule, upon examining it by other inſtances, Mr. Malcolm has ſhewn defective, as it does not anſwer in all poſitions of the intervals with reſpect to each other; but a certain order, wherein they are to be taken, being required: and there being no rule, with reſpect to the order, that will make this ſtandard anſwer to experience in every caſe: ſo that at laſt we are left to determine the degrees of *concord* by experience and the ear.

Not but that the degrees of *concord* depend much on the more or leſs frequent uniting the vibrations, and the ear's being more or leſs uniformly moved, as above; for that this mixture or union in motion is the true principle, or, at leaſt, the chief ingredient in *concord*, is very evident: but becauſe there ſeems to be ſomething farther in the proportion of the two motions, neceſſary to be known, in order to fix a catholic rule for determining all the degrees of *concord*, agreeable to ſenſe and experience.

The reſult of the whole doctrine is ſummed up in this definition.—*Concord* is the reſult of a frequent union, or coincidence of the vibrations of two ſonorous bodies, and, by conſequence, of the undulating motions of the air, which, being cauſed by theſe vibrations, are like and proportionable to them; which coincidence, the more frequent it is, with regard to the number of vibrations of both bodies, performed in the ſame time, *cæteris paribus*, the more perfect is that *concord*: till the rarity of the coincidence, in reſpect of one or both the motions, produces diſcord. *See ſome of the remarkable phænomena of ſounds accounted for from this theory, under the word* UNISON; ſee alſo INTERVAL, &c.

Mr. Carre, in the Memoirs of the Royal Academy of Sciences, lays down a new general propoſition, to determine the proportion which cylinders are to have, in order to form the *concords* or conſonances of muſic. And it is this—that the ſolid cylinders, whoſe ſounds yield thoſe *concords*, are in a triplicate and inverſe ratio of that of the numbers which expreſs the ſame *concords*.

Suppoſe, e. gr. two cylinders, the diameters of whoſe baſes and lengths are as 3 to 2; it is evident their ſolidities will be in the ratio of 27 to 8, which is the triplicate ratio of 3 to 2: we ſay then, that the ſounds of thoſe two cylinders will produce a fifth, which is expreſſed by thoſe numbers; and that the biggeſt and longeſt will yield the grave ſound, and the ſmalleſt the acute one.—And the like of others.

Concords are divided into *ſimple*, or original, and *compound*.

A *ſimple*, or *original concord*, is that whoſe extremes are at a diſtance leſs than the ſum of any two other *concords*.

On the contrary, a *compound concord* is equal to two or more *concords*.

Other muſical writers ſtate the diviſion thus: an octave 1 : 2 and all the inferior *concords* above expreſſed, are all ſimple and original *concords*: and all greater than an octave, are called *compound concords*; as being compoſed of, and equal to the ſum of one or more octaves, and ſome ſingle *concord* leſs than an octave; and are uſually, in practice, denominated from that ſimple *concord*.

As to the compoſition and relations of the original concords, by applying to them the rules of the addition and ſubtraction of intervals, they will be divided into *ſimple* and *compound*, according to the firſt and more general notion; as in the following table.

Simple *Concords*.	Compound *Concords*			
5 : 6 a 3d leſſ.	5th	3d g. and 3d l.	8ve. compoſed of	5th 4th or 6th g. 3d l. or 3d g. 3d l. 4th.
4 : 5 a 3d gr.	6th l.	4th 3d l.		
3 : 4 a 4th.	6th g.	4th. 3 g		

The octave is not only the firſt *concord* in point of perfection, the agreement of whoſe extremes is greateſt, and the neareſt to uniſon; inſomuch that, when founded together, it is impoſſible to perceive two different ſounds; but it is alſo the greateſt interval of the ſeven original *concords*; and, as ſuch, it contains all the leſſer, which derive their ſweetneſs from it, as they ariſe more or leſs directly out of it; and which decreaſe gradually, from the octave to the leſſer ſixth, which has but a ſmall degree of *concord*.

What is very remarkable, is the manner wherein theſe leſſer *concords* are found in the octave, which ſhews their mutual dependencies.

For, by taking both an harmonical and arithmetical mean between the extremes of the octave, and then both an harmonical and arithmetical mean betwixt each extreme, and the moſt diſtant of the two means laſt found; viz. betwixt the leſſer extreme and the firſt arithmetical mean, and betwixt the greater extreme and the firſt harmonical mean; we have all the leſſer *concords*.

Thus, if betwixt 360 and 180 the extremes of octave, we take an arithmetical mean, it is 270; and an harmonical mean is 240: then, betwixt 360 the greateſt extreme, and 240 the harmonical mean, take an arithmetical mean, it is 300; and an harmonical mean, is 288. Again, betwixt 180 the leſſer extreme of the octave, and 270 the firſt arithmetical mean, it is 225, and an harmonical one 216.

Thus have we a ſeries of all the *concords*, both aſcending towards acuteneſs from a common fundamental, 360; and deſcending towards gravity from a common acute term 180: which ſeries has this property, that taking the two extremes, and any other two at equal diſtances, the four will be in geometrical proportion.

The octave, by immediate diviſion, reſolves itſelf into a fourth and fifth; the fifth, again, by immediate diviſion, produces the two thirds; the two thirds are therefore found by diviſion, though not by immediate diviſion: and the ſame is true of the two ſixths. Thus do all the original *concords* ariſe out of the diviſion of the octave; the fifths and fourths immediately and directly, the thirds and ſixths mediately.

From the perfection of the octave ariſes this remarkable property, that it may be doubled, tripled, &c. and yet ſtill will perſevere a *concord*, i. e. the ſum of two or more octaves are *concord*; though the more compound will be gradually leſs agreeable: but it is not ſo with any other *concord* leſs than octave; the doubles, &c. whereof are all diſcords.

Again, whatever ſound is *concord* to one extreme of the octave is *concord* to the other alſo: and if we add any other ſimple *concord* to an octave, it agrees to both its extremes; to the neareſt extreme it is a ſimple *concord*, and to the fartheſt a compound one.

Another thing obſervable in this ſyſtem of *concords*, is, that the greateſt number of vibrations of the fundamental cannot exceed five; or that there is no *concord* where the fundamental makes more than five vibrations, to one coincidence with the acute term. It may be added, that this progreſs of the *concords* may be carried on to greater degrees of compoſition, even *in infinitum*; but ſtill the more compound, the leſs agreeable.

So a ſingle octave is better than a double one, and that than a triple one; and ſo of fifths, and other *concords*. Three or four octaves is the greateſt length we go in ordinary practice: the old ſcales went but to two; no voice or inſtrument will well go above four. See THIRD, FOURTH, and FIFTH.

CONCORDANCE, a dictionary or index to the Bible, wherein all the leading words, uſed in the courſe of the inſpired writings, are ranged alphabetically; and the various places where they occur referred to; to aſſiſt in finding out paſſages, and comparing the ſeveral ſignifications of the ſame word.

Cardinal Hugo de St. Charo is ſaid to have employed five hundred monks at the ſame time in compiling a Latin *concordance*: beſide which, we have ſeveral other *concordances* in the ſame language; one, in particular, called the *concordance* of England, compiled by J. Darlington, of the order of Predicants; another more accurate one, by the Jeſuit de Zamora.

R. Mordecai Nathan has furniſhed us with a Hebrew *concordance*, firſt printed at Venice in 1523, containing all the Hebrew roots branched into their various ſignifications, and under each ſignification all the places in ſcripture wherein it occurs: but the beſt and moſt uſeful Hebrew *concordance* is that of Buxtorf, printed at Baſil in 1632.

Dr. Taylor, publiſhed in 1754, a Hebrew *concordance* in two volumes folio, adapted to the Engliſh Bible, and diſpoſed after the manner of Buxtorf. See the preface of this work.

The Greek *concordances* are only for the New Teſtament: indeed we have one of Conr. Kircher's on the Old; but this is rather a concordantial dictionary than a *concordance*;

ance; containing all the Hebrew words in an alphabetical order; and underneath, all the interpretations or ſenſes the LXX. give them; and in each interpretation, all the places where they occur in that verſion.

In 1718, Trommius publiſhed his Greek *concordance* for the Septuagint at Amſterdam, in two volumes folio; and Schmidius improving on a ſimilar work of H. Stephen, has given an excellent Greek *concordance* for the New Teſtament, the beſt edition of which is that of Leipſic, an. 1717.

Calaſius, an Italian Cordelier, has given us *concordances* of the Hebrew, Latin, and Greek, in two columns: the firſt, which is Hebrew, is that of R. Mordecai Nathan, word for word, and according to the order of the books and chapters: in the other column is a Latin interpretation of each paſſage of Scripture quoted by R. Mordecai; this interpretation is Calaſius's own; but in the margin he adds that of the LXX. and the Vulgate, when different from his. The work is in four volumes folio, printed at Rome in 1621.

We have ſeveral very copious *concordances* in Engliſh; as Newman's, &c. but the laſt and beſt eſteemed, is that in 4to. by Alex. Cruden.

CONCORDANT *Verſes*, ſuch as have ſeveral words in common; but which, by the addition of other words, convey an oppoſite, at leaſt, a different meaning. Such are thoſe,

$$\textit{Et}\left\{\begin{array}{l}\textit{Canis}\\ \textit{Lupus}\end{array}\right\}\textit{in ſilva}\left\{\begin{array}{l}\textit{venatur}\\ \textit{nutritur}\end{array}\right\}\textit{\& omnia}\left\{\begin{array}{l}\textit{ſervat.}\\ \textit{vaſtat.}\end{array}\right.$$

CONCORDAT, in the *Canon Law*, denotes a covenant, or agreement concerning ſome beneficiary matter, as a reſignation, permutation, promotion, or the like.

The council of Trent, ſeſſ. vi. *de reform.* cap. 4. ſpeaking of *concordats* made without the authority and approbation of the pope, calls them *concordias quæ tantum ſuos obligant auctores, non ſucceſſores*. And the congregation of cardinals, who have explained this decree, declares alſo, that a *concordat* cannot be valid ſo as to bind ſucceſſors, unleſs confirmed by the pope.

Concordat is alſo uſed, abſolutely, among the French, for an agreement concluded at Bologna in 1516, between pope Leo X. and Francis I. of France, for regulating the manner of nominating to benefices.

The *concordat* ſerves in lieu of the Pragmatic *ſanction*, which has been abrogated; or, rather, it is the pragmatic ſanction ſoftened and reformed.

The *concordat* between the pope and the republic of Venice reſembles the former.

There is alſo a German *concordat*, made between the emperor Frederic III. and the princes of Germany, in 1448, relating to beneficiary matters, confirmed by pope Nicholas V.

CONCOU, in *Botany*, a name given by the people of Guinea to an herb which is in great eſteem with them for killing that troubleſome ſort of worm called the Guinea-worm, which breeds in their fleſh. They bruiſe the leaves, and, mixing them with oil, apply them in form of a cataplaſm. The leaves of this ſhrub ſomewhat reſemble thoſe of the caggow, but they are thicker and ſtiffer, and are not ſo full of veins. They are broadeſt within one third of the baſe, and from thence they go tapering to each end. They are placed on long footſtalks of a fine green throughout. Phil. Tranſ. N° 232.

CONCOURSE, or Concurrence, the reciprocal action of divers perſons, or things, co-operating toward the ſame effect, or end.

The ſchoolmen diſtinguiſh two kinds of *concurrence*; viz. *mediate*, which conſiſts in giving a power or faculty to act; and *immediate*, which is a contemporary influence of one cauſe along with another, to produce an effect — Thus, the grandfather *concurs mediately* to the production of a grandſon, as he originally gives the power of generating to the father; but the father *concurs immediately* with the mother to the production of the ſame child.

With reſpect to the agency of God, ſome divines maintain both theſe kinds of concurrence; others deny the latter. See Cause.

Concourse, *Point of.* See Focus.

CONCRETE, in the *School Philoſophy*, an aſſemblage, or compound.

Concrete, *Phyſical*, or a Concrete *body*, may denote any mixed body, or body compoſed of different principles; and conſequently, all ſenſible bodies whatever, as all bodies ariſe from a coalition of divers elements, or at leaſt of divers principles, matter, and form.

But, in ſtrictneſs, *concrete* is only uſed for thoſe compounds wherein the ingredients ſtill retain their diſtinct natures, nor are wholly converted into any new common nature.

Authors diſtinguiſh *natural concretes* and *artificial* ones: antimony is a *natural concrete*, and ſoap a *factitious concrete*.

Concrete *Juices*. See Juices.

Concrete, *Logical*, or a Concrete *word*, called alſo *paronymum*, is that which has a compound ſignification, as denoting both the ſubject, and ſome quality or accident of the ſubject, which gives it its denomination.

Such, e. gr. are *man*, *learned*, *white*; for *man* ſignifies as much as *having human nature*; *learned*, as much as *having learning*, &c. Hence, the word *concrete* is chiefly uſed to expreſs the union of qualities or quantities with the bodies or ſubjects, without any ſeparation, even in idea.

The oppoſite term, whereby things are ſeparated in thought, is *abſtract*.

Concrete properly ſignifies a ſubject accompanied with its form or quality; as *pious*, *hard*, *white*: *abſtract*, on the contrary, expreſſes the form and quality without the ſubject, as *piety*, *hardneſs*, *whiteneſs*.

Concrete *Numbers*, are thoſe which are applied to expreſs or denote any particular ſubject: as, two men, three pounds, two thirds of a ſhilling, &c.

Whereas, if nothing be connected with a number, it is taken abſtractedly or univerſally: thus, three ſignifies only an aggregate of three units; let thoſe units be men, pounds, or what you pleaſe.

CONCRETION, the act whereby ſoft bodies are rendered hard; or, an inſenſible motion of the particles of a fluid or ſoft body, whereby they come to a conſiſtence.

The word is uſed indifferently for *induration*, *condenſation*, *congelation*, and *coagulation*.

Concretion is alſo uſed for the coalition of ſeveral little particles into a ſenſible maſs, called a concrete; by virtue of which union, the body acquires this or that figure, and theſe or thoſe properties.

CONCUBINAGE ſometimes expreſſes a criminal, or prohibited commerce between the two ſexes; in which ſenſe it comprehends *adultery*, *inceſt*, and *ſimple fornication*.

In its more reſtrained ſenſe, *concubinage* is uſed for a man's and a woman's cohabiting together in the way of marriage; without having paſſed the ceremony thereof.

Concubinage was anciently tolerated: the Roman law calls it an allowed cuſtom, *licita conſuetudo*. When this expreſſion occurs in the conſtitutions of the Chriſtian emperors, it ſignifies what we now call a *marriage in conſcience*.

The *concubinage* tolerated among the Romans in the time of the republic, and of the heathen emperors, was that between perſons not capable of contracting marriage together: nor did they even refuſe to let inheritances deſcend to children which ſprung from ſuch a tolerated cohabitance.

Concubinage between ſuch perſons they looked on as a kind of marriage, and even allowed it ſeveral privileges: but then this *concubinage* was confined to a ſingle perſon, and was of perpetual obligation, as much as marriage itſelf.

Hottoman obſerves, that the Roman laws had allowed of *concubinage* long before Julius Cæſar made that law whereby every one was allowed to marry as many wives as he pleaſed. The emperor Valentinian, Socrates tells us, allowed every man two.

Concubinage is alſo uſed for a marriage performed with leſs ſolemnity than the formal marriage; or a marriage with a woman of inferior condition, and to whom the huſband does not convey his rank, or quality.

Cujas obſerves, that the ancient laws allowed a man to eſpouſe, under the title of *concubine*, certain perſons, ſuch as were eſteemed unequal to him, on account of the want of ſome qualities requiſite to ſuſtain the full honour of marriage. He adds, that though *concubinage* was beneath marriage, both as to dignity, and civil effects; yet was *concubine* a reputable title, very different from that of *miſtreſs* among us.

The commerce was eſteemed ſo lawful, that the *concubine* might be accuſed of adultery in the ſame manner as a wife.

This kind of *concubinage* is ſtill in uſe in ſome countries, particularly in Germany, under the title of a *half-marriage*, *morgengabic marriage*, or *marriage with the left-hand*; alluding to the manner of its being contracted, viz. by the man's giving the woman his left-hand inſtead of the right.

This is a real marriage, though without ſolemnity: the parties are both bound for ever; though the woman be thus excluded from the common rights of a wife, for want of quality or fortune.

The children of *concubines* were not reputed either legitimate or baſtards, but natural children, and were capable only of donations.

They were deemed to retain the low rank of the mother; and were on this ground unqualified for inheriting the effects of the father.

Concubinage, in a *Legal Senſe*, is uſed as an exception againſt her that ſueth for dower, alleging thereby, that ſhe was not a wife lawfully married to the party, in whoſe lands ſhe ſeeks to be endowed, but his *concubine.*

CONCUBINE, a woman whom a perſon takes to cohabit with him, in the manner, and under the character, of a wife, without being authorized thereto by a legal marriage.

Concubine is alſo uſed for a real, legitimate, and only wife, diſtinguiſhed by no other circumſtance but a diſparity of birth or condition between her and the huſband. Du Cange obſerves, that one may gather from ſeveral paſſages in the epiſtles of the popes, that they anciently allowed of ſuch *concubines.* The ſeventeenth canon of the firſt council of Toledo declares, that he, who with a faithful wife, keeps a *concubine*, is excommunicated; but that if the *concubine* ſerved him as a wife, ſo that he had only one woman, under the title of *concubine*, he ſhould not be rejected from communion: which ſhews that there were legitimate wives under the title of *concubines.*

In effect, the Roman laws did not allow a man to eſpouſe whom he pleaſed; there was required a kind of parity, or proportion, between the conditions of the contracting parties: but a woman of inferior condition, who could not be eſpouſed as a wife, might be kept as a *concubine*; and the laws allowed of it, provided the man had no other wife.

It is certain the patriarchs had a great number of wives, and that theſe did not all hold the ſame rank; ſome being ſubaltern to the principal wife; which were what we call *concubines*, or half-wives. The Romans prohibited a plurality of *concubines*, and only had regard to the children iſſuing from a ſingle *concubine*, becauſe ſhe might become a legitimate wife. Solomon had 700 wives, and 300 *concubines:* the emperor of China has ſometimes two or three thouſand *concubines* in his palace. Q. Curtius obſerves, that Darius was followed in his army by 365 *concubines*, all in the equipage of queens.

CONCUPISCENCE, among divines, an irregular deſire, appetite, or luſt after carnal things, inherent in human nature.

The dominion or prevalence of *concupiſcence*, according to F. Malebranche, is what we call *original ſin.* See Original *ſin.*

The origin of *concupiſcence* he aſcribes to thoſe impreſſions made on the brain of our firſt parents at their fall; which are ſtill tranſmitted and continued on thoſe of their children: for as animals produce their like, and with like traces in the brain (whence the ſame ſympathies and antipathies in the ſame kind; and whence the ſame conduct on the ſame occaſions); ſo our firſt parents, after their fall, received ſuch deep traces in the brain, by the impreſſion of ſenſible objects, that they might well be ſuppoſed to communicate them to their children.

The ſchoolmen uſe the term *concupiſcible appetite* for the deſire we have of enjoying any good; in oppoſition to *iraſcible appetite*, whereby we eſchew what is evil.

CONCURRENCE. See Concourse.

CONCURRING, or Congruent *Figures*, in *Geometry*, ſuch as, being laid upon one another, do exactly correſpond to, and cover one another, and conſequently muſt be equal among themſelves. Thus, triangles having two ſides and the contained angle equal each to each, appear to be equal to one another in all reſpects. See Congruity.

CONCUSSION *crimen repetundarum*, in *Juriſprudence*, is the abuſe of power by ſome perſon entruſted with a public commiſſion or employment; by extorting money from thoſe under his power or command. This crime is taken notice of in the heads of the Digeſt, or Code—*ad legem Juliam repetundarum*; and it is to be obſerved, that he who gave a bribe contrary to the oath he had taken, might be proſecuted as well as the receiver: and that the judge who was corrupted was deemed guilty of *concuſſion*, as much as he who purchaſed property which was in a courſe of litigation. The magiſtrates were even forbidden to acquire any thing by way of purchaſe, donation, or otherwiſe, in the provinces wherein they reſided, under pain of being guilty of *concuſſion.*

The crime of *concuſſion* was not ranked in the number of public offences, except when committed by a magiſtrate: when committed by a perſon of inferior ſtation, it was only a private crime; but it is not the quality of the perſon which renders the crime public or private, but the nature of the crime itſelf.

CONDALUS, in *Antiquity*, a kind of ring uſually worn by ſlaves.

COND, Con, or Conn, in *Sea Language*, ſignifies to guide or conduct a ſhip in her right courſe.

He that *conds* her, ſtands aloft with a compaſs before him, and gives the word of direction to the man at the helm how he is to ſteer. See Steering.

If the ſhip go before the wind, or, as they call it, betwixt the ſheets, the word is either *ſtarboard*, or *port the helm*; according as the *conder* would have the helm put to the right or left ſide of the ſhip, upon which the ſhip always goes the contrary way.

If he ſays, *helm a mid-ſhip*, he would have the ſhip to go right before the wind, or directly between her two ſheets.

If the ſhip ſail by a wind, or on a quarter wind, the word is, *aloof, keep your luff, fall not off, veer no more, keep her to, touch the wind, have a care of the lee-latch:* all which expreſſions are of the ſame import, and imply that the ſteerſman ſhould keep the ſhip near the wind.

On the contrary, if he would have her ſail more large, or more before the wind, the word is, *eaſe the helm, no near, bear up.*

If he cries *ſteady*, it means, keep her from going in and out, or making yaws (as they call it), howſoever ſhe ſails, whether large, or before a wind: and when he would have her go juſt as ſhe does, he cries, *keep her thus, thus,* &c.

CONDEMNATION, the act of paſſing, or pronouncing SENTENCE, or giving judgment, againſt a man; whereby he is ſubjected to ſome penalty or PUNISHMENT; either in reſpect of fortune, reputation, or life.

Condemnation *to the galleys.* See Galley.

Condemnation *of prizes* taken from the enemy. See Prizes.

CONDENSATION, the act whereby a body is rendered more denſe, compact, and heavy.

Condenſation conſiſts in bringing the parts cloſer to each other, and increaſing their contact: in oppoſition to *rarefaction*; which renders the body lighter and looſer, by ſetting the parts farther aſunder, and diminiſhing their contact, and of conſequence their coheſion.

Wolfius, and ſome of the more accurate writers, reſtrain the uſe of the word *condenſation* to the action of cold: what is done by external *application*, they call *compreſſion.*

Air eaſily *condenſes*, either by cold, or by art: water congeals, but has been ſuppoſed never to *condenſe*; i. e. to be brought into a leſs ſpace; becauſe it has even penetrated the moſt ſolid body, even gold, rather than loſe of its bulk. See Compression. A ſyrup *condenſes* in ebullition.

It was found, in the obſervatory at France, during the great cold of the year 1670, that the hardeſt bodies, even metals, glaſs, and marble itſelf, were ſenſibly *condenſed* by the cold, and became much harſher, and more brittle, than before; till their former ſtate was retrieved by the enſuing thaw.

Water alone ſeems to expand by cold; inaſmuch as when congealed, the ice takes up more ſpace than the water did before. But this muſt be rather owing to the intromiſſion of ſome foreign matter, as the nitrous particles of the ambient air, than to any proper rarefaction of the water by the cold.

The Carteſians, indeed, taking it for granted that there is no vacuum, deny that there can be any ſuch thing as proper *condenſation*, or RAREFACTION. According to them, when a body takes up more ſpace than it did before, its parts are diſtended by the detruſion of a ſubtile matter through its pores: and when its bulk, again, is reduced into leſs ſpace, this is owing to the extruſion or egreſs of that matter through the ſame pores; by virtue whereof, the parts of the body, though not the parts of matter, come nearer each other.

For as extenſion and matter, according to them are the ſame thing; a body can never take up more or leſs place, any otherwiſe than by the acceſſion or diminution of matter: and thus they conclude there is no VACUUM.

Now, that, in the rarefactions of groſs bodies, their parts are diſtended by the acceſſion of air, is frequently manifeſt; but this does not follow from the plenitude of the world, but from the fluid and elaſtic nature of air; or from its gravity and preſſure. That there is ſuch a thing as *condenſation*, without the loſs of any matter, is evident from Galileo's experiment: a cock, being with a female ſcrew fitted to a hollow braſs ball, or cylinder, ſo as that a ſyringe, by means of a male ſcrew, may be applied to it; by working the ſyringe, the air will be forced into the ball, and turning the cock, it will be retained; inſomuch that, upon examining the veſſel by the balance, its weight will be found increaſed. If the cock be returned, the air will burſt out with violence, and the ball will ſink to its former weight.

From the experiment it follows, 1°, That air may be crouded into a leſs volume and bulk than it ordinarily takes up, and is therefore compreſſible.—*For the quantity of its* COMPRESSION, ſee Air.

2°, That from the recovery of its weight, juſt ſo much air is expelled as was injected; and that, therefore, compreſſed air returns to its primitive expanſion, if the compreſſing force be removed; and it has therefore an elaſtic force.

3°, That it is a certain ſign of compreſſion, if, upon opening the orifice of a veſſel, any portion of air be obſerved to fly out.

4°, That ſince the weight of the veſſel is increaſed by injecting air; the aerial maſs muſt have a niſus downwards, in lines perpendicular to the horizon; and is therefore heavy, and preſſes ſubject bodies in lines perpendicular to the horizon, according to the conditions of gravity.

Condenſed air has its effects juſt oppoſite to thoſe of rarefied air; birds, &c. appear briſker and more lively therein than in the common air, &c.

CONDENSER, a pneumatic engine, made of glaſs, in a cylindric or globular figure, or conſiſting of two very ſtrong braſs cups, whoſe brims, covered with wet leather, are preſſed together, and kept down by an iron croſs-bar with pillars and ſcrews, by which, with an *injecting* SYRINGE, an unuſual quantity of AIR may be crouded into a given ſpace. The orifice of the *condenſer* is fitted with a female ſcrew to receive the male ſcrew at the end of the ſyringe: it is alſo furniſhed with a GAGE.

They can by this throw in 2, 3, 4, 5, or 10 atmoſpheres into the *condenſer*, i. e. twice, thrice, four, &c. times as much air as there would be in the ſame compaſs without the engine. See CONDENSATION.

CONDENSING *of wines*. See WINES.

CONDERS, in our *Cuſtoms*. See BALKERS.

CONDIGNITY, *merit of*. See MERIT.

CONDITION, in the *Civil Law*, an article of a treaty, or contract; or a clauſe, charge, or obligation, ſtipulated in a contract, or added in a donation, legacy, teſtament, &c.

The donee does not loſe his donative, if it be charged with any diſhoneſt or impoſſible *conditions*. Lawyers diſtinguiſh three kinds of *conditions*, under which a legacy or donation may be made: theſe are the *caſual*, which depends merely on chance; the *poteſtative*, which is abſolutely in our power; and the *mixed condition*, which is both caſual and poteſtative together.

CONDITION, in *Common Law*, is a manner, quality, or reſtriction, annexed to an act; qualifying or ſuſpending the ſame; and making it precarious and uncertain, whether or no it ſhall take effect.

In a leaſe there may be two ſorts of *conditions*; *condition collateral*, and *condition annexed to the rent*.

CONDITION, *collateral*, is that annexed to a collateral or foreign act; as, v. gr. that the leſſee ſhall not go to Paris.

Condition is alſo divided into *condition in deed*, and *condition implied*.

CONDITION *in deed*, or *expreſſed*, is annexed by expreſs words to the feoffment, leaſe, or grant, either in writing, or without. As, if I infeoff a man in lands, reſerving a rent to be paid at ſuch a feaſt; *upon condition*, if the feoffee fail of payment, it ſhall be lawful for me to reenter.

CONDITION *implied*, called alſo *condition in law*, is when a man grants to another the office of a ſteward, bailiff, keeper of a park, &c. for life: though there be no *condition* expreſſed in the grant, yet the law makes one covertly; which is, that if the grantee do not juſtly execute all things belonging to the office, it ſhall be lawful for the granter to diſcharge him.

CONDITION *precedent*, is when a leaſe or eſtate is granted to a perſon for life, upon *condition* of the payment of a certain ſum by the leſſee to the leſſor at a certain day, when he ſhall have fee-ſimple: in this caſe the *condition* precedes the eſtate in fee, and on performance gains the fee-ſimple.

CONDITION *ſubſequent*, is when a man grants to another his manor in fee, upon *condition* that the grantee ſhall pay to him a certain ſum on ſuch a day, or that his eſtate ſhall ceaſe: ſo that here the *condition* follows the eſtate, and the performance preſerves it.

CONDITION *without which*, *ſine qua non*, is uſed in *Philoſophy*, in ſpeaking of ſome accident or circumſtance, which is not eſſential to the thing, but is yet neceſſary to its production. Thus, light is a *condition without which* a man cannot ſee objects, though he have good eyes; and thus fire, though conſidered in itſelf, may burn without wood; yet is its preſence a *condition without which* the wood cannot be burnt.

CONDITIONAL, ſomething not abſolute, but ſubject to limitation. See CONDITION.

Conditional legacies are not due till the conditions are accompliſhed.

The Arminian divines maintain, that all the decrees of God, relating to the ſalvation and damnation of man, are truly *conditional*; and the Calviniſts, that they are all abſolute. See ARMINIAN, &c.

CONDITIONAL *conjunctions*, in *Grammar*, are thoſe which ſerve to make propoſitions conditional. As, *if*, *unleſs*, *provided that*, *in caſe of*, &c.

CONDITIONAL *propoſitions*, in *Logic*, are ſuch as conſiſt of two parts, connected together by a conditional particle. Of theſe, the firſt, wherein the condition lies, is called the *antecedent*, and the other the *conſequent*.

Thus, If the ſoul be ſpiritual, it is immortal; is a *conditional propoſition*, wherein, *if the ſoul*, &c. is the antecedent, and *is immortal* the conſequent.

The truth of theſe propoſitions depends on the truth of the connection of them, and they may be properly denied or contradicted when the negation affects their conjunctive particles.

CONDITIONAL *ſyllogiſm*, is that whoſe major or minor, or both, are *conditional* propoſitions: e. gr. If there be a God, the world is governed by Providence; but there is a God, therefore the world is governed by Providence.

CONDITIONAL *eſtate*, and *reſignations*. See the ſubſtantives.

CONDITIONALS, *ſcience of*, i. e. of *conditional truths*, imports that knowlege which God has of things, conſidered, not according to their eſſence, their nature, or their real exiſtence; but under a certain ſuppoſition, which imports a condition never to be accompliſhed.

Some of the ſchoolmen deny, that God has the knowlege of *conditionals*: the Thomiſts maintain, that God's knowlege of *conditionals* depends on a predeterminating decree; others deny it.

F. Daniel obſerves, that the truths which compoſe the knowlege of *conditionals*, being very different from thoſe which compoſe the knowlege of intuition, and that of underſtanding; a third claſs muſt be added, and the knowlege of God be divided into *intuitive*, *intellective*, and *conditional*. See KNOWLEGE.

CONDORE, in *Ornithology*, the name of the largeſt of all birds in South America; and, perhaps, by the deſcription of it, in the world. It is frequently met with on the Andes. It is of the carnivorous kind, and ſo very ſtrong, fierce, and voracious, that it often ſeizes lambs from the flock; and Don Ulloa informs us, that he actually ſaw one of them riſing with a lamb in its talons. The Indians have various ways of catching them: beſides traps and ſnares laid for them near any carrion, they kill a cow or other animal, and moiſten its fleſh with the juice of ſome ſtrong intoxicating herbs, and then bury the body till it putrefies. In this ſtate they take it up and lay it on the ground; and when the *condores* come near to devour it, they are intoxicated and rendered motionleſs, when the Indians fall upon and kill them.

CONDORMIENTES, religious ſectaries, whereof there have been two kinds. The firſt aroſe in Germany, in the thirteenth century; their leader was a native of Toledo. They held their meetings near Cologne; where they are ſaid to have worſhipped an image of Lucifer, and to have received anſwers and oracles from him: the legend adds, that an eccleſiaſtic having brought the euchariſt to it, the idol broke into a thouſand pieces; which put an end to the worſhip. They had their name from their *lying all together*, men and women, young and old.

The other ſpecies of *Condormientes* were a branch of Anabaptiſts in the ſixteenth century; ſo called, becauſe they lay, ſeveral of both ſexes, in the ſame chamber; on pretence of evangelical charity.

CONDUCT, *ſafe*. See SAFE-*conduct*.

CONDUCTOR, the name of a ſurgeon's inſtrument, uſed when a ſinus is laid open, and being put up into the bladder, ſerves to guide or conduct the knife, in the operation of cutting for the ſtone. See LITHOTOMY.

CONDUCTOR, in *Surgery*, likewiſe denotes an inſtrument, not long ſince contrived by Mr. Wathen, for ſecuring a fractured limb in the conveyance of the patient from the place where the accident occurred, to the place where the cure is to be completed. It conſiſts of two tin CANULÆ, with grooves and ſliders: theſe *canulæ* with their ſliders incloſed are, like SPLINTS of the ſame length, to be placed one on each ſide of the fractured leg, and ſecured on the knee and ancle joints by a tin band, which is jointed and cuſhioned. The ſlide may be drawn out at pleaſure, and the degree of extenſion thus procured is continued by a key-check, which faſtens on the teeth of the ſlider. The *conductor* may be ſhortened by preſſing the key, and letting the ſlider return into the *canula*.

CONDUCTORS, in *Electricity*, a term firſt introduced into this ſcience by Dr. Deſaguliers, and uſed to denote thoſe ſubſtances, which are capable of receiving and tranſmitting the electric virtue, in oppoſition to ELECTRICS, in which the ſame virtue may be excited and accumulated. The former are alſo called *non-electrics*, and the latter *non-conductors*. All bodies are ranked under one or other of theſe two claſſes; though none of them are *perfect electrics*, or *perfect conductors*, ſo as wholly to retain, or freely and without reſiſtance to tranſmit the electric fluid. Electricians, in the infancy of this ſcience, apprehended, that ſome ſubſtances contained the electric matter, and that others were wholly deſtitute of it; and they were hence led to call the former *electrics per ſe*, and the latter *non-electrics:* but ſubſequent experiments proved, that the electric fluid was really drawn from thoſe bodies, which at firſt were thought to have none in them; and that it was diffuſed through *all the matter* of the terraqueous globe; and, therefore, the terms *conductor* and *non-conductor* were adopted, as leſs exceptionable, and more agreeable to phenomena. Metals and ſemi-metals, ores, and all fluids (excepting air and oils), together with the ſubſtances containing them, the effluvia of flaming bodies, ice, unleſs froze very hard, and ſnow, moſt ſaline and ſtony ſubſtances, charcoals, of which the beſt are thoſe that have been expoſed to the greateſt heat, ſmoke, and the vapour of hot water, belong to the claſs of *conductors*. We may obſerve here, that the electric fluid paſſes through the ſubſtance, and not merely over the ſurfaces of metallic *conductors:* becauſe if a wire of any kind of metal be covered with ſome electric ſubſtance, as reſin, ſealing-wax, &c. and a jar be diſcharged through it, the charge will be conducted as well with as without the electric coating.

It has likewiſe been alleged, that electricity will pervade a vacuum, and will be tranſmitted through it almoſt as freely as through the ſubſtance of the beſt *conductor:* but Mr. Walſh found, that the electric ſpark or ſhock would no more paſs through a perfect vacuum, made by the aſſiſtance of M. De Luc, than through a ſtick of ſolid glaſs. In other inſtances, when the vacuum hath been made with all poſſible care, the experiment has not ſucceeded. We may alſo obſerve, that many of the forementioned ſubſtances are capable of being electrified, and that their *conducting* power may be deſtroyed and recovered by different proceſſes: e. g. green wood is a *conductor*; but baked, it becomes a *non-conductor:* its *conducting* power is reſtored by charring it; and again deſtroyed by reducing it to aſhes. And again, many electric ſubſtances, as glaſs, reſin, air, &c. become *conductors*, by being made very hot: air heated by glaſs muſt be excepted. The difference between theſe two kinds of ſubſtances, in conſequence of which ſome retain, and others convey the electric matter, has been among the *deſiderata* in this ſcience. Dr. Franklin, in a letter dated 1751, obſerves, that the perfect *conductors* of electric matter are only metals and water; and that other bodies *conduct* only as they contain a mixture of theſe; without more or leſs of which they will not *conduct* at all. But this ingenious philoſopher found reaſon afterwards to retract this opinion; ſince ſeveral ſubſtances have been diſcovered to act as good *conductors*, as, particularly, hot air and charcoal, which contain no water or metal, at leaſt in ſuch a quantity as to induce a change in their nature; and S. Beccaria has proved, that water itſelf is an imperfect *conductor*.

Dr. Prieſtley has lately advanced another hypotheſis, no leſs probable than ingenious. He conſiders the characteriſtic diſtinction between *conducting* and *non-conducting* ſubſtances to conſiſt in this, that the former contain PHLOGISTON intimately united with ſome baſe; and that the latter, if they contain it at all (glaſs being ſuppoſed to contain none), retain it more looſely. He was led to this diſcovery by his experiments on the *conducting* power of CHARCOAL, which he found exactly to agree with metals in this particular, that while they have the phlogiſton, they *conduct*, and, when deprived of it, they will not *conduct*. Dr. Prieſtley was afterwards confirmed in his hypotheſis, upon obſerving the affinity between phlogiſton and water, which gave him occaſion to conclude, that water, in its natural ſtate, contains ſome portion of phlogiſton; in proof of which concluſion he has ſince found, that long agitation in the pureſt water injures air, ſo that a candle will not burn in it, which is preciſely the effect of all phlogiſtic proceſſes. Is not (ſays S. Beccaria) the inflammability of reſins, ſulphurs, and other oiled ſubſtances, the cauſe why ſuch bodies are diſpoſed to be electrified by deficiency, ſince in conſequence of ſuch inflammability they receive, when rubbed, a greater degree of heat? And may not the great quantity of phlogiſton with which metallic ſubſtances abound, as well as the great eaſe with which common fire moves within them, be the reaſon why metallic ſubſtances quickly contract by friction a conſiderable degree of heat, and are thus diſpoſed to give (or part with) their electric fire in the higheſt degree? We may obſerve, that when metallic bodies are melted by lightning, the bodies contiguous to them are very liable to be burnt by the phlogiſton which is then ſet free from them. We may add to the above conjectures, that glaſs, when unpoliſhed, alſo contracts heat more eaſily on account of the ſeparation between the parts which compoſe its ſurface, and of their ſmallneſs; in the ſame manner as inflammable bodies are the more eaſily kindled, as their ſurface has a greater ratio to their maſs. Mr. Henly, in a very long courſe of experiments, obſerved, that thoſe bodies that were moſt replete with phlogiſton, became the moſt eaſily, and the moſt powerfully electrified *negatively* by friction: he alſo obſerves, that a thick ſcum from the ſurface of ſome linſeed oil, perfectly dried, became a very ſtrong negative electric. See on this ſubject Prieſtley's Hiſt. of Electricity, vol. i. Obſervations on Air, vol. i. p. 283, &c. vol. ii. p. 254. Cavallo's Complete Treat. of Elect. chap. ii. Franklin's Letters, &c. p. 96, & 262. ed. 1769. Henly's Exp. and Obſ. in Elect. Phil. Tranſ. vol. lxvii. part i. p. 122, &c.

CONDUCTOR, *prime*, in *Electricity*, is an inſulated *conductor* ſo connected with the ELECTRICAL *machine*, as to receive the electricity immediately from the excited electric. The firſt metallic *conductors*, that were applied to this purpoſe, were thoſe of Mr. Grey in 1734: he ſuſpended ſeveral pieces of metal on ſilken lines, and charged them with electricity. Mr. Du Fay faſtened to the end of an iron bar, which he uſed as his *prime conductor*, a bundle of linen threads, to which he applied the excited tube; but theſe were afterwards changed for ſmall wires ſuſpended from a common gun-barrel, or other metalline rod. In the preſent advanced ſtate of the ſcience, this part of the electrical apparatus has been conſiderably improved. The *prime conductor* is made of hollow braſs, and generally of a cylindric form (ſee *Tab. Electricity, fig.* 4.); and care ſhould be taken, that it is perfectly ſmooth and round, without points and ſharp edges; if holes are made in it for the purpoſes of different experiments, the ſame caution ſhould be obſerved. The ends of the *conductor* are ſpherical; and it is neceſſary, that the part moſt remote from the electric ſhould be made much larger and rounder than the reſt, in order to reſiſt the effort of the electric matter to eſcape, which is always the greateſt at the greateſt diſtance from the electric: and the other end ſhould be furniſhed with ſeveral pointed wires or needles, either ſuſpended from, or fixed to an open metallic ring, and pointing to the globe or cylinder, in order to collect the fire. The *prime conductor*, inſtead of hanging on ſilken ſtrings, which are liable to continual motion, ſhould be ſupported by pillars of ſolid glaſs covered with ſealing-wax or good varniſh. The electrician ſhould be provided with ſeveral metallic *conductors* of different ſizes, which may be uſed as occaſion requires. *Prime conductors* of a larger ſize are uſually made of paſte-board, covered with tin-foil or gilt paper: and theſe are uſeful for throwing off a longer and denſer ſpark than thoſe of a ſmaller ſize: they ſhould terminate in a ſmaller knob or obtuſe edge, at which the ſparks ſhould be ſolicited. Mr. Nairne prepared a *conductor* ſix feet in length, and twelve inches in diameter, from which he drew electrical ſparks at the diſtance of ſixteen, ſeventeen, or eighteen inches. But there is a *maximum*, which the ſize of the *prime conductor* ſhould not exceed; for it may be ſo large, that the diſſipation of the electricity from its ſurface may be greater than that which the electric is capable of ſupplying.

Dr. Prieſtley recommends a *prime conductor* of poliſhed copper, in the form of a pear (ſee *fig.* 6. *k.*), ſupported by a pillar and a firm baſis of baked wood: this receives its fire by a long arched wire of ſoft braſs (*l*), which may be eaſily bent, and raiſed or lowered to the globe: it is terminated by an open ring (*m*), in which are hung ſome ſharp-pointed wires. In the body of this *conductor* are holes for the inſertion of metalline rods. This, he ſays, collects the fire perfectly well, and retains it equally every where. Phil. Tranſ. vol. lxiv. part i. art. 7. Hiſt. Elect. vol. ii. § 2.

Mr. Henly has contrived a new kind of *prime conductor*, which, from its uſe, is denominated the *luminous conductor* (ſee *fig.* 8.) It conſiſts of a glaſs tube, E F, eighteen inches long, and about two inches in diameter The tube is furniſhed at both ends with braſs caps and ferules about two inches long, as F D and E B, cemented and made air-tight, and terminated by braſs balls D and B. In one of theſe caps, as F, a ſmall hole is drilled, which is covered by a ſtrong valve, and which ſerves for exhauſting the tube of its air; and the ball D is made to ſcrew on the cap F. Within the tube at each end there is a knobbed wire, projecting to the diſtance of two inches and a half from the braſs caps, and terminating as repreſented at H and I. To the ball D is annexed a fine-pointed wire for receiving and collecting the electricity, and at the other end B there is a wire with a knob or ball for diſcharging it. The *conductor*, thus prepared, is ſupported on pillars of ſealing-wax or glaſs. Beſides the common purpoſes of a *prime conductor* to exhibit and aſcertain the direction of the electric matter in its paſſage through it: for, when the point C is brought near the excited globe or cylinder of a machine, it will appear illuminated with a ſtar, and a weak light will occupy the inner part of the tube; a lucid pencil will iſſue from the ball H, and the oppoſite ball I will be illuminated with a ſtar. But if the point C be connected with the inſulated rubber of a machine, the appearances will be reverſed; the ſtar will appear at H, and the pencil at I; for in the former caſe H diſcharged, and in this caſe it receives the electric fire, as in *fig.* 9. If the knob of an uncharged bottle be nearly in contact with the braſs ball B, or a chain be ſuſpended from it to the table, and the experiment be repeated as above deſcribed, the ball I, when C is preſented to the excited glaſs, will be enveloped with a denſe white atmoſphere of electricity; and when C is preſented to the inſulated rubber, the atmoſphere will appear upon the ball H; and the ſame will happen on the application, firſt, of a bottle poſitively charged, and then of a bottle negatively charged, as in *fig.* 10 and 11. From an experiment ſimilar to this, S. Beccaria inferred, that electricity conſiſts of one uniform homogeneous fluid, and not of two, viz. the vitreous and reſinous, as ſome have ſuppoſed: for, if this were the caſe, both balls ſhould have been encompaſſed with their proper atmoſpheres at the ſame time. If inſtead of balls, the wires in the tube terminate in points, the appearance will be the ſame. Phil. Tranſ. vol. lxiv. part ii. p. 403.

Conductors, *pointed metallic*, were propoſed by Dr. Franklin for preſerving buildings, &c. ſoon after the identity of electricity and lightning was aſcertained; and they exhibit a very important and uſeful application of modern diſcoveries in this ſcience. This ingenious philoſopher, having found that pointed bodies are better fitted for receiving and throwing off the electric fire than thoſe that were terminated by blunt ends or flat ſurfaces, and that metals were the readieſt and beſt *conductors*, ſoon diſcovered that lightning and electricity reſembled one another in this and other diſtinguiſhing properties: he accordingly recommended a pointed metalline rod to be raiſed ſome feet above the higheſt part of a building, and to be continued down into the ground or the neareſt water. The lightning, ſhould it ever come within a certain diſtance of this rod or wire, would be attracted by it, and paſs through it preferably to any other part of the building, and be conveyed into the earth or water, and there diſſipated, without doing any damage to the building. Many facts have occurred to evince the utility of this ſimple and ſeemingly trifling apparatus. However, ſome electricians, of whom Mr. Wilſon is the principal, have objected to the pointed termination of this *conductor*; preferring rather a blunt end: becauſe, they ſay, a point invites the electricity from the clouds, and attracts it at a greater diſtance than a blunt *conductor*. Phil. Tranſ. vol. liv. p. 234. vol. lxiii. part ii. p. 49.

This ſubject has been very accurately examined and diſcuſſed; and pointed *conductors* are almoſt univerſally, and for the moſt ſufficient reaſons, recommended as the moſt eligible and proper. A ſharp-pointed *conductor*, as it attracts the electric fire of a cloud at a greater diſtance than the other, draws it off by degrees; and by conveying it away gently and in a continued ſtream, prevents a ſtroke; whereas a *conductor* with a blunt termination receives the whole diſcharge of a cloud at once, and is much more likely to be exploded, whenever a cloud comes within the ſtriking diſtance. To which we may add, that buildings guarded by either natural or artificial *conductors* terminating in a point, have ſeldom or ever been ſtruck by lightning; but others, having flat or blunt terminations, have been often ſtruck and damaged by it. For a farther account of the nature and efficacy of points in electricity, ſee Points.

The beſt *conductor* for this purpoſe is a rod of iron, or rather of copper, as being a better *conductor* of electricity, and not ſo liable to ruſt, about three quarters of an inch thick, which is either to be faſtened to the walls of a building by wooden cramps, or ſupported by wooden poſts at the diſtance of one or two feet from the wall: the upper end of it ſhould terminate in a pyramidal form with a ſharp point and edges; and if it is made of iron, be gilt or painted near the top; and be elevated above the higheſt part of the building, e. g. the ſtack of chimnies to which it may be faſtened, at leaſt five or ſix feet. The lower end ſhould be driven five or ſix feet into the ground, and directed away from the foundations of the building, or continued till it communicates with the neareſt water. If this part be made of lead, it will be more ſecure from decay. When the *conductor* is formed of different pieces of metal, care ſhould be taken that they are well joined: and Mr. Henly adviſes, that a communication be made from the *conductor* by plates of lead, eight or ten inches broad, with the lead on the ridges and gutters, and with the pipes that carry down the rain water, which ſhould be continued to the bottom of the building, and made to communicate either with moiſt earth or water, or with the main pipe which ſerves the houſe with water. Phil. Tranſ. vol. lxiv. part ii. p. 403. If the building be large, two, three, or more *conductors* ſhould be applied to different parts of it, in proportion to its extent.

Chains have been uſed for the preſervation of ſhips; but as the electric matter does not paſs readily through the links of it, copper wires, a little thicker than a gooſe quill, have been preferred, and are now generally uſed. They ſhould reach two or three feet above the higheſt maſt, and be continued down in any convenient direction, ſo as always to touch the ſea-water. Theſe were firſt recommended to Lord Anſon by Dr. Watſon in 1762. Phil. Tranſ. vol. lii. part i. p. 633. See Franklin's Letters, &c. ed. 1769. p. 65, 124, 479, &c. and Cavallo's Elect. chap. ix.

The *conductor* or machine for drawing electricity from the clouds is thus conſtructed: A pole, *a*, of a manageable length is erected on the top of a building (the higher the better), having on the upper end a ſolid piece of glaſs or baked wood, a foot long (ſee *fig.* 12.). This is covered with a tin or copper veſſel, *b*, in the ſhape of a funnel, in order to prevent its being wetted. Above this there riſes a long ſlender rod, *c*, terminating in a pointed wire, having a ſmall wire twiſted round it, to conduct the electricity the better to the funnel. From the funnel a wire, as *d*, deſcends along the building, and is conveyed through the window into the room, where the experiments are made. This wire is connected with an inſulated *conductor*, which will be electrified whenever there is a conſiderable quantity of electricity in the air; and notice will be given, when it is properly charged, either by Mr. Canton's balls (ſee Electrometer), or by a ſet of bells, deſcribed under that article. For the ſafety of theſe experiments, the electrified wire ſhould be brought within a few inches of a *conducting* rod which ſerves to guard the houſe, that the redundant electricity may paſs off in that way, without ſtriking any perſon who may happen to ſtand near it.

Experiments on the electricity of the atmoſphere may be made with greater exactneſs, by raiſing a kite, by means of a ſtring in which a ſmall wire is twiſted. The beſt ſtring for this purpoſe may be formed by twiſting a copper thread, ſuch as is uſed for trimmings, &c. or, if expence be diſregarded, a ſilver or gold thread, with two very ſmall threads of twine. Mr. Nairne uſes a ſtring ſoaked in a ſtrong ſolution of ſalt, which becomes a good *conductor*, by imbibing the moiſture of the air. The extremity of this line muſt be ſilk, and the wire muſt terminate in a metallic *conductor* of any convenient form. But the following apparatus will ſerve for ſtill greater ſecurity in a thunder-ſtorm. Let the ſtring of the kite (*Tab. Electricity, fig.* 13.) be wound upon a reel, *b*, and paſs through a ſlit in a flat board, faſtened at the top of it, by which more or leſs of the ſtring may be let out at pleaſure. Let the reel be fixed to the top of ſuch a funnel, *c*, as was above deſcribed; and from the funnel let a metallic rod, *d*, with a large knob be projected, to ſerve for a *conductor*. The funnel and reel muſt be ſupported by a ſtaff, *e*, the upper end of which, at leaſt, ſhould be well baked; and the lower end may be made ſharp to thruſt into the ground, when the kite is well raiſed. The ſafety of this apparatus depends upon the chain, *f*, faſtened to the ſtaff, by a hook a little below the funnel, and dragging on the ground: for the redundant lightning will ſtrike from the funnel to the chain, and thus be conducted as far as any one chuſes, without touching the perſon who holds the ſtaff. Sparks may be taken from the *conductor* belonging to this apparatus with all ſafety, by means of a ſmall rod of baked wood, *a*, furniſhed with a ſmall funnel, *b*, and a braſs rod, *c*, and a chain connected with it; for the lightning, which ſtrikes the rod, will paſs by the funnel and chain, without touching the perſon who holds the rod. Hiſt. of Elect. vol. ii. p. 103, &c. 8vo. ed. 1775.

Conductors, in the *Military Art*, are aſſiſtants given to the commiſſary of the ſtores, to receive or deliver out ſtores to the army; to attend at the magazines by turns, when in garriſon; and to look after the ammunition-waggons in the field. They bring their account every night to the commiſſary, and are immediately under his command.

CONDUCTOS *ad proficiſcendum.* See Capias.

CONDUIT, a canal, or pipe, for the conveyance of water, or other fluid matter.

In the earth are ſeveral ſubterraneous *conduits*, through which the waters paſs that form ſome springs; and through which alſo paſs the vapours, which form metals and minerals.

Artificial conduits for water are made of lead, ſtone, caſt iron, potters earth, &c. See Plumbery.

In the province of New Mexico, there is ſaid to be a ſubterraneous *conduit*, in form of a grotto, extending ſix hundred miles in length. See Duct, Tube, &c.

CONDYLOMA, in *Anatomy*. See Condylus.

Condyloma, in *Medicine*, is a ſoft, painleſs tumour, of the œdematous kind, ariſing on the internal coat of the anus, and the muſcles of that part, or in the neck of the matrix.

The word comes from κονδυλος; becauſe the *condyloma* has uſually *rugæ*, or wrinkles, like the joints of the body.

The *condyloma*, by long continuance, grows fleſhy, and, ſhooting out as from a ſtalk, takes the denomination *ficus*. See Ficus.

Condylomata are frequently the effect of venereal ailments, and, if neglected, ſometimes prove cancerous: their cure depends on mercurial unctions, and proper eſcharotics to conſume them; though extirpation either by ligature or inciſion, if the nature of the part will admit, is the moſt expeditious. A ſalivation is often neceſſary, in order to facilitate and complete the cure.

CONDYLUS, Κονδυλος, a name which *Anatomiſts* give to a little round eminence, or protuberance at the extremity of a bone. See *Tab. Anatomy (Oſteol.) fig.* 2. *lit. n.*

Such is that of the lower jaw, received within the cavity of the *os petroſum.*

When this eminence is large, it is called the head of the bone.

CONE, in *Geometry*, a ſolid body, having a circle for its baſis, and terminated at the top in a point, or vertex. See *Tab. Conics, fig.* 2.

The *cone* is generated by the motion of a right line, KM, round an immoveable point K, called its *vertex*, along the circumference of a plane, called its *baſe*, MN: or it may be conceived as generated by the revolution of the triangle KLM, about the right line KL, which is called the axis of the *cone*, and KM its *latus*, or ſide.

If the axis be perpendicular to the baſe, it is ſaid to be a *right cone:* and if inclined, or oblique, a *ſcalenous cone.* *Scalenous cones* are again divided into *obtuſe-angled*, and *acute-angled.*

Euclid defines a *cone* a ſolid figure, whoſe baſe is a circle, as CD (*fig.* 3.), and is produced by the entire revolution of the plane of a right-angled triangle CAB, about the perpendicular leg AB.

If this leg, or axis, be greater than CB, half the baſe; the ſolid produced is an *acute-angled cone*; if leſs, it is an *obtuſe-angled cone*; and, if equal, a *right-angled cone.*

But Euclid's definition only extends to a *right cone:* that is, to a *cone* whoſe axis is at right angles to the baſe; and not to oblique ones, whoſe axis is not at right angles to the baſe.

For a more general and comprehenſive deſcription of a *cone*, which may take in both right and oblique ones, ſuppoſe an immoveable point A (*fig.* 4.) without the plane of the circle BDEC; and ſuppoſe a right line AE, drawn through that point, and produced infinitely both ways, to be moved quite about the circumference of the circle; the two ſuperficies that will ariſe from this motion, are each called *conic ſuperficies*; but, taken conjunctly, they are called *ſuperficies vertically oppoſite*, or only *oppoſite ſuperficies.*—The immoveable point A, common to both the ſuperficies, is called the *vertex*; the circle BDEC, the *baſe*; the right line AC, drawn through the vertex A and C, the *center of the baſe*; and if infinitely produced, the *axis*; and the ſolid comprehended under the conical ſuperficies and the baſe, is a *cone.*

Properties of the Cone.—1. *The area or ſurface of every right* cone, *excluſive of its baſe, is equal to a triangle whoſe baſe is the periphery, and its height the ſide of the* cone.

Or, the curve ſuperficies of a right *cone* is, to the area of its circular baſe, as AC (*fig.* 3.), the length of the hypothenuſe of the right-angled triangle deſcribing it, is to CB, the baſe of the ſame triangle: that is, as the ſlant height of the *cone*, to the ſemidiameter of the baſe.

Hence, the ſurface of a right *cone* is equal to a ſector of a circle deſcribed on the ſide of the *cone*, as a radius, whoſe arch is equal to the periphery of the *cone*; and has therefore the ſame proportion to its periphery, which the diameter of the baſe has to twice the ſide of the *cone.* *Hence we have a method of deſcribing a rete or cage that ſhall juſt cover a* cone.—Thus, with the diameter of the baſe AB (*Tab. Conics, fig.* 6.) deſcribe a circle, and produce the diameter to C, till AC be equal to the ſide of the *cone.* To 2 AC and AB, determined in numbers, and 360°, find a fourth proportional; and with the radius CA, on the center C, deſcribe an arch DE equal to the number of degrees found: the ſector CDE with the circle AB will be a rete for the right *cone.*

If, then, the ſide of a truncated *cone* be ſet off from A to F, and an arch GH be deſcribed with the radius CF; by finding a fourth proportional to 360°, to the number of degrees of the arch GH, and to FC; and thence determining the diameter of the circle IF, we ſhall have a net or cover of the truncated *cone.*

For CDBAE is a net for the entire *cone*; CGFIH for the *cone* cut off; therefore, DBEHIG for the truncated *cone.*

2. *Cones and pyramids, having the ſame baſes and altitudes, are equal to each other.*

Now, it is ſhewn, that every triangular priſm may be divided into three equal pyramids; and therefore, that a triangular pyramid is one third of a priſm, ſtanding on the ſame baſe, and having the ſame altitude.

Hence, ſince every multangular body may be reſolved into triangular ones, and every pyramid is a third part of a priſm having the ſame baſe and altitude; ſince a *cone* may be eſteemed an infinite-angular pyramid, and a cylinder an infinite-angular priſm; a *cone* is a third part of a cylinder, which has the ſame baſe and altitude.

Hence we have a method of meaſuring the ſurface and ſolidity of a cone.—Thus, *for the ſolidity:* find the ſolidity of a priſm, or cylinder, having the ſame baſe with the *cone*, or pyramid. Which found, divide by 3: the quotient will be the ſolidity of a *cone*, or a pyramid. Thus, v. gr. if the ſolidity of a cylinder be 605592960, the ſolidity of the *cone* will be found 201864320.

For the ſurface; that of a right *cone* is had by multiplying the ſemi-periphery of the baſe into the ſide, and adding the product to the baſe.

Suppoſe, e. gr. the diameter of the *cone* NM (*fig.* 2.) 56, the periphery will be 175,9296, and the baſe 2463,0144. Suppoſe the altitude or axis KL, 246; ſince $LM = \frac{1}{2} NM = 28$, and $KM^2 = KL^2 + LM^2 = 60516 + 784 = 61300$, $KM = 247,5$ &c. Conſequently the ſuperficies of the *cone*, excluſive of the baſe, is 21771,288; and the whole together 24234,3024.

The *ſolidity* of an oblique *cone* is obtained in the ſame manner with that of the right *cone:* but it is much more difficult to find its ſurface, ſince it cannot be reduced to the meaſure of a ſector of a circle, becauſe all the lines drawn from the vertex to the baſe are not equal. See a Memoir on this ſubject, by M. Euler, in the Nouv. Mem. de Peterſburgh, tom. i. Dr. Barrow has demonſtrated, in his Lectiones Geometricæ, that the ſolidity of a *cone* with an elliptic baſe, forming part of a right *cone*, is equal to the product of its ſurface by a third of one of the perpendiculars drawn from the point in which the axis of the right *cone* interſects the ellipſe; and that it is alſo equal to one third of the height of the *cone* multiplied by the elliptic baſe: and therefore that the perpendicular is to the height of the *cone*, as the elliptic baſe to the ſurface.

As to the meaſure of the ſurface, and ſolidity, of a truncated cone, ABCD (*fig.* 7.). Its altitude CH, and the diameters of its baſes AB and CD, being given, find their circumferences: to the ſquare of the altitude CH, add the ſquare of the ſemi-difference of the radii AH, and from the aggregate extract the ſquare root, which will give the ſide AC: the ſemi-ſum of the peripheries, multiplied by that ſide, gives the ſuperficies of the *truncated cone.*

To find the ſolidity: As the difference of the ſemidiameters AH is to the altitude of the truncated *cone* CH, ſo is the greater ſemidiameter AF to the altitude of the entire *cone* FE. This being found, ſubtract the altitude of the truncated *cone* GF, which will leave that of the *cone* taken off, EG.

Find the ſolidity of the *cone* CED and AEB; ſubtract the other from this; the remainder will be the ſolidity of the truncated *cone* ACDB.

For the ſections of the Cone, ſee Conic *ſection.*—*For the ratio of* Cones *and Cylinders*, ſee Cylinder.—*For the centers of gravity and of oſcillation of a* Cone, ſee Center.

Cones *of the higher kinds*, are thoſe whoſe baſes are circles of the higher kinds; and are generated by ſuppoſing a right line fixed in a point, on high, though conceived capable of being extended more or leſs, on occaſion; and moved or carried round a circle.

Cone *of rays*, in *Optics*, includes all the ſeveral rays which fall from any point of a radiant, on the ſurface of a glaſs.

Cone, *double*, or *ſpindle*, in *Mechanics*, is a ſolid formed of two equal *cones* joined at their baſes. If this be laid on the lower part of two rulers making an angle with one another, and elevated above the horizontal plane, it will move towards the raiſed ends, and ſeem to aſcend, though it really deſcends. Let ABD (*Tab. Mechanics, fig.* 11.) be the common baſe of the two *cones*, its center C will be the center of gravity of the whole ſolid; therefore if DF repreſents one of the rulers elevated to an angle FDG, whoſe ſine FG is leſs than the ſemidiameter of the *cone* CD, it is plain that the center of gravity C at the poſition of the *cone* in D, is more diſtant from the center of the earth, to which all heavy bodies tend, than in its poſition between the legs of the ruler at F; and therefore it will deſcend, as on an inclined plane CFE, from C to F, where it will ſtop, being ſupported on the raiſed ends of the rulers.

Cone, in *Aſſaying*. See Melting-*cone*.

Cone, in *Botany*, a hard dry ſeed-veſſel of a conical figure, conſiſting of ſeveral woody parts; and is, for the moſt part, ſcaly, adhering cloſely together, and ſeparating when ripe.

Cone-*ſtone*, in *Natural Hiſtory*, the name given by many to a ſpecies of TUBULUS *marinus*, not known to us in its recent ſtate, but frequently found foſſile in the Swediſh ſtones uſed in pavements.

Cone *and key*. Bracton, lib. ii. cap. 37. num. 3. ſays, *Fæmina in tali ætate* (*i. e.* 14. *et.* 15. *annorum*) *poteſt diſponere domui ſuæ, et habere* cone *et* key.

The words come from the Saxon *colne*, i. e. *calculus*, and *key, clavis*; ſo that a woman was then held to be of competent years when ſhe was able to keep the accounts and keys of the houſe: and Glan. lib. vii. cap. 9. has ſomewhat to the ſame purpoſe.

CONEPATL, in *Zoology*, the name of an American animal, very much like the rackoon in ſhape, but variegated with two long ſtreaks of white, one on each ſide of the ridge of the back, which run even into the tail. It is a tame and harmleſs animal, but of a ſtinking ſmell; and when purſued, or provoked, will diſcharge its excrements at the perſon who offends it, to ſix or eight feet diſtance; theſe have a very bad ſmell, and ſpoil people's cloaths, by leaving indelible yellow ſpots on them. Ray. See Yzquiepatl.

CONESSI, or Conesti, in the *Materia Medica*, a bark brought from the Eaſt Indies. It is frequent in Ceylon, and Malabar, where the natives take it in diarrhœas, lienteries, and dyſenteries. We uſe it in powder for the ſame purpoſes, the doſe being from half a dram to a dram. It is proper to give a doſe of ipecacuanha before taking it.

This tree grows alſo on the Coromandel coaſt, in the Eaſt Indies, and is not unlike the *cadagopala* of the *hortus Malabaricus*. The bark ſhould be freſh powdered, and the electary prepared with ſyrup of oranges every day or every other day. Med. Eſſ. vol. iii. art. 4.

CONFARREATION, a ceremony among the ancient Romans, uſed in the marriage of perſons whoſe children were deſtined for the honour of the prieſthood.

Confarreation was the moſt ſacred of the three modes of contracting marriage among that people; and conſiſted, according to Servius, in this, that the *pontifex maximus* and *flamen dialis* joined and contracted the man and woman, by making them eat of the ſame cake of ſalted bread: whence the term, *far* ſignifying *meal* or *flour*.

Ulpian ſays, it conſiſted in the offering up of ſome pure wheaten bread; rehearſing, withal, a certain formula, in preſence of ten witneſſes. Dionyſius Halicarnaſſeus adds, that the huſband and wife did eat of the ſame wheaten bread, and threw part on the victims.

CONFECTION, in *Pharmacy*, a kind of compound remedy of the conſiſtence of a ſoft electary.

There are ſeveral electaries, which bear the name of *confections*; ſome of which, in the medical language, are *corroborative*, and others *purgative*.

Of the number of the corroborative *confections* are thoſe of *alkermes*, of *hyacinth*, and the *anacardine*: a purgative one is the *confection Hamech*. The *confection of alkermes* has its name from the principal ingredient therein; which is the *kermes*, or *alkermes*, or ſcarlet-grain. The other ingredients are, pearls, muſk, cinnamon, ambergris, leaf-gold, juice of pippins, and roſe water. It is ranked among the beſt cardiacs, and is frequently uſed for the palpitation of the heart, or ſyncope; and ſometimes in the ſmall-pox and meaſles.

The *confection of hyacinth* has nearly the ſame virtues with that of *alkermes*; but, beſides, it is frequently uſed as an aſtringent. It conſiſts of near triple the number of drugs; whereof the precious ſtone, called the *hyacinth*, is eſteemed the principal; the chief of the reſt are, red coral, bole armoniac, terra ſigillata, myrrh, the ſantals, burnt hartſhorn, camphire, ſapphire, emerald, topaz, and moſt of the ingredients of the *confection* of alkermes.

The *anacardine confection*, now diſuſed in England, is compoſed chiefly of ANACARDIUMS; whence the name. The other drugs are, long pepper, black pepper, moſt kinds of myrobalans, caſtoreum, &c. It is uſed to purge the blood, and is proper in cold diſeaſes.

The *confection Hamech* takes its name from that of its inventor, an Arabian phyſician. Its ingredients are, polypody, myrobalans, agaric, ſenna, tamarinds, red roſes, manna, colocynth, &c. It is applied as a draſtic for the purging of the groſſer humours and viſcidities; it is alſo of ſome reputation in vertigoes and cancers.

Confectio *cardiaca*, a name given in the late London Diſpenſatory to the ſo much eſteemed medicine, commonly known by the name of the *confectio Raleighana*. The compoſition is alſo altered, as well as the name, and is ordered now to be made in the following manner: take freſh tops of roſemary, and juniper berries, of each a pound; the leſſer cardamum ſeeds, freed from their huſks, zedoary, and ſaffron, of each half a pound. Draw a tincture from theſe, with a gallon and half of proof ſpirit; reduce this tincture, when filtered, to the weight of about two pounds and a half, by a gentle evaporation; then finiſh the electary by adding the following ſpecies finely powdered: viz. of compound powder of crabs claws, ſixteen ounces; cinnamon and nutmeg, of each two ounces; cloves, an ounce; double refined ſugar, two pounds. Pemberton's London Diſpenſatory, p. 338.

Confectio *Damocratis*. See Mithridate.

Confectio *Fracaſtorii*. See Diascordium.

Confectio *Japonica*, is prepared of Japan earth, three ounces; tormentil root, nutmeg, and olibanum, of each two ounces; opium, diſſolved in Liſbon wine, a dram and a half; ſimple ſyrup and conſerve of roſes, of each fourteen ounces. An electary of theſe ingredients ſupplies the place of *diaſcordium*; and the doſe is from a ſcruple to a dram.

Confectio *Paulina*, a name given in the late London Diſpenſatory to the compoſition which uſed to be called *confectio archigenis*. It is now ordered to be made in the following manner: take coſtus or zedoary, cinnamon, long pepper, black pepper, ſtrained ſtorax, galbanum, opium, and Ruſſia caſtor, of each two ounces; of ſimple ſyrup, boiled to the conſiſtence of honey, an equal weight to thrice the ſpecies. Pemberton's London Pharm. p. 339.

CONFECTOR, among the *Ancient Romans*, a ſort of GLADIATOR, hired to fight in the amphitheatre againſt beaſts; thence alſo denominated *beſtiarius*.

The *confectores* were thus called *à conficiendis beſtiis*, from their diſpatching and killing beaſts.

The Greeks called them *ϖαραϐολοι*, q. d. *daring, raſh, deſperate*; whence the Latins borrowed the appellations PARABOLANI, and *parabolarii*. The Chriſtians were ſometimes condemned to this ſort of combat.

CONFECTS, or Confits, a denomination given to fruits, flowers, herbs, roots, and juices, when boiled and prepared with ſugar, or honey, to diſpoſe them to keep, or render them more agreeable to the taſte.

The ancients only *confited* with honey; at preſent, ſugar is more frequently uſed. *Confects half-ſugared*, are thoſe only covered with a little ſugar, to leave more of the natural taſte of the fruit.

Confects are reduced to eight kinds; viz. *liquid confects*, *marmalades*, *jellies*, *paſtes*, *dry confects*, *conſerves*, *candies*, and *dragees*, or *ſugar-plums*.

Liquid confects are thoſe whoſe fruits, either whole, in pieces, in ſeeds, or in cluſters, are *confited* in a fluid tranſparent ſyrup, which takes its colour from that of the fruits boiled in it. There is a good deal of art in preparing theſe well; if they be too little ſugared, they turn; and if too much, they candy. The moſt eſteemed of the liquid *confects* are plums, eſpecially thoſe called mirabels, barberries, quinces, apricots, cherries, orange flowers, little green citrons from Madeira, green caſſia from the Levant, myrobalans, ginger, cloves, &c.

Marmalades are a kind of paſtes almoſt liquid, made of the pulp of fruits, or flowers, that have ſome conſiſtence; ſuch as apricots, apples, pears, plums, quinces, oranges, and ginger. Marmalade of ginger is brought from the Indies by way of Holland: it is eſteemed good to revive the natural heat in old men. See Marmalade.

Jellies are juices of ſeveral fruits, wherein ſugar has been diſſolved, and the whole, by boiling, reduced into a pretty thick conſiſtence; ſo as, upon cooling, to reſemble a kind of thin tranſparent glue, or ſize. *Jellies* are made of various kinds of fruits, eſpecially gooſberries, currants, apples, and quinces: there are other jellies made of fleſh, fiſh, hartſhorn, &c. but they are not to be kept, being very ſubject to corrupt.

Paſtes are a kind of marmalades, thickened to that degree by a proper boiling, as to aſſume any form, when put into little molds, and dried in the oven. The moſt in uſe are thoſe of gooſberries, quinces, apples, apricots, and orange flowers: thoſe of piſtachoes are much eſteemed; thoſe of ginger are brought from the Indies.

Dry confects are thoſe whoſe fruits, after having been boiled in the ſyrup, are taken out again, drained, and put to dry in an oven. Theſe are made of ſo many kind of fruits, that it would be hard to explain them all: the moſt conſiderable are citron and orange-peel, plums, pears, cherries, apricots, &c.

Conſerves are a kind of dry *confects*, made with ſugar, and paſtes of flowers or fruits, &c. The moſt uſual among theſe are thoſe of roſes, mallows, roſemary; of heps, of orange flowers, violets, jeſſamin, piſtachoes, citrons, and ſloes.

Note. The apothecaries, under the title of *conſerves*, comprehend all kind of *confects*, both dry and liquid; whether of flowers, fruits, ſeeds, roots, barks, or leaves, prepared with ſugar or honey, to preſerve, &c.

Candies are ordinarily entire fruits, candied over with ſugar, after having been boiled in the ſyrup; which renders them like little rocks, cryſtalliſed; of various figures and colours, according to the fruits encloſed within them. The beſt candies are brought from Italy. See CANDY.

Sugar-plums are a kind of little dry *confects*, made of ſmall fruits, or ſeeds, little pieces of bark, or odoriferous and aromatic roots, &c. incruſtated and covered over with a very hard ſugar, ordinarily very white. Of theſe there are various kinds, diſtinguiſhed by various names: ſome made of raſberries, others of berberries, melon-ſeeds, piſtachoes, filberds, almonds, cinnamon, orange-peel, corianders, aniſeed, caraways, &c.

CONFEDERACY, an alliance or league between divers princes and ſtates.

Confederacy, in *Law*, is when two or more perſons combine to do any damage to another, or to commit any unlawful act.

Confederacy is puniſhable, though nothing be put in execution: but then it muſt have theſe four incidents; 1. That it be declared by ſome matter of proſecution; as by making of bonds or promiſes to one another: 2. That it be malicious; as for unjuſt revenge: 3. That it be falſe; i.e. againſt the innocent: and, laſtly, That it be out of court, voluntarily.

CONFERTA *folia*, among *Botaniſts*. See LEAF.

CONFERVA, in *Botany*. See HAIR-*weed*.

We find many of our pools and rivers in the ſummer months thick covered with the green confervæ; they are alſo frequently driven by the winds againſt the ſhores of our rivers, and cover the whole ſurface with a green mantle. This, with us, has never been found to be of any ill conſequence to animals; but there is a peculiar ſpecies of it in ſome parts of the world, that is undiſtinguiſhable from ours in appearance, but is poiſonous. Phil. Tranſ. Nº 13.

CONFESS *and avoid*, in *Law*, a ſpecies of REPLICATION, in which the plaintiff introduces ſome new matter or diſtinction, conſiſtent with his former declaration: as in an action of treſpaſs upon land of which the plaintiff is ſeiſed; if the defendant ſhews a title to the land by deſcent, the plaintiff may either deny the fact, or *confeſs and avoid* it, by replying, that ſuch deſcent happened, but that the defendant hath ſince demiſed the lands to the plaintiff for the term of life. Blackſt. Com. vol. iii. p. 310.

CONFESSION, *confeſſio*, in *Rhetoric*, the ſame with what is otherwiſe called PARHOMOLOGY.

Confession, in a *Civil Senſe*, a declaration, or acknowlegement of ſome truth, though it be againſt the intereſt of the party who makes it; whether it be in a court of juſtice, or out of it. It is a maxim, that in civil matters, the *confeſſion* is never to be divided, but always taken entire; and that a criminal is never condemned on his ſimple *confeſſion*, without other collateral proofs; nor is a voluntary extra-judicial *confeſſion* admitted as any proof. A perſon is not admitted to accuſe himſelf, according to that rule in law, *non auditur perire volens*.

Confession *of action*, in *Law*, is a ſpecies of PLEA to the ACTION, in which the merits of the complaint are anſwered, by confeſſing either wholly, or, which is moſt common, in part.

Confession *of indictment*, is a priſoner's acknowlegement of the offence, when he is brought to the bar to be arraigned: upon a ſimple and plain confeſſion, which the court is backward in receiving and recording, nothing remains but to award judgment. This *confeſſion* is made before the judge; in conſequence of which, the priſoner ſubmits to the legal penalty annexed to his crime: or the priſoner by *confeſſion* becomes an APPROVER, or accuſer of others.

Confession, in *Theology*, denotes the verbal acknowlegement which a penitent makes of his ſins to God: in a more partial and reſtricted ſenſe, it is a declaration of a perſon's ſins, made to a prieſt, in order to obtain abſolution for the ſame. The Romiſh church makes *confeſſion* a part of the ſacrament of penance.

Confeſſion was anciently public and general, in the face of the church; though the Romaniſts have ſince altered it, and made it private and auricular.

Confeſſions are to be buried in eternal ſilence, under pain of the greateſt puniſhment to the prieſt who reveals them. Bellarmin, Valentia, and ſome other Romiſh controverſial writers, endeavour to trace up AURICULAR *confeſſion* to the earlieſt ages; and thus contend for a point given up by the reſt. M. Fleury owns, that the firſt inſtance of auricular *confeſſion* he can meet with, is that of St. Eloi, who being grown old, made a *confeſſion* to a prieſt of all his ſins from his youth upwards.

The Indians, according to Tavernier, have a kind of *confeſſion*; and the ſame may be ſaid of the Jews: theſe laſt have formulas for thoſe who are not capable of making a detail of all their ſins: the ordinary form is in alphabetical order, each letter containing a capital ſin. This they uſually rehearſe on Mondays and Thurſdays, and on faſt-days, and other occaſions; ſome every night and morning. When any of them find themſelves near death, they ſend for ten perſons, more or leſs, one of them a rabbin; and in their preſence recite the *confeſſion*. See Leo de Modena.

Confession *of faith*, denotes a liſt, or enumeration and declaration of the ſeveral ARTICLES of belief, in a church.

The *Augſburg* or AUGUSTAN *confeſſion* is that of the Lutherans; it was preſented to Charles V. in 1530.

In the council of Rimini, the catholic biſhops found fault with dates in a *confeſſion of faith*, and obſerved that the church never uſed to date them.

CONFESSIONAL, or **Confessionary**, in *Church Hiſtory*, a place in churches, uſually under the main altar, wherein were depoſited the bodies of deceaſed ſaints, martyrs, and confeſſors.

Confessional is alſo uſed in the Romiſh church for a little box, or deſk in the church, where the confeſſor takes the confeſſions of the penitent.

CONFESSO, *Pro*-Confesso. See Pro-Confesso.

CONFESSOR, a Chriſtian who has made a ſolemn, and reſolute profeſſion of the faith, and has endured torments in its defence. A mere ſaint is called a *confeſſor*, to diſtinguiſh him from the roll of dignified ſaints; ſuch as *apoſtles*, *martyrs*, &c.

In eccleſiaſtical hiſtory, we frequently find the word *confeſſors* uſed for martyrs: in after-times, it was confined to thoſe, who after having been tormented by the tyrants, were permitted to live and die in peace. And at laſt it was alſo uſed for thoſe, who after having lived a good life, died under an opinion of ſanctity. According to St. Cyprian, he who preſented himſelf to torture, or even to martyrdom, without being called to it, was not called a *confeſſor*, but a *profeſſor*: and if any out of a want of courage abandoned his country, and became a voluntary exile for the ſake of the faith, he was called *exterris*.

Confessor is alſo a prieſt, in the Romiſh church, who has a power to hear ſinners in the ſacrament of penance, and to give them abſolution.

The church calls him in Latin *confeſſarius*, to diſtinguiſh him from *confeſſor*, which is a name conſecrated to ſaints. The *confeſſors* of the kings of France, from the time of Henry IV. have been conſtantly Jeſuits: before him the Dominicans and Cordeliers ſhared the office between them. The *confeſſors* of the houſe of Auſtria have alſo, ordinarily, been Dominicans and Cordeliers; but the latter emperors have all taken Jeſuits.

Confessor *to his Majeſty*. See CLERK *of the cloſet*.

CONFIGURATION, the exterior ſurface, that bounds bodies, and gives them their particular figure.

That which makes the ſpecific difference between bodies, is the different *configuration*, and the different ſituation of their parts. A ſhort, or a long ſight, depend on the different *configuration* of the cryſtalline.

Configuration *of the planets*, in *Aſtrology*, is a certain diſtance or ſituation of the planets in the zodiac, whereby they are ſuppoſed to aid, or oppoſe each other. See ASPECT.

Configurations *of ſalts*, a term uſed by ſome to expreſs the combinations of the particles of the ſalts of plants, and other ſubſtances, into certain figures, on evaporating the water in which they had been diſſolved, ſo haſtily as not to admit of their ſhooting into their own regular cryſtals.

CONFIRMATION, the act of ratifying or rendering a title, claim, pretenſion, report, or the like, more ſure and indiſputable.

Confirmation, in *Law*, denotes the conveyance of an eſtate, or right *in eſſe* from one man to another, whereby a voidable eſtate is made ſure and unavoidable, or a particular eſtate is increaſed, or poſſeſſion made perfect: and it is particularly uſed for the ſtrengthening or homologating an eſtate of one already in poſſeſſion of it by a voidable title.

Thus, if a biſhop grant his chancellorſhip by patent, for term of the patentee's life; this is no void grant: yet it is voidable by the biſhop's death, except it be ſtrengthened alſo by the dean and chapter's *confirmation*.

Confirmation, in *Rhetoric*, is the third part of an oration, wherein the orator undertakes to prove, by laws, reaſons, authorities, and other arguments, the truth of the propoſitions advanced in his narration. Cicero, De Invent. lib. i. cap. 24.

Confirmation is either *direct*, or *indirect:* the firſt confirms what the orator has to urge for ſtrengthening his own cauſe: the ſecond, properly called CONFUTATION, refels the oppoſite arguing of the adverſaries. The two parts together are ſometimes placed under the head or title of CONTENTION.

The *confirmation* is, as it were, the life and ſoul of the oration: in this the main ſtreſs of the argumentation lies. Whence Ariſtotle, properly enough, calls it πιςις, *fides.*

CONFIRMATION, in *Theology*, the ceremony of laying on of hands, for the conveyance of the Holy Ghoſt.

Among the ancients it was conferred immediately after baptiſm; and was eſteemed, in ſome meaſure, to be a part thereof: whence the fathers call it the *accompliſhment* of baptiſm. The ground of the practice was an opinion of the imperfection of baptiſm, which in their apprehenſion only prepared perſons for the reception of the graces of the Holy Spirit, which were actually conferred in *confirmation.* Tertull. de Bapt. p. 599, &c. and Lord King's Hiſt. of the Prim. Church, chap. v. p. 80, &c.

Among the Greeks, and throughout the Eaſt, it ſtill accompanies baptiſm; but the Romaniſts make it a diſtinct independent ſacrament.

It appears that *confirmation* has all along been ordinarily conferred by the biſhop: St. Cyprian, and moſt of the fathers, ſpeak of it in ſuch terms as to imply it to have been confined to the biſhop alone; and Fleury and moſt of the moderns, from them, lay it down as a diſtinguiſhing character between the offices of a prieſt or deacon, and that of a biſhop, that the former might baptize, but the latter alone might anoint and *confirm*; by virtue of their ſucceſſion to the apoſtles, to whom it originally belonged. But from ſome paſſages in St. Gregory, &c. others gather, that the prieſts, on occaſion, had likewiſe the power of *confirming*.

It has been alleged, that, as *confirmation* always ſucceeded baptiſm, and made a neceſſary part of it, and ſeveral of the primitive Chriſtians eſteemed both neceſſary to ſalvation, it muſt have been performed by preſbyters as well as by biſhops; becauſe the biſhop of a church might be abſent for a very conſiderable time, as was the caſe with Cyprian, or the ſee might be vacant: and as preſbyters baptized, it is reaſonable to conclude that they alſo *confirmed.* Lord King has ſhewn that *confirmation* and abſolution were the ſame thing; and that preſbyters, ſometimes with the biſhop, and ſometimes without the biſhop, did abſolve by impoſition of hands: and he has cited ſeveral ancient authorities in order to prove, that *confirmation* was frequently repeated with reſpect to the ſame perſons. Hiſt. Prim. Church, p. 91, &c.

It is certain, among the Greeks, the prieſt who baptizes, alſo *confirms:* which practice, Lucas Holſtenius ſhews, is of ſo old a ſtanding among them, that it is now generally looked on as belonging properly, and of right, to the prieſt: though ſome will have it to have been borrowed by them from the biſhops. Hence, ſome of the Latin divines acknowlege, that though the biſhop be the ordinary miniſter of *confirmation*, yet, that the prieſt, in his abſence, may alſo confer it, in quality of miniſter extraordinary.

The council of Rouen, held in 1072, decrees, that *confirmation* muſt be conferred faſting, both on the ſide of the giver, and that of the receiver.

It has been urged, however, that this ceremony, with reſpect to the real importance and utility of it, was peculiar to the days of the apoſtles: though it is retained among Proteſtants, it is doubted whether it be a neceſſary inſtrument of grace. The order of *confirmation* in the church of England, does not determine the preciſe age of the perſon to be *confirmed.*

CONFISCATE, in *Law*, is applied to goods forfeited to the exchequer, or public treaſury.

The word is derived from *fiſcus*, *a hamper*, *panier*, or *baſket*, wherein the emperor's money uſed to be kept.

The title to goods which are not claimed by any other, is given by law to the king. If a man, indicted for ſtealing the goods of another, in which caſe they become, in effect, the proper goods of him indicted, be aſked about them in court, and diſclaim them; he thereby loſes the goods, though he be afterwards acquitted of the theft, and the king ſhall have them as *confiſcate:* but otherwiſe, had he not diſclaimed them.

CONFISCATION, a legal adjudication of goods or effects to the fiſc, or treaſury.

Thus, the bodies and effects of criminals, traitors, &c. and merchandizes that are contraband, prohibited, or brought aboard or aſhore without paying the duties, when ſeized, are *confiſcated.*

It is an axiom in law, that he who *confiſcates* the body, *confiſcates* alſo the effects, to the profit of the king, or the lord of the fee; i. e. he who is condemned to loſe his life, muſt alſo loſe his goods: yet the widows of criminals do not loſe their dowries, nor their ſhare in the goods of the community, by the forfeiture of their huſbands.

CONFLAGRATION, a general burning of a city, or other conſiderable place. In which ſenſe, Nero is ſaid to have procured the Chriſtians to be accuſed of the *conflagration* of Rome, which was done by his own order.

But the word is more ordinarily reſtrained to that grand period, or cataſtrophe, of our world, wherein the face of nature is expected to be changed by a deluge of fire, as it was anciently by that of water. The ancient Pythagoreans, Platoniſts, Epicureans, and Stoics, appear to have had a notion of the *conflagration*; though whence they ſhould derive it, unleſs from the ſacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themſelves had it from the Jews.

Seneca ſays expreſsly, *Tempus advenerit quo ſidera ſideribus incurrent, & omni flagrante materia uno igne, quicquid nunc ex depoſito lucet, ardebit.* This general diſſolution the Stoics call εκπυρωσις, *ecpyroſis.* Mention of the *conflagration* is alſo ſeveral times made in the books of the Sibyls, Sophocles, Hyſtaſpes, Ovid, Lucan, &c.

Dr. Burnet, after F. Tachard, and others, relates, that the Siameſe believe, that the earth will at laſt be parched up with heat; the mountains melted down; and the earth's whole ſurface reduced to a level, and then conſumed with fire. And the Bramins of Siam do not only hold, that the world ſhall be deſtroyed by fire; but, alſo, that a new earth ſhall be made out of the cinders of the old. Various are the ſentiments of authors on the ſubject of the *conflagration*; the cauſe whence it is to ariſe, and the effects it is to produce. Divines ordinarily account for it metaphyſically; and will have it take its riſe from a miracle, as a fire from heaven. Philoſophers contend for its being produced from natural cauſes; and will have it effected according to the laws of mechanics: ſome think an eruption of a central fire ſufficient for the purpoſe; and add, that this may be occaſioned ſeveral ways; viz. either by having its intention increaſed; which, again, may be effected either by being driven into leſs ſpace by the encroachments of the ſuperficial cold, or by an increaſe of the inflammability of the fewel whereon it is fed: or by having the reſiſtance of impriſoning earth weakened; which may happen, either from the diminution of its matter, by the conſumption of its central parts; or by weakening the coheſion of the conſtituent parts of the maſs, by the exceſs or the defect of moiſture.

Others look for the cauſe of the *conflagration* in the atmoſphere; and ſuppoſe, that ſome of the meteors there engendered in unuſual quantities, and exploded with unuſual vehemence, from the concurrency of various circumſtances, may be made to effect it, without ſeeking any further.

The aſtrologers account for it from a conjunction of all the planets in the ſign Cancer; as the deluge, ſay they, was occaſioned by their conjunction in Capricorn.

Laſtly; Others have recourſe to a ſtill more effectual and flaming machine; and conclude the world is to undergo its *conflagration* from the near approach of a COMET, in its return from the ſun. Thoſe wandering bodies do indeed ſeem to menace us a little; being able, both by their tranſverſe motion acroſs the earth's way, by the hugeneſs of their ſize, and the intenſe fire wherewith they glow in their receſs from the perihelion, to produce the moſt ſignal changes and revolutions in the ſyſtem of things.

Mr. Whiſton has ſhewn, that they are extremely well fitted to produce the phenomena of the deluge; and has gone a good way towards proving, that the comet of 1680, was the very body to which that event was owing; as being then in its approach toward the ſun, and its atmoſphere crouded with the watery vapours it had gathered in thoſe inconceivably cold regions, into which it had fled off in its aphelion.

This ſame comet, Sir Iſaac Newton has calculated, when in its perihelion, December the 8th, was heated, by the vicinity of the ſun, to a degree two thouſand times more hot than red-hot iron: he ſhews, likewiſe, that it would ſcarce be cool again in fifty thouſand years.

This ſame comet, Dr. Halley obſerved November the 11th, was not above a ſemidiameter of the earth from the earth's way: ſo that had the earth, at that time, been in that part of its orbit, ſomething very extraordinary might have been apprehended; but whether in the way of fire, or water, may, perhaps, to ſome, leave room to doubt. But it is ſcarcely conceivable, that the comet ſhould bring any vehement degree of heat, out of thoſe regions it comes from, whatever heat it might carry thither.

CONFLUENCE, **Conflux**, the place where two RIVERS join, and mix their waters.

CONFLUENT, in *Medicine*, an epithet given to that ſpecies of *ſmall*-POX wherein the puſtules run into one another.

CONFORMATION, the particular texture and conſiſtence of the parts of any body, and their diſpoſition to make a whole.

We ſay, light of different colours is reflected from bodies according to their different *conformation*; in oppoſition to the Carteſians, who pretend, that reflected light becomes of different colours, according to the different *conformation* of the bodies that reflect it. The *conformation* of the members of an embryo is not perfect enough to allow of diſſection.

Conformation, in *Medicine*, is uſed to expreſs that make and conſtruction of the human body, which is peculiar to every individual.

Hence, a *mala conformatio* ſignifies ſome fault in the firſt rudiments; whereby a perſon comes into the world crooked, or with ſome of the *viſcera*, or cavities, unduly framed, or proportioned. Many are ſubject to incurable aſthmas, from a too ſmall capacity of the *thorax*, and the like original vicious *conformations*.

CONFORMITY, in the *Schools*, is the CONGRUENCY, or relation of agreement between one thing and another: as between the meaſure, and the thing meaſured; the object, and the underſtanding; the thing, and the conception; the thing, and the diviſion thereof, &c.

Conformity, *occaſional*. See OCCASIONAL *conformity*.

CONFRERES, from *con*, and *frere*, *brother*; denote brethren in a religious houſe, or the fellows of one and the ſame ſociety. 32 Hen. VIII. c. 24.

CONFRONTATION, the act of bringing two perſons, in preſence of each other, to diſcover the truth of ſome fact, which they relate differently.

The word is chiefly uſed in criminal matters; where the witneſſes are *confronted* with the accuſed; the accuſed with one another, or the witneſſes with one another.

CONFUSED *notion*. See NOTION.

Confused *viſion*. See VISION.

CONFUSION, in a general ſenſe, is oppoſed to ORDER; in a perturbation whereof, *confuſion* conſiſts: e. gr. when things prior in nature do not precede; or poſterior do not follow, &c.

In a logical ſenſe, *confuſion* is oppoſed to *diſtinctneſs*, or *perſpicuity*; and may happen, either in words, as when miſconſtrued or miſapplied; or in ideas, as when the idea of any thing preſents ſomething along with it, which does not properly belong to that thing.

In a phyſical ſenſe, *confuſion* is a ſort of UNION, or MIXTURE by mere contiguity. Such is that between fluids of contrary natures; as oil and vinegar, &c.

Confusion, *property by*, in *Law*, denotes the intermixture of the goods of two perſons in ſuch a manner, that their reſpective portions cannot be aſcertained. If this be by conſent, they have a common intereſt in proportion to their ſhares; but the law allows no remedy to the perſon who mixes his property with that of another, without his knowlege and approbation. Blackſtone's Comm. vol. ii. p. 405.

Confusion *of tongues*, in the *Hiſtory of the World*, is a memorable event, which happened in the one hundred and firſt year, according to the Hebrew chronology, and the four hundred and firſt year by the Samaritan, after the flood, at the overthrow of Babel; and which was providentially brought about, in order to facilitate the diſperſion of mankind, and the population of the earth. Until this period there had been one common language, which formed a bond of union, that prevented the ſeparation of mankind into diſtinct nations; and ſome have ſuppoſed, that the tower of Babel was erected as a kind of fortreſs, by which the people intended to defend themſelves againſt that ſeparation, which Noah had projected. Uſher ad A. M. 1757.

There has been a conſiderable difference of opinion, as to the nature of this *confuſion*, and the manner in which it was effected. Some learned men, prepoſſeſſed with the notion that all the different idioms now in the world did at firſt ariſe from one original language, to which they may be reduced, and that the variety among them is no more than muſt naturally have happened in a long courſe of time by the mere ſeparation of the builders of Babel, have maintained, that there were no new languages formed at the *confuſion*; but that this event was accompliſhed by creating a miſunderſtanding and variance among the builders, without any immediate influence on their language. But this opinion, advanced by Le Clerc, &c. ſeems to be directly contrary to the obvious meaning of the word שׂפה, *ſhapha*, *lip*, uſed by the ſacred hiſtorian. Others have imagined, that this was brought about by a temporary *confuſion* of their ſpeech, or rather of their apprehenſions, cauſing them, whilſt they continued together and ſpoke the ſame language, to underſtand the words differently: Scaliger is of this opinion. Others again account for this event, by the privation of all language, and by ſuppoſing that mankind were under a neceſſity of aſſociating together, and of impoſing new names on things by common conſent. Another opinion aſcribes the *confuſion* to ſuch an indiſtinct remembrance of the original language which they ſpoke before, as made them ſpeak it very differently; ſo that by the various inflections, terminations, and pronunciations of divers dialects, they could no more underſtand one another, than they who underſtand Latin can underſtand thoſe who ſpeak French, Italian, or Spaniſh, though all theſe languages ariſe out of it. This opinion is adopted by Cauſabon, and by biſhop Patrick in his Commentary in loc. and is certainly much more probable than either of the former: and Mr. Shuckford maintains, that the *confuſion* aroſe from ſmall beginnings, by the invention of new words in either of the three families of Shem, Ham, and Japhet, which might contribute to ſeparate them from one another; and that in each family new differences of ſpeech might gradually ariſe, ſo that each of theſe families went on to divide and ſubdivide among themſelves. Others again, as Mr. Joſ. Mede and Dr. Wotton, &c. not ſatisfied with either of the foregoing methods of accounting for the diverſity of languages among mankind, have recourſe to an extraordinary interpoſition of divine power, by which new languages were framed and communicated to different families by a ſupernatural infuſion or inſpiration; which languages have been the roots and originals from which the ſeveral dialects that are, or have been, or will be ſpoken, as long as this earth ſhall laſt, have ariſen, and to which they may with eaſe be reduced. As to the number of languages thus introduced, many opinions have been adopted. If there were no more than there were nations or heads of nations, then the number would be ſeven for Japhet, four for Ham, and five for Shem; but if there were as many as there were families, which is the more probable opinion, their number cannot be certainly aſſigned. However, the Hebrews fancy they were ſeventy, becauſe the deſcendents from the ſons of Noah, enumerated Geneſis x. were juſt ſo many. Allowing then the languages of the chief families to have been fundamently different from each other, the ſub-languages and dialects within each branch would probably have had a mutual affinity, greater or leſs, as they ſettled nearer or farther from each other. But whichſoever of theſe hypotheſes is adopted, the primary object of the *confuſion* at Babel was the ſeparation and DISPERSION *of mankind*. Cleric. Comm. in Gen. x. 1. Scaliger Exerc. in Cardan. § 1. Caſaubon. Diatrib. de Ling. Heb. Mede's Works, vol. i. p. 276. Wotton's Diſc. and Brett's Eſſ. on the *Confuſion* of Languages. Univerſ. Hiſt. vol. i. part i. chap. 2. § 5. Shuckſ. Conn. vol. i. p. 146.

The ingenious and learned Dr. Bryant has lately, in the third volume of his Analyſis of Ancient Mythology, advanced a new and ſingular hypotheſis, both with reſpect to the *confuſion* of tongues and the diſperſion. He ſuppoſes that the *confuſion* of language was local and partial, and limited to Babel only. By כָּל־הָאָרֶץ, Gen. xi. 1 and 8. which our tranſlators render *the whole earth*, he underſtands *every region:* and by the ſame words in ver. 9. the *whole region* or province. This *confuſion* was occaſioned, as he ſuppoſes, by a labial failure; ſo that the people could not articulate. Thus their ſpeech was confounded, but not altered; for, as ſoon as they ſeparated, they recovered their true tenor of pronunciation, and the language of the earth continued for ſome ages nearly the ſame. The interviews between the Hebrews and other nations, recorded in Scripture, were conducted without an interpreter; and he farther obſerves, that the various languages which ſubſiſt at this day retain ſufficient relation to ſhew, that they were once dialects from the ſame matrix, and that their variety was the effect of time. See DISPERSION.

CONFUTATION, in *Rhetoric*, &c. a part of an oration, wherein the orator ſeconds his own arguments, and ſtrengthens his cauſe, by refelling and deſtroying the oppoſite arguments of the antagoniſt. This is done by denying what is apparently falſe, by detecting ſome flaw in the reaſoning of the adverſe party, by granting their argument, and ſhewing its invalidity, or retorting it upon the adverſary.

Confutation makes a branch of what we call CONFIRMATION. The confirmation and *confutation* are ſometimes called CONTENTION.

CONGE, in the *French Law*, a licence, or permiſſion, granted by a ſuperior to an inferior, which gives him a diſpenſation from ſome duty to which he was before obliged.

The word is French: Menage derives it from the Latin *commiatus*, uſed for *commeatus*, and *commeare*, often ſeen among ancient writers: the Italians ſay, *congedo*.

A monk cannot go out of his convent, without the *conge* of his ſuperiors.

CONGE *d'accorder*, i.e. *leave to accord*, or *agree*, is uſed in the ſtatute of fines, anno 18 Edw. I. to the following purpoſe. *When the original is delivered, in preſence of the parties before juſtices, a pleader ſhall ſay this: Sir, juſtice,* conge d'accorder; *and the juſtice ſhall ſay to him, What ſaith Sir R, and ſhall name one of the parties, &c.*

CONGE *d'elire*, is the king's permiſſion royal to a dean and CHAPTER, in time of a vacancy, to chooſe a biſhop. See CANON, and COLLATION.

Gwyn obſerves, that the king of England, as ſovereign patron of all biſhopricks and other benefices, had anciently the free appointment of all eccleſiaſtical dignities; inveſting, firſt, *per baculum & annulum*; and afterwards by letters patent: but that, in proceſs of time, he made the election over to others, under certain forms and conditions; as, that they ſhould at every vacancy, before they choſe, demand of the king *congé d'elire*, i. e. leave to proceed to election; and after election to crave his royal aſſent, &c. He adds, that king John was the firſt who granted this; which was afterwards confirmed by ſtat. Weſtm. 3 Edw. I. cap. 1. and again in the Articuli Cleri, 25 Edw. III. cap. 1.

CONGE, in *Architecture*, denotes a moulding either in form of a quarter-round, or of a cavetto; which ſerves to ſeparate two members from one another. See *Tab. Archit. fig.* 6.

Such is that which joins the ſhaft of the column to the cincture, called alſo *apophyge*; which, in Greek, ſignifies *eſcape*; the column ſeeming to ſpring hence: by the Latins it is called *ſcapus, the ſhaft of the column.*

The *conge*, originally, was a ring or ferril, fixed on the extremities of wooden pillars, to keep them from ſplitting; this, afterwards, came to be imitated in ſtone-work.

CONGEABLE, from the French *congè* (i. e. *leave, licence,* or *permiſſion)*, ſignifies as much as lawful, or lawfully done, or done with leave and permiſſion; as, *then entry of the diſſeiſee is* congeable.

CONGELATION, FREEZING; the act of fixing the fluidity of any liquid, by COLD, or the application of cold bodies: in which it differs from *coagulation*, which is produced by other cauſes. See CONCENTRATION.

Salt-petre *congeals* water in ſummer. See ICE. Metals and minerals are ſaid to be juices *congealed*, in the veins of the earth, by their mixing with one another, or with other heterogeneous bodies; or by the conſumption and evaporation of their fineſt parts.

Rock CRYSTAL was by the ancients held to be nothing but water *congealed* in the mountains.

CONGELATIONS *by artificial cold*. See *Artificial* FREEZING.

CONGELATION *of wines*. See WINES.

CONGENERES *muſculi*, in *Anatomy*, are ſuch muſcles in an animal body, as ſerve together to produce the ſame motion; and they are ſo called becauſe they aſſiſt one another in their action.

CONGER, in *Zoology*, a ſpecies of the MURÆNA; the name of the *ſea*-EEL, a very voracious and extremely large fiſh of the eel kind.

The name is derived from γογγρος, which is formed of a duplication of the adjective γρωος, or γρος, *voracious*, from γρω, *I devour.*

It grows to an enormous ſize, four or five cubits being a common length with it, and its thickneſs that of a man's thigh. It is of a pale grey on the back, and a fine milk white on the belly, and has on each ſide a ſtrait white line, ſomewhat broad, made as it were of a double, ſometimes ſingle row of dots, and running from the head to the tail; the top of its back fin is black all the way; and in the end of its upper jaw, juſt at the noſe, it has two ſhort tubular horns, out of which a mucous liquor may be ſqueezed. Their fleſh is very agreeable, but is not eaſy of digeſtion. Willughby.

Theſe fiſhes form a conſiderable article of commerce in Cornwall; whence they are exported to Spain and Portugal, particularly to Barcelona. They are ſometimes caught by a ſingle hook and line; but chiefly by BULTERS. They are afterwards cured, by ſlitting and hanging them on a frame to dry, that the fat may exude. The dried *congers* are ground into a powder, and uſed by the Portugueſe and Spaniards to thicken and give a reliſh to their ſoups. Pennant's Zoology, vol. iii. p. 149.

CONGERIES, a Latin word, ſometimes uſed in our language for a collection or heap of ſeveral particles, or bodies, united into one maſs, or aggregate.

CONGERIES, in *Rhetoric*. See SYNATHROISMUS.

CONGESTION, in *Medicine*, a maſs, or collection of humours, crouded together, and hardened, in any part of the body; and there forming a preternatural tumour.

Congeſtion is effected by little and little; in which it differs from *defluxion*, which is more ſudden.

CONGESTIONES, in *Medicine*. See STUFFINGS.

CONGIARIUM, CONGIARY, among *Medaliſts*, a gift, or donative, repreſented on a medal.

The word comes from the Latin CONGIUS; becauſe the firſt preſents made to the people of Rome conſiſted in wine and oil, which were meaſured out to them in *congii*.

The *congiary* was properly a preſent made by the emperors to the people of Rome. Thoſe made to the ſoldiers were not called *congiaries*, but *donatives*.

The legend on medals repreſenting *congiaries* is, *congiarium*, or *liberalitas*.

Tiberius gave a *congiary* of three hundred pieces of money to each citizen: Caligula twice gave three hundred SESTERCES a head: Nero, whoſe *congiaries* are the firſt that we find repreſented on medals, gave four hundred.

CONGITELLA, in *Antiquity*, half a CONGIUS.

CONGIUS, an ancient Roman meaſure for things liquid; containing ſix ſextaries, or ten Roman pounds; equal to ſeven pints Engliſh wine meaſure.

From the original ſtandard of Veſpaſian extant at Rome, Greaves deduced the value of the Roman pound to be 5256 Troy grains. See DENARIUS. But Mr. Raper, in an excellent paper on this ſubject, has ſuggeſted ſeveral objections againſt the accuracy of this concluſion. Phil. Tranſ. vol. lxi. part ii. p. 496.

The *congius* has alſo been uſed in England, as appears by a charter of king Edmund in 946.

CONGLOBATE *glands*, in *Anatomy*, thoſe glands whoſe ſubſtance is not divided, but firm, entire, and continued; and their ſurface ſmooth and uniform.

They are thus called, in oppoſition to *conglomerate* glands.

Conglobate glands have each of them an artery which brings them blood, a vein which carries it back again, after the proper juice has been filtrated, and ſeveral excretory ducts.

Some of them have a cavity in the middle, with LYMPHATIC veſſels, which diſcharge themſelves into a common reſervoir, or canal.

CONGLOBATE *flowers*, are thoſe with globular heads.

CONGLOMERATE *glands*, are thoſe which are compoſed of ſeveral little ones; or they are ſeveral glandulous bodies joined together under the ſame common membrane. See GLAND.

Such are the ſalival glands, lachrymal glands, the pancreas, &c. which ſee under their proper articles.

The *conglomerate* glands, beſides their arteries, veins, and nerves, are alſo furniſhed with an excretory veſſel, ramified throughout their own ſubſtance; by means whereof they diſcharge the liquors they have filtrated into reſervoirs.

CONGLOMERATE *flowers*, are thoſe which are irregularly crouded together.

CONGLUTINATION, the act of gluing, or faſtening, two bodies together, by the intervention of ſome third, whoſe parts are unctuous and tenacious, in the nature of a glue, *gluten*; from whence the word is formed.

In the animal œconomy, the parts of the body are ſaid to be *conglutinated* by means of their natural moiſture; by the help of bandages, as in ſeveral caſes of ſurgery; or by the ſupply of viſcid particles. In which laſt acceptation, *conglutination* differs little from *accretion*, or *nutrition*.

CONGO *money*, or Guinea money, a name given to a peculiar ſpecies of *concha veneris*, or porcelain-ſhell, which paſſes by way of money among the natives of thoſe places. It is diſtinguiſhed from the other porcelains by having a dentated mouth, and ſix gibbous protuberances on its ſurface.

CONGREGATION, an aſſemby of ſeveral eccleſiaſtics, united ſo as to conſtitute a body.

The term is principally uſed for aſſemblies of CARDINALS, appointed by the pope, and diſtributed into ſeveral chambers, for the diſcharge of certain functions and juriſdictions, after the manner of our offices and courts.

The firſt is the *congregation* of the holy office, or the INQUISITION: the ſecond, that of juriſdiction over biſhops, and regulars: the third, that of councils; this has power to interpret the council of Trent: the fourth, that of cuſtoms, ceremonies, precedences, canonizations, called the *congregation* of *rites:* the fifth, that of St. Peter's fabric, which takes cognizance of all cauſes relating to piety and charity, part whereof is due to the church of St. Peter: the ſixth, that of waters, rivers, roads: the ſeventh, of fountains and ſtreets: the eighth, that of the INDEX, which examines the books to be printed, or corrected: the ninth, that of the council of ſtate, for the management of the territories belonging to the pope and church; ſee CAMERLINGO: the tenth, *de bono regimine*; of which two laſt, the cardinal-nephew is chief: the eleventh, that of money: the twelfth, that of biſhops; wherein thoſe who are to be promoted to biſhopricks in Italy are examined; this is held before the pope: the thirteenth, that of conſiſtorial matters; the chief whereof is the cardinal dean: the fourteenth, a *congregation* for propagating the faith; ſee COLLEGE: and the fifteenth, that of eccleſiaſtical immunity, for ſetting ſuits againſt churchmen. There is alſo a *congregation* of alms, which takes care of every thing that relates to the ſubſiſtence of Rome, and the ſtate of the church.

CONGREGATION is alſo uſed for a company or ſociety of religious, cantoned out of this or that order; and making, as it were, an inferior order, or a ſubdiviſion of the order itſelf.

Such are the *congregations* of the oratory, and thoſe of CLUNY, &c. among the BENEDICTINS.

The word is alſo uſed for aſſemblies of pious perſons, in manner of fraternities; frequent among the Jeſuits, in honour of the Virgin, &c.

CONGREGATION *of* AIDS, *of* IMMACULATE *conception*, *of the* LATERAN, *of* MISSION, *of* PENITENCE, *of Holy* SACRAMENT, *of Holy* TRINITY; ſee AIDS, IMMACULATE, &c.

CONGREGATION, in *Phyſics*, is uſed by Dr. Grew for the leaſt and loweſt degree of mixtion; or that wherein the parts of the mixt do not conſiſt with, or adhere to, each other, but only touch in one point.

That author declares himſelf of opinion, that the particles of all FLUIDS only touch in this manner; or that their COHESION only amounts to a *congregation*.

CONGREGATIONALISTS. See INDEPENDENTS.

CONGRESS, CONGRESSUS, is uſed for an aſſembly of commiſſioners, deputies, envoys, &c. from ſeveral courts or provinces, meeting to concert matters for their common good.

The *congreſs* at the Hague, which held during the courſe of the war terminated in 1697, by the treaty of Ryſwick, was compoſed of the envoys of all the princes in the confederacy againſt France.

CONGRESS is alſo uſed for an eſſay, or trial, made by appointment of a lay, or ſpiritual judge, in the preſence of ſurgeons and matrons, to prove, whether or no a man be or be not impotent; in order to the diſſolution of a marriage. See IMPOTENCE.

Neither the civil nor canon law make any mention of this trial of virility by *congreſs*: it had its origin in France, from the boldneſs of a young fellow, who, in open court, being hard preſſed by his wife, demanded the *congreſs*. The judge, ſurpriſed with the novelty of the demand, found it could not be denied; as being the ſureſt evidence the caſe could admit of.

In time it became a branch in the French juriſprudence, and was authoriſed by decrees and arrets: it obtained for about the ſpace of one hundred and twenty years, and was annulled by an arret of parliament in 1677, as being found precarious; ſome having failed under the experiment out of mere modeſty and ſhame, which is found to have the ſame effect with actual impotency.

CONGRUITY, or CONGRUENCY, in the *Schools*, a ſuitableneſs or relation of agreement between things; whereby we come at the knowlege of what may be expected from them.

The ſyſtem of *congruity* in matters of grace conſiſts in this; that God, who knows perfectly the nature of grace, and the diſpoſitions of the will in all the circumſtances that ſhall befal a man, gives graces, wherewith, by virtue of their *congruity* with the will of man, conſidered in thoſe circumſtances, man will always infallibly, but not neceſſarily, do, what God would have him do: becauſe the will, in the language of the *congruiſts*, does always infallibly, though voluntarily, chooſe what appears beſt.

CONGRUITY, *merit of*. See MERIT.

CONGRUITY, in *Geometry*, is applied to figures, lines, &c. which exactly correſpond when laid over one another; as having the ſame terms, or bounds.

Thoſe things between which there is a *congruity*, are equal, and ſimilar.

Euclid, and, by his example, moſt other geometricians, demonſtrate all their elements from the ſole principle of *congruity*: M. Leibnitz, and after him Wolfius, ſubſtitute the notion of SIMILITUDE in lieu of that of *congruency*.

CONGRUITY, in a lax ſenſe, is uſed to expreſs an aptitude, in ſome bodies, to unite, or incorporate; by reaſon of ſome ſimilitude or fitneſs of their figures: as *incongruity* denotes an unfitneſs of their ſurfaces for joining together. Thus, quickſilver will unite with gold, and many other metals, but will roll off from wood, ſtone, glaſs, &c. and water, which will wet ſalt, and diſſolve it, will ſlip off from tallow without adhering to it; as alſo from a duſty ſurface, and from the feathers of water-fowl. Two drops of water, or of mercury, will, on contact, immediately join and coaleſce; but oil of tartar, poured upon quickſilver, and ſpirit of wine and oil of turpentine on that, and air over all, will remain in the ſame veſſel without any manner of union, or mixture with each other. And the cauſe hereof is, that the figures of ſome bodies will not admit other bodies near enough to be within their ſpheres of ATTRACTION, whence they cannot join, and cohere; but where their fitneſs of figure will let them approach near enough to feel each other's attractive power, then they cloſe, and hold together. See COHESION.

CONIC *Section*, a curve line ariſing from the ſection of a *cone* by a plane.

The *conic ſections* are three, viz. the *ellipſis*, *hyperbola*, and *parabola*; beſide the *circle* and the *triangle*, which, though they ariſe from the ſection of a *cone*, are not uſually conſidered in that capacity.

That the triangle is a *conic ſection*, as well as the other four, is ſhewn by Apollon. in Con. lib. i. p. 3. As to the circle; it ariſes either from the ſection of a *cone* by a plane parallel to the baſis, or from the ſubcontrary ſection of the ſcalene *cone*. Vid. Apoll. Con. lib. i. prop. 5.

Though the equations, geneſis, and many of the properties, with the ratios, dimenſions, &c. of each of the *conic ſections*, be ſeparately given under their reſpective articles in this work, ELLIPSIS, HYPERBOLA, and PARABOLA; yet, to make the doctrine of *conics*, which is ſo conſiderable a part of the higher geometry, and of ſuch frequent uſe in the new aſtronomy, the motion of projectiles, &c. more complete, we ſhall here put the whole in a new light, and bring it together into one contracted view.

The common interſection, then, of any plane with a *conic* ſuperficies, we obſerve, is called a *conic ſection*: and this ſection varies, and acquires a different name, according to the different inclinations of the cutting plane. For,

1. If a cone be any way cut by a plane, through the vertex; and again by another plane parallel to the former plane: then the ſection, made in the ſuperficies thereof, is called an *hyperbola*; the plane of which, being produced to meet the oppoſite ſuperficies, will make another ſection, which is likewiſe called an *hyperbola*: and both of theſe, conjunctly, are called *oppoſite ſections*.

2. If through the vertex of a cone a plane paſſes without the ſuperficies thereof, that is, neither cutting nor touching it; and the cone be again cut by another plane parallel to the former; the ſection made in the ſuperficies thereof, is called an *ellipſis*.

3. If a plane touch the ſuperficies of a cone, and the cone be cut by a plane parallel to it, the ſection is a *parabola*.

The more ancient mathematicians, before the time of Apollonius Pergæus, admitted only the right cone into their geometry, and they ſuppoſed the ſection of it to be made by a plane perpendicular to one of its ſides; and as the vertical angle of a right cone may be right, acute, or obtuſe, the ſame method of cutting theſe ſeveral cones, viz. by a plane perpendicular to one ſide, produced the *conic ſections*. The parabola was called the ſection of a right-angled cone; the ellipſe, the ſection of the acute-angled cone; and the hyperbola, the ſection of the obtuſe-angled cone. But Apollonius, who, on account of his writings on this ſubject, obtained the appellation of *Magnus Geometra*, obſerved, that theſe three ſections might be obtained in every cone, both ſcalene and right, and that they depended on the different inclination of the plane of the ſection to the cone itſelf. Apollon. Con. Ed. Hall. lib. i. p. 9.

But, inſtead of conſidering theſe curves as ariſing by ſection of the cone itſelf, their deſcription, nature, and properties, are found more eaſy of conception, when conſidered as drawn on a plane: for which reaſon, after Des Cartes, and moſt of the later writers, we ſhall rather chooſe to lay them down in this ſecond manner.

Geneſis or conſtruction of the ellipſis.—To conceive the production and nature of an ellipſis, let H and I (*Tab. Conics*, *fig.* 13.) be two points, nails, or little pegs, about which put a thread BHI; then putting your finger to the thread, and keeping the ſame always in an equal tenſion, move the finger round from the point B, till you return to the ſame point B again.

By this revolution of the point B, will be deſcribed the curve line called the *ellipſis*, which differs from the delineation of a circle only in this, that a circle hath only one center, but the ellipſis two: though if the points H and I ſhould come together, into one, the elliptic curve would become perfectly circular.

But by how much greater the diſtance is betwixt thoſe points, the ſame length of the thread ſtill remaining; by ſo much the farther is this figure removed from the circular: ſo that, according to the different proportion of the diſtance H I to the ſum of the parts BH, BI of the thread, or to the line D K, which is equal to that ſum, diverſe ſpecies of ellipſes will be deſcribed.

But then, if the length of the thread be increaſed or diminiſhed, in the ſame proportion as the diſtance of the points H and I is increaſed or diminiſhed, there will indeed be deſcribed divers ellipſes, but all of the ſame ſpecies: whence it appears, that ellipſes are not only innumerable in magnitude, but in ſpecies alſo; and reach from a circle to a right line: for, as when the points H and I meet together, the ellipſis becomes a circle; ſo, when they are removed from each other half the length of the thread, it becomes a right line, both ſides meeting together.

Whence alſo it appears, that every ſpecies of ellipſes is no leſs different from any other, than the extremes of them are different on this ſide from a circle, and on that from a right line. It alſo appears from this delineation, that if from a point taken at pleaſure in the elliptic periphery, as the point B, you draw two lines to the two central points; theſe two lines B H and B I, taken together, will be equal to the greateſt diameter D K; and conſequently, that the ſum of them is always given.

In the ellipſis DFKR (*fig.* 14.) the point C is called the *center*; the points H and I, the *foci*; D K, the *greater axis*, or *tranſverſe axis*, or the *principal diameter*, or *latus tranſverſum*; and F R, the *leſſer axis:* all the right lines paſſing through the center C, are *diameters*; and all right lines terminated at the periphery, and divided into two equal parts by any diameter, are called *ordinates.* That part of every diameter intercepted betwixt the vertex thereof, and the ordinate, as $M\mu$, is called the *abſciſs* thereof. A line drawn from the vertex of the diameter, parallel to the ordinates thereof, as $\eta\theta$, is a *tangent* to the ellipſis in that vertex. A diameter parallel to the ordinates of another diameter, is termed a *conjugate diameter*; and the ordinate to the greater axis, which paſſes through either of the foci, as M A (*fig.* 13.), is termed the *principal latus rectum*, or the *parameter* of the greater axis. See AXIS, CENTER, DIAMETER, FOCUS, ORDINATE, PARAMETER, &c.

Properties of the ellipſis.—1. The ordinates of every diameter are demonſtrated to be parallel to each other.

2. The ordinates of the principal diameters or axes are perpendicular to the axes themſelves; but the ordinates of the reſt of the diameters are oblique to their diameters; and, in ellipſes of divers ſpecies, are ſo much the more oblique, at equal diſtance from the axis, by how much the proportion of the greater axis to the leſſer is the greater; but in the ſame ellipſis, ſo much the more oblique, by how much the more remote the diameters are from the axes.

3. There are only two conjugate diameters, which are equal to each other; viz. thoſe whoſe vertices are at equal diſtances from the vertices of the axes: thus, the diameter V T (*fig.* 14.) is conjugate, and equal to that other G M; where V F is equal to M F, and V D equal to M K.

4. The obtuſe angle V C M of theſe two diameters, which are conjugate and equal, is greater, and the acute angle V C G is leſs, than every other angle contained under the reſt of the diameters that are conjugate to each other.

5. If the lines μP and νB be ſemiordinates to any diameter, as M G, the ſquare of the ſemiordinate μP is to the ſquare of the ſemiordinate νB, as is the rectangle $M\mu \times \mu G$, to the rectangle $M\nu \times \nu G$; that is, $\mu P q$ is to the rectangle comprehended under the two parts, into which the diameter is divided by the ordinate K P, as $\nu B q$ is to the rectangle under the parts of the diameter made by the ordinate A B.

6. The parameter, or *latus rectum* of any diameter, is a third proportional to that diameter, and its conjugate: that is (in *fig.* 13.), if the diameter D K is to its conjugate diameter E F, as E F is to Y; then Y is the parameter or *latus rectum* of the diameter D K: whence A M, an ordinate to the axis through the focus, is, as above, equal to the principal parameter, and is a third proportional to the greater and leſſer axis.

7. The ſquare of every ſemiordinate, as M I, is always leſs than the rectangle made of any abſciſs whatever, as I K drawn into the *latus rectum* of its own diameter, or than I K × Y. And in *fig.* 14. $P\mu q$ is leſs than the rectangle made of the abſciſs $M\mu$, and the *latus rectum* of M G: from which defect, or ελλειψις, this ſection hath its name.

8. If from any point, as B, in *fig.* 13. you draw the right lines BH and BI to the foci, the ſum of them will be equal to the greater axis, as was ſhewn above: and if the angle I B H, comprehended by thoſe lines, be biſected by the right line ba, the line ba is perpendicular to the tangent V B in the point B; that is, to the curve in the point of contact.

9. The diſtance of a body turned round in an ellipſis, about the focus H, from the ſame focus, is the greateſt of all in the point K; leaſt of all in the point D; and mean in the points E and F; and that mean diſtance H F is equal to the greater half-axis D C or C K; as is maniſeſt from the production of the ellipſis.

10. The vaniſhing ſubtenſe of the angle of contact, parallel to the diſtance from the focus, at an equal perpendicular interval from that diſtance, always remains given and unvaried in the ſame ellipſis, yea, and in the ſame parabola and hyperbola too. Thus, if dZ be always given, gd alſo will always remain given in a diſtance infinitely ſmall.

11. The area of the ellipſis is to the area of the circle circumſcribed, as the leſſer axis is to the greater; and ſo are all correſpondent parts whatſoever among themſelves, as M I K, m I K: and the ordinates to the greater axis, as M I, are divided by the elliptic periphery always in the ſame proportion, ſo that M I is to m I always in the ſame proportion; to wit, that of the leſſer axis to the greater. And we are to reaſon in the ſame manner concerning a circle inſcribed in an ellipſis. See QUADRATURE.

12. All parallelograms deſcribed about the conjugate diameters of the ellipſis, and comprehending the ellipſis, are equal. Thus, the parallelogram $\alpha\beta\varphi\delta$, *fig.* 14. is equal to the other parallelogram $\epsilon\zeta\eta\theta$: and thus it is every where.

13. If a right line always paſſing through one of the foci be ſo moved, that the elliptic area, deſcribed by the ſame, is proportional to the time; the angular motion of a right line drawn from the other focus to the former line, will be almoſt equable: thus, in *fig.* 13. if the angular motion of the line H B be ſo tempered, that the ſame, being according to the reciprocal proportion of the diſtance accelerated or retarded, deſcribes the area D H B, proportional to the time; the angular motion K I B about the other focus I, will be almoſt proportional to the time, and conſequently without any notable acceleration or retardation, and nearly equable; that is to ſay, where the ellipſis does not differ much from a circle.

Geneſis of the parabola.—Let D I be an infinite right line, and I L another perpendicular to it (*fig.* 15.); then, taking in the line D I, any point, F, let the line F I be biſected in the point T; and let there be taken two threads joined together in the point T, one T I, the other T F: and let a pin fixed to the threads in the point T be moved to the right and left, in ſuch a manner, that when the pin is in any other poſition, as in P, the thread T I, which here becomes P L, be always perpendicular to I L; or, which is the ſame thing, parallel to D I, but equal to the thread T F; which in this caſe becomes P F, ever paſſing through the point F.

The curve thus generated by the pin, infinitely produced both ways, is a parabola: in which $gPiTsRo$, is called the *periphery*; I D, the *axis*, or *principal diameter*; I L, the *directrix*; F, the *focus*; the point T, the *principal vertex.*

An ordinate to the axis through the focus is equal to the principal *latus rectum:* all right lines, as ni, &c. parallel to the axis, are diameters, as dividing the lines kT, &c. which are parallel to the tangents at their vertices, into two equal parts; and they are called diameters belonging to the vertices in which they terminate, as i, and R.

Properties of the parabola.—1. Every diameter, or right line parallel to the axis, biſects all the lines within the figure, which are parallel to the tangent of the vertical point: and theſe biſected lines are called *ordinates.*

2. The ordinates of the axis are perpendicular to it; but the ordinates of the reſt of the diameters are oblique to their diameters; and ſo much the more oblique, by how much the vertex of the diameter is further removed from the principal vertex of the parabola.

3. The *latus rectum*, or parameter to every diameter, is a third geometrical proportional to any abſciſs, and its ſemiordinate; that is, if the *latus rectum* of the diameter in, or that of the vertex i, be y; then, as the abſciſs iq is to the ſemiordinate qk, ſo is that ſemiordinate qk to y.

4. The principal *latus rectum*, or that belonging to the axis, is equal to the ordinate hi paſſing through the focus; and quadruple of F T, the leaſt diſtance of the focus from the principal vertex. See FOCUS.

5. The *latus rectum*, belonging to any vertex or diameter, is alſo quadruple of the diſtance of that vertex from the focus: thus, the *latus rectum* of the vertex s is quadruple Fs, and ſo it is every where: and therefore the parameter of the axis is the leaſt of all parameters.

6. The diſtance of any vertex or point in the parabola whatever, from the focus, is equal to the leaſt diſtance of the ſame from the line L I, which is perpendicular

to the axis; and is diſtant from the principal vertex, by a quarter of the principal *latus rectum.*

7. The ſquare of every ſemiordinate, as *q k*, is equal to a rectangle made of the *latus rectum*, of the ſame vertex as *y*, and *i q* the abſciſs of the diameter of the vertex. And from the equality of the ϖαραϐολη, or compariſon in the figure, betwixt the rectangle and the ſquare of the ſemiordinate, without any exceſs or defect, the name of the ſection is derived.

8. Since therefore the *latus rectum* in any diameter is given, the abſciſſes will be as the ſquares, or in the duplicate ratio of the ſemiordinates. Thus, T F is to T G as *i* F *q* is to *g* G *q*, and ſo likewiſe is *i q* to *i r*, as the ſquare of *q* T is to the ſquare of *r l:* and thus every where. From whence, alſo, when the abſciſs of the axis is equal to the principal *latus rectum*, or fourfold of the diſtance from the vertex, it will be equal to its ſemiordinate.

9. The angle, comprehended by any tangent whatever, and a line from the focus, is equal to an angle comprehended by the ſame tangent, and any diameter, or the axis. Thus, the angles I *i* F, and *p i n*, are equal: whence, by the way, all the rays of light which fall on the concave part of the ſurface, produced by the convolution of the parabola about the axis, which fall, we ſay, on the ſame, parallel to the axis, will be reflected from a concave paraboloid figure to the focus F, and there beget a moſt vehement burning: from which property, the point F has the name *focus*, and has communicated the ſame to the like points in the hyperbola and ellipſis.

10. A parabola, like an hyperbola, does not incloſe a ſpace, but ſtretches out *in infinitum.*

11. A parabolic curve always tends more and more, *in infinitum*, to a paralleliſm with its diameters; but can never arrive thereat.

12. If two parabolas be deſcribed, with the ſame axis and vertex; the ordinates to the common axis will be cut off by the parabola in a given proportion; and the areas comprehended by the ſame axis and ordinate, and the reſpective curves, will be in the ſame given proportion to one another.

13. Every parabolic ſpace comprehended betwixt the curve and the ordinate, is to the parallelogram made of the ſame baſe and altitude, in a ſubſequialteral proportion, that is, as 2 is to 3; and to the external ſpace in a duplicate proportion, or as 2 is to 1: ſo *q i* T is to *q i* I, as 2 is to 3; and to *i* I T as 2 is to 1. From whence it becomes eaſy to ſquare the parabola. See QUADRATURE.

14. The diſtance between the vertex of the axis, and the point where any tangent interſects it, as I, is equal to the abſciſs of the axis which belongs to the ordinate applied from the point of contact: ſo T I is equal to T F; and thus it is every where.

15. All parabolas are like, or of the ſame ſpecies; as are alſo all circles.

16. If a diameter be continued through the point of concourſe of two tangents; this diameter will biſect the line that joins the contacts: which property of the parabola may likewiſe be underſtood of the ellipſis, and hyperbola.

Geneſis of the hyperbola.—Suppoſe a ſtaff or rule of a ſufficient length, as I B (*fig.* 16.): let I and H be two central points, anſwering to the foci of an ellipſis, in which let nails be faſtened; then, there being tied to one end of the ſtick a rope or thread as long again as the ſtick, let the other end thereof be bored through, and ſo fixed upon the nail I; and fix the other end of the rope, by a knot, upon the other nail H: which done, laying your finger on the point B, where the rope and ſtaff are tied together, let your finger deſcend ſo long, till you have thereby applied, and joined the whole rope to the ſtaff, or rule; the ſtaff having been in the mean while, as it needs muſt, wheeled about the center I. Thus, with the point B, the vertex of the angle H B I you will have deſcribed a curve line X B D, which is part of an hyperbola; the whole conſiſting of that curve which will reſult from the curve X B D, which hath added to it the curve Y D, the produce of the rule and work, as turned to the other ſide.

Further, transferring the hole, or knot of the rope to the nail I, and faſtening the end of the ſtaff on the nail H, you will deſcribe another hyperbola, vertically oppoſite to the former, which will be altogether like and equal thereto. But if, without changing any thing in the rule and nails, you only apply a longer rope; you will have an hyperbola of a different ſpecies from the former: and if you ſtill lengthen the rope, you will have ſtill other ſorts of hyperbolas; till at length, making the rope double the length of the rule, you will have the hyperbola changed into a right line.

But if you alter the diſtance of the nails, in the very ſame proportion in which you change the difference betwixt the length of the rope, and that of the ſtick; in this caſe you will have hyperbolas marked out, which are altogether of the ſame ſpecies, but have their ſimilar parts differing in magnitude.

Laſtly, If the length of the rope and rule be equally increaſed, their difference in the mean while, and the intervals of the nails, remaining the ſame; not a different hyperbola, either as to ſpecies or magnitude, will be deſcribed, nor any other than a greater part of the ſame hyperbola.

It muſt be owned, however, that many properties of an hyperbola are better known from another manner of generating the figure, which is as follows: let L L and M M (*fig.* 17.) be infinite right lines interſecting each other at any angle whatever, in the point C: from any point whatever, as D or *e*, let D *c*, D *d* be drawn parallel to the firſt lines; or *e c*, *e d*; which, with the lines firſt drawn, make the parallelograms, as D *c* C *d*, or *e c* C *d*. Now, conceive two ſides of the parallelogram, as D *c*, D *d*, or *e c*, *e d*, to be ſo moved, this way and that way, that they always keep the ſame paralleliſm; and that at the ſame time the areas always remain equal; that is to ſay, that D *c* and *e c* remain always parallel to M M; and D *d* or *e d* always parallel to L L; and that the area of every parallelogram be equal to every other, one ſide being increaſed in the ſame proportion wherein the other is diminiſhed: by this means, the point D or *e* will deſcribe a curve line within the angle comprehended by the firſt lines; which is altogether the ſame as that deſcribed above. So alſo in the angle vertically oppoſite will be deſcribed a like and equal hyperbola; if the parallelogram C *c* K *d*, equal to the former, be ſuppoſed to be moved, in the ſame manner as before: which hyperbolas are, as was ſaid before, called *oppoſite ſections*, or *oppoſite hyperbolas.*

In each figure, D K is the *tranſverſe axis*, or *tranſverſe diameter of the hyperbola*, or the *oppoſite ſections*; the point C, the *center*; H and I, the *foci*. In the latter figure, all the lines paſſing through the center C, as *i h*, are *diameters:* but if hyperbolas be deſcribed in the following angles, as L C M, M C L, thoſe ſections will be called *following ſections:* and if the diſtance of the primary vertex of thoſe hyperbolas from the common center C, as C β, or C γ, be equal to the ſemitangent K *u* or K ω, at the primary vertex of theſe, thoſe ſections are called *conjugate ſections:* and all the figures together form the *hyperbolic ſyſtem.*

Further, *i b* the ordinate to the axis through the focus, is equal to the principal *latus rectum*, or the parameter of the axis; and an indeterminate diameter, which is parallel to the ordinates of any determinate diameter, is called the *conjugate diameter* of the ſame.

Properties of the hyperbola.—1. Any diameter, or right line, paſſing through the center, biſects all its ordinates; that is, all the right lines which are terminated on both ſides by the hyperbolic periphery.

2. The ordinates of the axis are perpendicular to the ſame; but the ordinates of the reſt of the diameters are oblique to their diameters: and ſo much the more in divers ſpecies, at equal diſtances from the axis, by how much the difference of the angles including the hyperbolas is the greater: and in the ſame hyperbola, ſo much the more oblique, by how much the diameters are farther removed from the axis.

3. If any lines, as H *b* and Q *s*, be ſemiordinates to any diameter whatever, as K D; the ſquare of the ſemiordinate H *b* is to the ſquare of the ſemiordinate Q *s*, as the rectangle K H × D H is to the rectangle K Q × D Q: and ſo bn^2 is to dK^2, as the rectangle *i b* × *h b* is to the rectangle *i d* × *h d:* and thus every where.

4. The *latus rectum*, or parameter of every diameter, is a third geometrical proportional to the diameter, and the conjugate thereof (or its tangent, which is equal to it): that is, if the *latus rectum* of any diameter, as D K, be *y*; then, as the diameter D K is to its conjugate β γ, or its equal ω *u*; ſo is that conjugate β γ, or that tangent ω *u*, to *y*. And as the ordinate to the axis through the focus is the principal *latus rectum*, ſo it is more than double of the leaſt diſtance of the focus from the vertex.

5. The ſquare of any ſemiordinate, as Q *s*, is greater than a rectangle made of the abſciſs D Q, drawn into the *latus rectum* of its own diameter, as *y:* and, in like manner, the ſquare of the ſemiordinate *b n* is greater than the rectangle of the abſciſs *i b*, into the *latus rectum* of the diameter *h i*. From which ὑπερϐολη, or exceſs, this ſection hath its name.

6. If from any point of the hyperbola, as B (*fig.* 16.), there be drawn right lines to both the foci, as B H, B I, the difference of theſe lines will always be equal to the axis D K; as will eaſily appear from the delineation itſelf.

7. If the angle H B I, comprehended by lines drawn to

the foci, be biſected by the right line E B, that right line will be a tangent to the hyperbola in the point B.

8. The right lines L L and M M (*fig.* 17.), which incloſe the hyperbolas, are aſymptotes of the hyperbolas; that is, they are ſuch, to which, on both ſides, the curve approaches nearer and nearer, but is never able to touch or coincide therewith.

9. The ſpecies of hyperbolas are various, according to the different magnitude of the angle L C M, comprehended by the aſymptotes; but that angle remaining the ſame, the ſpecies of the hyperbola remains unchanged: yet, according to the different magnitudes of the parallelograms, by which hyperbolas are deſcribed, hyperbolas of divers magnitudes do ariſe: if the angle contained by the aſymptotes be a right angle, the hyperbola is called *equilateral*, or *rectangular*; and the *latus rectum* of all the diameters will (as in a circle) be equal to the diameters.

Laſtly, If hyperbolas be deſcribed about the ſame axis in divers angles of the aſymptotes, the right lines perpendicular to the axis will be cut off in a given proportion by them all; and the ſpaces likewiſe incloſed by the right lines, or ordinates, the produced axis, and the curves, will be in the ſame given proportion.

10. If the diſtances from the center of the hyperbola, be taken in a geometrical proportion in one of the aſymptotes, ſo that CI, CII, CIII, CIV, CV, CVI, be in continued geometrical proportion; and if from thoſe points there be drawn parallel to the other aſymptote the lines I 1, II 2, III 3, IV 4, V 5, VI 6; the ſpaces I 2, II 3, III 4, IV 5, V 6, will be equal among themſelves. And conſequently, if that aſymptote C M be ſuppoſed to be divided, according to the proportion of numbers exceeding one another in a natural ſeries, thoſe ſpaces will be proportional to the logarithms of all thoſe numbers.

Common properties of all the Conic *ſections.*—From the whole it may be gathered, 1. That the *conic ſections* are in themſelves a ſyſtem of regular curves, naturally allied to each other; and that one is changed into another perpetually, when it is either increaſed, or diminiſhed, *in infinitum.* Thus, the circle, the curvature thereof being ever ſo little increaſed or diminiſhed, paſſes into an ellipſis; and the ellipſis, its center going away infinitely, and the curvature being by that means diminiſhed, is turned into a parabola; and when the curvature of the parabola is ever ſo little changed, there ariſeth the firſt of the hyperbolas; the ſpecies whereof, which are innumerable, will all of them ariſe orderly by a gradual diminution of the curvature; till the curvature vaniſhing away, the laſt hyperbola ends in a right line perpendicular to the axis. From whence it is manifeſt, that every regular curvature, like to that of a circle, from the circle itſelf to a right line, is a conical curvature, and is diſtinguiſhed with its peculiar name, according to the divers degrees of that curvature.

2. That the *latus rectum* of a circle is double to the diſtance from the vertex: that all the *latera recta* of ellipſes are in all proportions to that diſtance betwixt the double and quadruple, according to their different ſpecies: that the *latus rectum* of the parabola is juſt quadruple of that diſtance: and, laſtly, that the *latera recta* of hyperbolas are in all proportions beyond the quadruple, according to their various kinds.

3. That all diameters in a circle and ellipſis interſect one another in the center of the figure within the ſection: that in the parabola they are all parallel amongſt themſelves, and to the axis; but that in the hyperbola they interſect one another, but this without the ſection, in the common center of the oppoſite ſections.

4. That the curvature, with reſpect to the focus, in all theſe figures, is increaſed or diminiſhed proportionably.

The doctrine of the *conic ſections* is of great uſe in phyſical and geometrical aſtronomy, and the phyſico-mathematical ſciences. This doctrine has been much cultivated by geometers ancient and modern; and we have many good treatiſes on the ſubject; but that publiſhed by Mr. Simpſon, profeſſor of mathematics at Glaſgow, deſerves to be particularly mentioned not only for its elegance, but for its geometrical accuracy, which, as he juſtly remarks in his preface, has not always been ſo well obſerved in treatiſes of this kind, as it ought to be. See alſo Gregorii a St. Vincenti Opus de Quadratura Circuli, & Sectionum Coni; Mydorgius de Sectionibus Conicis; De la Hire de Sectionibus Conicis; Trevigar Elem. Section. Con.; Hamilton's Tract. Geom. de Section. Con.; De l'Hoſpital's Anal. Treat. of Conic Sections; Muller's Treatiſe, &c.; and Halley's Edition of Apollonius, &c. Oxon. 1710. fol.

To the properties of the *conic ſections* mentioned above, it may be proper to add the properties of their oſculatory circles, or circles of *curvature.* See Curvature.

Conic *ſections, ſimilar.* See Similar.

CONICS, that part of the higher geometry, or *geometry of* curves, which conſiders the cone, and the ſeveral curve lines ariſing from the ſections thereof.

CONICTHYODONTES, or *Plectronitæ*, in *Natural Hiſtory*, one of the three names by which the foſſil teeth of fiſh are known: ſo called, from their ſuppoſed reſemblance to the ſpur of a fighting-cock.

Though authors aſſure us that theſe are the teeth of a fiſh, the jaws having been found with theſe bodies in them; yet they do not pretend to know to what fiſh they belong. They are generally of an oblong conic figure, broad at the baſe, and narrower at the point, where they are uſually a little crooked: they are hollowed at the root, and are from the tenth of an inch to two inches long, commonly of a cheſnut colour, and are found in the ſtrata of clay, but moſt uſually in thoſe of ſtone; and are ſeen more frequently in England, than in any other part of the world. Hill's Foſſils, p. 645.

CONIFERA *ſalicis facie*, in *Botany*. See *Silver* Pine-*tree*.

Conifera *alpyi folia*, in *Botany*. See *Spurge-leaved* Pine.

CONIFEROUS, a term applied to ſuch trees, ſhrubs, or herbs, as bear a ſquammous or ſcaly fruit, of a woody ſubſtance, and a figure approaching to that of a cone; in which there are uſually many ſeeds; and, when they are ripe, the ſeveral cells or partitions in the cone gape or open, and the ſeeds drop out. Of this kind are the fir, the pine, beech, and the like.

CONJOINT, or Conjunct, is applied in *Ancient Muſic*, in the ſame ſenſe as *conſonant*, to two or more ſounds heard at the ſame time. See Consonance.

Conjoint *degrees*, two notes which immediately follow each other in the order of the ſcale; as *ut* and *re*.

Conjoint *tetrachords*, are two tetrachords, where the ſame chord is the higheſt of the one, and the loweſt of the other.

CONIRA, in *Botany*, a name uſed by ſome authors for the *myrrhis*. Ger. Emac. Ind. 2.

CONISALUS, in *Mythology*, a god of the Athenians mentioned by Strabo, and ſuppoſed to be the ſame with Priapus.

CONISOR. See Cognisor.

CONISSALÆ, in *Natural Hiſtory*, the name of a claſs of foſſile bodies: the word is derived from κονισσαλος, *powder*; all the ſpecies of bodies of this claſs being found like common ſand, in form of powder, have been uſually confounded together, under the common name of sands.

The *coniſſalæ* are defined to be ſtones of a differently debaſed, cryſtalline, or ſparry matter, but always found in form of ſmall and diſunited particles, great numbers of which being amaſſed together, form a kind of powder.

Of this claſs of bodies there are two diſtinct and large genera. 1. The sands properly ſo called, which are compoſed of particles all appearing to have a tendency to the ſame regular figures, tranſparent, vitrifiable by a ſtrong fire, and not ſoluble in, or effervеſcing with acids. 2. The saburræ, or grit of ſtone found looſe; theſe are found in form of powder, the particles of which, in general, have no tendency to any particular figure, but appear to be rudely broken fragments of larger maſſes. Hill's Hiſt. of Foſſ. p. 543. See Arenæ.

CONISTERIUM, in *Antiquity*, that part of the *gymnaſium* where the duſt was kept, with which thoſe who had been anointed were ſprinkled. It was alſo called *coniſtra*. Potter Arch.

CONJUGATE *diameter*, or axis, in *Conics*, is a right line biſecting the tranſverſe diameter. See Conic *ſection*.

Conjugate *axis*, of an *Ellipſis*, is the ſhorteſt diameter, or axis, biſecting the longer, or tranſverſe axis. Such is E F, *Tab. Conics*, *fig*. 31.

It is demonſtrated, 1. That in an ellipſis, the *conjugate* axis is a mean proportional between the tranſverſe axis and the parameter. 2. The ſquare of the *conjugate* axis is to that of the tranſverſe, as the ſquare of the ſemiordinate is to the rectangle of the ſegments of the axis. 3. That a right line drawn from the focus to the extremity of the ſemi-*conjugate* axis, is equal to the tranſverſe ſemi-axis.

Hence, the *conjugate* axes being given, the focus is eaſily determined; and the ellipſis thence eaſily deſcribed.

Conjugate *axis*, in an *Hyperbola*, is a mean proportional between the tranſverſe axis and the parameter.

It is thus called, becauſe the *conjugate* axis of an ellipſis has the ſame ratio. In an hyperbola, the ſquare of the *conjugate* axis is to the ſquare of the tranſverſe, as the parameter to the tranſverſe axis.

Conjugate *point*, in *Geometry*. See Point.

Conjugate *hyperbola*. See Hyperbola.

Conjugates, in *Rhetoric*, denote words deduced from the ſame origin with that of the ſubject: e. g. *He who does juſtly, is juſt.*

CONJUGATION, in *Grammar*, an orderly diſtribution of the ſeveral parts or inflexions of verbs, in their different MOODS and TENSES, to diſtinguiſh them from each other.

The Latins have four *conjugations* diſtinguiſhed by the terminations of the infinitive, *are*, *ēre*, *ĕre*, *ire*; and moſt of the French grammarians reduce the *conjugations* of their language to the ſame number, ending in *er*, *re*, *ir*, and *oir*. Some have added a fifth Latin *conjugation* called the *mixt*, becauſe it is compoſed of the third and fourth, as *accipere*, *accipio*.

The Greeks have three kinds of verbs; the firſt called *barytons*, becauſe the laſt ſyllable is pronounced with a grave accent; ſee BARYTONUM: ſuch are τεινω, *tendo*, and τυπτω, *verbero*: the ſecond are circumflex verbs, which admit a contraction in their termination, and are then marked with a circumflex accent; ſuch is αγαπαω, αγαπω, *amo*: the third kind comprehends the verbs in μι, as ειμι, *ſum*. Of the firſt ſort there are ſix *conjugations*; of the ſecond, three; and of the third, four. But Meſſrs. de Port Royal reduce theſe thirteen *conjugations* to two: viz. one in ω, comprehending the barytons and circumflex verbs; and the other, thoſe in μι.

In the Hebrew language there are four *conjugations*; viz. *kal* with its paſſive *niphal*, *pihel* with its paſſive *pyhal*, to which alſo may be referred *pohel*, *hiphil* with its paſſive *hophal*, and *hithpahel*. The third perſon ſingular maſculine of the firſt *conjugation* is the præterite of the theme; the ſecond *conjugation* has a *dageſh forte* in the ſecond radical; the third has the prefix letter ה; and the fourth, the ſyllable הִתְ.

In Engliſh, where the verbs have ſcarce any natural inflexions, but derive all their variations from additional particles, pronouns, &c. we have hardly any ſuch thing as ſtrict *conjugations*.

Some grammarians, however, diſtribute Engliſh verbs into three *conjugations*, or claſſes, diſtinguiſhed from one another by a peculiar formation in ſome principal part belonging to each: and they obſerve that the three different terminations of the participles, *d*, *t*, *n*, may be conſidered as the characteriſtics of the *conjugations*. Lowth's Introd. to Engliſh Grammar, p. 104. 1772.

Others again diſtinguiſh them by the different inflection of the firſt tenſe in each root, and thus make four *conjugations* in the active voice: the firſt has three radicals alike; as *I do read*; *I read*, i. e. yeſterday; *I have read*, i. e. juſt now. The ſecond has the firſt and third radical alike; as *I run*, *I ran*, *I have run*. The third *conjugation* has the ſecond and third radical alike; as *I eſteem*, *I eſteemed*, *I have eſteemed*. The fourth has the three radicals different; as *I write*, *I wrote*, *I have written* or *writ*. The paſſive voice, being made up of the third radical and the auxiliary verb *am*, admits of no difference of *conjugations*. Ward's Eſſays on the Engliſh Language, p. 87.

CONJUGATION, in *Anatomy*, is underſtood of a pair of nerves; or two nerves, ariſing together, and ſerving for the ſame operation, ſenſation, or motion; there being ſcarce any NERVE in the body without its fellow.

The ancient phyſicians only knew of ſeven pairs, or *conjugations* of nerves; the moderns have diſcovered thirty new ones.

CONIUM. See HEMLOCK.

CONJUNCT. See CONJOINT PAIR.

CONJUNCT *of an arch*. See SUPPLEMENT.

CONJUNCT *ſentence*. See SENTENCE.

CONJUNCTION, in *Aſtronomy*, the meeting of two ſtars, or planets, in the ſame optical point of the heavens, i. e. in the ſame degree of the zodiac; and is either *true* or *apparent*.

If the two bodies meet both in the ſame degree of longitude and latitude, a right line drawn from the center of the earth through the center of one of them, paſſes through that of the other; and the *conjunction* is ſaid to be *true* and *central*: and if the lower hides the upper, the *conjunction* is ſaid to be *corporal*.

If the line paſs wide of the center of the earth, the *conjunction* is ſaid to be *partile*.

If the bodies do not meet preciſely in the ſame degree, but are joined with ſome latitude, the *conjunction* is ſaid to be *apparent*. Thus, when a right line, ſuppoſed to be drawn through the centers of two planets, does not paſs through the center of the earth, but through the eye of the ſpectator; it is ſaid to be an *apparent conjunction*.

Conjunctions are alſo divided into *great* and *greateſt*: *great conjunctions* are thoſe which only happen at conſiderable diſtances of time from each other; as that of Saturn and Jupiter, which happens every twenty years.

Greateſt conjunctions are thoſe which happen in times very remote; as the *conjunction* of the three ſuperior planets, Mars, Jupiter, and Saturn, which only return once in five hundred years. But this diviſion has little place in aſtronomy; being founded on the notion of the particular influences, &c. of the heavenly bodies in ſuch and ſuch aſpects.

Aſtrologers maintain, that the deluge was owing to a *conjunction* of all the planets in Capricorn; and that the conflagration will be occaſioned by their *conjunction* in Cancer: whence they pretend to foretel the end of the world.

The *conjunction* is the firſt, or the principal, of all the aſpects; and that whence the other aſpects commence; as oppoſition is the laſt, where they terminate. See CHARACTER.

The MOON is in *conjunction* with the ſun every MONTH. Her *conjunctions* and oppoſitions are called by a general name, *ſyzygies*.

Eclipſes of the ſun never happen, but when there is a *conjunction* of the ſun and moon in or near the nodes of the ecliptic.

CONJUNCTION, in *Grammar*, a particle which expreſſes a relation or dependence between words, and phraſes; thus called, becauſe ſerving to join or connect the parts or members of a diſcourſe: or, as Mr. Harris defines it, a *conjunction* is a part of ſpeech, void of ſignification itſelf, but ſo formed as to help ſignification, by making *two* or more ſignificant ſentences to be *one* ſignificant ſentence: and he diſtributes them into ſuch as connect ſentences and their meaning, and ſuch as conjoin the ſentences whilſt they disjoin the ſenſe. The former are *conjunctive*, and are either COPULATIVE or CONTINUATIVE; and the latter *disjunctive*, ſome of which are ſimple, as, *either* it is day *or* it is night, and ADVERSATIVE, as, it is not day *but* it is night. Hermes, p. 240, &c.

The *conjunction* is the ſixth of the eight vulgar parts of ſpeech.

Conjunctions render the diſcourſe more ſmooth and fluent; and ſerve very good purpoſes in the argumentative, and narrative ſtyle; but they muſt ever be omitted where a perſon ſpeaks with emotion, as only ſerving to weaken and enervate it. Boileau obſerves, that nothing gives more warmth and life to a diſcourſe, than to drop the *conjunctions* or copulatives: a paſſion, adds he, embarraſſed with *conjunctions*, and uſeleſs particles, loſes all the fire and vehemence it would acquire in its progreſs.

Conjunctions are of various kinds.

CONJUNCTIONS *copulative*, or *conjunctive*, are thoſe which expreſs a relation of union or compariſon between things: as, *and*, *only*, *as much as*, *in the ſame manner as*, *neither more nor leſs*, *inaſmuch as*, *not only*, *but alſo*.

CONJUNCTIONS *adverſative*, thoſe which expreſs a reſtriction, or contrariety: as, *but*, *nevertheleſs*, *although*, *far from*.

CONJUNCTIONS *cauſal*, thoſe which ſhew, that the reaſon of ſomething is brought: as, *for*, *becauſe*, *ſeeing*, *the rather ſince*, *inaſmuch as*.

CONJUNCTIONS *concluſive*, thoſe which denote a conſequence drawn: as, *for which reaſon*, *but then*, *of conſequence*, *ſo that*, &c.

CONJUNCTIONS *conditional*, are thoſe which import a condition: as, *if*, *if not*, *on condition that*, *provided that*, *in caſe of*.

CONJUNCTIONS *continuative*, thoſe which expreſs a ſucceſſion, or continuation of the diſcourſe: as, *in effect*, *even*, *whatever it be*.

CONJUNCTIONS *disjunctive*, thoſe which expreſs a relation of ſeparation or diviſion: as, *neither*, *whether*, *or*.

CONJUNCTIONS *dubitative*, thoſe which expreſs ſome doubt, or ſuſpenſion of opinion: as, *if*, *that is to ſay*, &c.

CONJUNCTIONS *exceptive*, are, *if it be not*, *unleſs that*, &c.

CONJUNCTIVA, *tunica*, *adnata*, or *albuginea*, in *Anatomy*. See ADNATA.

CONJURATI *fratres*. See FRATRES.

CONJURATION, ſignifies a plot or confederacy, made by perſons combining together by oath or promiſe, to do ſome public harm.

But it was more particularly uſed, formerly, for having a perſonal conference with the devil, or ſome evil ſpirit, to know any ſecret, or to effect any purpoſe. Anno 5 Eliz. c. 16.

It is ſaid in ſome of our law books, that the difference between *conjuration* and *witchcraft* is, that the former endeavours by prayers and invocation of God's powerful name, to compel the devil to ſay or to do what the offender commands him; the latter deals rather by friendly and voluntary conference or agreement with the devil or familiar, to have the offender's deſires ſerved, in lieu of blood, or other gift offered to the devil, eſpecially of the offender's ſoul. And both theſe differ from *inchantment* or *ſorceries*; becauſe thoſe are perſonal conferences with the devil, and theſe are but medicines and ceremonious forms of words (commonly called *charms*) without apparition. Cowel.

The ſtatute of king James I. againſt *conjuration* and witchcraft, is repealed; and no proſecution ſhall be commenced on the ſame: but where perſons pretend to exerciſe any kind of witchcraft or *conjuration*, &c. or undertake to tell fortunes, or, from their ſkill in any crafty ſcience, to diſcover where goods ſtolen or loſt may be found; upon conviction they ſhall be impriſoned a year, and ſtand in the pillory once in every quarter, in ſome market-town, and may be ordered to give ſecurity for their good behaviour, by ſtat. 9 Geo. II. c. 5.

CONN, in *Sea-Language*. See COND.

CONNA, in *Botany*, a name uſed by ſome authors for the tree which produces the *caſſia fiſtula* uſed in medicine. Hort. Manut. vol. i. p. 37.

CONNARUS, in the *Materia Medica*, a name given by ſome authors to a large ſpecies of jujube. Ger. Emac. Ind. 2.

CONNATA *folia*, among *Botaniſts*. See LEAF.

CONNECTING *oil*. See OIL.

CONNECTION, or CONNEXION, a relation whereby one thing adheres to, or depends on another.

Euclid's propoſitions have ſuch a *connection* among themſelves, that the latter cannot ſubſiſt without the former.

CONNECTION, or *continuity*, in the *Drama*, conſiſts in the joining of the ſeveral ſcenes together.

When the ſcenes of an act ſucceed one another immediately, and are ſo joined as that the ſtage is never left empty, the *connection* is ſaid to be obſerved.

CONNECTIVES, in *Grammar*, one of the four ſpecies under which, according to Mr. Harris, all WORDS may be included. They are of two kinds, and as they connect ſentences or words, are called by the different names of CONJUNCTIONS and PREPOSITIONS. Hermes, p. 31, and 237.

CONNER. ALE-CONNER. See ALE-CONNER.

CONNIVENTES *valvulæ*, in *Anatomy*, wrinkles, or corrugations in the inner coat, or membrane, of the two large inteſtines, the *jejunum* and *ileum*.

They are formed as the *rugæ* of the ſtomach, viz. by the inner coat's being larger than the outer.

Theſe folds, or corrugations, ſome anatomiſts imagine in ſome meaſure to do the office of valves; by ſtreightening the paſſages, and conſequently impeding the motion of their contents: by which means, the LACTEALS have the more time to imbibe the CHYLE. See DIGESTION.

CONNOISSEUR, a French term, of late uſed in Engliſh: it literally denotes a perſon well verſed in any thing; being formed of the verb *connoitre, to know, underſtand*. Hence it comes to be uſed in our language for a critic, or perſon who is a thorough judge, or maſter in any way; particularly in matters of painting and ſculpture.

CONNAUGHT *worm*. See WORM.

CONOCARPODENDRON. See PINE-*tree*.

CONOCARPUS, in *Botany*. See BUTTON-*tree*.

CONOID, CONOIDES, in *Geometry*, a ſolid body, reſembling a cone, except in this, that, inſtead of a perfect circle for its baſe, it has an ellipſis, or ſome other curve approaching thereto.

The *conoid* is produced by the entire circumvolution of a conic ſection around its axis; and according to the denomination of the ſection from whence it is generated, it is differently denominated: if, v. gr. the ſolid be produced by the motion of a parabola, it is called a *parabolic conoid*; if by that of an hyperbola, an *hyperbolic conoid*; and an *elliptic conoid*, or a *ſpheroid*, when produced by the rotation of an ellipſis round one of its axes.

The famous ſolid of the leaſt reſiſtance, Sir Iſaac Newton, M. Fatio, and the Marquis De l'Hôpital, have demonſtrated to be a *conoid*.

CONOIDES, or CONARIUM, is a name given by *Anatomiſts* to a gland found in the third ventricle of the brain, reſembling a pine-apple; whence M. Des Cartes called it *pinealis*; and has fixed there the ſeat of the rational ſoul. See PINEAL *gland*.

CONONITES, in *Eccleſiaſtical Hiſtory*, the followers of Conon of Alexandria in the ſixth century, reſembling in their opinions the SEVERIANS, THEODOSIANS, and TRITHEISTS.

CONOPEUM, in *Antiquity*, a ſort of net-work, made to keep away flies; it comes from κωνωψ, *a fly*.

CONQUASSATION, in *Pharmacy*, a ſpecies of comminution, or a particular operation, by which moiſt concreted ſubſtances, ſuch as recent vegetables, their fruits, lacteſcent ſeeds, and the ſofter parts of animals, are contuſed and agitated in a mortar, until partly by their proper ſucculence, or the affuſion of ſome liquor, they are reduced to a ſoft pulp. Metalline inſtruments are not to be uſed for this purpoſe; becauſe not only the manifeſt, but alſo the latent ſalts of the ſubſtances, ſubjected to this operation, acting on the inſtruments, may derive an adventitious virulent quality from them, which will not only render ſuch ſubſtances unfit for the intended purpoſes, but alſo nauſeous and hurtful when exhibited as medicines. James.

CONQUEST, in *Civil Juriſprudence*, is the acquiſition of property in common by a number of perſons.

In ſome countries they confound acquiſition with *conqueſt*; but, according to the moſt general acceptation, acquiſition is the gaining of unappropriated goods before the eſtabliſhment of a community: whereas by the term *conqueſt*, is ordinarily intended whatever is acquired by a number of perſons in community; or by ſome one for all the others.

As it is more eſpecially in the union of perſons by marriage, that a community of property takes place; it is in reference to them that we frequently uſe the word *conqueſt*. There are nevertheleſs *conqueſts* alſo among other perſons who are in a tacit community or ſociety; ſuch as obtain by particular local cuſtoms. Encycl.

According to this ſenſe of the word, it has been contended by ſeveral, that William I. claimed this kingdom; that is, not by right of arms, but by right of *conqueſt* or acqueſt; under promiſe of ſucceſſion made by Edward the Confeſſor, and a contract entered into by Harold to ſupport his pretenſions to that ſucceſſion: and by old writers, *conqueſtus*, *acquiſitio*, and *perquiſitio*, are frequently uſed as ſynonymous terms. Blackſt. Comm. vol. i. p. 199. and vol. ii. p. 243.

CONQUEST, in the *Law of Nations*, is the acquiſition of ſovereignty by force of arms, by ſome foreign prince; who reduces the vanquiſhed under his empire. The right of *conqueſt* is derived from the laws of war; and when a people is ſubjected, the conduct of the conqueror is regulated by four kinds of law. Firſt, the law of nature, which dictates whatever tends to ſelf-preſervation; ſecondly, our reaſon, which teaches us to uſe others, as we would be treated ourſelves; thirdly, the laws of political ſociety, to which nature has not aſſigned any preciſe boundary; laſtly, the law which is derived from the particular circumſtances attending the *conqueſt*.

Thus, a ſtate conquered by another will be treated in one of the four methods following. Either the conqueror will continue it under its own laws, and will only claim the exerciſe of civil and eccleſiaſtical ſovereignty; or he will impoſe a new form of government; or he will deſtroy the frame of their ſociety, and incorporate the inhabitants with others; or he will exterminate them. Encycl.

CONSANGUINITY, the relation of kinſhip, between perſons of the ſame blood, or ſprung from the ſame root. It is either *lineal*, when it ſubſiſts between perſons, of whom one is deſcended in a direct line from the other; or *collateral*, when relations deſcend from the ſame anceſtor, but do not deſcend from each other. It is eaſy to compute, by the rules of progreſſion, how many lineal anceſtors any man has within a certain number of degrees. Thus, it would appear that a perſon, at the 20th degree, or the diſtance of 20 generations, hath above a million of anceſtors: and if a ſimilar calculation be made of collateral kindred at the diſtance of 20 degrees forward, on the ſuppoſition that each couple of anceſtors leave, one with another, two children, the number will be 274877906944: as in the following tables.

Blackſtone's Commentaries, vol. ii. p. 204, 206.

Marriage is prohibited by the church to the fourth DEGREE of *conſanguinity*, incluſive; but, by the law of nature, *conſanguinity* is no obſtacle to marriage, except it be in the direct line.

Conſanguinity terminates in the ſixth and ſeventh degree, excepting in the ſucceſſion to the crown; in which caſe, *conſanguinity* is continued to infinity.

The civilians call *fratres conſanguinei*, thoſe born of the ſame father; in oppoſition to *fratres uterini*, who are only born of the ſame mother.

According to the common opinion, thoſe were not allowed to complain of an inofficious teſtament, i. e. of being diſinherited without cauſe; excepting from the turpitude of the perſon appointed heir in their place. But Van Water endeavours to ſhew the contrary; and urges, that the *conſanguinei* might plead inofficioſity, even where the teſtament was not made in favour of a perſon incapable. See KINDRED.

CONSCIENCE, Consciousness, in *Ethics*, a ſecret teſtimony or judgment of the ſoul, whereby it gives its approbation to things it does that are naturally good; and reproaches itſelf for thoſe that are evil.

Or, *conſcience* is a dictate of the underſtanding power, concerning moral actions; conſidered as it has the knowlege of laws; and conſequently as conſcious of what is to be done, or not done, with regard to the legiſlator.

In the more popular ſenſe of the word, *conſcience* is a judgment, either true or falſe, whereby we pronounce a thing good or evil. This makes what we call the inner *forum*, or tribunal.

Some divines maintain, that *conſcience* is infallible; and hold it to be that immutable law whereby God will judge men: they deny that the underſtanding can be the ſource of errors, and lay them all at the door of the will. A man, ſay they, may ſecure himſelf from error, by forbearing to judge of things till he have a clear and diſtinct perception of them.

Some of the ſchoolmen diſtinguiſh between the *conſcience* antecedent to an action, and that conſequent to it: the firſt, called *antecedent conſcience*, determines what is good, and what evil; and conſequently preſcribes what is to be done, and what avoided.

Conſequent conſcience is a kind of ſecondary or reflex judgment, with regard to the goodneſs, &c. of things already done or committed.

The *rule of conſcience* is the will of God, ſo far as it is made known to us, either by the light of nature, or by that of revelation.

With reſpect to the knowlege of this rule, *conſcience* is ſaid to be *rightly informed*, or *miſtaken*; *firm*, or *wavering*, or *ſcrupulous*, &c. With reſpect to the conformity of our actions to this rule when known, *conſcience* is ſaid to be *good*, or *evil*, &c.

Philoſophers, in lieu of the word *conſcience*, which ſeems appropriated to theological matters, ordinarily uſe that of *conſciouſneſs*; whereby they mean an inner ſentiment of a thing, whereof one may have a clear and diſtinct notion. In this ſenſe, they ſay, that we do not know our own ſoul, nor are aſſured of the exiſtence of our own thoughts, otherwiſe than by *ſelf-conſciouſneſs*.

Conscience, *court of*. See Court.

CONSCRIPT, Conscriptus, a popular term in the *Roman Hiſtory*, uſed in ſpeaking of ſenators, who were called *conſcript* fathers, *patres conſcripti*; becauſe their names were written in the regiſter, or catalogue of the ſenate.

Livy, lib. i. cap. 1. tells us, that when Brutus filled up the places of the ſenators cut off by Tarquin, with others choſen out of the equeſtrian order, thoſe new ſenators only had the appellation given them of *patres conſcripti*. But it is certain, that, in after-times, all the ſenators were called *patres conſcripti* without any diſtinction.

CONSECRATION, the act of converting, or ſetting apart, any profane, or common thing, to a pious purpoſe; with certain ceremonies, prayers, benedictions, &c. appropriate thereto.

Conſecration is the reverſe of ſacrilege and profanation, which conſiſt in perverting a thing ſet apart for a pious purpoſe, to a profane and popular one.

The biſhop *conſecrates* a church, or a chalice; the pope *conſecrates* medals, agnus dei's, &c. and grants indulgences to thoſe who bear them about them with devotion.

The *conſecration* or dedication of a church is an epiſcopal ceremony, conſiſting in a great number of benedictions, with aſperſions and unctions of chriſm, &c. on the walls, both withinſide and without. The form for *conſecrating* churches, chapels, and church-yards, or places of burials in England, may be ſeen in Wilkins's Concilia Magnæ Britanniæ, &c. vol. iv. p. 668. It directs that the biſhop and clergy, of whom there are to be at leaſt two, ſhall enter the church or chapel in their ſeveral habits, and, as they walk up from the weſt to the eaſt end, repeat alternately the 24th Pſalm; the biſhop beginning, "The earth is the Lord's," &c. with the "Gloria patri." When they are come to the Lord's table, the biſhop ſitting in his chair ſhall have the inſtrument of dedication, donation, and endowment of the church or chapel, church-yard, or burial-place, preſented to him by the founder, or ſome proper perſon, which he ſhall cauſe to be read by his regiſter, or other officer; and then the inſtrument ſhall be laid on the table, and he ſhall ſtand on the north ſide of it, and turning to the congregation, deliver an addreſs to them, which is followed by ſuitable prayers. One of the prieſts then reads the ſervice of the day, introducing proper pſalms and leſſons: after which, the biſhop proceeds to the communion ſervice, and inſtead of the collect of the day, uſes one proper to the occaſion. When the Epiſtle and Goſpel are read, they are ſucceeded by the Nicene creed and the ſermon; and then the biſhop is to proceed with the ſervice of the communion. When the ſervice in the church is finiſhed, the biſhop and clergy with the people ſhall go into the church-yard, and make uſe of a prayer for the occaſion. See ubi ſupra.

The cuſtom of *conſecrating* perſons, temples, altars, veſtments, utenſils, &c. is very ancient; and all the ceremonies thereof are preſcribed under the old law. When thoſe *conſecrations* relate to men, they are properly called *ordinations*; excepting thoſe performed to BISHOPS and KINGS, which ſtill retain the name of *conſecration*. Thoſe which only conſiſt in a ceremony inſtituted by the church, are more properly called *benedictions*. When they regard churches, altars, veſſels, &c. they are properly called *dedications*.

Consecration is particularly uſed for the benediction of the elements in the euchariſt.

The Romaniſts define it, the converſion of the bread and wine into the real body and blood of Jeſus Chriſt: and that this is the ſentiment of their church, is evident from the prieſt's elevating the hoſt immediately after *conſecration*, for the people to adore it. See Elevation, &c.

There is a great controverſy between the Latin and Greek churches, touching the words of *conſecration*: the common opinion among the Romaniſts, agreeable to St. Thomas and the ſchoolmen, is, that the *conſecration* of the bread and wine conſiſts in theſe words, *This is my body*; *this is my blood*. The Greeks, on the contrary, attribute the change of the elements to a certain prayer, which they call the *invocation of the Holy Ghoſt*, rehearſed after the words *This is my body*; *this is my blood*; which the Greeks maintain are only neceſſary in the proceſs of the *conſecration*, as they contain the hiſtory of the inſtitution; not as they contribute any thing to the change.

Consecration, among *Medaliſts*, is the ceremony of the APOTHEOSIS of an emperor; or his tranſlation into heaven, and reception among the gods.

On medals, the *conſecration* is thus repreſented: on one ſide is the emperor's head, crowned with laurel, ſometimes veiled; and the inſcription gives him the title of *divus*: on the reverſe is a temple, a buſtum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus: at other times the emperor is ſeen in the air, borne up by the eagle; the inſcription always, CONSECRATIO.

Theſe are the uſual ſymbols: yet on the reverſe of that of Antoninus, is the Antonine column. In the apotheoſis of empreſſes, inſtead of an eagle there is a peacock. As to the honours rendered theſe princes after death, they were explained by the words *conſecratio*, *pater*, *divus*, and *deus*. Sometimes around the temple or altar are put, *memoria felix*, or *memoriæ æternæ*: for princeſſes, *æternitas*,

æternitas, and *ſideribus recepta*; on the ſide of the head, *dea*, or Θεα.

CONSECTARY, a propoſition that follows, or is deduced, from ſome preceding definition, lemmata, axioms, concluſions, or the like. Some rather chooſe to call it a *conſequence*; and others a *corollary*, &c.

CONSECUTIVELY, **Conſecutive**, in the *School Philoſophy*, is ſometimes uſed in oppoſition to *antecedently*, and ſometimes to *effectively*, or *cauſally*.

Thus, ſay the ſchoolmen, the corruption of one thing is the generation of another, not *effectively*, but *conſecutively*: that is, ſince matter cannot be without form, it is neceſſary, that the generation of one thing follow upon the corruption of another.

CONSENT *of parts*, in the *Animal Oeconomy*, a certain agreement, or ſympathy, by means whereof, when one part is immediately affected, another, at a diſtance, becomes affected in like manner.

This mutual accord, or *conſent*, is doubtleſs effected by the commerce of the nerves, and their artful diſtribution and ramification throughout the body.

The effect is ſo ſenſible, as even to come under the phyſician's cognizance: thus, the ſtone in the bladder, by vellicating the fibres there, will pain and draw them ſo much into ſpaſms, as to affect the coats of the bowels in the ſame manner, by the intermediation of nervous threads, and make a colic there; and alſo extend their twitches ſometimes as far as the ſtomach, and occaſion grievous vomitings: the remedy, therefore, in ſuch caſes, is to regard the part originally affected, how remote and grievous ſoever may be the conſequences and ſymptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, thoſe of the mouth, cheeks, præcordia, and parts adjacent, &c. is ſuppoſed by naturaliſts to be the inſtrument of that particular and extraordinary *conſent* between thoſe parts. Hence it is, that a ſavoury thing ſeen or ſmelt excites the appetite, and affects the glands and parts of the mouth; that a ſhameful thing ſeen or heard affects the cheeks with bluſhes; on the contrary, if it pleaſe, it affects the præcordia, and excites the muſcles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, ſo as to occaſion tears, and the muſcles of the face, putting them into an aſpect of crying.

Dr. Willis, quoted by Mr. Derham, imputes the pleaſure of kiſſing, and its effects, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected, an irritation is occaſioned in the latter. See Sympathy.

CONSENTES, in *Mythology*, derived from the old Latin *conſo*, *to counſel*, denotes twelve ſuperior deities among the Romans, who were apprehended to belong to the council of Jupiter. Theſe were Jupiter, Neptune, Mars, Apollo, Mercury, Vulcan; and Juno, Veſta, Minerva, Diana, Ceres, and Venus. Varro mentions twelve other deities under the ſame denomination, who ſuperintended agriculture. Lib. i. De Re Ruſtica.

Theſe *conſentes* had a temple at Piſa in Italy.

CONSENTIA were feaſts inſtituted in honour of theſe deities.

CONSEQUENCE, in *Logic*, the concluſion of a reaſoning, or argument.

The two premiſes of a ſyllogiſm being granted, the *conſequence* muſt alſo be granted.

In a more reſtrained ſignification, *conſequence* is uſed for the relation or connexion between two propoſitions, whereof one follows, or is inferred, from the other.—Thus: *It is an animal, and therefore feels.*

CONSEQUENT, the laſt propoſition of an argument; being ſomething deduced or gathered from a preceding argumentation. An enthymeme only contains two propoſitions, the *antecedent* and *conſequent*: if the *antecedent* be abſurd, the *conſequent* muſt be ſo too.

Conſequent, in a more preciſe ſenſe, is uſed for the propoſition which contains the concluſion, conſidered in itſelf, and without any regard to the *antecedent*: in which ſenſe, the *conſequent* may be true, though the *conſequence* be falſe.

Conſequent *of a ratio*, in *Arithmetic*, the latter of the two terms of a ratio; or that to which the antecedent is referred. See Proportion.

Thus, in *a* : *b*, or *a* to *b*, *b* is the *conſequent*, *a* the antecedent.

Conſequents, in *Rhetoric*, are alſo uſed to ſignify ſuch things, as being allowed, neceſſarily, or very probably, infer their antecedents. Thus with reſpect to a ſubſtance, it is corruptible, and therefore material.

CONSEQUENTE, Conſequenza, or *in* Conſequenza, in the *Italian Muſic*. A part of a *fugue*, or *canon*, is ſaid to be *in conſequenza*, when it follows the firſt part called the *guide*, imitating its motions, notes, and figures. Broſſ. Dict. Muſ. in voc.

CONSEQUENTIA, in *Aſtronomy*, is oppoſed to Antecedentia; and a motion *in conſequentia* is a motion in the order of the ſigns of the zodiac.

CONSERVATIVE *ſuture*. See Suture.

CONSERVATOR, an officer eſtabliſhed for the ſecurity and preſervation of the privileges granted ſome cities and communities; or, a perſon who has a commiſſion to judge of, and decide, the differences ariſing among them.

In moſt catholic univerſities, there are two *conſervators*; the *conſervator* of royal privileges, or thoſe granted by kings; and the *conſervator* of apoſtolical privileges, or thoſe granted by the pope.

The firſt takes cognizance of perſonal and mixed cauſes between the regents, ſtudents, &c. and the latter of ſpiritual matters between eccleſiaſtics.

Anciently there were appointed *conſervators* of treaties of peace between princes; which *conſervators* became judges of the infractions made on a treaty, and were charged with procuring ſatisfaction to be made. Theſe were uſually the feudatories of the ſeveral powers.

In lieu of *conſervators*, princes now have recourſe to other indifferent princes to guarantee their treaties. See Guarantee.

Conſervator *of the peace*, in our *Ancient Cuſtoms*, was a perſon who had an eſpecial charge, by virtue of his office, to ſee the king's peace kept.

Till the erection of justices of the peace by king Edward III. there were ſeveral perſons who by common law were intereſted in keeping the ſame: ſome having that charge as incident to other offices; and others ſimply, or of itſelf, called *cuſtodes*, or *conſervators of the peace*.

The chamberlain of Cheſter is ſtill a *conſervator* in that county; and petty conſtables are, by the common law, *conſervators*, &c. in the firſt ſenſe, within their own juriſdiction: ſo are alſo the coroner and the ſheriff within their own county. The king is the principal *conſervator* of the peace within all his dominions: the lord chancellor, lord treaſurer, lord high ſteward, lord marſhal, lord high conſtable, all the juſtices of the court of king's bench, by their office, and the maſter of the rolls, by preſcription, are general *conſervators* of the peace through the whole kingdom, and may commit breakers of the peace, and bind them in recogniſances to keep it.

Conſervator *of the truce, and ſafe conducts*; *conſervator induciarum, & ſalvorum regis conductuum*, was an officer appointed in every ſea-port, under the king's letters patent. His charge was to enquire of all offences committed againſt the king's truce, and ſafe conducts upon the main ſea, out of the franchiſes of the cinque-ports, as the admirals were wont to do, and ſuch other things as are declared anno 3 Hen. V. cap. 6. See alſo ſtat. 4. Hen. V. cap. 7.

CONSERVATORIOS are muſical ſchools eſtabliſhed for the inſtruction of children in the profeſſion of muſic. There are four of theſe at Venice, deſigned for the education of girls, and three at Naples, for the education of boys. It has been ſuggeſted that the operation of caſtration was performed in the *conſervatorios*; but the practice is abſolutely prohibited; and the young caſtrati are brought from Lucia in Puglia: but before the operation is performed, their voices are tried in a *conſervatorio*. The ſcholars of the Venetian *conſervatorios* have been chiefly celebrated for taſte, and neatneſs of execution; and thoſe of Naples have had the reputation of being the firſt *contrapuntiſts*, or compoſers, in Europe.

CONSERVATORY is ſometimes uſed for a place to preſerve snow and ice. See Phil. Tranſ. N° 8. p. 140. See Ice-*Houſe*.

CONSERVE, in *Pharmacy*, a dry confect, or form of medicine, or food, contrived to preſerve the flowers, leaves, roots, peels, or fruits of ſeveral ſimples, as near as poſſible to what they were when freſh-gathered; and to give them an agreeable taſte.

Phyſicians, under the name of *conſerves*, commonly comprehend all kinds of confects of flowers, fruits, roots, ſeeds, barks, &c. both liquid and dry.

Conſerves are made by beating up the thing to be preſerved with ſugar; viz. a triple quantity thereof to thoſe which are moſt moiſt and corruptible, and a double quantity to ſuch as are leaſt ſo.

Thus, e. gr. to make *conſerve* of roſes, roſemary-flowers, ſage-flowers, or the like; they pound them in a ſtone mortar, and when pounded, put to them fine ſugar, and beat the whole well together. For fruits, as currants, &c. they ſet them on the fire to make them yield their juice, then drain and ſtrain them, and thicken what comes from them over the fire, and add to it the ſugar.

This laſt ſort of *conſerve* is particularly called a jelly.

CONSIDERATIO *curiæ*, in *Law*, denotes the judgment of the court.

CONSIDERATION, in *Law*, the material cauſe, or *quid pro quo* of any contract, and without which no contract is obligatory or binding.

This *conſideration* is either *expreſſed*; as if a man bargain to give ten guineas for a horſe: or *implied*, when the law itſelf enforces a *conſideration*; as if a man coming into an inn, take meat, drink, and lodging for himſelf and horſe, the law preſumes he intends to pay for them, though there be no expreſs contract between him and his hoſt; and if he diſcharge not the houſe, the hoſt may ſtop his horſe.

There is alſo a *conſideration* of nature and blood; and valuable *conſideration* in deeds and conveyances.

Conſiderations of natural love, affection, marriage, &c. are good to raiſe uſes to a man's family; if the uſes are limited to a ſtranger, then it muſt be for valuable *conſideration*, not for love, affection, &c. 1 Inſt. 271. 1 Rep. 176.

CONSIGNMENT, or **Consignation**, the depoſiting any ſum of money, bills, papers, or commodities, in ſure hands; either by order of a court of juſtice, in order to their being delivered to the perſons to whom they are adjudged; or voluntarily, in order to their being remitted to the perſons they belong to, or ſent to the places they are deſtined for.

Consignment *of goods*, is the delivering, or making them over to another.—Thus, goods are ſaid to be *conſigned* to a FACTOR, when they are ſent to him to be ſold, &c. or when a factor ſends back goods to his principal, they are ſaid to be *conſigned* to him.

CONSILIUM, *dies conſilii*, in *Law*, was a time allowed for one accuſed to make his defence, and to anſwer the charge of the accuſer. It is now uſed for a ſpeedy day appointed to argue a demurrer; which the court grants after a demurrer joined on reading the record of the cauſe. See EMPARLANCE.

CONSIMILI *Caſu*. See CASU.

CONSISTENCE, a ſtate of reſt, wherein things capable of growth, or decreaſe, continue for ſome time at a ſtand, without either.

This term is particularly uſed with regard to trees, for the time, or age, beyond which they do not grow, and yet at which they do not decline.

Thus we diſtinguiſh three ſtates or ſtages of a tree; its growth, *conſiſtence*, and return: and theſe are common to all trees, even fruit trees.

The *conſiſtence* of an oak is from fifty to a hundred and ſixty years: ſome, however, hold, that their *conſiſtence* only commences from a hundred years; aſſerting that they grow till that time, and that they continue in that ſtate of perfection to two hundred years of age.

Consistence, in *Phyſics*, is that ſtate of a body wherein its component particles are ſo connected, or entangled among themſelves, as not to ſeparate or recede from each other.

Conſiſtence only differs from *continuity* in this, that *conſiſtence* implies a regard to motion or reſt, which continuity does not; it being ſufficient to denominate a thing *continuous*, that its parts are contiguous to each other.

When uſed relative to a diſeaſe, it imports the *criſis* or *acme* thereof: when applied to the humours, excrements, or excretions, it imports their ſtate as to thickneſs or thinneſs.

Consistence is particularly uſed with regard to bodies conſidered as they are more ſoft, or more hard, more liquid, or more dry.

Forms of medicines, as electaries, lambatives, boluſes, ſyrups, unguents, &c. differ chiefly in *conſiſtence*.

Not only the gratefulneſs, but alſo the operation of medicines, depend in ſome meaſure on their *conſiſtence*; for medicines of a thick *conſiſtence* are taken into the ſtomach, and penetrate into the body with greater difficulty, than ſuch as are thin and liquid; and it requires more trouble to ſwallow a thick than a thin medicine: for this reaſon thick medicines are generally nauſeous and ungrateful; and this is the reaſon why cathartic boluſſes are often diſſolved in ſome agreeable liquor, ſince in this form they are more grateful than in any other: for this reaſon alſo apozems are generally clarified by whites of eggs, or a ſtrainer.

On the contrary, a thick *conſiſtence* is on ſome occaſions more to be deſired; in ulcers of the aſpera arteria, and œſophagus, for inſtance, where we muſt give medicines made up with gum tragacanth, or other ſubſtances of a like nature, which by their viſcidity fix the medicines, as it were, longer to the part affected.

CONSISTENT *Bodies*, is a term much uſed by Mr. Boyle for ſuch as we ordinarily call *firm*, or *fixt bodies*; in oppoſition to *fluid* ones.

That author has a particular eſſay of the *atmoſphere of conſiſtent bodies*; wherein he ſhews, that all, even ſolid, hard, ponderous, and fixed bodies, do exhale or emit effluvia to a certain ſpace all around them.

CONSISTENTES, in *Church Hiſtory*, a kind of penitents who were allowed to aſſiſt at prayers, but could not be admitted to receive the ſacrament.

CONSISTORIAL *Advocate*. See ADVOCATE.

CONSISTORY, or *Roman* **Consistory**, denotes the college of CARDINALS; or the pope's ſenate, and council, before whom judiciary cauſes are pleaded.

Du-Cange derives the word from *conſiſtorium*; i. e. *locus ubi conſiſtitur*; uſed chiefly for a veſtible, gallery, or antechamber, where the courtiers wait for admiſſion; and called *à conſiſtente multitudine*.

The *conſiſtory* is the firſt court, or tribunal of Rome: it never meets but when the pope pleaſes to convoke it: the pope preſides in it in perſon, mounted on a magnificent throne, and habited in his *pontificalia*; on the right are the cardinal-biſhops and prieſts, and on the left the cardinal deacons.

The place where it is held, is a large hall in the apoſtolical palace, where princes and ambaſſadors of kings are received. The other prelates, prothonotaries, auditors of the rota, and other officers, are ſeated on the ſteps of the throne; the courtiers ſit on the ground; ambaſſadors on the right, and *conſiſtorial* and fiſcal advocates behind the cardinals.

Beſides the public *conſiſtory*, there is alſo a private one, held in a retired chamber, called the chamber of *papegay*; the pope's throne here being only raiſed two ſteps high.

Nobody is here admitted but the cardinals, whoſe opinions are collected, and called *ſentences*. Here are firſt propoſed and paſſed all bulls for biſhopricks, abbeys, &c. Hence biſhopricks, and abbeys, are ſaid to be *conſiſtorial benefices*; in regard, they muſt be propoſed in the *conſiſtory*, the annates be paid to the pope, and his bulls taken.

Anciently they were elective; but by the concordat, which aboliſhes elections, they are appointed to be collated by the pope alone, on the nomination of the prince.

Consistory was alſo the name of a COURT under Conſtantine, where he ſat in perſon, and heard cauſes: the members of this court were called *comites*.

Consistory is alſo uſed among the reformed, for a council or aſſembly of miniſters and elders, to regulate their affairs, diſcipline, &c.

Consistory, or *Court Chriſtian*, in the *Engliſh Laws*, is a council of eccleſiaſtical perſons, or the place of juſtice in an eccleſiaſtical or ſpiritual court.

Every archbiſhop and biſhop has a *conſiſtory-court*, held before his chancellor or commiſſary, either in his cathedral, in ſome chapel, aiſle, or portico, belonging thereto; or in ſome other convenient place of his dioceſe, for eccleſiaſtical cauſes. The ſpiritual court was anciently, in the time of the Saxons, joined with the county or hundred court; and the original of the *conſiſtory* court, as divided from thoſe courts, is found in a law of the Conqueror, quoted by lord Coke.

From this court there lies an appeal to the archbiſhop of each province reſpectively.

CONSOLATION, one of the places in *Rhetoric*, wherein the orator endeavours to abate and moderate the grief or concern of another.

In *conſolation*, a principal regard is to be had to the circumſtances and relations of the parties. Scaliger conſiders this exceeding well, De Arte Poetica. "The *conſolator*, ſays he, is either a ſuperior, an inferior, or an equal; with regard, either to preferment, honour, wealth, wiſdom, or age. Livia is therefore to comfort Ovid, in a manner very different from that wherein Ovid comforts Livia. Thus, as to authority, a father and ſon, Cicero and Pompey, are to conduct their *conſolations* very differently: ſo in wealth; as if a client ſhould undertake to comfort Craſſus: in wiſdom; as when Seneca comforts Polybius and his mother: as to age, there need no examples.

"A ſuperior may interpoſe his authority, and may even chide; a wiſe man may even diſpute; ſentences will become him. An inferior is to ſhew reſpect and affection, and own he had this from ſome wiſe or learned perſon: an equal to appeal to their common friendſhip."

CONSOLE, in *Architecture*, a part or member projecting in manner of a bracket, or ſhoulder-piece; ſerving to ſupport a corniche, buſt, baſe, beam, little vault, or the like. See *Tab. Architecture, fig.* 32.

The word is derived from the French *conſolider*, *to reunite, join*, &c. agreeable to the office of this member.

Conſoles are alſo, upon occaſion, called *mutules*, *modillions*, &c. according to their form.

Some of them are ſtriated or fluted; others in form of cartouches; others have drops, in the manner of triglyphs.

Vitruvius calls all thoſe of gates *prothyrides*; of *thyra*, gate. See PROTHYRIS.—Thoſe made of the end of a plank of wood, cut triangular-wiſe, are called *ancones*. See ANCON.

Conſoles are frequently uſed as keys of arches, projecting out, to ſupport a vaſe, or other ornament.

CONSOLIDA, in *Botany*. See **Bugle**.

Consolida *major*. See **Comfry**.

CONSOLIDATION, in *Law*, the combining and uniting two benefices into one. Stat. 37 Hen. VIII. cap. 21. which union is to be by the aſſent of the ordinary, patron, incumbent, &c. and to be of ſmall churches lying near together.

The term is borrowed from the civil law; where it properly ſignifies an union of the poſſeſſion, or occupation, with the property. Thus, if a man hath by legacy *uſumfructum fundi*, and afterwards buys the property, or fee-ſimple, of the heir; this is called a *conſolidation*.

Consolidation, in *Medicine*, expreſſes the action of uniting broken bones, or the lips of wounds, by means of *conſolidating remedies*, as they are called; which, cleanſing with a moderate heat and force, taking corruption out of the wounds, and preſerving the temperature of the parts. cauſe the nouriſhment to be fitly applied to the part affected. See **Wound**, and **Fracture**.

CONSONANCE, in *Muſic*, is ordinarily uſed in the ſame ſenſe with *concord*, viz. for the union or agreement of two ſounds produced at the ſame time, the one grave, the other acute; which, mingling in the air, in a certain proportion, occaſion an accord agreeable to the ear.

Consonance is ſometimes uſed to ſignify a ſound ariſing from ſeveral others ſounding together, whether agreeable, or diſagreeable to the ear.

In this ſenſe *conſonance* may be divided into CONCORD and DISCORD.

Dr. Holder, on this principle, defines *conſonancy*, "A "paſſage of ſeveral tunable ſounds through the medium, "frequently mixing and uniting in their undulated mo"tions, cauſed by the well-proportioned commenſurate "vibrations of the ſonorous bodies, and conſequently "arriving ſmooth and ſweet, and pleaſant to the ear; as, "on the contrary, *diſſonancy* he maintains to ariſe from "diſproportionate motions of ſounds, not mixing, but "jarring and claſhing as they paſs, and arriving in the "ear grating and offenſive."

Which notion of a *conſonance* exactly quadrates with that we have already laid down for a *concord*. Accordingly, moſt authors confound the two together; though ſome of the more accurate diſtinguiſh them; making *conſonance* to be what the word implies, a mere *ſounding of two or more notes together*, or *in the ſame time*; in contradiſtinction to the motion of thoſe ſounds *in ſucceſſion*, or one after the other.

In effect, the two notions coincide; for two notes, thus played in *conſonance*, conſtitute a concord; and two notes that pleaſe the ear in *conſonance*, will likewiſe pleaſe it in ſucceſſion. Notes in *conſonance* conſtitute harmony, as notes in ſucceſſion conſtitute *melody*.

In the popular ſenſe, *conſonances* are either *ſimple* or *compound*, &c. The moſt perfect *conſonance* is uniſon; though many, both among the ancients and moderns, diſcard it from the number of *conſonances*; as conceiving *conſonance* an agreeable mixture of different ſounds, grave and acute; not a repetition of the ſame ſound.

The ſecond *conſonance* is the octave; then the fifth, the fourth, the thirds, and the ſixths: the reſt are multiples, or repetitions of theſe.

Consonance, in *Grammar*, denotes a like cadence, or cloſe of words, periods, &c.

Conſonances are ordinarily faults in diſcourſe, eſpecially in Engliſh proſe: though the ancients make a figure of them, which they call ὁμοιοτελευτον. Too great a *conſonancy* in the rhymes has always an ill effect.

CONSONANT, a letter which produces no ſound alone, or without ſome other letter, either vowel or *conſonant*, joined along with it.

And hence the name *con-ſonant*, q. d. *quæ ſonant cum alia*.

A *conſonant*, conſidering it philoſophically, is nothing elſe but the modification of a ſound, produced by means of the organs of the voice, not a production of ſound itſelf: thus, v. gr. the ſounds ſignified by the characters *a*, *e*, *i*, *o*, *u*, &c. are differently modified when we ſay *ab*, than when we ſay *ac* or *ca*, *ad* or *da*; and thoſe modifications are called *conſonants*.

The letters of the alphabet are divided into *vowels* and *conſonants*. *Conſonants*, again, are divided into *ſingle*, as *b*, *h*, *m*, *q*, &c. and *double*, as *x* in *axillary*, correſponding to the ξ of the Greeks.

Conſonants, again, are divided into *liquid*, as *l*, *r*, *m*, *n*; and *mute*, as *b*, *d*, and the reſt.

But the moſt natural diviſion of *conſonants* is that of the Hebrew grammarians; who have been imitated therein by the grammarians of other oriental languages: theſe divide the *conſonants* into five claſſes, with regard to the five principal orders of the voice; which all contribute, it is true, but one more notably than the reſt, to certain modifications, which make five general kinds of *conſonants*. Each kind, or claſs, comprehends ſeveral *conſonants*, which reſult from the different degrees of the ſame modification, or from the different motions of the ſame organs.

Theſe organs are the *throat*, *palate*, *tongue*, *teeth*, and *lips*; whence the five claſſes of *conſonants* are denominated *guttural*, *palatal*, *lingual*, *dental*, and *labial*.

We account ſixteen *conſonants* in the Engliſh alphabet, viz. *b*, *c*, *d*, *f*, *g*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *ſ*, *t*, *x*, *z*; to which there are three others to be added, viz. the *h*, and *j conſonants*, and *v conſonant*, which makes the whole number of *conſonants* nineteen: one whereof is guttural, viz. the aſpirate *h*; five *palatal*, viz. *c*, as when pronounced before *a*, *o*, and *u*, as in *cavern*, *corn*, *curioſity*; *g*, as in *Geneva*; *j conſonant* in *julep*; *k* in *kernel*; and *q* in *query*.

The four *lingual conſonants* are *d*, *l*, *n*, *t*; the four *dental*, are *r*, *s*, *x*, *z*, the three laſt whereof are hiſſers: and five *labial*, *b*, *f*, *m*, *p*, and *v conſonant*.

With regard to which diviſion, it may be obſerved, that though the *g* be modified in three different manners, as it comes before an *a*, an *o*, or an *u*; yet it is ſtill a *conſonant* of the palate; that the *j conſonant* differs in nothing but its figure from the *g* before *e* or *i*; that *k* has the ſame pronunciation with the *c*; that *x* comprehends the ſound of two letters in its ſound, viz. *c* or *k*, and *ſ* or another *c*, as in *Alexander*, and *Alexis*, which we pronounce as if wrote *Alecſander*, and *Aleccis*, or *Alecſis*; and that the *c* before an *e* or *i*, is no *conſonant* of the palate, becauſe in that caſe it loſes its proper ſound, and aſſumes the hiſſing ſound of the *ſ*.

The abbot Dangeau thinks the nature of the diviſion of the Hebrew grammarians to be very reaſonable; but he does not acquieſce in the diſtribution they have made of them: to find a natural and juſt diviſion of the *conſonants*, he obſerves, no regard muſt be had to the characters that repreſent them; nor any thing be conſidered but their ſound, or the modification they give the ſound.

On this principle, the ſame author finds in the French five *labial conſonants*, *b*, *p*, *v*, *f*, and *m*; five *palatal* ones, *d*, *ſ*, *g*, *k*, *n*; four *hiſſers*, *s*, *z*, *j*, *ch*; two *liquids*, *l* and *r*; two that run into and mix with each other, as *ll*, and *gn*; which laſt, however, is peculiar to the French language; and the *h* aſpirate.

He adds, 1. That *m* and *n* are properly two naſal *conſonants*; the *m*, a *b* paſſed through the noſe, and the *n* a *d*, in like manner, pronounced through the noſe; and, in effect, people in a cold pronounce *barket* for *market*, *deed* for *need*, &c.

2. That among the *conſonants*, ſome are weak, others *ſtrong*; their difference conſiſting in this, that the former are preceded with a ſmall emiſſion of the voice, which ſoftens them; which the latter have not. The weak are *b*, *c*, *d*, *g*, *z*, *j*; the ſtrong, *p*, *f*, *t*, *k*, *ſ*, *ch*.

It may be here obſerved, that when we ſpeak of a perſon's talking *through the noſe*, it muſt be underſtood in a ſenſe quite different from what the word ſeems naturally to import: ſince the noſe in this caſe concurs leſs to the pronunciation than when we do not ſpeak through the noſe; in regard the air, not being able to make its way through the noſe, is returned into the mouth, where it forms a dull obtuſe ſound, called *naſal*.

From the whole we may conclude, that the exceſs of *conſonants* in one language above another only conſiſts in this, that there are more modifications of ſound received and eſtabliſhed in the one than in the other: for all men, having the ſame organs, may form the ſame modifications; ſo that it is entirely owing to cuſtom, nothing to nature, that the Engliſh have not the ϑ of the Greeks, the *ain* and *heth* of the Hebrews, the *ch* of the Germans, the *gn* of the French, the *gl* of the Italians, the *ll* of the Welſh, &c.

Alſo, that the Chineſe have no *r*, the Iroquois no labial *conſonants*, the Hurons have abundance of aſpirates, and the Arabs and Georgians abundance of double *conſonants*: which laſt is owing to this, that they make ſeveral organs concur ſtrongly and equally to the modification of a ſound; whereas, in the reſt, only one organ is moved very ſtrongly and ſenſibly, and the reſt weakly.

It is hence alſo viſible, that in all languages the ASPIRATES, or guttural letters, are real *conſonants*; ſince the throat modifies the ſound as much as the palate, tongue, or lips.

Laſtly, to find all the *conſonants* that may be formed in any language, there needs nothing but to obſerve all the modifications that the ſounds of ſpeech will admit of, by which we ſhall have all the *conſonants* practicable.

CONSONANTE, in the *Italian Muſic*, is uſed to ſignify concords, or thoſe intervals which afford pleaſure, be they either perfect, as the fifth and eighth, or imperfect, as the third, ſixth, &c. See **Octave**, &c.

CONSORT. See **Queen**.

CONSOUND, a name given to ſeveral different plants: thus *ſymphytum* is called the great *conſound*, *bugula* the middle *conſound*, *bellis* the leaſt *conſound*, and *ſolidago* the Saracens *conſound*.

CONSPIRACY, in *Law*, is taken for a combination or CONFEDERACY to do ſomething evil, or illegal: though in the original ſenſe of the word, and in its uſe in other languages, it ſignifies merely an agreement, whether for good, bad, or matters indifferent.

In our ſtatutes and law-books, *conſpiracy*, in a general ſenſe, is frequently confounded with *maintenance*, and *champarty*.

CONSPIRACY, in its ſpecial ſignification, is uſed for a confederacy of two, at leaſt, falſly to indict one, or procure one to be indicted of felony.

The puniſhment of this *conſpiracy*, at the king's ſuit, anciently was, that the party attainted loſe his frank-law; to the end that he may not be impanelled on juries, and the like; that his lands, goods, and chattels, be eſtreated; his trees raſed, and his body committed to priſon.

Even *conſpiracies*, or combinations in caſes of leſs moment, as thoſe of victuallers, touching ſelling of victual, ſhall be grievouſly puniſhed. 37 Hen. VIII.

CONSPIRATIONE, in *Law*, a writ that lies againſt *conſpirators*.

CONSPIRATORS, according to the ſtatute, are thoſe that do confederate, or bind themſelves by oath, covenant, or other alliance, that every of them ſhall aid, and bear the other, falſly and maliciouſly, to indite, or cauſe to indite, or falſly to move, or maintain pleas; and all ſuch as cauſe children, within age, to appeal men of felony, whereby they are impriſoned, and ſore grieved: and ſuch as retain men in the country, with liveries or fees, to maintain their malicious enterprizes: and this extendeth as well to the takers, as the givers: and ſtewards, and bailiffs, of great lords, which, by their ſeigniory, office, or power, undertake to bear, or maintain quarrels, pleas, or debates, that concern other parties than ſuch as touch the eſtate of their lords, or themſelves. Anno 33 Edw. I. ſtat. 2. 2 Inſt. fol. 384 and 562.

CONSPIRING *powers*, in *Mechanics*, are all ſuch as act in directions not oppoſite to one another. See POWER, and MOTION.

CONSTABLE. *Lord High* CONSTABLE, is an ancient officer of the crown, now diſuſed in England, except on ſolemn occaſions, as the king's coronation, and the like; and alſo ſuppreſſed in France by Louis XIII. in 1627; though the office has been exerciſed in the command of the MARSHALS, by the firſt officer in the army.

Some derive the word from the Saxon, and make it originally ſignify the *ſtay*, or hold, of the *koning*, or *king*: others, with more probability, derive it from *comes ſtabuli*, the maſter of the ſtables, or perhaps of the horſe; and ſuppoſe that the dignity, which at firſt was civil, in time became military, and the maſter of the ſtables was made general of the army.

The function of the *conſtable* of England conſiſted in the care of the common peace of the land, in deeds of arms, and matters of war. To the court of the *conſtable*, and that of the marſhals, belonged the cognizance of contracts, deeds of arms without the realm, and combats, blaſonry of arms, &c. within it.

The firſt *conſtable* of England was created by the Conqueror: the office continued hereditary till the thirteenth of Hen. VIII. when it was laid aſide, as being ſo powerful as to become troubleſome to the king. Since that time, the *conſtable* is only created occaſionally.

From thoſe mighty magiſtrates, the *conſtables* of England, are derived thoſe inferior ones, ſince called the *conſtables* of *hundreds and franchiſes*: theſe were firſt ordained in the thirteenth year of Edward I. by the ſtatute of Wincheſter; which, for the conſervation of the peace, and view of armour, appointed that two *conſtables* ſhould be choſen in every hundred and franchiſe. They are generally choſen and ſworn by the juſtices of peace in their ſeſſions.

Theſe are what we now call *conſtabularii capitales*, or *high conſtables*; becauſe continuance of time, and increaſe of people, &c. have occaſioned others of like nature, but inferior authority, in every town, called *petty-conſtables*, or *ſub-conſtabularii*, firſt inſtituted about the reign of Edward III. But they are now uſually choſen by the jury at the court-leet; and if no court-leet be held, appointed by two juſtices of the peace; though they are uſually choſen by the pariſhioners, and ſworn by a juſtice of peace. If the perſon elected refuſes to ſerve, a writ of mandamus may be had to compel him to do it; or they may be bound over to the ſeſſions, indicted, fined, and impriſoned. Phyſicians, apothecaries, ſurgeons, &c. attornies, officers of the courts at Weſtminſter, barriſters at law, &c. qualified diſſenting teachers, and proſecutors of a felon to conviction, are excuſed from ſerving this office. Diſſenters, ſcrupling the oaths, may execute the office by deputy. 1 W. and M. cap. 18. Theſe are under the direction of the high *conſtable*, and their charge is very extenſive.

Beſides theſe, we have *conſtables* denominated from particular places, as *conſtable* of the Tower, of Dover-caſtle, of Windſor-caſtle, of the caſtle of Caernarvon, and many other of the caſtles of Wales; whoſe office is the ſame with that of the caſtellani, or governors of caſtles.

CONSTABLES *of London*. The city of London is divided into twenty-ſix wards, and the wards into precincts, in each whereof is a *conſtable*. They are nominated by the inhabitants of each precinct on St. Thomas's day, and confirmed, or otherwiſe, at the court of wardmote. After confirmation, they are ſworn into their offices at a court of aldermen, on the next Monday after Twelfth day.

Such as are choſen into the office, are obliged to place the king's arms, and the arms of the city, over their doors; and if they reſide in alleys, at the ends of ſuch alleys toward the ſtreets, to ſignify that a *conſtable* lives there, and that they may be the more eaſily found when wanted.

CONSTABLE, *provoſt of the*. See PROVOST.

CONSTANT *winds*. See WIND.

CONSTANT *quantity*, in *Geometry*, that which remains the ſame, while others increaſe or decreaſe. Thus the ſemidiameter of a circle is a *conſtant quantity*; for while the abſciſs and ſemi-ordinates increaſe, it remains the ſame.

CONSTAT, in *Law*, the name of a certificate, which the clerk of the pipe, and auditors of the exchequer, make at the requeſt of any perſon, who intends to plead or move in that court for the diſcharge of any thing; and the effect of it is, the certifying what does *conſtare* upon record, touching the matter in queſtion. 3 and 4 Edw. VI. cap. 4. and 13 Eliz. cap. 6.

A *conſtat* is held to be ſuperior to a *certificate*; becauſe this may err or fail in its contents, that cannot, as certifying nothing but what is evident upon record. Alſo the exemplification under the great ſeal of the inrolment of any letters patent, is called a *conſtat*. Coke on Littl. fol. 225. b. The difference between a *conſtat*, *inſpeximus*, and *vidimus*, is treated of at large in Page's caſe, Coke's fifth report.

CONSTELLATION, in *Aſtronomy*, an aſſemblage or ſyſtem of ſeveral ſtars, expreſſed and repreſented under the name and figure of ſome animal, or other thing: this aſſemblage is by ſome called alſo an *aſteriſm*.

The ancients portioned out the firmament into ſeveral parts, or *conſtellations*; reducing a certain number of ſtars under the repreſentation of certain images, in order to aid the imagination, and the memory, to conceive and retain their number, diſpoſition, and even to diſtinguiſh the virtues which they attributed to them: in which ſenſe a man is ſaid to be born *under a happy conſtellation*, i. e. under a happy configuration of the heavenly bodies.

The diviſion of the heavens into *conſtellations* is very ancient; and, probably, as old as aſtronomy itſelf; at leaſt, it was known to the moſt ancient authors extant, whether ſacred or profane. In the book of Job, mention is made of the names of ſome of them; witneſs that ſublime expoſtulation, *Canſt thou reſtrain the ſweet influence of the* Pleiades, *or looſen the bands of* Orion? And the ſame may be obſerved of the oldeſt among the heathen writers, Homer and Heſiod.

The diviſion of the ancients only took in the viſible firmament, or ſo much as came under their notice: this they diſtributed into forty-eight *conſtellations*; twelve whereof took up the zodiac: the names they gave them are, *Aries*, *Taurus*, *Gemini*, *Cancer*, *Leo*, *Virgo*, *Libra*, *Scorpio*, *Sagittarius*, *Capricornus*, *Aquarius*, *Piſces*: from whence the ſigns of the ecliptic and zodiac take their names; though now no longer contiguous to the *conſtellations* which denominate them. See SIGN.

The other ſtars, on the northern ſide of the zodiac, were diſpoſed into twenty-one *conſtellations*; viz. *Urſa major* and *minor*, *Draco*, *Cepheus*, *Bootes*, *Corona Septentrionalis*, *Hercules*, *Lyra*, *Cygnus*, *Caſſiopeia*, *Perſeus*, *Andromeda*, *Triangulum*, *Auriga*, *Pegaſus*, *Equuleus*, *Delphinus*, *Sagitta*, *Aquila*, *Ophiuchus*, or *Serpentarius*, and *Serpens*: to which have been ſince added *Antinous*, and *Coma Berenicis*.

The ſtars on the ſouthern ſide of the zodiac were diſtributed into fifteen conſtellations: their names are, *Cetus*, *Eridanus fluvius*, *Lepus*, *Orion*, *Canis major* and *minor*, *Argo*, *Hydra*, *Crater*, *Corvus*, *Centaurus*, *Lupus*, *Ara*, *Corona meridionalis*, and *Piſcis auſtralis*: to which have been ſince added fourteen others; viz. *Phœnix*, *Grus*, *Indus*, *Pavo*, *Apus*, or *Avis Indica*, *Apis Muſca*, *Chamæleon*, *Triangulum auſtrale*, *Piſcis volans*, *Toucan*, *Hydrus*, *Xiphias*, or *Dorado*, *Columba Noachi*, and *Robur Carolinum*. See each *conſtellation*, and the ſtars contained in it, under its proper head, ARIES, TAURUS, &c.

Of theſe *conſtellations*, the eighteen laſt, with the greateſt part of *Argo navis*, *Centaurus*, and *Lupus*, are not viſible in our horizon.

The other ſtars, not comprehended under theſe *conſtellations*, yet viſible to the naked eye, the ancients called *informes*, or *ſporades*, ſome whereof the modern aſtronomers have ſince reduced into new figures, or *conſtellations*. See INFORMES, and SPORADES.

Thus, Hevelius, v. gr. between *Leo* and *Urſa major*, makes *Leo minor*; and between *Urſa minor*, and *Auriga*, over *Gemini*, makes *Lynx*; under the tail of *Urſa major*, *Canes venatici*, *Cerberus*, *Vulpecula*, and *Anſer*, *Scutum Sobieſki*, *Lacerta*, *Camelopardalus*, *Monoceros*, and *Sextans*.

In theſe *conſtellations*, the ſtars are ordinarily diſtinguiſhed by that part of the image wherein they are found. Bayer diſtinguiſhes them farther by the letters of the Greek alphabet: and many of them, again, have their peculiar names, as *Arcturus*, between the knees of *Bootes*; *Gemina*, or *Lucida*, in the *Corona ſeptentrionalis*; *Palilitium*, or *Aldebaran*, in the *Bull's* eye, *Pleiades* in the neck, and *Hyades* in the forehead of the *Bull*; *Caſtor* and *Pollux* in the heads of *Gemini*; *Capella*, with the *Hœdi*, in the ſhoulder of *Auriga*; *Regulus*, or *Cor Leonis*; *Spica Virginis* in the hand, and *Vindemiatrix* in the ſhoulder of *Virgo*; *Antares*, or *Cor Scorpionis*; *Fomahaut*, in the mouth of *Piſcis auſtralis*; *Regel*, in the foot of *Orion*; *Sirius*, in the mouth of *Canis major*; *Procyon*, in the back of *Canis minor*; and the *Pole-ſtar*, the laſt in the tail of *Urſa minor*.

The Greek and Roman poets, from the ancient theology, give us wild and romantic fables about the origin of the *conſtellations*, probably derived from the hieroglyphics of the Egyptians, and tranſmitted, with ſome alterations, from them to the Greeks; which may be ſeen in Hyginus's Poeticon Aſtron. and Ricciolus's Almageſt. lib. vi. cap. 3, 4, 5; and Sherburne's Notes upon Manilius. Hence, ſome out of a vain zeal, rather than any love for the ſcience, have been moved to alter either the figures of the *conſtellations*, or at leaſt their names.

Thus, venerable Bede, inſtead of the profane names and figures of the twelve *conſtellations* of the zodiac, ſubſtituted thoſe of the twelve apoſtles; whoſe example being followed by Julius Schillerius, in 1627, he completed the reformation, and gave ſcripture names to all the *conſtellations* in the heavens.

Thus, *Aries*, or the Ram, became converted into St. Peter; *Taurus*, or the Bull, into St. Andrew; *Andromeda* into the ſepulchre of Chriſt; *Lyra* into the manger of Chriſt; *Hercules* into the Magi coming from the Eaſt; *Canis major* into David, &c. Weigelius, profeſſor of mathematics in the univerſity of Jena, made a new order of *conſtellations*; converting the firmament into a *cœlum heraldicum*; and introducing the arms of all the princes in Europe, by way of *conſtellations*.

Thus, *Urſa major*, he transformed into the elephant of the kingdom of Denmark; the *Swan* into the Ruta with ſwords of the houſe of Saxony; *Ophiuchus* into the croſs of Cologne; the *Triangle* into the compaſſes, which he calls the *ſymbol of artificers*; and the *Pleiades* into the *Abacus Pythagoricus*, which he calls that of merchants, &c.

But the more knowing among aſtronomers never approved of innovations; as ſerving no purpoſe but to introduce confuſion into aſtronomy. The old *conſtellations*, therefore, are ſtill retained; both becauſe better could not be ſubſtituted, and likewiſe to keep up the greater correſpondence and uniformity between the old aſtronomy and the new. See CATALOGUE.

CONSTERNATION is defined by ethical writers to be an exceſs of HORROR, owing to the ill government of our *admiration* and *fear*: or ſuch an immoderate degree of *fear* as confounds the faculties, and incapacitates a perſon for conſultation and execution.

CONSTIPATION, in *Medicine*, a hardneſs of the *alvus*, or belly, with a difficulty of diſcharging the ſame; otherwiſe called *coſtiveneſs*.

Riding poſt, eating of medlars, or quinces, ſeveral preparations of milk, hard-roaſted eggs, &c. *conſtipate* the belly.

A *conſtipation* of the belly, if it continue long, ſometimes degenerates into the iliac paſſion, or twiſting of the guts. Moſt perſons of a hot and dry conſtitution are afflicted with a coſtiveneſs, or *conſtipation*; but this is ſeldom attended with any ill conſequences.

The proper remedy for a *conſtipation* is a clyſter; if this fail, lenient cathartics; and when they alſo fail, others muſt be exhibited of a more draſtic or powerful nature.

A *conſtipation*, or obſtinate coſtiveneſs, is thought by Dr. Stevenſon to be firſt or laſt owing to, or attended with, a kind of palſy of the inteſtines, and may ſometimes be cured by fomenting the belly with wine, in which aromatics have been boiled, and drinking a little of the ſame when the pulſe is ſlow, and the body cool. This diſorder, though of long continuance, and come to a dangerous height, has been cured by a cold *pediluvium*, and by placing the patient with his bare ſoles on a cold floor, and daſhing his feet, legs, and thighs, with cold water. See Medic. Eſſ. Edinb. abr. vol. i. p. 249, ſeq.

CONSTITUENT *parts*, in *Chemiſtry*. The *conſtituent parts* of bodies are their diſſimilar parts, or principles, into which they may be reſolved, by the rules of that art. They are thus called in diſtinction from the INTEGRANT parts of bodies, which are parts of the ſame nature and properties with the bodies themſelves. Thus quickſilver, diſſolved by aqua fortis, may be ſeparated from the diluted menſtruum, by means of a copper plate, in its own form; this therefore was only divided into its integrant parts; but cinnabar reſolved by chemiſtry into ſulphur and mercury, is divided into its *conſtituent* parts, neither of theſe, nor any particle of them, being cinnabar, or having its properties. Shaw's Lectures, p. 15.

CONSTITUTION, an eſtabliſhment, ordinance, deciſion, regulation, or law, made by authority of a prince, or other ſuperior, eccleſiaſtical or civil.

The *conſtitutions* of the Roman emperors make a part of the *civil* LAW. The *conſtitutions* of the church make a part of the CANON *law*. Some of the papal *conſtitutions* are in form of bulls, others of briefs.

CONSTITUTIONS, *Legatine*, were eccleſiaſtical laws enacted in national ſynods, held under the cardinals Otho and Othobon, legates from pope Gregory IX. and pope Clement IV. in the reign of Henry III. about the years 1220, and 1268.

CONSTITUTIONS, *Provincial*, are principally the decrees of provincial ſynods, held under ſeveral archbiſhops of Canterbury, from Stephen Langton, in the reign of Henry III. to Henry Chicheley, in the reign of Henry V. and adopted alſo by the province of York in 1463, under Henry VI.

CONSTITUTIONS *of* 1603. See CANON *Law*.

CONSTITUTIONS, *Apoſtolical*, denote a collection of regulations attributed to the apoſtles, and ſuppoſed to have been collected by S. Clement, whoſe name they likewiſe bear.

Theſe are divided into eight books; conſiſting of a great number of rules and precepts, relating to the duties of Chriſtians, and particularly to the ceremonies and diſcipline of the church.

Authors are divided about their genuineneſs: the generality hold them ſpurious, and endeavour to prove them poſterior to the apoſtolic age; maintaining they were unknown till the fourth century: which, if ſo, ſhews St. Clement had no hand in them. It is certain, that no ſuch book is quoted as Scripture by any Chriſtian writer of the three firſt centuries. The firſt who cites it is Epiphanius, and yet he ſpeaks of it as of doubtful authority; and ſome modern writers are of opinion, that the *Conſtitutions* quoted by Epiphanius were different from the preſent *Conſtitutions*; and that the eight books, as we have them, were not compoſed and finiſhed till after his time, towards the middle, or before the end of the fifth century. They evidently bear many internal characters of ſpuriouſneſs. See Lardner's Cred. vol. x. p. 320, &c.

Mr. Whiſton has ventured to oppoſe the general opinion; and with ſome reaſon, much learning, and more warmth, aſſerted the *Apoſtolical Conſtitutions* to be one of the ſacred writings, dictated by the apoſtles in their meetings, written down from their mouths by S. Clement, and intended as a ſupplement to the New Teſtament; or, rather, as a ſcheme and ſyſtem of Chriſtian faith and polity. See his Eſſay on the *Apoſtolical Conſtitutions*, and his hiſtorical preface; wherein the ſeveral ſteps he made in his fancied diſcovery are traced.

What makes the *Conſtitutions* more ſuſpected by the orthodox, is, that they ſeem to favour of Arianiſm.

CONSTITUTIONS *of Clarendon*. See CLARENDON.

CONSTITUTION is alſo uſed, in a phyſical ſenſe, for the temperament of the body, or for that diſpoſition of the whole which ariſes from the quality and proportion of its parts.

Phyſicians conſider the *conſtitution*, as depending chiefly on the humours or juices of the body; and hence, as this or that humour is ſuppoſed to predominate, the bile, e. g. or the blood, phlegm, choler, or ſpirit; the perſon uſed to be denominated of a *bilious*, *ſanguine*, *phlegmatic*, *choleric*, or *mercurial conſtitution*.

CONSTRICTION, the act of binding, or drawing the parts of a thing cloſe together.

The word is compounded of *con*, *together*; and *ſtringere*, *to tie* or *cloſe up*.

CONSTRICTOR, in *Anatomy*, a name given by Spigelius, and ſome others, to a muſcle now very well known by the name of the *ſphincter ani*.

CONSTRICTOR *cunni*, in *Anatomy*, the name given by Albinus to a muſcle called by others the SPHINCTER *vaginæ*; by ſome the *orbicularis pudendi*, and the *inferior clitoridis muſculus*.

CONSTRICTOR *labiorum*, or *orbicularis*, a muſcle proper to the lips. See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 8. See **Lip.** Its fibres make a kind of (*orbis*) ring about the mouth (whence it is alſo called *orbicularis*); and ſerve to conſtringe, and draw up the lips, as in kiſſing, &c. whence ſome call it *baſiator*, and *oſculatorius*.

This Verheyen will not have to be one muſcle, but a pair, whoſe fibres meet and join at both corners of the mouth; each acting on one lip only, though concurrently.

Other authors are unanimous in calling it one muſcle; and will have it of the ſphincter kind; though Dr. Drake thinks improperly: in regard, it is not like the other ſphincters in conſtant action, but at the command of the will; the diſtinguiſhing mark between a **sphincter** and another muſcle.

Constrictor *palpebrarum.* See **Orbicularis.**

Constrictores *naſi*, a pair of muſcles common to the *alæ* of the noſe, and the upper lip.

They ariſe fleſhy from the forepart of the fourth bone of the upper-jaw; and after a ſtrait aſcent, are inſerted into the roots of the *alæ naſi*, and ſuperior parts of the upper lip.

Their uſe is to draw the *alæ* downwards, nearer each other: and at the ſame time draw the upper lip alſo downwards; an action which we uſe in taking of ſnuff, or in ſmelling at any thing.

CONSTRUCTION, in *Geometry*, the art or manner of drawing, or deſcribing a figure, ſcheme, the lines of a problem, or the like. The equality of the lines of ſuch a triangle, &c. is demonſtrated from their *conſtruction*.

Construction *of equations*, is the method of reducing a known **equation** into lines and figures; whereby the truth of the rule, canon, or equation, may be demonſtrated geometrically.

The method of *conſtructing* equations is different, according to the diverſity of equations.

To conſtruct a ſimple equation: The whole myſtery conſiſts in this, that the fractions, to which the unknown quantity is equal, be reſolved into proportional terms: the method of which will be better ſhewn by examples than it can be taught by many rules.

1. Suppoſe $x = \frac{ab}{c}$; then will $c : a :: b : x$, to be determined by the method of finding a fourth proportional.

2. Suppoſe $x = \frac{abc}{de}$; let $d : a :: b : \frac{ab}{d}$. This fourth proportional found, being called g; $x = \frac{gc}{e}$, which is therefore found as in the former caſe.

3. Suppoſe $x = \frac{aa - bb}{c}$. Since $aa - bb = (a+b) \times (a-b)$; $c : a+b :: a-b : x$.

4. Suppoſe $x = \frac{a^2b - bcc}{ad}$. By the firſt caſe we find $g = \frac{ab}{d} = \frac{a^2b}{ad}$, and $h = \frac{bc}{d}$. Again, by caſe 1. $i = \frac{hc}{a}$, and $x = g - i$, the difference of the lines g and i.

5. Suppoſe $x = \frac{ab}{c} + \frac{adc}{bc}$. Find, as in the preceding caſe, $g = \frac{ab}{c}$, and $f = \frac{adc}{bc}$. Then will $x = g + f$ be the ſum of the lines g and f.

6. Suppoſe $x = \frac{a^2b + bcd}{af + cg}$. Seek $\frac{cg}{a}$, and let $f + \frac{cg}{a} = h$; then will $af + cg = ah$; conſequently, $x = \frac{a^2b + bcd}{ah}$. Thus is the preſent caſe brought to the preceding one.

7. Suppoſe $x = \frac{a^2 - bad}{af + bc}$. Find $\frac{af}{b}$, and make $\frac{af}{b} + c = h$; then will $af + bc = bh$. Hence, $x = \frac{a^2b - bad}{bh} = \frac{a^2 - ad}{h}$. Conſequently, $h : a :: a - d : x$.

8. Suppoſe $x = \frac{a^2 + b^2}{c}$. Conſtruct the triangle ABC (*Tab. Algebra*, *fig.* 1.) whoſe ſide $AB = a$, $BC = b$; then will $AC = \sqrt{a^2 + b^2}$. Let $AC = m$; then will $a^2 + b^2 = m^2$. And therefore $x = \frac{m^2}{c}$; conſequently, $c : m :: m : x$.

9. Suppoſe $x = \frac{a^2 - b^2}{c}$. On AB (*fig.* 2.) $= a$ deſcribe a ſemicircle, and therein ſet off $AC = b$. Since the triangle ACB is rectangular; $CB = \sqrt{a^2 - b^2}$. Let $CB = m$: then will $x = \frac{m^2}{c}$; conſequently, $c : m :: m : x$.

0. Suppoſe $x = \frac{a^2b + bcd}{af + bc}$. Say, $b : a :: f : \frac{fa}{b}$; and let $\frac{fa}{b} + c = h$; then will $bc + af = bh$. Hence, $x = \frac{a^2b + bcd}{bh} = \frac{a^2 + cd}{h}$. Find betwixt $AC = c$ (*fig.* 3.) and $CB = d$, a mean proportional $CD = \sqrt{cd}$. Let $CE = a$; then will $DE = \sqrt{a^2 + cd}$. Call this m; then will $x = \frac{m^2}{b}$; conſequently, $h : m :: m : x$.

To conſtruct a quadratic equation geometrically. Since quadratic equations may be reduced to ſimple ones, thoſe may likewiſe be *conſtructed* from the methods already laid down: for if the equation be pure, $x^2 = ab$; then will $a : x :: x : b$; wherefore we ſhall find $x = \sqrt{ab}$; if between $AC = a$, and $BC = b$, we find a mean proportional DC. If the equation be adfected, $x^2 + ax = b^2$; then will $x = \frac{1}{2}a \sqrt{\frac{1}{4}a^2 + b^2}$; that is, either $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 + b^2}$; or, $x = \sqrt{\frac{1}{4}a^2 + b^2} - \frac{1}{2}a$, or, $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 - b^2}$, or $x = \frac{1}{2}a - \sqrt{\frac{1}{4}a^2 - b^2}$.

The whole myſtery, therefore, of *conſtructing* quadratics comes to this: that the value of $\sqrt{\frac{1}{4}a^2 + b^2}$, and alſo the value of $\sqrt{\frac{1}{4}a^2 - b^2}$, be found; both of which are ſhewn in the preceding article. For, if in the rectangular triangle (*fig.* 1.) $AB = \frac{1}{2}a$, and $BC = b$; then will $AC = \sqrt{\frac{1}{4}a^2 + b^2}$. But if on $AB = \frac{1}{2}a$ (*fig.* 2.) be deſcribed a ſemicircle; and therein applied $AC = b$; $CB = \sqrt{\frac{1}{4}a^2 - b^2}$, as was ſhewn in the article preceding. See **Curve.** See Maclaurin's Algebra, part iii. cap. 2. and Simpſon's Alg. p. 269.

To conſtruct cubic and biquadratic equations. The roots of any equation may be determined by the interſections of a ſtrait line with a curve of the ſame dimenſions as the equation; or by the interſections of any two curves whoſe indices multiplied by each other give a product equal to the index of the propoſed equation.

Thus, the roots of a biquadratic equation may be determined by the interſections of two conic ſections; for the equation by which the ordinates from the four points in which theſe conic ſections may cut one another can be determined will ariſe to four dimenſions; and the conic ſections may be aſſumed in ſuch a manner, as to make this equation coincide with any propoſed biquadratic: ſo that the ordinates from theſe four interſections will be equal to the roots of the propoſed biquadratic.

If one of the interſections of the conic ſection falls upon the axis, then one of the ordinates vaniſhes, and the equation by which theſe ordinates are determined will then be of three dimenſions only, or a cubic; to which any propoſed cubic equation may be accommodated. So that the three remaining ordinates will be the three roots of that propoſed cubic. The conic ſections for this purpoſe ſhould be ſuch as are moſt eaſily deſcribed. The circle may be one, and the parabola is uſually aſſumed for the other.

Let APE (*Tab.* II. *Analyſis*, *fig.* 40). be the common Apollonian parabola. Take on its axis the line AB = half of its parameter. Let C be any point in the plane of the parabola, and from it as a center deſcribe, with any radius CP, a circle meeting the parabola in P. Let PM, CD, be perpendiculars on the axis in M and D, and let CN, parallel to the axis, meet PM in N.

Then will always $CPq = CNq + NPq$ (47 E. 1.)

Put $CP = a$, the parameter of the parabola $= b$, $AD = c$, $DC = d$, $AM = x$, $PM = y$.

Then $CNq = \overline{x \overset{\backsim}{+} c}|^2$, $NPq = \overline{y \overset{\backsim}{+} d}|^2$; and $\overline{x \overset{\backsim}{+} c}|^2 + \overline{y \overset{\backsim}{+} a}|^2 = a^2$. ($x \backsim c$ is the difference of x and c indefinitely, which ever of the two is greateſt.) That is, $x^2 \pm 2cx + c^2 + y^2 \pm 2dy + d^2 = a^2$. But, from the nature of the parabola, $y^2 = bx$, and $x^2 = \frac{y^4}{b^2}$; ſubſtituting therefore theſe values for x^2 and x, it will be, $\frac{y^4}{b^2} \pm \frac{2cy^2}{b} + y^2 \pm 2dy + c^2 + d^2 - a^2 = 0$. Or, multiplying by b^2, $y^4 \pm \overline{2bc + b^2} \times y^2 \pm 2db^2 \times y + \overline{c^2 + d^2 - a^2} \times b^2 = 0$. Which may repreſent any biquadratic equation that wants the ſecond term; ſince ſuch values may be found for a, b, c, and d, by comparing this with any propoſed biquadratic, as to make them coincide. And then the ordinates from the points P, P, P, P, on the axis will be equal to the roots of that propoſed biquadratic. And this may be done, though the parameter of the parabola (viz. b) be given: that is, if you have a parabola already made or given, by it alone you may reſolve all biquadratic equations, and you will only need to vary the center of your circle and its radius.

If the circle deſcribed from the center C paſs through the vertex A, (*fig.* 41.) then $CPq = CAq = CDq + ADq$, that is, $a^2 = d^2 + c^2$; and the laſt term of the biquadratic $(c^2 + a^2 - a^2)$ will vaniſh; therefore, dividing the reſt by *y*, there ariſes the cubic, $y^{3*}\pm\overline{2bc+b^2}\times y\pm 2db^2=0$. Let the cubic equation propoſed to be reſolved be $y^{3*}\pm py\pm r=0$. Compare the terms of theſe two equations, and you will have $\pm 2bc+b^2=\pm p$, and $\pm 2db^2=\pm r$, or, $\mp c=\frac{b}{2}\mp\frac{p}{2b}$, and $d=\pm\frac{r}{2b^2}$. From which you have this conſtruction of the cubic $y^{3*}\pm py\pm r=0$, by means of any given parabola APE.

From the point B *take in the axis (forward if the equation has* $-p$*, but backwards, if* p *is poſitive) the line* BD $=\frac{p}{2b}$*; then raiſe the perpendicular* DC $=\frac{r}{2b^2}$*, and from* C*, deſcribe a circle paſſing through the vertex* A*, meeting the parabola in* P*, ſo ſhall the ordinate* PM *be one of the roots of the cubic* $y^{3*}\pm py\pm r=0$.

The ordinates that ſtand on the ſame ſide of the axis with the center C are negative or affirmative, according as the laſt term *r* is *negative* or *affirmative*; and thoſe ordinates have always *contrary* ſigns that ſtand on *different* ſides of the *axis*. The roots are found of the ſame value, only they have contrary ſigns, when *r* is poſitive as when it is negative; the ſecond term of the equation being wanting.

For a farther account of the *conſtruction* of ſuch equations, ſee Maclaurin's Algebra, part iii. chap. 3. De la Hire's Conſtructions des Equations Analytiques, Marquis de l'Hoſpital Sect. Con lib. ix. However, the intent of theſe geometrical *conſtructions* is more readily anſwered by the method of extracting roots by APPROXIMATION.

CONSTRUCTION, in *Grammar*, *ſyntax*; or the arranging and connecting the words of a ſentence, according to the rules of the language.

The *conſtruction* is generally more ſimple, eaſy, and direct, in the modern tongues than in the ancient: we have very few of thoſe inverſions which occaſion ſo much embarraſſment and obſcurity in the Latin; our thoughts are uſually delivered in the ſame order wherein the imagination conceives them: the nominative caſe, for inſtance, always precedes the verb, and the verb goes before the oblique caſes it governs.

The Greeks and Latins, M. St. Evremont obſerves, uſually end their periods, where, in good ſenſe and reaſon, they ſhould have begun them; and the elegance of their language conſiſts, in ſome meaſure, in this capricious arrangement, or rather in this tranſpoſal and diſorder of the words.

Conſtruction is either *ſimple* or *figurative*.—*Simple*, is that wherein all the terms, or parts of the diſcourſe, are placed in their natural order.

Figurative conſtruction, is that wherein we recede from this ſimplicity, and uſe certain expreſſions, ſhorter, and more elegant, than nature affords.

The ſyntax, or *conſtruction* of words, is diſtinguiſhed into two parts, CONCORD, and GOVERNMENT OF REGIMEN.

CONSTRUCTIVE *treaſon* was defined by 25 Edw. III. cap. 2. See TREASON.

CONSUALES *ludi*, among the Romans, the ſame with CIRCENSES *ludi*. See alſo CIRCUS.

CONSUALIA, in *Antiquity*, feaſts which were held among the ancients, in honour of the god Conſus, i. e. Neptune; different from thoſe other feaſts of the ſame deity called Neptunalia.

They were introduced with a magnificent cavalcade, or proceſſion on horſeback; becauſe Neptune was reputed to have firſt taught men the uſe of horſes; whence his ſurname of Ἱππιος, *Equeſtris*.

Evander is ſaid to have firſt inſtituted this feaſt: it was re-eſtabliſhed by Romulus, under the name of *Conſus*; becauſe it was ſome god under the denomination of Conſus, that ſuggeſted to him the rape of the Sabines.

It is ſaid, that it was with a view to this rape, that he made that eſtabliſhment. This, however, is certain, that it was to this feaſt all his neighbours were invited; when, taking advantage of the ſolemnities and ſacrifices, he ſeized the women. To draw the greater concourſe of people, he gave out, that he had found an altar hid under-ground, which he intended to conſecrate, with ſacrifices to the god to whom it had been originally erected.

Thoſe who take upon them to explain the myſteries of the heathen theology, ſay, that the altar hid under ground, is a ſymbol of the ſecret deſign of Romulus to ſeize his neighbours wives.

The *conſualia* were of the number of feaſts called *ſacred*; as being conſecrated to a divinity.—Originally they were not diſtinguiſhed from thoſe of the Circus: whence it is, that Valerius Maximus ſays, that the rape of the Sabines was effected at the games of the Circus.

Plutarch obſerves, that during the days of this ſolemnity, horſes and aſſes were left at reſt, and were dreſſed up with crowns, &c. on account of its being the feaſt of Neptunus Equeſtris.—Feſtus ſays, the cavalcade was performed with mules; it being an opinion, that this was the firſt animal uſed to draw the car.

Servius gives us to underſtand, that the *conſualia* fell on the thirteenth of Auguſt; Plutarch, in the life of Romulus, places them on the eighteenth, and the old Roman calendar on the twenty-firſt of that month.

CONSUBSTANTIAL, in *Theology*, a term of like import with *co-eſſential*; denoting ſomething of the ſame ſubſtance with another.

The orthodox believe the Son of God to be *conſubſtantial* with the Father.

The term ὁμοουσιος, *conſubſtantial*, was firſt adopted by the fathers of the councils of Antioch and Nice, to expreſs the orthodox doctrine the more preciſely, and to ſerve as a barrier and precaution againſt the errors and ſubtilties of the Arians; who owned every thing excepting the *conſubſtantiality*.

The Arians declared, that the word was God, as having been made God; but they denied that he was the ſame God, and of the ſame ſubſtance, with the Father: accordingly, they exerted themſelves to the utmoſt to aboliſh the uſe of the word. The emperor Conſtantine uſed all his authority with the biſhops to have it expunged out of the ſymbols; but it ſtill maintained itſelf, and is at this day, as it was then, the diſtinguiſhing criterion between an Athanafian and an Arian.

Sandius will have it, that the word *conſubſtantial* was unknown till the time of the council of Nice; but it is certain it had been before propoſed to the council of Antioch, wherein Paulus Samoſatenus had been condemned; though it had there the fortune to be rejected. Curcellæus, on the other hand, maintains, that it was an innovation in doctrine in the council of Nice, to admit an expreſſion, the uſe whereof had been aboliſhed by the council of Antioch.

According to St. Athanaſius, the word *conſubſtantial* was only condemned in the council of Antioch, inaſmuch as it implied the idea of a pre-exiſtent matter, prior to the things formed thereof: now, in this ſenſe, it is certain, the Father and the Son are not *conſubſtantial*, there having been no pre-exiſtent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church, with regard to the manner of the change made in the bread and wine in the euchariſt; though the term *conſubſtantiation* was ſubſtituted in the room of tranſubſtantiation, at the cloſe of the thirteenth century, by John, ſurnamed Pungens Aſinus, a doctor of the univerſity of Paris.

The divines of that profeſſion maintain, that, after conſecration, the body and blood of our Saviour are ſubſtantially preſent, together with the ſubſtance of the bread and wine; which is called *conſubſtantiation*, or IMPANATION. See alſo TRANSUBSTANTIATION, and LUTHERANISM.

CONSUETUDINIBUS *& ſervitiis*, in *Law*, a writ of right, which lies againſt the tenant that deforceth his lord of the rent, or ſervice, due to him.

CONSUL, the chief magiſtrate of the Roman commonwealth.

After the Romans had expelled their kings, they were governed by two *conſuls*, eſtabliſhed in the year of Rome 245, having their name *à conſulendo*. Brutus and Collatinus were the firſt, elected by an aſſembly of the people: their office was to hold a year; and if either of them died in the courſe of the year of their *conſulate*, a new one was to be elected.

The *conſuls* were the head of the ſenate; they commanded the armies of the republic, and were ſupreme judges of the differences between the citizens. In regard, however, that they had made ſome abuſe of this power, it was allowed, by the Valerian law, for the party aggrieved to appeal from their tribunal to the people; eſpecially in caſes where the life of a Roman citizen was concerned.

In progreſs of time, the *conſuls* being too much taken up with the grand affairs of ſtate, or at the heads of armies, there were other magiſtrates created for the diſtribution of juſtice to the people, in lieu of the *conſuls*.

The right of convoking the ſenate in ancient Rome, on all occaſions, belonged of courſe to the *conſuls*, as the ſupreme magiſtrates of the city, which, in their abſence, devolved regularly to the next magiſtrates in dignity, the prætors, and the TRIBUNES.

To be elected *conſul*, it was regularly required, that the candidate ſhould be at leaſt forty-three years old; though we meet with ſome few exceptions from this rule. The election was held in the month of January, in the Campus Martius; and afterwards in the Capitol.

Conſuls were even continued under the emperors, after the republic was deſtroyed: but *conſul* was here little more than an honourable title; which, however, the people were fond of keeping up; as eſteeming it ſome remain of their ancient liberty. It dwindled for a long time; and, at laſt, became abſolutely extinct in the time of Juſtinian: after whom, no emperor either created any *conſul*, or aſſumed the dignity himſelf.

Baſil is the laſt in the conſular liſt, for the year 541. By this time, the dignity was depreciated to that degree, that it was conferred on the meaneſt perſons: indeed, Juſtinian endeavoured to retrieve it twenty-five years after, and created himſelf *conſul*, but without effect.

From the eſtabliſhment of the republic, and the *conſulate* under L. Jun. Brutus, and L. Tarq. Collatinus, to the *conſulate* of Baſil, i. e. from the year of Rome 244, or 245, 509 years before Jeſus Chriſt, to the year of Rome 1294, the ſpace of 1049 years, the years were accounted by the *conſuls*: but from the time of Baſil, in the year of Chriſt 541, we find no mention made of *conſuls*, or *conſulates*; but the time was then computed by the years of the emperors reigns, and the indictions.

Indeed, for ſome time after the *conſulate* of Baſil, the years are marked thus; *poſt conſulatum Baſilii*, 1, 2, 3, &c. See the Faſti Conſulares of M. D'Almeloveen. That author reckons 1060 pairs of *conſuls*, beſide the ſubſtitute *conſuls*, *ſuffecti*, elected to ſupply vacancies by death; and yet there were but 1049 years, and conſequently only ſo many *conſulates*.

The perpetual *conſulates* of the eaſtern emperors, which compoſe the faſti Bizantini, commenced in the year of Chriſt 567, and ended in 668, in the laſt year of Conſtans.

Conſtantine Pogonatus would have the *conſulate* inſeparable from the empire; which it continued to be till the time of Conſtantine Porphyrogenetus.

In this form of government, the empire and *conſulate* were ſo cloſely united, that the empreſs Irene would needs aſſume the *conſulate* when ſhe was only regent of the empire.

But the French kings, thoſe of Italy, and the Saracen princes who commanded in Spain, taking on them the title of *conſuls*, as well as emperors of Conſtantinople; theſe laſt deſpiſed it, and laid it aſide: ſo that the name was only continued to the magiſtrates of ſome cities, and certain other officers, as is ſhewn by F. Pagi.

Under the emperors there were *ordinary conſuls*, *honorary conſuls*, and *ſuffecti*; which laſt were alſo on foot in the time of the republic.

In the middle age, we find the word *conſul* uſed for *comes*, COUNT, and proconſul, for VISCOUNT; as is obſerved by Spelman, and De Marca.

And thus *conſul*, in our LAW-books, ſignifies an *earl*. Bract. lib. i. cap. 8. tells us, that as *comes* is derived from *comitatu*, ſo *conſul* is derived from *conſulendo*: and in the laws of Edward the Confeſſor, mention is made of *vicecomites*, and *viceconſules*.

CONSUL, at preſent, is uſed for an officer eſtabliſhed by virtue of a commiſſion from the king, and other princes, in the ports and factories of the Levant, on the coaſts of Africa, Barbary, Spain, and other foreign countries of any conſiderable trade; to facilitate and diſpatch buſineſs, and protect the merchants of the nation.

Theſe commiſſions are never granted to perſons, as *conſuls* of the French nation, under the age of thirty years. When the *conſulate* is vacant, the moſt ancient of the deputies of the nation are to diſcharge the function thereof, till the vacancy be filled up by the king.

The *conſuls* are to keep up a correſpondence with the miniſters of England reſiding in the courts whereon their *conſulates* depend. Their buſineſs is, to ſupport the commerce and the intereſt of the nation; to diſpoſe of the ſums given, and the preſents made, to the lords and principals of places; to obtain their protection, and prevent the inſults of the natives on the merchants of the nation. There are alſo *conſuls* of other nations eſtabliſhed in the Levant, eſpecially French and Dutch.

CONSULS alſo denote judges elected among merchants and dealers, in ports and trading towns, chiefly in France; to terminate, *gratis*, and on the ſpot, without any proceſs, ſuch differences and demands as may ariſe relating to their merchandizes, bills of exchange, and other articles of commerce.

The firſt juriſdiction of *conſuls* eſtabliſhed in France, is that of Tholouſe; the edict of whoſe eſtabliſhment bears date 1549, under the reign of king Henry II. that of Paris followed fourteen years afterwards. By degrees, they were eſtabliſhed in moſt of the conſiderable trading towns in that kingdom.

CONSULAR *comitia*, and *medals*. See the ſubſtantives.

CONSULTATION, in *Law*, a writ whereby a cauſe, formerly removed by prohibition from the eccleſiaſtical court to the king's court, is returned thither again.

If the judges of the king's court, upon comparing the libel with the ſuggeſtion of the party, find the ſuggeſtion falſe, or not proved; and therefore the cauſe to be wrongfully called from the court-chriſtian; then, upon ſuch deliberation, or *conſultation*, they decree it to be returned again, and the writ obtained hereon is called a *conſultation*.

CONSUMMATION, the end, period, or completion, of any work.—Thus, we ſay, the *conſummation* of all things; meaning the end of the world. By the incarnation, all the prophecies are ſaid to be *conſummated*.

Conſummation of marriage denotes the laſt act of marriage, which makes its accompliſhment.

CONSUMPTION, *Tabes*, in *Medicine*, a diſeaſe ariſing from a defect of nouriſhment; or a preternatural decay of the body, by a gradual waſte of muſcular fleſh. See ATROPHY.

It is frequently attended with an hectic fever; and is divided by phyſicians into ſeveral kinds, according to the variety of its cauſes: as *univerſal* or *ſcorbutic conſumption*, where it ariſes from a cacochymia, or ſcorbutic habit; and *pulmonic conſumption*, or *conſumption of the lungs*, where it ariſes from ſome cauſe in the lungs, properly called a PHTHISIS. See SCORBUTUS, &c.

A *conſumption* may either be *accidental*, *natural*, or *hereditary*.—*Accidental conſumptions* may ariſe, 1. From ulcers, chalky ſtones, or polypuſes in the lungs, cauſed by ſomething that obſtructs the circulation in the pulmonary veſſels, or renders the blood viſcid, as a ſuppreſſion of any natural evacuation. 2. From intemperance, occaſioning either a cacochymia, or plethora. 3. From peripneumonies, pleuriſies, aſthmas, coughs, catarrhs, diarrhœas, venereal diſorders, and exceſs of venery. 4. From grief, hard ſtudy, &c.

Natural conſumptions may ariſe from the ſtraitneſs of the thorax, or an ill conformation of the parts.

An *hereditary conſumption* may be communicated from the parents, without any other viſible cauſe.

A *conſumption* uſually begins with flying pains and ſtitches; a troubleſome pain at the pit of the ſtomach, or in the diaphragm; frequent ſpitting, loſs of appetite, a quick pulſe, a ſweetneſs or ſaltneſs in the ſaliva, heat and fluſhings in the face and palms of the hands after meals, an hectic fever towards the evening, heavineſs, faintneſs, night-ſweats; and, where the lungs are firſt diſordered, a cough, catarrh, or aſthma, uſually precede it. When theſe ſymptoms are violent, it is confirmed; and then comes on an expectoration of purulent or bloody matter, and the vomica pulmonum; at length, the feet ſwell, the expectoration ſtops, a diarrhœa comes on; and then the facies Hippocratica, and death. The cure of an *univerſal*, or *muſcular conſumption*, depends principally upon removal into a proper air, exerciſe, and the uſing of a regular nouriſhing diet, particularly vegetables and milk; the appetite is to be excited by proper bitters, and other ſtomachics.

In a *pulmonary conſumption*, or *phthiſis*, balſamics and oleaginous medicines, are uſually added

Dr. Wainwright, indeed, takes the particles of oily medicines to be too groſs and viſcid to enter the ſmall orifices of the lacteals; and thinks, that their operation or effect being confined to the firſt paſſages, they are not only of no ſervice in the cure, but are apt to pall the appetite, occaſion obſtructions in the mouths of the lacteals, and diarrhœas.

But this ſeems contrary to common experience: that their particles are ſmall enough to enter the lacteals, is evident, from the ſudden relief nephritic perſons find in violent paroxyſms of the ſtone by the paſſages being relaxed ſoon after their exhibition. That diarrhœas, and blunting the appetite in ſome conſtitutions, will be the conſequence of their continuance, or exhibition in too great quantities, muſt be allowed; but then this is either accidental to ſome kinds of conſtitutions, or ariſes from ſome error in uſing them.

As to the lacteals being obſtructed by their uſe, it ſeems a mere notion, and as much unſupported by experience as that other hypotheſis, which a late author, Dr. Quincy, has been fond of aſſerting; viz. that the uſe of butter is apt to foul the glands.

A *conſumption* is frequently the conſequence of a neglected COLD.

Beſides repeated ſmall bleedings, which is the beſt of all remedies for diminiſhing the hectic fits, the ſaline draughts and a cool diet are to be uſed. Colliquative ſweats may be checked by drinking about a pint of limewater, ſoftened with a little new milk.

In the advanced ſtate of a *conſumption*, we may diſtinguiſh two kinds of coughs, one cauſed by the ulcers of the lungs, and the other by a thin rheum falling upon the *fauces* and *trachea*. For the firſt of theſe, about ten drops of balſam of Peru or Copaiba may be given twice a day in a bolus of conſerve of roſes; and for the latter, incraſſants, as conſerve of roſes and opium; which laſt ought to be given with caution, as being apt to heat the body. See Balsams.

Consumption, in *Farriery*, is alſo a diſeaſe incident to horſes, conſiſting in a waſte of muſcular fleſh, attended with a ſlow fever. In this diſorder bleeding in ſmall quantities is recommended: mercurial purges, and a powder of native cinnabar, gum guaiacum and nitre, of each one pound, in the quantity of an ounce twice a day; ſpring graſs, and ſalt marſhes, are alſo of great ſervice, when there is any proſpect of a recovery.

CONSUS. See Consualia.

CONTACT, the relative ſtate of two things that touch each other, or whoſe ſurfaces join to each other without any interſtice. The *contact* of two ſpherical bodies is only in one point; and the ſame holds of a tangent and the circumference of a circle.—Hence, becauſe very few ſurfaces are capable of touching in all points, and the coheſion of bodies is in proportion to their *contacts*; thoſe bodies will ſtick faſteſt together, which are capable of the greateſt *contact*.

Contact, *angle of*, is the angle HLM (*Tab. Geometry, fig.* 10.) formed by the arch of a circle ML, with the tangent HL, at the place of the *contact*.

Euclid demonſtrates, that the right line HL, ſtanding perpendicular on the radius CL, touches the circle only in one point: nor can there be any other right line drawn between the tangent and the circle.

Hence, the angle of *contact* is leſs than any rectilinear one; and the angle of the ſemicircle between the radius CL, and the arch ML, is greater than any rectilinear acute angle.

This paradox of Euclid has exerciſed the wits of mathematicians: it was the ſubject of a long controverſy between Peletarius and Clavius; the firſt of whom maintained the angle of *contact* heterogeneous to a rectilinear one; as a line is heterogeneous to a ſurface: the latter maintained the contrary.

Dr. Wallis has a formal treatiſe on the *angle of contact*, and of the ſemicircle; where, with other great mathematicians, he approves of the opinion of Peletarius.

CONTAGION, *infection*, or the communicating, or transferring, a diſeaſe from one body to another.

Contagion, in ſome diſeaſes, is only effected by an immediate contact, or touch: as the madneſs of a dog, which is communicated by biting; and the poiſon of the pox, which is tranſmitted from the infected perſon in the act of copulation. In others it is conveyed by infected clothes; as the itch.—In others the *contagion* is tranſmitted through the air to a great diſtance, by means of ſteams, or effluvia, expiring from the ſick; as in the plague, and other peſtilential diſtempers: in which caſe, the air is even ſaid to be *contagious*, i. e. full of *contagious* particles.

In times of peſtilential *contagion*, the phyſician, and others who attend upon the ſick, are in the moſt imminent danger of falling into the ſame condition; nor have any of the ſo much boaſted preſervatives againſt this been found of any conſequence; on the contrary, the very remedies, many of them at leaſt, which have been contrived on this occaſion, are very dangerous when lodged in imprudent hands, as well as uſeleſs and improper in all. The beſt methods of ſafety are firſt never to viſit a patient in any infectious diſorder when one is faſting, but ſome generous wine ought always to be drank firſt. Some are of opinion that it is proper to eat firſt a piece of bread and butter, ſoaked in vinegar, either ſimple, or with rue firſt ſtamped in it. When one is in the patient's apartment, great care is to be taken never to eat or drink there, nor to ſwallow one's ſpittle; and it is no idle cuſtom in thoſe who are continually in the infected room to chew zedoary, myrrh, angelica, cinnamon, or the like warm and aromatic drugs; for all theſe things promote a plentiful diſcharge of ſaliva from the mouth, which it is certain, when ſwallowed, cannot but often carry peſtilential particles down with it into the ſtomach, whence they will eaſily find their way into the blood. It may be added as a good rule, that we never ſtay too long in an infected room; for a conſtitution that could have reſiſted the *contagion* for a ſmall time, may eaſily be overpowered by too long a continuance in the way of it.

After one is returned home from a viſit of this kind, it is always proper to waſh one's hands and mouth with vinegar and water; to change clothes, hanging the former in the air, and then to drink ſome warm liquor, as tea of ſcordium, ſage, or other herbs of that kind, or, in their place, coffee; for this opens the pores; and if any ſmall quantity of the peſtilential virus ſhould have mixed itſelf with the blood, expels it by a gentle perſpiration. It may be alſo of great aſſiſtance to all about the ſick, for preventing them from being infected, to hold frequently ſpunges dipt in vinegar to their noſes, and frequently to ſprinkle vinegar on a red-hot iron, in the room, to correct and mend the air, and to ſmoke tobacco. Heiſter's Surgery, p. 201. See Epidemical.

CONTARA, in *Botany*, a name given by ſome authors to the plant which produces the *faba ſancti Ignatii*, or St. Ignatius's bean.

CONTARII, in *Antiquity*, a kind of horſemen, whoſe chief armour was the *contus*, a kind of long ſpear.

CONTEMPLATION, an act of the mind, whereby it applies itſelf to conſider, reflect on, and admire, the wonderful works of God, nature, &c.

Contemplation is the height of perfection of the myſtic divines. See Mystic.

CONTEMPORARY, or **Cotemporary**, a perſon, or thing, of the ſame time, or that exiſted in the ſame age, with another. Socrates, Plato, and Ariſtophanes, were *contemporaries*: the beſt hiſtories are thoſe of *contemporary* authors.

CONTEMPT, in *Law*, is diſobedience to the rules and orders of a court, which hath power to puniſh ſuch offence; and a man may be impriſoned for a *contempt* done in court, but not for a *contempt* out of court, or for private abuſe. Cro. Eliz. 689.

Attachment alſo lies for contempt to the court, to bring in the offender to anſwer to interrogatories, &c. and if he cannot acquit himſelf, he ſhall be fined. 1 Lill. 305.

As the degrees of this crime vary, the puniſhment is leſs or greater; ſometimes a mere fine, and ſometimes impriſonment.

CONTENEMENT, a word, in our *Ancient* law-*books*, about whoſe ſignification authors are not rightly agreed. According to ſome, it ſhould ſignify the countenance, credit, or reputation, a perſon has, from and by reaſon of his freehold. In which ſenſe it is uſed in the ſtat. 1 Edw. III. &c. where it ſtands as ſynonymous with *countenance*.

Others will have it ſignify what is neceſſary for the ſupport and maintenance of men, according to their ſeveral qualities, conditions, or ſtates of life. Thus, Spelman, *Contenementum eſt æſtimatio, & conditionis forma, qua quis in republica ſubſiſtit.* And in this ſenſe it occurs in Magna Charta, cap. 14.

CONTENT, in *Mathematics*, a term frequently uſed for the capacity of a veſſel, or the area of ſpace; or the quantity of any matter, or ſpace, included in certain bounds. The *content* of a tun of round timber is 43 ſolid feet. A load of hewn timber contains 50 cubic feet: in a foot of timber are contained 1728 cubic or ſquare inches, and as often as 1728 inches are contained in a piece of timber, be it round, or ſquare; ſo many feet of timber are contained in the piece.

In gauging, the gallon for beer and ale is allowed to contain 282 cubic inches, and the wine gallon 231; the gallon of dry meaſure 272.

Hence, as oft as 282 cubic inches are contained in any veſſel, round or ſquare; ſo many gallons of ale or beer it holds; and the like may be obſerved of the other meaſures.

Multiply, therefore, one ſide of a ſquare, or oblong, into the other; and divide by one of thoſe numbers, according to the quality of the liquor; the quotient gives the area in gallons, upon an inch deep.

Though the work may be conſiderably ſhortened by only multiplying the ſides of ſquares, or the diameters of rounds, into themſelves; the product is the number of gallons, and parts, the veſſel contains, upon an inch in depth: and when that receives an augmentation, by being two, three, or four inches deep, it then commences a ſolid body, and contains as many gallons, and parts, as it is inches and parts deep.

A cubic foot contains ſix gallons and almoſt a pint of ale and beer; and ſeven gallons two quarts, of wine. A cubic foot of dry meaſure contains ſix gallons and a half, and ſomething more. A buſhel of ſalt contains 56 pounds averdupoiſe. See Gauging.

CONTENTIOUS *juriſdiction*, in *Law*, denotes a court, or aſſembly, which has a power to judge and determine differences between contending parties.

The lords chief juſtices, judges, &c. have a *contentious juriſdiction*; but the lords of the treaſury, the commiſſioners of cuſtoms, &c. have none; being merely judges of accompts and tranſactions.

CONTESTATIO *Litis*, among *Civilians*, denotes a general aſſertion that the plaintiff hath no ground of action, which aſſertion is afterwards extended and maintained in his plea.

CONTEXT, among *Divines* and *Critics*, that part of Scripture, or other writing, which lies about the text, before or after it, or both.

To take the full and genuine ſenſe of the *text*, the *context* ſhould be regarded.

CONTEXTURE, a word frequently uſed in ſpeaking both of the works of nature and art; and denoting the diſpoſition and union of the conſtituent parts with reſpect to one another.

CONTIGNATION, in *Architecture*, the art or act of FLOORING, by laying *tigna*, RAFTERS, together.

CONTIGUITY, the relation of bodies touching one another. See Continuity.

CONTIGUOUS, a relative term, underſtood of things diſpoſed ſo near each other, that they join their ſurfaces, or touch.

The houſes in ancient Rome were not *contiguous*, as ours are, but all inſulated.

Contiguous *angles*, in *Geometry*, are ſuch as have one leg common to each angle; otherwiſe called *adjoining angles*. In contradiſtinction to thoſe produced by continuing their legs through the point of contact, which are called *oppoſite* or *vertical* ANGLES.

CONTINENCE, in *Ethics*, a moral virtue, by which we reſiſt concupiſcence. It ſhould ſeem that there is this diſtinction between *chaſtity* and *continence*, in that it requires no effort to be chaſte, which reſults from conſtitution; whereas *continence* appears to be the conſequence of a victory gained over ourſelves. The verb *continere*, in the Latin, ſignifies *to reſtrain*.

CONTINENT, in *Geography*, a terra firma, main-land, or a large extent of country, not interrupted by ſeas: ſo called, in oppoſition to *iſland*, *peninſula*, &c. See Earth, Ocean, &c.

Sicily is ſaid to have been anciently torn from the *continent* of Italy; and it is an old tradition, which ſome of our antiquaries have ſtill a regard to, that Britain was formerly a part of the *continent* of France.

The world is ordinarily divided into two grand *continents*; the old and the new: the old comprehends Europe, Aſia, and Africa; the new the two Americas, north and ſouth.

Continent *cauſe* of a diſtemper is that whereon the diſeaſe depends ſo immediately, that it continues ſo long as that remains, and no longer.

Thus a ſtone in the bladder may be the *continent cauſe* of a ſuppreſſion of urine.

Continent *fevers*, a term uſed by medical writers to expreſs ſuch fevers as continue through their whole courſe exactly in the ſame tenor in which they begun, without the leaſt viſible intermiſſion. They are thus called in oppoſition to the *continuous* fevers, which, though they never regularly go off ſo as to have *intermiſſions*, yet have frequent *remiſſions*. Of the number of *continent fevers* are the *ephemera*, whether it be ſtrictly diary, or continues more days; alſo the *ſynocha*, which is called the *continent fever*, by way of eminence. Junker's Conſp. Med. p. 252. See Fever.

CONTINGENCY *of blood*, in the writers of the laws of Scotland, is uſed for proximity of blood. Bayne, Crim. Law. p 48.

CONTINGENT, ſomething caſual, uncertain, or dependent upon CHANCE.

Contingent, *future*, in *Logic*, denotes a conditional event which may, or may not, happen, according as circumſtances fall out.

Contingent is alſo a term of relation for the quota that falls to any perſon upon a diviſion.

Each prince of Germany, in time of war, is to furniſh ſo many men, ſo much money and munition, for his *contingent*. By the new treaty of Hanover it is ſtipulated, that in caſe of a rupture with the emperor, the kings of Great Britain and Pruſſia may furniſh their *contingents*, as ſiefs of the empire, at the ſame time they are at war therewith.

Contingent *uſe*, in *Law*, is an uſe limited in a conveyance of land, which may, or may not, happen to veſt, according to the *contingency* expreſſed in the limitation of ſuch uſe.

Contingent *legacy*, is a legacy depending on the life of the legatee; if it be left to any perſon, *when* or *if* he attains the age of twenty-one, and he dies before that time, it is a lapſed legacy; but if it is left *to be paid* when he attains that age, it is a veſted legacy; and if the legatee dies, his repreſentatives ſhall receive it out of the teſtator's eſtate at the time when it would have become payable, had the legatee lived. Blackſt. Com. vol. ii. p. 513.

Contingent *remainder*, in *Law*, is where an eſtate is limited to take place *in futuro*, upon an uncertain event; as where a particular eſtate, which doth ſupport a remainder, may or may not determine before the remainder may commence. 10 Rep. 85. See Remainder.

Contingent *line*, or *Line of* Contingency, in Dialling, is a line that croſſes the SUBSTILE at right angles.

Contingents are ſometimes alſo uſed by mathematicians in the ſame ſenſe as TANGENTS.

CONTINUAL *claim*. See Claim *continual*.

Continual *proportionals*. When in a ſeries of quantities, the firſt is to the ſecond as the ſecond to the third, and the third to the fourth, and the fourth to the fifth, &c. they are called *continual proportionals*.

CONTINUANCE, in *Law*, is much the ſame as PROROGATION among the civilians. See Discontinuance.

Continuance *of a writ*, or *action*, is its holding in force from one term to another, in a caſe where the ſheriff has not returned, or executed, a former writ iſſued out in the ſame action.

Continuance *of aſſiſe*. If a record in the treaſury be alleged by one party, and denied by the other, a certiorari ſhall be ſued to the treaſury and chamberlain of the exchequer: who, if they certify not that the ſaid record is there, or likely to be in the Tower; the king ſhall then ſend to the juſtices, repeating the certificate, and will them to *continue the aſſiſe*.

CONTINUANDA *aſſiſa*. See Assisa.

CONTINUANDO, in *Law*, a term uſed where a plaintiff would recover damages for ſeveral treſpaſſes in the ſame action.

To avoid multiplicity of ſuits, a man may in one action of treſpaſs recover damages for forty, or more, treſpaſſes; laying the firſt to be done with a *continuance* to the whole time wherein the reſt of the treſpaſſes were done; which is done in this form: *continuando tranſgreſſionem prædictam, &c. à prædicto die, &c. uſque, &c.*

Continuando *proceſſum*. See Processum.

CONTINUANS *punctum*. See Punctum.

CONTINUATION *of motion*. See Motion, and Projectile.

CONTINUATIVE *conjunctions*. See Conjunction.

CONTINUATO, in the *Italian Muſic*, is uſed to direct a ſinger, or player, to continue or hold on a ſound, in equal ſtrength or manner; or to continue a movement in an equal degree of time all the way.

CONTINUED, or Continual *fever*, is ſuch a FEVER as ſometimes remits, but never intermits, or goes entirely off, till its period. They are thus called to diſtinguiſh them from the CONTINENT fevers.

A *continual* fever may be defined to be the continuance of an increaſed velocity in the CIRCULATION of the BLOOD, beyond what is natural to the conſtitution.

If this velocity often decreaſes and riſes again to the ſame height, it is called a *continual periodical fever*.

And if it entirely ceaſe in the ſpace of a day, or two, it is called an *ephemeris*.

A *continual* fever, then, may remit, or abate, and increaſe again, alternately; but not intermit, which would conſtitute it an intermitting fever, or ague.

Continued *Quantity*. } See Continuum, Continuity,
Continued *Body*, &c. } and Quantity.

Continued, or *thorough baſs*, in *Muſic*, is that which continues to play conſtantly both during the recitatives, and to ſuſtain the choir, or chorus.

Continued *proportion*, in *Arithmetic*, is that wherein the conſequent of the firſt ratio is the ſame with the antecedent of the ſecond—as 3 : 6 : : 6 : 12. See Proportion.

On the contrary, if the conſequent of the firſt ratio be different from the antecedent of the ſecond, the proportion is ſaid to be *diſcrete*: as, 3 : 6 : : 4 : 8. See Discrete.

Continued *zocle*, or *ſocle*, in *Architecture*. See Socle.

Continued *Attic*, *Community*, *Pedeſtal*. See the ſubſtantives.

CONTINUI *ſolutio*. See Solutio.

CONTINUITY is uſually defined, among *Schoolmen*, the immediate coheſion of parts in the ſame *quantum*. Others define it, a mode of body, whereby its extremes become one: and others, a ſtate of body reſulting from the mutual implication of its parts.

Continuation relates to *duration*, and *continuity* to *extenſion*. We ſay, the *continuation* of a work, or an action; and the *continuity* of ſpace or ſize; *continuation* of the ſame conduct; and *continuity* of the ſame building.

There are two kinds of *continuity*; *mathematical*, and *phyſical*. The firſt is merely imaginary, and fictitious; ſince it ſuppoſes real or phyſical parts where there are none.

Phyſical continuity is ſtrictly, that ſtate of two or more parts, or particles, wherein they appear to adhere, or conſtitute one uninterrupted quantity, or *continuum*; or between which we perceive no intermediate ſpace.

The ſchoolmen diſtinguiſh two other ſorts of *continuity*; viz. *homogeneous*, and *heterogeneous*. The firſt, where our ſenſes do not perceive the bounds, or extremes, of the parts; and this agrees even to air, water, &c. The ſecond, where our ſenſes do indeed perceive the extremes of certain parts, yet at the ſame time obſerve the ſame parts cloſely linked to each other; either in virtue of their ſituation or figure, &c. and this is chiefly attributed to the bodies of animals and plants.

The *continuity* of bodies is a ſtate merely relative to our ſight and touch: e. gr. if the diſtance of two ſeparate objects be ſuch, as that the viſual angle they ſubtend is inſenſible to the eye, which it will be if leſs than ſixteen ſeconds, the two ſeparate bodies will then appear *contiguous*. Now, the reſult of ſeveral *contiguous* objects is a *continuity*: ſo that any number of viſible objects, being placed ſo as that the diſtances ſubtend angles of leſs than ſixteen ſeconds, they will appear to form one *continuum*.

And hence, as we can determine the diſtance at which any given magnitude becomes inviſible; it is eaſy to find at what diſtance any two bodies, however remote from each other, will appear as contiguous; and ſeveral, as forming one *continuum*. For the phyſical cauſe of *continuity*, ſee Cohesion.

Leibnitz, an eminent mathematician, has ſuppoſed what he calls a law of *continuity* to obtain in the univerſe, by which law every thing that is executed or done in nature, is done by infinitely ſmall degrees. He urges, that good ſenſe dictates this truth, *natura non operatur per ſaltum*, or that nothing can paſs from one extreme to another, without paſſing through all the intermediate degrees. Bernouilli Opera, tom. iii. p. 9. ſeq.

This law ſeems ſubject to difficulties; rigorouſly taken, it ſuppoſes actual, and yet infinitely ſmall changes, which ſome philoſophers cannot reliſh; and if we ſuppoſe changes only imperceptible to our ſenſes, but finite, the law of *continuity* is no leſs violated, than if the univerſe were to be ſuddenly deſtroyed, as M. Maupertuis juſtly obſerves. Mem. de l'Acad. de Berlin. tom. ii. p. 284.

This law of *continuity* led Mr. Bernouilli to reject all HARD *bodies* as chimeras, and naturally impoſſible.

CONTINUO, in the *Italian Muſic*, is ſometimes applied to *baſſo*, to ſignify the thorough baſs. Thut *baſſo continuo*, is the continual, or thorough baſs. It is ſometimes marked in muſic books by the letters B, C.

Continuo is alſo uſed for a ſpecies of harmony mentioned by Julius Pollux, and which, ſays Zarlino, anſwers to the perpetual burden of our bag-pipes, which now and them muſt be harmonious.

CONTINUOUS *fevers*. See Continued *fever*.

CONTINUUM, or Continued *quantity*, in *Phyſics*, denotes a quantity, or co-extenſion, whoſe parts are not divided, but joined and connected together; ſo as to leave no room to determine where one begins, and another ends.

It is controverted, among philoſophers, whether a *continuum* be infinitely diviſible, i. e. diviſible into infinite proportionable parts?

The ancients attributed the riſe of water, in pumps, to the love of CONTINUITY, and the abhorrence of a VACUUM; becauſe the weight and preſſure of the air was not then known.

Mathematicians divide QUANTITY into *continued*, and *diſcrete*.

Continued quantity is that expreſſed by lines, and makes the ſubject of *geometry*.

Diſcrete quantities are thoſe expreſſed by numbers, which make the ſubject of *arithmetic*.

In medicine and chirurgery, wounds, ulcers, fractures, &c. are expreſſed by the phraſe SOLUTIO *continui*, or *ſolution of continuity*.

In a critical ſenſe, we ſay, there ought to be a *continuity*, i. e. a connexion between the parts of a diſcourſe.

In the epic poem, particularly, the action ſhould have a *continuity* in the narration, though the events, or incidents, be not continued. As ſoon as ever the poet has opened his ſubject, and brought his perſons on the ſtage, the action is to be *continued* to the end; every character muſt be at work, and no ſuch thing as an idle perſon to be ſeen.

F. Boſſu obſerves, that, by retrenching dull languiſhing incidents, and intervals void of action, which break the *continuity*, the poem acquires a *continued* force, which makes it run equally throughout.

CONTOBABDITES, a ſect in the ſixth century. Their firſt leader was Severus of Antioch, who was ſucceeded by John the grammarian, ſurnamed Philoponus, and one Theodoſius; whoſe followers were alſo called Theodoſians.

Part of them, who were willing to receive a book compoſed by Theodoſius on the Trinity, made a ſeparate body, and were called *Contobabdites*, from I know not what place, which Nicephorus does not mention, but which muſt apparently have been the place where they held their aſſemblies.

The *Contobabdites* allowed of no biſhops; which is the only circumſtance given us concerning them.

CONTOPÆCTÆ, of *κοντος*, *pole*, and *ϖηκτος*, *compact*, in *Antiquity*, a ſort of artiſts who ſupported a pole on their foreheads ſo firmly, that boys could play, dance, and wreſtle together on it.

CONTOR, or Cuntor, a bird of Peru, ſaid to be the largeſt in the world. With its wings expanded, it meaſures ſixteen feet from the tip of the one to the other; a ſingle feather of it is four feet two inches long; its beak is ſtrong enough to tear off the hide, and rip up the bowels of an ox. Two of them will deſtroy a bull. Phil. Tranſ. N° 208. p. 61. See Condore.

CONTORSION, the action of twiſting, or wreſting, a member of the body out of its natural ſituation.

Rope-dancers accuſtom themſelves to *contorſions* of their limbs from their youth, to render the fibres of their articulations lax, and ſupple, for all kinds of poſtures.

Contorsion, in *Medicine*, has many ſignifications. Firſt, the *iliac paſſion* is thus called; ſecondly, an *incomplete diſlocation* is thus named, when a bone is partly forced from its articulation; thirdly, a diſlocation of the vertebræ of the back ſideways, or crookedneſs of theſe vertebræ, are called *contorſions* of them; fourthly, a diſorder of the head is thus called, in which it is drawn toward one ſide, either by a ſpaſmodic contraction of the muſcles on the ſame ſide, or a palſy of their antagoniſt muſcles on the other. James's Med. Dict.

The *contorſion* of the neck is uſually occaſioned, according to Nucke, by a relaxation, or *paralyſis*, of one of the maſtoidal muſcles: for hence it happens, that its antagoniſt, whoſe power is now no longer balanced, contracting with its proper force, draws the head towards that ſide.

He adds, that this diſorder cannot be remedied too ſpeedily; and preſcribes, from the beginning, liniments capable of relaxing and ſoftening the fibres, to be uſed, not only to the muſcle in contraction, but alſo, and principally, to the paralytic muſcle, which is the ſeat of the diſorder.

CONTOUR, *outline*; that which terminates and defines a figure.

A great part of the ſkill of the painter conſiſts in managing the *contours*.

The *contour* of a figure makes what we call the *draught*, or *deſign*. The *contour* of a face, the Italian painters ordinarily call the *lineaments* of it.

CONTOURNE, in *Heraldry*, is uſed when beaſts are repreſented ſtanding, or running, with their faces to the ſiniſter-ſide of the eſcutcheon; they being always ſuppoſed to look to the dexter-ſide, unleſs it be otherwiſe expreſſed.

CONTOURNIATED, a term applied, among *Antiquaries*, to a kind of medallions which have a broad riſing rim on each ſide; and figures that have ſcarce any relievo, in compariſon with the true medallions.

They have their name from their edges; which appear as if turned in the lathe. All we have remaining of theſe *contourniated* medals, ſeem to have been ſtruck about the ſame time. F. Hardouin conjectures them not to be earlier than the thirteenth century; other antiquaries go back as far as the fifth; and others find inſtances of them as ancient as the time of Nero.

This ſort of work ſeems to have had its origin in Greece, and to have been appropriated to honour the memories of great men; principally, thoſe who had borne away the prize at the ſolemn games; ſuch are thoſe remaining of Homer, Solon, Euclid, Pythagoras, Socrates, Apollonius Tyaneus, and ſeveral athletæ, whoſe victories are expreſſed on them by palms and chariots, either bigæ, or quadrigæ.

CONTRA, or Counter, in *Compoſition*. See Counter.

Contra *apertura*, in *Surgery*, a counter opening. This is ſometimes very neceſſary in wounds made by puncture or a bullet, in order to diſcharge whatever is contained in the wound, and prevent its growing fiſtulous. James's Med. Dict.

Contra *formam collationis*, is a writ that lies where a man has given lands, in perpetual alms, to a religious houſe, hoſpital, ſchool, or the like, and the governor, or managers, have alienated the lands, contrary to the intention of the donor.

This was founded on the ſtatute of Weſtm. 2. cap. 41.

Contra *formam feoffamenti*, is a writ for a tenant, who is infeoffed by the lord's charter, to make certain ſuit and ſervice to his court; and is afterwards diſtrained for more than is contained therein. Reg. of Writs, fol. 176. Old Nut. B. ii. fol. 162.

Contra *formam ſtatuti*, is the uſual concluſion of every indictment, &c. laid on an offence created by ſtatute.

CONTRABAND, in *Commerce*, a prohibited commodity; or, a merchandize bought or ſold, imported or exported, in prejudice, and contrary, to the laws and ordinances of a ſtate, or the public prohibitions of the ſovereign.

The word comes from the Italian *contrabando*, of *contra* and *bando*, q. d. contrary to edict, or publication of prohibition.

Contraband goods are not only liable to confiſcations themſelves;

ſelves; but do alſo ſubject all other allowed merchandizes found with them in the ſame box, parcel, or bale, together with the horſes, waggons, &c. which conduct them to the ſame.

There are *contraband* goods, which, beſides confiſcation, are prohibited on pain of death; as, v. gr. in France, India, and China ſtuffs, linens, &c.

In England there are two principal *contrabands* for exportation, wools and live ſheep, which all ſtrangers are prohibited from carrying out, on pain of having the right hand cut off; the other, that of ſheep-ſkins and calf-ſkins, which all foreigners are in like manner prohibited from exporting, on pain alſo of having the right hand cut off; yet the ſubjects of England are allowed to tranſport the ſame from France to England.

Other *contrabands* for exportation are raw horns, white aſhes, ſtocking-looms, or any part thereof, fullers earth, and all raw hides, or ſkins.

Of goods *contraband* as to the import, there are above fifty in the liſts made in 1662, and yet there are twenty-five of them which now ſtand in the tariff; the non-execution of the acts of parliament, whereby they were impoſed, ſeeming to have reſtored them to the freedom of importation.

The chief of thoſe ſtill *contrabanded*, and not tariffed, are woollen caps, woollen cloths, ſaddles, and harneſs, dice, billiards, all ſorts of tanned, or dreſſed hides, dreſſed furs, all ſorts of ſhoemakers ware, locks, and divers ſorts of cutlers ware; all painted goods, except paper; wires, buckles, gold and ſilver leaf, and horns for lanterns.

Since the year 1662, ſeveral other commodities have been made *contraband*; particularly, ſilk and galloons, laces, embroidery, fringes, buttons, and other ſilk and thread manufactures; black taffaties, called *alamodes*, or lute-ſtring.

In 1719 and 1720, an attempt was made in parliament to paſs a bill for putting gold and ſilver, whether in coined ſpecies, or otherwiſe, among the number of *contraband* goods for exportation; but in vain, by reaſon of the ſtrong oppoſition made by thoſe who enrich themſelves by the export of theſe metals; which, by the laws of the kingdom, are allowed to be ſent away, upon entering them, paying the duty of the export, and making oath of their being foreign, i. e. of their not being the coin, or the plate of the kingdom, melted down.

CONTRACT, a mutual conſent of two, or more, parties, who promiſe and oblige themſelves voluntarily, to do ſomething, pay a certain ſum, or the like.

SALES, EXCHANGES, DONATIONS, LEASES, &c. are ſo many different ſpecies of *contracts*.

CONTRACT is particularly uſed, in *Common Law*, for an agreement or covenant between two, with a lawful conſideration, or cauſe.

As, if I ſell my horſe for money; or covenant, in conſideration of 20*l.* to make you a leaſe of a farm; theſe are good *contracts*, becauſe there is *quid pro quo*.

CONTRACT *Nude*, and *Quaſi*. See the adjectives.

CONTRACT, *uſurious*, is a *contract* to pay more intereſt for money than the laws allow.

It is a devaſtavit in executors to pay a debt upon an uſurious *contract*.

CONTRACT. In marriage, the Romaniſts diſtinguiſh the civil *contract*, which is the conſent of the parties, from the *ſacrament*, which is the benediction of the prieſt.

Thoſe *contracts* are ſaid to be *null*, which the law prohibits: ſuch are all *contracts* between perſons incapable of *contracting*, as minors, religious, lunatics, wives without conſent of their huſbands, &c.

CONTRACT is alſo uſed for the inſtrument in writing, which ſerves as a proof of the conſent granted, and the obligation paſſed between the parties.

Among the ancient Romans, *contracts*, and all voluntary acts, were written, either by the parties themſelves, or by one of the witneſſes, or by a domeſtic ſecretary of one of the parties, whom they call a *notary*; but who was no public perſon, as among us.

The *contract*, when finiſhed, was carried to the magiſtrate, who gave it a public authority by receiving it *inter acta* into the number of the ACTS under his juriſdiction; giving each of the parties a copy thereof, and ſealed with his ſeal. Which practice paſſed into France, where it obtained a long time.

CONTRACTILE *force*, that property, or power, inherent in certain bodies, whereby, when extended, they are enabled to draw themſelves up again to their former dimenſions.

For the cauſe of this property, which is of the utmoſt conſequence to a right underſtanding of the animal œconomy, ſee FIBRE.

CONTRACTION, in *Logic*, a ſpecies of reduction, wherein the thing that reduces does alſo abridge, or bring the thing reduced into a leſſer compaſs.

The deſign of *contraction* is to bring things, which before were too lax and diffuſive, nearer together; that ſo their mutual relation may appear the more clearly, and they may better ſtrengthen and ſupport each other.

To this head are referred the arguments, as they are called, of poems and orations; the titles and ſummaries of chapters, &c.

CONTRACTION, in *Phyſics*, denotes a diminiſhing of the extent, or dimenſions, of a body; or a bringing of its parts cloſer to each other; upon which it becomes heavier, harder, &c. See CONDENSATION.

Contraction, in this ſenſe, ſtands oppoſed to *dilatation*.

All bodies *contract* by COLD, and dilate, or rarefy, by HEAT. See RAREFACTION.

CONTRACTION is frequently uſed, by anatomical writers, to expreſs the ſhrinking up of a fibre, or an aſſemblage of fibres, when extended.

Convulſions and ſpaſms proceed from a preternatural *contraction* of the fibres of the muſcles of the part convulſed.

On the contrary, paralytic diſorders generally proceed from a too great laxneſs of the fibres of the parts affected; or from the want of that degree of *contraction* neceſſary to perform the natural motion or action of the part.

In the firſt, therefore, the animal ſpirits are ſuppoſed to flow, either in too great a quantity, or irregularly; and, in the laſt, the animal ſpirits are either denied a free paſſage into the part affected, or the tenſion of the fibrillæ is ſuppoſed inſufficient to promote the circulation.

Contraction evidently appears to be the true natural ſtate of all the muſcles; for, if a muſcle be at any time freed from the power of its antagoniſt, it is immediately found to *contract*; and is not, by any action of the will, or the ſpirits, to be reduced to a ſtate of dilatation.

CONTRACTION *of the heart, arteries, lungs, &c.* See SYSTOLE, HEART, ARTERY, PULSE, &c.

CONTRACTION, in *Grammar*, the reduction of two vowels, or ſyllables, into one; as, *may'nt*, for *may not*; *ſhouldſt*, for *ſhouldeſt*, &c.

The Greeks abound with *contractions*, both in their verbs, and their nouns.

CONTRADICENTE. See NEMINE *contradicente*.

CONTRADICTION, a ſpecies of direct oppoſition, wherein one thing is found diametrically oppoſite to another.

The ſchoolmen uſually define it, *oppoſitio inter ens, & non-ens, medio carens*: where, by *ens*, and *non-ens*, are underſtood any two extremes, whereof one affirms, and the other denies; and it is ſaid to be *medio carens*, to diſtinguiſh it from the other ſpecies of compoſition; the extremes, here, neither agreeing in ſubject, as is the caſe in PRIVATION; nor in eſſence and kind, as in CONTRARIETY.

CONTRADICTION, *freedom of*. See FREEDOM.

CONTRADICTION, *imply a*. See IMPLY.

CONTRADICTOR, in a legal ſenſe, a perſon who has a right or title to contradict, or gainſay.

An inventory of the effects of a minor ought to be made in preſence of his guardian, or truſtee, who is the legal *contradictor*: a decree againſt a farmer has no effect on the landlord, the firſt not being the legitimate *contradictor*.

CONTRADICTORY *propoſitions*, are oppoſites, one of which imports a mere, and naked, denial of the other.

Of theſe, therefore, one muſt be poſitive, and the other negative; as *ſitting*, and *not ſitting*; *white*, and *not white*. *Contradictory* propoſitions mutually deſtroy each other.

To have two propoſitions truly *contradictory*, they muſt be oppoſite, both in quantity and quality, i. e. one muſt be univerſal, and the other particular, which makes the oppoſition of quantity; and the one affirmative, and the other negative, which makes the oppoſition in quality. Thus, v. gr. *All uſe of wine and ſilver is evil*; falſe: *Some uſe of wine and ſilver is not evil*; true. To this it is neceſſary, that the one deny, and the other affirm, the ſame thing, of the ſame ſubject, conſidered in the ſame circumſtances: unleſs the queſtion be about an eſſential attribute, in which caſe, no regard is had to circumſtances; every thing having always its own eſſence. This the logicians expreſs by *affirmare & negare idem, de eodem, ſecundum idem*.

There may likewiſe be *contradictory* propoſitions on a particular ſubject; e. gr. an individual. Theſe are called *ſingle contradictory propoſitions*; as, *Peter is innocent*, *Peter is not innocent*, or *is a criminal*. Now, to have theſe propoſitions *contradictory*, Peter muſt be conſidered at the ſame time, without which they may be both true: ſince there may be a time wherein Peter was innocent, and another wherein he was a criminal.

CONTRA-FISSURE, in *Medicine*, a term applied to that ſpecies of fracture, or fiſſure, in the ſkull, where the ſide, oppoſite to that where the blow was received, is cracked.

This ſpecies of fracture is taken notice of by Celſus, lib. viii. cap. 4. yet Ægineta denies the poſſibility of it; and is herein followed by Gorræus, and many of the moderns. Their chief argument is, that the ſkull is not one uniform continuous bone, but is divided by ſeveral ſutures, which prevent the effects of a ſtroke from being communicated to the oppoſite part, and confine the miſchief to the part ſtruck. Here, ſay they, if a ſkull be found cracked on the oppoſite ſide, or any where but in the place where the blow is immediately received, this muſt proceed from a ſecond or third blow, which, perhaps, the patient, being ſtunned, does not remember. But there are ſo many cogent inſtances on the other ſide of the queſtion, that the reality of *contra-fiſſures* is now generally allowed.

The uſual ſymptoms attending a *contra-fiſſure*, are a delirium, ſometimes a bleeding at the noſe and mouth, ſtupidity, and involuntary paſſing of the urine and excrements, and convulſions. If theſe happen, and after ſearch made in the part where the injury was received, no fracture, or depreſſion of the ſkull be found, there is a ſuſpicion of a *contra-fiſſure*; eſpecially if the patient be apt to point to that part.

If the ſymptoms be by intervals, and not to a great degree, or there be reaſon to believe the fiſſure to have reached only through one of the tables, it is ſufficient to bare the bone, and uſe a raſpatory; then to fill the rima, or crack, with proper powders, as of iris, gum, myrrh, powder of diapente, &c. and above all apply a pledget, dipped in the tincture of euphorbium, or of equal parts of ſpirit of wine, and honey of roſes. If theſe fail, the trepan muſt be had recourſe to.

CONTRA-HARMONICAL *proportion*, that relation of three terms, wherein the difference of the firſt and ſecond is to the difference of the ſecond and third, as the third is to the firſt.

Thus, e. gr. 3, 5, and 6, are numbers *contra-harmonically* proportional; for 2 : 1 :: 6 : 3.

To find a mean contra-harmonically proportional to two given quantities: the rule is, divide the ſum of the two ſquared numbers by the ſum of the roots; the quotient is a *contra-harmonically* mean proportional between the roots.

CONTRA-INDICATION, is an INDICATION which forbids that to be done which the main ſcope of a diſeaſe points out.

Suppoſe, e. gr. in the cure of a diſeaſe a vomit were judged proper; if the patient be ſubject to a vomiting of blood, it is a ſufficient *contra-indication* as to its exhibition.

CONTRALTO, in *Muſic*. See COUNTER-*Tenor*.

CONTRAMANDATIO *Placiti*, in LAW-*Books*, ſignifies a reſpiting, or giving the defendant further time to anſwer; or, an imparlance, or countermanding of what was formerly ordered. See COUNTERMAND.

CONTRAMANDATUM, a lawful excuſe, which the defendant, by his attorney, allegeth for himſelf, to ſhew that the plaintiff has no cauſe to complain, *ſi dies placiti ſit contramandatus*. 11 Hen. I. See the article COUNTERMAND.

CONTRAMURE, in *Fortification*, an outwall, built about the main WALL of a city. See RAMPART.

CONTRAMURE, in *Civil Architecture*. See COUNTERMURE.

CONTRA-*Points*, in *Muſic*. See the article COUNTERPOINT.

CONTRAPOSITION, in *Logic*. See the article CONVERSION.

CONTRARIENTUM *Rotulus*. See the article ROTULUS.

CONTRARIETY, that which denominates two things *contrary* to each other.

Contrariety conſiſts in this, that one of the terms imports a negation of the other, either mediately or immediately; ſo that *contrariety* may be ſaid to be the contraſt, or oppoſition of two things, one of which implies the abſence of the other.

CONTRARIETY, *freedom of*. See FREEDOM.

CONTRARIES, are poſitive OPPOSITES; which being of the ſame kind, or ſame common nature, and ſubſiſting by turns in the ſame ſubject, are as remote from each other as poſſible, and mutually expel each other. Such are whiteneſs and blackneſs, cold and heat, &c.

Hence, properly ſpeaking, only qualities can be *contraries: contrariety*, in effect, only agrees to qualities *per ſe*; to other things it agrees *per accidens*, or *in ordine ad qualitatem*.

CONTRARY, however, is often uſed in a more extenſive ſignification, viz. for any inconſiſtence or difference between the nature and qualities of things. It is a popular maxim in philoſophy, that *contraria juxta ſe poſita magis eluceſcunt*; *contraries* ſet off one another. In this ſenſe is the word *contrary* uſed in the ſchools; and hence an argument *à contrario*.

This method of improving things *è contrario*, is much uſed, and with good ſucceſs, by F. Bourdaloue in his Sermons.

CONTRARY, in *Rhetoric*. F. de Colonia lays down three kinds of *contraries* in rhetoric; viz. *adverſatives*, *privatives*, and *contradictories*.

Adverſatives are thoſe that differ much in the ſame thing, as virtue and vice, war and peace: thus Tully, *Si ſtultitiam fugimus, ſapientiam ſequamur*; *& bonitatem, ſi malitiam*. And Quintilian, *malorum cauſa bellum eſt, erit emendatio pax*. Drances argues thus in Virgil:

> *Nulla ſalus bello: pacem te poſcimus omnes.*

Privatives are habits, and their privations. *Contradictories* are thoſe, one whereof affirms, and the other denies, the ſame thing, of the ſame ſubject.

CONTRARY *propoſitions*, in *Logic*, univerſal propoſitions, one of which affirms, and the other denies, the ſame predicate of the ſame ſubject; as *every ſquare is a parallelogram*, and *no ſquare is a parallelogram*. Theſe propoſitions differ in quality, but not in quantity, and therefore are diſtinguiſhed from CONTRADICTORY propoſitions, which differ in quantity and quality.

Contrary propoſitions cannot be both true, but may both be falſe: whereas, in *contradictory* propoſitions, one is neceſſarily true, and the other falſe.

CONTRARY *point of flexure*. See POINT.

CONTRAST, in *Painting* and *Sculpture*, expreſſes an oppoſition, or difference of poſition, attitude, &c. of two or more figures; contrived to make a variety in a painting, &c.

The word comes from the Italian *contraſtare, to oppoſe*, or *thwart*; and that, according to M. Huet, from the Latin *contra ſtatio*.

Thus, when in a group of three figures, one appears in front, another ſhews his hind-parts, and a third is placed ſideways, there is ſaid to be a *contraſt*.

M. de Piles defines *contraſt* an oppoſition between the lines which form the objects; by means whereof they tend to ſet off one another.

A *contraſt*, well managed, is one of the greateſt beauties of a painting. The *contraſt* is not only to be obſerved in the poſition of ſeveral figures, but alſo in that of the ſeveral members of the ſame figure: thus, if the right arm advance the fartheſt, the right leg is to be hindmoſt; if the right eye be directed one way, the right arm is to go the contrary way, &c. The *contraſt* muſt be purſued, even into the drapery.

To **CONTRAST**, in *Architecture*, is to avoid the repetition of the ſame thing, in order to pleaſe by variety: as is done in the great gallery of the Louvre, where the pediments are, alternately, arched and angular.

CONTRAST-*wheel*, in *Clock-work*. See WHEEL, CLOCK, and WATCH.

CONTRAVALLATION, *line of*, in *Fortification*, is a trench, guarded with a parapet; made by the beſiegers, betwixt them and the place beſieged, to ſecure themſelves on that ſide, and ſtop the ſallies of the garriſon.

It is without muſquet-ſhot of the town, and ſometimes goes quite round it, ſometimes not, according as the general finds occaſion. The army, forming a ſiege, lies between the lines of CIRCUMVALLATION and *contravallation*. It is now ſeldom uſed.

CONTRAVENTION, a man's failure of performing or diſcharging his word, obligation, or duty, or the laws and cuſtoms of the place. The penalties impoſed in caſes of *contravention*, only paſs for comminatory.

In a more limited ſenſe, *contravention* implies the non-execution of an ordinance, or edict.

Contravention is ſuppoſed to be a degree below PREVARICATION; and to be only the effect of negligence or ignorance.

CONTRAYERVA, *Dorſtenia*, in *Botany*, a genus of the *tetrandria monogynia* claſs. Its characters are theſe: it hath one common involucrum, ſituated vertically, upon which ſit ſo many ſmall flowers, which have no petals, but four ſhort ſtamina. In the center is ſituated a roundiſh germen, which afterward becomes a ſingle ſeed, incloſed in the common fleſhy receptacle. There are three ſpecies, which are natives of Spaniſh America.

Theſe plants are at preſent very rare in Europe; nor was it known what the plant was whoſe roots were imported, and had long been uſed in medicine in England, until the late Dr. Houſton informed us: for although F. Plumier had diſcovered one ſpecies of this plant, and had given the name of *Dorſtenia* to the genus, yet he ſeems not to have known that the *contrayerva* was the root of that plant. Miller's Gard. Dict.

The *contrayerva* root was firſt brought into Europe by Sir

Francis Drake, about the year 1581, and from him called *Drakena*. It is eſteemed a very great alexiterial, and a ſovereign antidote againſt poiſon.

Its juice is a violent poiſon, ſaid to be uſed by the Peruvians to poiſon their arrows. *Contrayerva* ſignifies *counter-poiſon*, becauſe the root of it is ſaid to be an antidote againſt the poiſon of its juice.

The root is ſmaller than that of the iris, reddiſh without, and white within, knotty and fibrous. To be good, it muſt be new, heavy, and of a duſky red colour. In ſmell it reſembles fig-leaves; its taſte is aromatic, accompanied with ſomewhat of acrimony. It is diaphoretic and antiſeptic, and is uſed in low nervous fevers, and in thoſe of the malignant kind.

There is an officinal compoſition, which takes its name from this root, prepared with it, mixed with the teſtaceous powders, called *lapis contrayerva*. The London college directs it to be made of the compound powder of crab's claws one pound and a half, and of *contrayerva* root five ounces, mixed and powdered. Both the root and lapis are of great efficacy in the ſmall-pox, meaſles, fevers, and in all caſes where either a diaphoreſis or perſpiration is required; its ſucceſs being much more to be depended on than the Gaſcoign's powder; which, among the more knowing, is now very much deſpiſed.

It is agreed on by the generality of writers, that the *contrayerva* root is one of the beſt anti-epidemics yet known. Dr. Hodges, in his treatiſe of the laſt London PLAGUE, has a recipe, which he ſays was attended with great ſucceſs, and of which this root was one of the chief ingredients.

There is another kind of *contrayerva* brought from Virginia, more ordinarily called SERPENTARIA: this is very aromatic; it is but ſeldom preſcribed ſingly, though ſaid to have the ſame ſucceſs againſt poiſons and venoms with the *contrayerva* of Peru. This is an excellent ſubſtitute for the *contrayerva*. See Lewis's Mat. Med. and Neumann's Chem. Works.

CONTRE-BEND, in *Heraldry*. The bar is called a *contre-bend*, or *counter-band*, becauſe it cuts the ſhield contrary, and oppoſite ways.

They alſo ſay, *contre-chevron*, *contre-pal*, &c. when there are two ordinaries of the ſame nature oppoſite to each other; ſo as colour be oppoſed to metal, and metal to colour. And the coat is ſaid to be *contre* or *counter-paled*, *counter-bended*, *counter-feſſed*, *counter-componed*, or *counter-barred*, when ſo divided.

Counter-quartered, is when one of the quarters is quartered again: hence alſo *counter-flowered*, *counter-coloured*, &c.— Animals are ſaid to be *counter-paſſant*, when one paſſes on one ſide, and another on another. See COUNTER-COMPONED, COUNTER-CHANGED, COUNTER-CHEVRONED, ERMINE, COUNTER-QUARTERED, &c.

CONTRE-*Queue d'Hironde*, in *Fortification*. See QUEUE, &c.

CONTRIBUTION, the payment of each perſon's quota, or the part he is to bear in ſome impoſition, or common expence.

Contributions are either *involuntary*, as thoſe of taxes and impoſts; or *voluntary*, as thoſe of expences for carrying on ſome undertaking for the intereſt of the community.

CONTRIBUTIONS, in a military ſenſe, are impoſitions paid by frontier countries to ſecure themſelves from being plundered, and ruined by the enemy's army.

The peaſants till their ground under the faith of *contributions*, as ſecurely as in time of profound peace.

CONTRIBUTIONE *facienda*, a writ which lies where ſeveral perſons are jointly bound to the ſame thing, and one or more of them refuſe to *contribute* their ſhare.

If tenants in common, or joint, hold a mill *pro indiviſo*, and equally ſhare the profits thereof; the mill falling to decay, and one or more of them refuſing to *contribute* to its reparation, the reſt ſhall have the writ *de contributione facienda* to compel them. And if there be three coparceners of land that owe ſuit to the lord's court, and the eldeſt performs the whole; then may ſhe have this writ to compel the refuſers to a *contribution*.

CONTRITION, in *Theology*, expreſſes a real ſorrow, reſulting from the thought of having offended God; from the ſole conſideration of his goodneſs; without any regard to the puniſhment the ſin is entitled to.

Some of the Romiſh doctors avow, notwithſtanding the practice of their church, that *contrition* is valid, and carries with it every thing neceſſary to obtain pardon, without the ceremony, or, as they call it, the *ſacrament* of confeſſion and abſolution.

And in this they make the difference between *contrition* and ATTRITION to conſiſt. This doctrine was lately maintained by F. Seguenot upon St. Auguſtine; but it was cenſured by the faculty of Paris.

CONTROL. See COMPTROL.

CONTROLLER. See COMPTROLLER.

CONTROVER, in *Law*, he who of his own head deviſes or invents falſe, or feigned news.

CONTROVERSIAL *divinity*. See POLEMICAL *divinity*.

CONTUMACY, in *Law*, a refuſal to appear in court when legally ſummoned; or a diſobedience to the rules and orders of a court having power to puniſh ſuch offence.

The word is uſed in civil, as well as criminal matters; but more rarely in the firſt, wherein the words *default*, and *contempt*, ordinarily ſupply its place: the refunding of the charges of a contempt, judged at the hearing, is alſo the penalty of *contumacy*. In a criminal ſenſe, the *contumacious* is condemned, not becauſe the crime is proved on him, but becauſe he is abſent.

By the Roman laws, there was no proceſs in caſe of *contumacy*, during the firſt year of abſence: they only took an inventory of the goods of the fugitive, and, if he died in the year, he died *integri ſtatus*; but, after the year was expired, he was deemed culpable.

In England, *contumacy* is to be proſecuted to outlawry.— In France, all *contumacies* are annulled, if the accuſed make his appearance in five years: if he die in that time, his relations are permitted to purge his memory.

CONTUS, κοντος, in *Antiquity*, a long ſpear, chiefly uſed by the horſe.

CONTUSION, *bruiſe*, in *Medicine*, a ſolution of continuity, either in fleſh or bone, occaſioned by a fall, a blow, or a violent preſſure, whereby the fleſh is damaged, but without any external rupture, or any manifeſt loſs of ſubſtance; and an effuſion of blood enſues, from ſeveral little broken veſſels, ſo as to diſcolour the ſkin, though it doth not make its way through the pores.

Or, *contuſions* may be defined a particular ſort of tumours, attended with a ſtagnation of the blood in the part affected; and generally, with an inflammation, diſcolouration, and pain.

Contuſions are either *internal*, or *external*. When from any external injury, there proceeds an internal diſorder, e. gr. an aſthma, ſpitting of blood, or the like, the *contuſion* is ſaid to be *internal*. If only external ſymptoms appear, as a tumor, blackneſs, &c. it is termed *external*.

When the ſmall veſſels and fibres have been broken by a *contuſion*, the fluids that were contained in them will be forced out, and hence will proceed obſtructions, corruptions, inflammation, and ulcers, or even a gangrene, in proportion to the violence of the cauſe, and the nature of the affected part. When a bony part is the ſubject of a *contuſion*, the ſame miſchiefs will enſue from the injury inflicted on the perioſteum, as happen to the pericranium in wounds of the head; and when the medullary juice of the bones is affected, very violent diſorders are to be expected, though the bone is not fractured. When *contuſions* happen on the joints, they uſually bring on violent pains and inflammations, convulſions, gangrenes, ſphacelus, rigidity of the limbs, and caries; and the ſame miſchiefs will indeed ſometimes happen from *contuſions* of the muſcular parts. When the internal parts are *contuſed* great miſchiefs uſually enſue; but theſe entirely depend upon the nature of the injured part: theſe are ſometimes inflammations, ruptures of the veſſels, varixes, aneuriſms, hæmorrhages, ſtagnation of the fluids, corruptions, gangrene, and ſuppuration, and very often death is the neceſſary attendant on theſe ſymptoms. When the head receives a conſiderable *contuſion*, the ſenſes are taken away, the limbs become either convulſed, or rigid, and death preſently follows. In *contuſions* of the thorax, a difficulty of breathing follows, with ſpitting of blood, fainting fits, inflammation, and ulcers of the lungs, and death. After *contuſions* of the abdomen we may expect vomitings of blood, inflammations, ſuppurations, or gangrenes of the viſcera, and at length death; but if any large internal veſſel is burſt by the blow, it is no wonder if the patient dies upon the ſpot, even though there be no mark of violence left upon the external parts. Laſtly, if the eye is *contuſed*, tumor and inflammation will ſucceed, and frequently loſs of ſight.

Theſe are the effects of violent *contuſions* on the different parts. In the cure of ſlight *contuſions* the principal care is to divide the inſpiſſated fluids, and prevent the parts from ſuppurating, or being affected by the gangrenes: this may be done by hot wine, ſpirit of wine, ſpirit of wine with camphor, or Hungary water; or by applying cold water, or vinegar mixed with ſalt, to the part; or by clapping a broad piece of money, or a plate of lead, upon the tumor, and faſtening it on with a very tight bandage: or linen rags dipped in freſh warm urine ſhould be applied to the part. Theſe different methods ſucceed very well in tumors of the foreheads of children from falls, or any other ſlight *contuſion* in perſons of a tender make.

Larger *contuſions* are to be fomented with decoctions of the warm herbs, as ſcordium, ſavin, ſouthernwood, and ſuch like, either alone, or mixed with wine, or with ſalt water; great benefit alſo ariſes from applying to the parts a ſpunge dipped in a decoction of Venice ſoap made in freſh urine, or warm applications of lime-water, ſpirit of wine camphorated, vinegar with litharge, and vinegar with carraway ſeeds boiled in it. But when the *contuſion* is ſo violent, that it is apparently impoſſible to divide the ſtagnating fluids, and return them into circulation, and the parts are tending towards a gangrene, they muſt be ſcarified without delay, and by this means the ſtagnating fluids will be let out, and all danger of ſuppuration and gangrene prevented. After ſcarification warm fomentations are to be uſed, and the tumor ſhould be well rubbed with warm cloths before it is fomented, which will keep the blood in its fluid ſtate; or, if it is already concreted, will divide it, and make it fit to return to the veſſels, or, at leaſt, to eſcape through the pores of the ſkin. Into all theſe fomentations it is very proper to put wine, or ſpirit of wine, or elſe ſome other ſpirituous liquor; but if theſe are not to be had, ſalt water is to be uſed, which, if you are not near the ſea, may be had by adding a handful of ſalt to a quart of water; attenuating decoctions muſt alſo be taken inwardly; and bleeding, eſpecially in plethoric habits, is extremely neceſſary.

It ſometimes happens, when the *contuſed* parts lie very deep, or when the ſurgeon does not uſe the proper means, or the patient refuſes to ſubmit to proper treatment, that the ſtagnating fluids will corrupt and ſuppurate. When a ſuppuration on theſe occaſions is once begun, it muſt be carried on and forwarded by emollient cataplaſms, made of mallow, marſhmallow, and white lily roots, linſeed, fenugreek ſeed, pellitory, mercury, and other herbs of that kind, with crumbs of bread, and the emollient oils of lilies, chamomile, &c. Theſe muſt be laid on the part as hot as they can be borne; and ſometimes it is neceſſary to add the warm herbs, ſuch as onions, &c. and the gums, as galbanum, ammoniacum, and the others of that kind. Sometimes, in ſmall *contuſions*, a plaſter of diachylon with the gums, without any other application, will anſwer the purpoſe.

When the whiteneſs and ſoftneſs of the tumor evidently ſhew that the matter is formed, and fit to be diſcharged, the part is to be laid open with a knife, and, after the diſcharge of the matter, muſt be healed in the common way. Large *contuſions* are frequently attended with violent inflammations and gangrenes: in this caſe numerous and deep inciſions muſt be made on the part, and the wounds dreſſed with Venice treacle, ſoftened with ſpirit of wine with camphor, applying at the ſame time externally the warm fomentations. And when the parts are, from very large and deſperate *contuſions*, abſolutely ſphacelated, the limb muſt be taken off in time.

In caſe of inward *contuſions*, bleeding the patient is always neceſſary, and balſamics muſt be given internally: ſuch are ſpermaceti, powder of rhubarb, Iriſh ſlate, oleaginous, and pectoral medicines, &c. Externals proper for *contuſions* are liniments, or ointments of marſhmallows, oil of ſweet almonds, ſpirit of wine, with camphor; proper fomentations, and ſtrengthening emplaſters, as that of oxycroceum, &c. according as the nature of the *contuſion*, and part *contuſed*, requires.

CONTUSIONS *of the cranium.* When the cranium is violently *contuſed*, it will be diſcovered by the tumor and ſoftneſs of the part, by the ſeparation of the integuments from the cranium, and by the collection of ſtagnating blood which appears to be confined under the ſkin. In this caſe you are to endeavour to divide the confined fluids, by attenuating medicines externally applied, or to diſcharge them by making an opening with a knife; or, laſtly, to bring them to ſuppuration. When the extravaſation of fluids is very conſiderable, it is beſt to diſcharge the greateſt part of them inſtantly by inciſions, and what remains will then eaſily be diſperſed, by applying fomentations, and medicated bags of the warm herbs, rue, wormwood, ſavine, ſcordium, &c. quilted into bags, and boiled in wine, or in water, with a mixture of ſpirit of wine, or malt or melaſſes ſpirit. But where it is found impracticable to divide and attenuate the ſtagnating fluids, the ſuppuration of them muſt be attempted; and if the *contuſion* hath been but ſmall, after the ſuppuration is formed, and the matter diſcharged, the wound will eaſily heal, by the application of a vulnerary balſam.

In violent *contuſions*, when there is no opening, or but a very ſmall one, the wound muſt be enlarged with the knife, to prevent the neighbouring parts from being corroded; and by this means the wound will be eaſily cleaned, and the cure performed by the method before laid down. When the pericranium is wounded, but not in ſo great a degree as to lay the cranium bare, the wound is to be dreſſed with warm balſamic medicines. But where the cranium is expoſed and laid bare, its external lamella being robbed of its nouriſhment, by the deſtruction of the veſſels by which it was conſtantly ſupplied, it will loſe its natural colour, and become yellow, livid, black, and, by degrees, ſeparate from the neighbouring parts, and exfoliate, which will greatly protract the cure of the wound. To haſten this exfoliation, the ſurgeon ought to bore ſeveral holes through the denudated part, as deep as the diploe, with an awl, or ſuch like inſtrument. This operation not only forwards the exfoliation of the part, but makes way alſo for the ſprouting up of new veſſels. The dreſſing, which ought to be repeated each time with great expedition, is to be applied in the following manner: when the wound is well cleaned, pledgits thoroughly ſaturated with the mild balſamics, with the addition of a ſmall quantity of honey of roſes, are to be laid upon the injured part of the cranium; over theſe a ſticking plaſter is to be applied; and over that the proper bolſter and bandage. Theſe applications ſhould be continued till the cranium appears ſound, and the wound in a condition to heal. Heiſter's Surg. p. 84.

CONTUSIONS *of the eye.* See EYE.

CONVALESCENCE, in *Medicine*, the inſenſible recovery of health; or that ſtate in which after the cure of a diſorder, the body which has been reduced, has not yet regained its vigour, but begins to reſume its powers. Proper aliments conduce to the re-eſtabliſhment of the languid faculties; but as the tone of the bowels is weakened, the digeſtive faculty is not equal to its office, which is ſhewn by light ſweats over the whole body; and the ſmalleſt exceſs in this reſpect, is oftentimes the occaſion of dangerous relapſes. A perſon in this ſtate is like a taper relumined, which the leaſt degree of wind is ſufficient to extinguiſh. Encycl.

CONVALLARIA, in *Botany*. See LILY *of the Valley*.

CONVENT, a MONASTERY of religious, of either ſex. The word comes from the Latin *conventus*, *meeting*, of *convenire*, *to come together*.

CONVENTA *pacta*. See PACTA.

CONVENTICLE, a diminutive of *convent*; denoting, properly, a cabal, or ſecret aſſembly, of a part of the monks of a *convent*, to make a brigue or party in the election of an abbot.

From the ill uſe of theſe aſſemblies, the word is come into diſrepute; and now ſtands for any miſchievous, ſeditious, or irregular aſſembly. F. Doucine obſerves, the occidentals always eſteemed the fifth general COUNCIL an unlawful *conventicle*. The term *conventicle* is ſaid, by ſome, to have been firſt applied in England to the ſchools of Wickliff, and has been ſince uſed to ſignify the religious aſſemblies of all in this country who do not conform to the eſtabliſhed doctrines and worſhip of the church of England.

By 22 Car. II. cap. 1. it is enacted, that if any perſons of the age of ſixteen years, ſubjects of this kingdom, ſhall be preſent at any *conventicle*, where there are five or more aſſembled, they ſhall be fined 5*s.* for the firſt offence, and 10*s.* for the ſecond; and perſons preaching incur a penalty of 20*l.* Alſo ſuffering a meeting to be held in a houſe, &c. is liable to 20*l.* penalty. Juſtices of peace have power to enter ſuch houſes, and ſeize perſons aſſembled, &c. And if they neglect their duty, they ſhall forfeit 100*l.* And if any conſtable, &c. know of ſuch meetings, and do not inform a juſtice of peace, or chief magiſtrate, &c. he ſhall forfeit 5*l.* But the 1ſt W. and M. cap. 18. ordains, that proteſtant diſſenters ſhall be exempted from penalties: though if they meet in a houſe with the doors locked, barred, or bolted, ſuch diſſenters ſhall have no benefit from 1 W. and M. Officers of the government, &c. preſent at any *conventicle*, at which there ſhall be ten perſons, if the royal family be not prayed for in expreſs words, ſhall forfeit 40*l.* and be diſabled. Stat. 10 Anne, cap. 2.

CONVENTION, in our LAW-*Books*, is uſed when a parliament is called, which ſits and is diſſolved without any act paſſed, or judgment given. It is then ſaid not to be a *ſeſſion* of parliament, but a *convention*.

CONVENTION *of Rouen*, the ſame with BURSE of Rouen.

CONVENTION, a treaty, CONTRACT, or agreement, between two or more parties.

Every *convention* between men, provided it be not contrary to honeſty, and good manners, produces a natural obligation, and makes the performance a point of conſcience. Every *convention* has either a name, and a cauſe or CONSIDERATION, or it has none: in the firſt caſe, it obliges civilly and naturally; in the latter only naturally.

CONVENTION is much uſed both in ancient and modern pleadings for an agreement, or covenant.

In the book of rolls of the manor of Hatfield in Yorkſhire, we have a record of a pleaſant *convention*, anno 11 Edw. III. between Robert de Roderham and John de Ithen; the latter of whom ſold the devil in a ſtring for three-pence halfpenny to the former, to be delivered on the fourth day after the *convention*: when, the purchaſer making his demand, the ſeller refuſed to give him livery; to the great loſs (as the record repreſents it) of forty ſhillings to the purchaſer, &c. But it appearing to the court, that ſuch a plea does not lie among Chriſtians, the parties were adjourned to hell for judgment.

Convention is alſo the name given to an extraordinary aſſembly of parliament, or of the ſtates of the realm, held without the king's writ. Of this kind was the *convention* parliament which reſtored Charles II. This parliament met above a month before his return, and ſat full ſeven months after his reſtoration, and enacted ſeveral laws ſtill in force, which were confirmed by ſtat. 13 Car. II. c. 7. and c. 14.

The *convention* of eſtates, in 1688, after the retreat of king James II. upon mature deliberation, came to a concluſion, that king James, by his practices here, and his flight hence, had abdicated the kingdom; and that the throne was vacant; and therefore devolved to king William and queen Mary. Upon this, their aſſembly expired as a *convention*, and was converted into a parliament. It is declared by ſtat. 1 W. and M. c. 1. that this *convention* formed the two houſes of parliament, notwithſtanding the want of writs and other defects of form. See Abdication.

There was a *convention* of the like kind in Scotland, and with the like effect.

CONVENTIONAL *ſubrogation*. See Subrogation.

CONVENTIONE *facienda*, in *Law*, is a writ which lies for the breach of any covenant in writing. Fitzherbert calls it a writ of *covenant*.

CONVENTUAL, ſomething belonging to a convent. See Cœnobite.

Conventual is particularly uſed, ſince the year 1250, for a religious who actually reſides in a convent; in contradiſtinction to thoſe who are only gueſts, or are entertained there, or are in poſſeſſion of benefices depending on the houſe.

Conventual likewiſe denotes a claſs of the order of Franciſcans, who adopted the relaxation introduced into that order by pope Innocent IV. which allowed of property and poſſeſſions in their community. They were ſo called in oppoſition to the *Brethren of the Obſervance*. This diviſion took place in the year 1368.

Conventual *prior*, differs from a *clauſtral prior*, in that the former has the full right and authority of an abbot; the only difference between them being in the name: whereas the clauſtral prior is a dependent of the abbot, and derives all his authority from him.

The *conventual* prior is obliged to take prieſts orders in a year, or at moſt in two years, from the day of his admiſſion: in default whereof, the benefice becomes vacant.

Some priories are actually *conventual*, i. e. they are ſtocked with religious; others are only *conventual in habitu*, v. gr. where there have been no religious during the ſpace of forty years: the continuance of one ſingle religious, keeps the priory *conventual actu*; for, in default of one, the priory becomes ſimple. See Prior.

By a declaration of the king of France, in 1680, it is decided, that a *conventuality* never degenerates, or ceaſes, while there are regular places ſubſiſting in it for twelve religious, with revenues for their ſupport.

Conventual *auditors*. See Auditor.

CONVERGING *curves*. See Curve.

Converging, or Convergent *lines*, in *Geometry*, are thoſe which continually approximate, or whoſe diſtance becomes continually leſs and leſs: in oppoſition to *divergent* lines, whoſe diſtance becomes continually greater.

Lines that *converge* one way, diverge the other.

Converging *rays*, in *Dioptrics*, are thoſe rays which in their paſſage out of one medium, into another of a different denſity, are refracted towards one another; ſo that, if far enough continued, they will meet in a point, or focus.

All convex lenſes make the rays *converge*, and concave ones diverge, i. e. the one inflects them towards a center, and the other deflects them from it; and the more, as ſuch lenſes are portions of ſmaller ſpheres. On which properties, all the effects of lenſes, microſcopes, teleſcopes, &c. depend.

Rays coming *converging* out of a denſer medium into a rarer, become more *convergent*, and concur ſooner, than if they were to continue their motion through the firſt.

Rays coming *converging* out of a rarer into a denſer medium, *converge* leſs, and concur later, than if they had continued their motion through the firſt medium.

Parallel rays, paſſing from a denſer into a rarer medium, v. gr. from glaſs into air, the ſurface of the glaſs being towards the air, will become *convergent*, and concur in a focus.

Diverging rays, or rays coming from a point, under the ſame circumſtances, become *converging*, and meet in a focus; and as the radiant point comes nearer, the focus recedes farther off: if the radiant be near, the focus will be infinitely diſtant; i. e. the rays will be parallel: and if the point be brought nearer ſtill, the rays will diverge.

Converging *ſeries*, in *Mathematics*. See Series.

CONVERSATION, Discourse, theſe two words intend an interlocution between two, or among more perſons: with this diſtinction, that *converſation* is uſed for any general intercourſe of ſentiments whatever; whereas a *diſcourſe* means a *converſation* limited to ſome particular ſubject. Thus we ſay, a *converſable* man; meaning a man able to *converſe* on variety of ſubjects, or a man of general knowlege: but we do not ſay, a *diſcourſable* man. The word *diſcourſe* is generally uſed when we mention a ſuperior talking to an inferior.

CONVERSE, in *Geometry*, &c. A propoſition is ſaid to be the *converſe* of another, when, after drawing a concluſion from ſomething firſt ſuppoſed, we proceed to ſuppoſe what had been before concluded, and to draw from it what had been ſuppoſed. Thus, it is demonſtrated in geometry, that if the two ſides of a triangle be equal, the two angles oppoſite to thoſe ſides are equal alſo: the *converſe* of the propoſition is, that if the two angles of a triangle be equal, the two ſides oppoſite to thoſe angles are equal alſo.

Converse *direction*, in *Aſtrology*, is uſed in oppoſition to *direct* direction; i. e. by the latter, the promoter is carried to the ſignificator, according to the order of the ſigns: by the former it is carried from eaſt to weſt, contrary to the order of the ſigns.

CONVERSION, in a *Moral Senſe*, a return from evil to good; reſulting from a ſenſe, either of the natural deformity of the one, and amiableneſs of the other; or of the advantages and diſadvantages that ſpring from the one, and the other, reſpectively.

Or, it is a change of the heart, with regard to the morals, paſſions, deſires, and purſuits; and of the mind, with regard to the ſentiments, &c. See Regeneration.

Conversion, in *Law*, is where a perſon having the goods of another in his poſſeſſion, converts them to his own uſe, without conſent of the owner; for which the proprietor may maintain an action of trover and *converſion* againſt him.

Conversion, *Converſio*, in *Logic*, a circumſtance or affection of propoſitions, wherein the order of the terms, or extremes, is changed; ſo that the ſubject comes into the place of the predicate, and the predicate into that of the ſubject; without any alteration in the quality of either.

As, *No virtue is vice*; *No vice is virtue*: in which we ſee the ſubject of the former, made the predicate of the latter, and the predicate the ſubject; yet both true.

Converſion is uſually defined a due change of the order of the extremes, i. e. under ſuch a habitude and coherence with reſpect to each other, that the one is rightly inferred from the other.

Hence, in every legitimate *converſion* two things are required: 1. A communication, or reciprocation of terms; not in reſpect of words, but of order. 2. The inference of one propoſition from the other.

Ariſtotle makes two kinds of *converſion*; the one *ſimple*, by others called *univerſal*; wherein nothing is changed beſide the order of extremes, i e. the terms are tranſpoſed, without altering either the quality or quantity thereof: as, *No mind is body*; *No body is mind*.

The ſecond, *per accidens*, called alſo *particular*; wherein, beſide changing the places of the terms, there is a change of an univerſal ſign into a particular one: as, *Every good man ſtudies the welfare of his country*; *Some man that ſtudies the welfare of his country is good*.

To theſe, ſome of Ariſtotle's followers add a third kind of *converſion*, called *by contrapoſition*: as, *Every man is an animal*; *Every no-animal is no-man*.

Conversion, in *Rhetoric*, &c. is underſtood of arguments which are returned, retorted, and ſhewn on oppoſite ſides, by changing the ſubject into the attribute, and the attribute into the ſubject.

There are *converſions* of arguments, from one figure to another, and alſo from general propoſitions to particular ones. Thus Cicero againſt Antony: *Doletis tres exercitus P. R. interfectos? Interfecit Antonius. Deſideratis clariſſimos cives? Eoſque vobis eripuit Antonius. Auctoritas hujus ordinis afflicta eſt? Afflixit Antonius.*

Conversion, in *War*, is when the ſoldiers are ordered to preſent their arms to the enemy who attack them in flank, whereas they were before ſuppoſed to be in front: the evolution neceſſary thereto is called *converſion*, or quarter-wheeling.

Conversion *of equations*, in *Algebra*, is when the quantity ſought, or any part thereof, being in fractions, the whole is reduced to one common denomination; and then, omitting the denominators, the equation is continued in the numerators only.

Thus, ſuppoſe $a-b=\frac{aa+cc}{d}+b+b$; multiply all by d, and it will ſtand thus, $da-db=aa+cc+db+db$.

In *Arithmetic*, we uſe the term *proportion by converſion of ratio*, for a compariſon of the antecedent, and conſequent, in two equal ratios.

Thus, as there is the ſame ratio between two and three, as between eight and twelve; it is concluded there is the ſame ratio between two and one, as between eight and four.

CONVERSION, *center of*, in *Mechanics*. See CENTER.

CONVERSOS. See CONVERT.

CONVERT, a perſon who has undergone a CONVERSION.

CONVERT is chiefly uſed in reſpect of changes from one religion, or religious ſect, to another.

Converts with relation to the religion turned to, are denominated *apoſtates* with regard to that they have relinquiſhed.

The Jews formerly converted to Chriſtianity in England, were called *converſos*. Henry III. built them a houſe in London, and allowed them a competent ſubſiſtence for their lives; which houſe was called *domus converſorum*. But the number afterwards increaſing, they grew a burden to the crown; upon which they were diſtributed among the monaſteries: and after the expulſion of the Jews under Edward III. the *domus converſorum* was given for keeping of the rolls.

CONVERTS, in a *Monaſtic Senſe*, are lay-friars, or brothers, admitted for the ſervice of the houſe; without orders, and not allowed to ſing in the choir.

Till the eleventh century, the word was uſed for perſons who embraced the monkiſh life at the age of diſcretion; by which they were diſtinguiſhed from thoſe devoted in their childhood by their parents, called *oblati*.

But in the eleventh century, when they began to receive into monaſteries illiterate perſons, incapable of being clerks, and only deſtined for bodily labour; the ſignification of the word was neceſſarily changed. F. Mabillon obſerves, that it was John firſt abbot of Vallombroſa, who firſt introduced theſe *brother-converts*, diſtinguiſhed by their ſtate from the monks of the choir, who were then either clerks, or capable of becoming ſo.

CONVERTIBILITY *of ſpirits* into one another. See SPIRITS.

CONVERTIBILITY *of elements* into one another. See ELEMENTS.

CONVEX, bending down on every ſide, as the outſide of a globular body.

CONVEX *freeze, lens, mirrour, ſuperficies*. See FREEZE, LENS, MIRROUR, SUPERFICIES.

CONVEXITY, the exterior ſurface of a *convex*, i. e. gibbous and globular thing; in oppoſition to *concavity*, or the inner ſurface, when hollow or depreſſed.

The word is of particular import in catoptrics, and dioptrics; where it is applied to mirrors and lenſes.

A *convex* MIRROR repreſents its images ſmaller than the objects; as a concave one repreſents them larger: a *convex* mirrour reflects the rays from it, diverging; and therefore diſperſes and weakens their effect: as a concave one reflects them converging, ſo as they concur in a point, and have their effect increaſed: and by how much the mirrour is a portion of a ſmaller ſphere, by ſo much does it diminiſh the objects, and diſperſe the rays, the more.

A *convex* LENS is either *convex* on both ſides, called a *convexo-convex*; or it is plain on one ſide, and *convex* on the other, called a *plano-convex*: or concave on one ſide, and *convex* on the other, called a *convexo-concave*, or *concavo-convex*, as the one or the other ſurface prevails; i. e. as this or that is a portion of a ſmaller ſphere. See REFRACTION.

CONVEYANCE, in *Law*, a DEED, or inſtrument, by which lands, &c. are *conveyed*, or transferred by the proprietor, or owner thereof, to ſome other perſon.

A *conveyance* cannot be fraudulent in part, and good as to the reſt: for if it be fraudulent and void in part, it is void in all; and it cannot be divided. 1 Lill. Abr. 311.

Fraudulent *conveyances* to deceive creditors, defraud purchaſers, &c. are void, by ſtat. 50 Edw. III. c. 6. 13 Eliz. c. 5. 27 Eliz. c. 4.

Conveyances are ſuch either at common law, or by virtue of the ſtatute of uſes. Of the former ſort ſome are original or primary, which are thoſe by means whereof the benefit or eſtate is created or firſt ariſes: others are ſecondary, or DERIVATIVE. Original *conveyances* are thoſe by *feoffment*, *grant*, *leaſe*, *exchange*, and *partition*.

CONVICT, in *Common Law*, one who is found guilty of an offence, by the verdict of a jury.

According to Crompton, a perſon is alſo a *convict*, or ſaid to be *convicted*, when, after having been outlawed, he appears and confeſſes. *Conviction* and ATTAINDER are frequently confounded.

Perſons *convicted* of felony by verdict, &c. are not to be admitted to bail, unleſs there be ſome ſpecial motive for granting it; as where a man is not the ſame perſon, &c. for bail ought to be before trial, when it ſtands indifferent whether the party be guilty or not. 2 Hawk. 99. 114. *Conviction* of felony, and other crimes, diſables a man to be a juror, witneſs, &c.

CONVICT *recuſant*, he who has been legally preſented, indicted, and *convicted*, for refuſing to come to church to hear the common prayer, according to the ſtatutes 35 Eliz. and 3 Jac. I.

This is commonly underſtood to be a popiſh recuſant; though any others who refuſe coming to church on the ſame account are as properly denominated RECUSANTS.

CONVICTION, in *Theology*, expreſſes the firſt degree of repentance; wherein the ſinner becomes ſenſible of his guilt, of the evil nature of ſin, and of the danger of his own ways

CONVICTION, in *Law*. See CONVICT.

CONVICTION, *ſummary*, is ſuch as is directed by ſeveral acts of parliament for inflicting certain penalties created by thoſe acts, without the intervention of a jury: the party accuſed being acquitted or condemned by the ſuffrage of ſuch perſon only, as the ſtatute has appointed to be his judge. Of this kind are all trials of offences contrary to the laws of exciſe, and other branches of the revenue, proceedings before juſtices of the peace, and the method uſed by ſuperior courts of juſtice for puniſhing contempt by ATTACHMENT.

CONVIVIUM, *banquet*, in our *Ancient Cuſtoms*, and *Law Books*, ſignifies the ſame thing among the laity as PROCURATION among the clergy; viz. when the tenant was obliged, in virtue of his tenure, to provide meat and drink for his lord once, or oftener, in the year.

CONULUS, in *Natural Hiſtory*, the name of a genus of the *echinodermata*, of the general claſs of the *fibulæ*. Theſe are raiſed from a circular baſe into a taller and more pointed or a ſhorter and more obtuſe cone. The *echinitæ* of this genus have been called by authors *ſcolopendritæ*, *pileæ*, and by ſome *bufonitæ*; and are generally known in Engliſh by the name of cap-ſtones. Of theſe there are four ſpecies: 1. The *albogalerus*, or white-hat ſtone, found foſſile in our chalk-pits. 2. The *gibbulus*. 3. The *nodus*, the ſeries of the lines of which are flexuous, and make the ſuperficies ſomewhat gibboſe. 4. The *bulla*, the orders of lines in which are ſtrait, and reſemble a button. Klein's Echinod.

CONVOCATION, a general aſſembly of the clergy of a province, ſummoned by the king's writ to conſult of the more weighty affairs of the church, as oft as a parliament is convoked to conſult of thoſe of the ſtate.

The king's writ is directed to the archbiſhop of each province, requiring him to ſummon all biſhops, deans, archdeacons, cathedral and collegiate churches, &c.

Upon which, the archbiſhop directs his mandate to his dean provincial, firſt citing him peremptorily; then willing him, in like manner, to cite all the biſhops, deans, &c. and all the clergy of his province; but directing, withal, that one proctor ſent for each cathedral and collegiate church, and two for the body of the inferior clergy of each dioceſe, may ſuffice: which the dean accordingly does.

The place where the *convocation* of the province of Canterbury has been uſually held, is St. Paul's church; whence, of late, they have been prorogued to St. Peter's in Weſtminſter, in the chapel of Henry VII. or the Jeruſalem Chamber, where there is an upper and lower houſe. Chamberlayne.

The *upper* houſe, in the province of Canterbury, conſiſts of twenty-two biſhops, whereof the archbiſhop is always preſident. All, at the opening of a *convocation*, are in their ſcarlet robes and hoods.

The *lower* houſe conſiſts of twenty-two deans, twenty-four prebendaries, fifty-four archdeacons, and forty-four clerks, repreſenting the dioceſan clergy.

Each houſe hath a prolocutor choſen from among themſelves; and that of the lower houſe is preſented to the biſhops. Things are firſt uſually propoſed in the upper houſe; then communicated to the lower. All the members of both houſes have the ſame privileges for themſelves, and menial ſervants, as the members of parliament have.

The *convocation* exerciſes juriſdiction in making canons with the king's aſſent; and appeal lies from their proceedings to the king in chancery, or to his delegates.

The archbiſhop of York, at the ſame time, holds a *convocation* of the clergy of his province, after the like manner, at York; and, by conſtant correſpondence, debates and concludes of the ſame matters as are debated by that of Canterbury. Not that the northern province is obliged to follow what the ſouthern one does.

The Engliſh clergy, anciently, had their repreſentatives in the lower houſe of parliament; as appears by the record much prized by lord Coke.

CONVOLVULUS, *bindweed*, in *Botany*; a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath one large bell-ſhaped petal, which ſpreads open. It hath five ſhort ſtamina, and a roundiſh germen. The empalement afterward becomes a roundiſh capſule, with one, two, or three valves, containing ſeveral ſeeds, which are convex on their outſides, but on their inſides angular. There are thirty-two ſpecies, natives of various parts of the world. Miller. See *Tab.* III. *of Botany, Claſs* 1.

To this genus belong ſcammony, mechoacan, jalap, and turbith.

As to the bindweeds properly ſo called, they are cathartic, and ſaid to be good in preventing abortion; a decoction of them is recommended as a mild evacuant of bile.

Convolvulus, *ſcarlet*; *quamoclit*, or *ipomœa*; in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath a ſmall permanent empalement, cut into five parts at the top. The petal is funnel-ſhaped, having a long cylindrical tube, whoſe brim is five-pointed, ſpreading open flat. It hath five awl-ſhaped ſtamina. In the bottom of the tube is ſituated a round germen, which afterward becomes a roundiſh capſule with three cells, incloſing three oblong ſeeds. There are eight ſpecies. Miller.

CONVOLUTION, a winding or turning motion, proper to the trunks of ſome plants; as the *convolvulæ*, or bindweeds, and the claſpers of vines, and briony.

Dr. Grew thinks, that all thoſe plants whoſe roots are twiſted, have ſuch a *convolution*: and he aſſigns two great efficient cauſes of this winding motion, the ſun and the moon. It is very eaſy to try whether there be any ſuch *convolution* or not in the trunks of plants; which may be done, as he hints, by tying a little bit of paper to any of the branches which are exactly north, ſouth, &c. and then ſeeing whether it will change its poſition, or not, in reſpect of the point of the compaſs.

CONVOY, from the French *convoyer*, *to conduct*; *eſcort*; a ſea term, ſignifying one or more veſſels of war, entruſted with the conducting of a fleet of merchants; ſerving as a watch, and a ſhelter from the inſults of the enemies of the ſtate, or of pirates.

Convoy is alſo uſed in ſpeaking of military affairs by land; where it ſignifies a body of forces ſent to guard a ſupply of proviſions, arms, or ammunition, going to a camp, or the like.

CONUSANCE. See Cognisance.

CONUSOR. See Cognisor.

CONVULSION, from *convello*, *to draw together*; *ſpaſmus*; in *Medicine*, a continued involuntary contraction of ſome parts of the body, otherwiſe accuſtomed to move according to the direction of the will.

It owes its origin to a contraction of the muſcles of the part, occaſioned by a too copious and violent influx of the nervous juice: of which there may be infinite cauſes in the blood, arteries, meninges, brain, nerves, muſcles, cranium, &c.

If the *convulſion* be univerſal, attended with violent motions, foaming at the mouth, and periodical; it is uſually called an epilepsy.

The uſual evacuations and medicines proper for the cure of *convulſions*, are phlebotomy, emetics, cathartics, epiſpaſtics, and proper cephalics; as *ſal volat. oleoſ.* ſpirit of lavender, ſpirit of hartſhorn, tincture of caſtor, cinnabar of antimony, caſſumanar root, valerian root, volatile ſalt of amber, &c. given in different forms. In periodical univerſal *convulſions*, a ſalivation ſometimes anſwers, after other courſes have failed. Women and children are particularly liable to *convulſions*: women after delivery; as upon a ſtoppage of the *lochia*, or a violent extraction of the *placenta*. See Infants, and Spasm.

CONVULSIVE, in *Medicine*, is applied to thoſe motions, which, naturally, ſhould depend on the will; but which, by ſome external cauſe, become involuntary.

A *convulſive* motion is a contraction made by fits and intervals; wherein it differs from a *convulſion*, which is a continued contraction.

Convulſive motions ariſe from a diſorder in the origin of the nerves. A *convulſive* tenſion of the ſolids is one of the principal cauſes which deſtroy the equilibrium that ſhould obtain between the ſolids and the fluids.

Convulsive is alſo uſed for any thing that occaſions a *convulſion*, or *convulſive motion*.

Wounds of nerves are ſaid to be *convulſive*; white hellebore is *convulſive*. Children are very liable to *convulſive* diſorders from various cauſes; as repletion, curdling of the blood in the ſtomach or inteſtines, worms, dentition, &c. The cramp is a *convulſive* contraction of ſome muſcular part of the body.

Convulsive *aſthma*. See Asthma.

CONYZA, in *Botany*. See Fleabane.

COOK, in *Ichthyology*, a ſpecies of fiſh, which is ſometimes taken in great plenty on the coaſts of Cornwall. It is a ſcaly fiſh, and does not grow to any great ſize: the back is purple, the belly yellow, and the tail rounded.

Cook-room, in a *Ship*, is where the cook and his mate dreſs and deliver out the meat, &c. See *Tab. Shipping*, *fig.* 2. *n.* 32.

COOLER, among *Brewers*, *Diſtillers*, *&c.* a large veſſel, uſually of ſmall depth and large ſurface, in which liquors are cooled, after having been boiled.

Coolers, in *Medicine*, remedies ſo called: which may be conſidered under theſe two diviſions: 1. Thoſe which produce an immediate ſenſe of cold; which are ſuch as have their parts in leſs motion than thoſe of the organs of feeling. 2. Such as by a particular viſcidity, or groſſneſs of parts, give a greater conſiſtency to the animal fluids than they had before; whereby they are diſabled from moving ſo faſt, and will therefore have leſs of that inteſtine force on which their heat depends.

Of the former kind are fruits, and all acid liquors. To the latter belong cucumbers, and all ſubſtances producing viſcidity.

COOLNESS, in *Painting*, is a quality of colours relating only to their teint or hue: it is uſually applied to yellow and blue, and denotes a tendency to green, in either colour, by a ſlight admixture of the other. See Warmth.

COOM, a term for ſoot that gathers over an oven's mouth: alſo for that black greaſy ſubſtance which works out of the wheels of carriages.

Coom, or ſoot, is ſometimes uſed in medicine, infuſed in wine with other ingredients, as an anti-hyſteric, and againſt palpitations of the heart, &c. The ſpirit of ſoot is alſo uſed for the ſame intentions, and in cephalic caſes.

COOMB, or Comb *of corn*. See Comb.

COOMINGS, in *Naval Architecture*. See Coamings.

COOP, in *Huſbandry*, a tumbrel or cart encloſed with boards, and uſed to carry dung, grains, &c.

Coop is alſo the name of a pen, or encloſed place, where lambs, poultry, &c. are ſhut up in order to be fed.

COOPER, on board a *Ship*, the perſon that looks to the caſks, and all other veſſels, for beer, water, or any other liquor. He has a mate under him.

CO-OPERATOR, derived from *con*, and *opera*, *labour*, denotes any cauſe, natural or ſupernatural, which concurs with another to the production of an effect. Thus, nature and medicine *co-operate* in the cure of diſorders: and the will of man concurs with the grace of God in the performance of good works.

CO-OPERIRE *pallio*. See Pallio.

CO-OPTATION, derived from *co-opto*, *I chooſe*; ſignifies the admiſſion of members into any college or ſociety. Thus it was anciently applied to the choice of the augurs and pontiffs; and in modern times, to an extraordinary nomination and election of perſons of diſtinguiſhed merit into a learned ſociety.

CO-ORDINATE, ſomething of equal order, rank, or degree, with another.

CO-ORDINATION, in reſpect of cauſes, denotes an order of cauſes, wherein ſeveral of the ſame kind, order, and tendency, concur to the production of the ſame effect.

COOT, *fulica*, in *Zoology*, the name of a diſtinct genus of birds of the order of the *grallæ*, the diſtinguiſhing character of which is, that the beak is convex, the thighs are half naked, the noſtrils oblong, and the forehead wholly naked.

The *fulica* is a water-fowl diſtinguiſhed from the moorhen kind, by having its toes widened by a membrane, though not joined together by it, or webbed like the ducks. Of this there are ſeveral ſpecies; thoſe moſt known with us are, the common *coot*, and a larger kind called *macroule*, or *diable de mer*, the ſea-devil.

The common *coot* is a conſiderably large bird, weighing uſually a pound and half; its beak is of a bluiſh white, and is a finger's breadth and half long, ſomewhat flatted and ſharp at the point; its legs are of a yellowiſh green, and above the knee there is a yellow ſpot; it has ſemicircular membranes at the joints of its toes: but what is its moſt obvious diſtinction is, that it has from the beak to the crown of the head, a fleſhy excreſcence, which is roundiſh, ſoft, and ſmooth, and is always naked or deſtitute of feathers; and hence the bird is commonly called with us, the bald *coot*. It is all over black above, but of a deeper black about the head than in any other part, and its breaſt and belly are of a ſort of lead-colour; its wing-feathers have a brownneſs, mixed among the black, and ſome of them are tipped with white.

The other ſpecies, or *macroule*, called by Bellonius, the *fulica major*, is larger and of a finer black than this, and has a larger white excreſcence on its head.

The common *coot* is ſo plentiful about Peterborough in Northamptonſhire, that in the ſeaſon of its laying, whole hampers full of its eggs are there brought to market, and ſold at an inconſiderable price; the people boil them, and the ſhell is ſo thin, that they often eat them without taking it off. Ray.

COPAIBA, Copaifera, in *Botany*, the balſam of capivi-tree, a genus of the *decandria monogynia* claſs. Its characters are theſe: it hath a flower conſiſting of five leaves, which expands in form of a roſe, and has five ſhort ſtamina. The germen is fixed in the center of the flower, which afterward becomes a pod containing one or two ſeeds, which are ſurrounded with a pulp of a yellow colour. We know but one ſort of this tree; which grows near a village called Ayapel, in the province of Antiochi, in the Spaniſh Weſt Indies, about ten days journey from Carthagena. There are great numbers of theſe trees in the woods about this village, which grow to the height of fifty or ſixty feet. Some of theſe trees do not yield any of the balſam; thoſe which do, are diſtinguiſhed by a ridge which runs along their trunks. Theſe trees are wounded in their center, and they place calabaſh ſhells, or ſome other veſſels to the wounded part to receive the balſam, which will all flow out in a ſhort time. One of theſe trees will yield five or ſix gallons of balſam: but though they will thrive well after being tapped, yet they never afford any more balſam. Miller.

COPAL, in *Natural Hiſtory*, a ſhining, tranſparent, citron-coloured ſubſtance, of an agreeable ſmell, reſembling that of frankincenſe. It is brought from New Spain, where it ouſes out from inciſions made in the bark of a large tree; much after the manner in which the vine yields its ſap, when cut in the ſpring.

Copal is accounted a cephalic, and good for the palſy, and other weakneſſes of the nerves; but is not much uſed. What we in England call *gum copal*, is called *gum anime* in foreign parts; and on the contrary, what is there called *gum anime*, we call *copal*.

The Indians uſe it to burn on their altars: among the Europeans, it is uſed againſt diſorders of the breaſt, having a warming, reſolving, and humectating power. It is very rare; when good, it is of a fine tranſparent yellow; and melts eaſily, either in the mouth, or on the fire.

In defect of this is brought another kind from the Antilles, which is almoſt the only one known among the druggiſts; and its chief conſumption is in the making of varniſh. By digeſtion in linſeed oil, with a heat very little leſs than ſufficient to boil or decompoſe the oil, it may be diſſolved; and this ſolution, diluted with ſpirit of turpentine, forms a beautiful tranſparent VARNISH, which, when well applied and ſlowly dried, becomes very hard and durable. This varniſh is uſed for ſnuff-boxes, tea-boards, and other utenſils. It preſerves and gives luſtre to paintings, and reſtores the decayed colours of old pictures, by filling up the cracks, and rendering the ſurfaces capable of reflecting light more uniformly. It is improperly called *gum copal*, being a hard concrete juice of an American tree, which has neither the ſolubility in water common to GUMS, nor the ſolubility of ſpirit of wine common to RESINS, at leaſt in any conſiderable degree; by its properties it reſembles AMBER.

COPARCENARY, the ſhare, or quota of a COPARCENER.

COPARCENERS, from *con.* and *particens*, *partner*; or Parceners; ſuch as have equal portions in the inheritance of their anceſtor.

Coparceners are ſo either by *law*, or *cuſtom*. *Coparceners by law*, are the iſſue female; which, in default of a male heir, come equally to the lands of their anceſtor.

Coparceners by cuſtom, are thoſe who, by ſome peculiar cuſtom of the country, challenge equal parts in ſuch lands; as in Kent, by the cuſtom of gavelkind. The crown of England is not ſubject to *coparcenary*.

COPE, an eccleſiaſtical ornament, uſually worn by chantors and ſub-chantors, when they officiate in the church-ſolemnity. It is alſo worn by the Romiſh biſhops, and other ordinaries: it reaches from the ſhoulders to the feet. The ancients called it *pluviale*.

Cope, *St. Martin's*, was a relic formerly in great eſteem among the French kings; and was often carried with them to war as their ſtandard.

Cope, among *Miners*, is a duty of ſix pence for every load of ore, nine diſhes making one load.

COPEC, a Muſcovite coin. See Coin.

COPERNICAN *ſphere*. See Sphere.

Copernican *ſyſtem*, is that ſyſtem of the world, wherein the ſun is ſuppoſed at reſt in the center; and the planets with the earth, to move in ellipſes round him.

The heavens and ſtars are here ſuppoſed at reſt; and that diurnal motion which they appear to have from eaſt to weſt, is imputed to the earth's motion from weſt to eaſt.

This ſyſtem was aſſerted by many of the ancients; and particularly Ecphantus, Seleucus, Ariſtarchus, Philolaus, Cleanthes Samius, Nicetas, Heraclides Ponticus, Plato, and Pythagoras; from the laſt of whom it was anciently denominated the *Pythagoric ſyſtem*.

It was alſo held by Archimedes, in his book De Granorum Arenæ Numero; but after him it became neglected, and even forgotten, for many ages; till about three hundred years ago, when Copernicus revived it; from whom it took the new name of the *Copernican ſyſtem*.

Nic. Copernicus, now a name ſo popular, was born at Thorn, in Poliſh Pruſſia, in the year 1472, according to Junctinus, or 1473, according to Mœſtlinus. After the uſual domeſtic education, he was ſent to the univerſity of Cracow; where he applied himſelf to philoſophy and phyſic, and at length commenced doctor in medicine. In the mean time, having a ſtrong propenſity to mathematics, he diligently attended the lectures of Albert Brudzevius, and even learnt of him at home. After he had here attained to the uſe of the aſtrolabe, and was entering upon aſtronomy, he took Regiomontanus for his guide: though he ran through all the mathematics of the age, yet he ſeemed moſt taken with perſpective; on occaſion whereof he learned painting, in which he is ſaid to have excelled. When twenty-three years of age, being at Bologna, he became acquainted with that eminent mathematician Dom. Maria Ferrarienſis; and was admitted to ſhare with him in making aſtronomical obſervations. Here, in the year 1497, Copernicus firſt obſerved an occultation of Palilitium by the moon. Going on to Rome, he taught publicly, and made ſome conſiderable obſervations; and at his return to Cracow, he was made canon of the church of Wermelant, or Ermeland, and at length vicar-general.

The courſe he took in proſecuting aſtronomy, which has rendered his name immortal, was as follows. Obſerving how the aſtronomers of thoſe times were perplexed to make the planets move equably in circular orbits, viz. to ſuppoſe them to move, not about their own center, but that of the equant; and that they could no way make out a tolerably regular ſyſtem, out of all their hypotheſes; he reſolved to try what he could do. With this view he peruſed the writings of all the philoſophers and aſtronomers extant; and ſelected out of each what appeared probable and elegant. In this review he was chiefly taken with two almoſt ſimilar opinions (the one attributed to Martianus Capella, the other to Apollonius Pergæus): which give a very good account of the motions of Venus and Mercury; and explain the cauſe of their directions, ſtations, and retrogradations, very happily: the latter anſwering the ſame purpoſe with reſpect to the three ſuperior planets. But then, in both theſe hypotheſes, the earth is ſuppoſed the center: Copernicus choſe rather to adopt the opinion of the Pythagoreans; to remove the earth out of the center of the world; and to give it, not only a diurnal motion round its own axis, but alſo an annual one round the ſun.

On this footing he began to obſerve, calculate, compare, &c. and at length, after a long, ſolicitous diſquiſition, found himſelf in a condition to account for the phenomena and motions of all the planets; and to make an orderly arrangement, or diſpoſition of the whole heavens; wherein nothing could be altered, or diſplaced, without bringing the utmoſt confuſion into the whole.

Theſe things he began to write down about the year 1507. He then proceeded to furniſh himſelf with ſome new apparatus; particularly a parallactic inſtrument, and ſome Ptolemaic rulers, wherewith to obſerve the altitude of the ſtars, and determine the periods of the ſun and moon: and without other means, compoſed his ſix books De Orbium Cœleſtium Revolutionibus; containing the whole of aſtronomy, delivered after the example of Ptolemy, in a geometrical method. We have already obſerved, that he began it in 1507; he finiſhed it in 1530. Five years after, he poliſhed and improved it. He died of a dyſentery, and a palſy on his right ſide, in the year 1543; having juſt lived to ſee a copy of his book, which was juſt printed, a few hours before his death. See the order and diſpoſition of the heavenly bodies, as laid down by him, compared with thoſe in the other ſyſtems, under the head System.

This ſyſtem has been eſtabliſhed by new arguments advanced, by Kepler, Galileo, and Newton, in every ſucceeding age; and notwithſtanding the oppoſition it met with, from the prejudices of ſenſe againſt the earth's motion, the authority of Ariſtotle in the ſchools, the threats of ignorant bigots, and the terror of the inquiſition, it has generally prevailed. Galileo, after having demonſtrated the motion of the earth, was obliged, by the rancour of the Jeſuits, to go to Rome, and there ſolemnly renounce it. Beſides which cruel treatment, he was condemned to a year's impriſonment in the inquiſition, and the penance of repeating daily ſome penitential pſalms. As a ſpecimen of the authority of the Romiſh church in oppoſition to this ſyſtem, we ſhall only tranſcribe the declaration of the excellent commentators, Le Seur and Jacquier, on the Principia, prefixed to the third volume. *Newtonus in hoc tertio libro telluris motæ hypotheſim aſſumit. Autoris propoſitiones aliter explicari non poterant, niſi eâdem quoque factâ hypotheſi. Hinc alienam coacti ſumus gerere perſonam. Cæterum latis a ſummis pontificibus contra telluris motum decretis nos obſequi profitemur.*

COPERNICUS, is the name of an aſtronomical inſtrument, contrived, by Mr. Whiſton, for the calculation and exhibition of eclipſes, and of the motions of the planets, both the primary and ſecondary ones, &c.

It was ſo called by the inventor, as being built on the Copernican ſyſtem; or as repreſenting the heavenly bodies agreeable thereto. It conſiſts of ſeveral concentrical circles of wood; upon which are inſcribed numbers, transferred hither from the aſtronomical tables: by the various diſpoſitions of theſe circles, which are made ſo as to ſlide within each other, queſtions are ſolved; and thus long calculations are ſaved, and the work of many hours brought into a few minutes.

For the exhibition of eclipſes, there is a peculiar apparatus, conſiſting of a terreſtrial globe, ſo diſpoſed, as that, being turned round its axis, the light of the ſun, or a candle, is projected through a glaſs plane, marked out into concentric circles, expreſſing digits of the eclipſe: and thus is the path of the eclipſe, with its degree or quantity in any part of its path, agreeably and accurately repreſented.

The inſtrument not being very common, a particular deſcription would be ſuperfluous. The author of it has written a book to explain it.

COPHOSIS, in *Medical Writers*, is uſed for deafneſs, whether beginning, or perfect, or from what cauſe ſoever.

The word is derived from κοφεω, *I am deaf*.

COPHTI, Cophts, or Copti, a name given to the Chriſtians of Egypt; who are of the ſect of Jacobites.

The critics are extremely divided about the origin and orthography of the word: ſome write it *Gophti*, others *Cophtites*, *Cophtitæ*, *Copts*, &c. Scaliger derives the name from *Coptos*, an anciently celebrated town of Egypt, the metropolis of the Thebaid. Kircher refutes this opinion, and maintains, that the word originally ſignifies *cut*, and *circumſcribed*; and was given theſe people by the Mahometans, by way of reproach, becauſe of their practice of circumciſing: but P. Sollier, another Jeſuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from Αιγυπτος, the ancient name of Egypt, by retrenching the firſt ſyllable: but this opinion, too, P. Sollier diſputes. John de Leo and others ſay, that the Egyptians anciently called their country *Elchibith*, or *Cibth*, from Cibth their firſt king, whence *Cophtite*, &c. others ſay from Cobtim ſecond king of Egypt. Vanſleb derives the word *Copht* from Copt ſon of Miſraim, grandſon of Noah. All theſe etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophti*; whereas, in effect, none but the Chriſtians, and among thoſe none but the Jacobites, bear the name; the Melchites not being comprehended under it. Hence he chooſes to derive the word from the name *Jacobite*, by retrenching the firſt ſyllable; whence *Cobite*, *Cobea*, *Copta*, and *Cophta*.

The *Cophts* have a patriarch, who reſides at Cairo, but he takes his title from Alexandria: he has no archbiſhop under him, but eleven or twelve biſhops. The reſt of the clergy, whether ſecular or regular, is compoſed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monaſteries.

Beſides the orders of prieſts, deacons, and ſubdeacons, the *Cophts* have likewiſe archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a ſtrict ordination. This makes a conſiderable difference among the prieſts; and beſides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of archprieſts. By a cuſtom of ſix hundred years ſtanding, if a prieſt elected biſhop be not already archimandrite, that dignity muſt be conferred on him before epiſcopal ordination.

The ſecond perſon among the clergy, after the patriarch, is the titular patriarch of Jeruſalem, who alſo reſides at Cairo, becauſe of the few *Cophts* at Jeruſalem; he is, in effect, little more than the biſhop of Cairo: only he goes to Jeruſalem every Eaſter, and viſits ſome other places in Paleſtine near Egypt, which own his juriſdiction. To him belongs the government of the *Cophtic* church, during the vacancy of the patriarchal ſee.

To be elected patriarch, it is neceſſary the perſon have lived all his life in continence: it is he confers the biſhopricks. To be elected biſhop, the perſon muſt be in the celibate; or, if he have been married, it muſt not be above once.

The prieſts and inferior miniſters are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneouſly obſerves. They have a great number of deacons, and even confer the dignity frequently on children. None but the loweſt rank among the people commence eccleſiaſtics; whence ariſes that exceſſive ignorance found among them: yet the reſpect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occaſionally.

The monaſtic life is in great eſteem among the *Cophts*: to be admitted into it, there is always required the conſent of the biſhop. The religious *Cophts* make a vow of perpetual chaſtity; renounce the world, and live with great auſterity in deſerts: they are obliged to ſleep in their cloaths and their girdle, on a mat ſtretched on the ground; and to proſtrate themſelves every evening a hundred and fifty times, with their face and breaſt on the ground. They are all, both men and women, of the loweſt claſs of the people; and live on alms. The nunneries are properly hoſpitals; and few enter but widows reduced to beggary.

F. Roderic reduces the errors and opinions of the *Cophts* to the following heads: 1. That they put away their wives, and eſpouſe others while the firſt are living. 2. That they have ſeven ſacraments; viz. baptiſm, the euchariſt, confirmation, ordination, faith, faſting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œcumenical councils; that of Nice, Conſtantinople, and Epheſus. 5. That they only allow of one nature, will, and operation, in Jeſus Chriſt, after the union of the humanity with the divinity. For their errors in diſcipline, they may be reduced, 1. To the practice of circumciſing their children before baptiſm, which has obtained among them from the twelfth century. 2. To their ordaining deacons at five years of age. 3. To their allowing of marriage in the ſecond degree. 4. To their forbearing to eat blood: to which ſome add their belief of a baptiſm by fire, which they confer by applying a hot iron to their forehead or cheeks.

Others palliate theſe errors, and ſhew that many of them are rather abuſes of particular perſons, than doctrines of the ſect. This ſeems to be the caſe with regard to their polygamy, eating of blood, marrying in the ſecond degree, and the baptiſm of fire: for circumciſion, it is not practiſed as a ceremony of religion; nor as of any divine appointment, but merely as a cuſtom which they derive from the Iſhmaelites; and which, perhaps, may have had its origin from a view to health and decency in thoſe hot countries.

The *Cophts*, at different times, have made ſeveral reunions with the Latins; but always in appearance only, and under ſome neceſſity of their affairs. In the time of pope Paul IV. a Syrian was diſpatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he acknowleged his authority, and promiſed obedience; deſiring a perſon might be diſpatched to Alexandria, to treat about a re-union of his church to that of Rome: purſuant to which, Pius IV. ſucceſſor to Paul, choſe F. Roderic, a Jeſuit, whom he diſpatched in 1561, in quality of apoſtolical nuntio.

But the Jeſuit, upon a conference with two *Cophts* deputed for that purpoſe by the patriarch, was made to know, that the titles of *father of fathers*, *paſtor of paſtors*, and *maſter of all churches*, which the patriarch had beſtowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch uſed to write to his friends: they added, that ſince the council of Chalcedon, and the eſtabliſhment of ſeveral patriarchs independent of one another, each was chief and maſter of his own church. This was the anſwer the patriarch gave the pope, after he had received a ſum of money remitted to him from Rome, by the hands of the Venetian conſul.

COPHTIC, or Coptic, the language of the Cophts, the ancient language of the Egyptians, mixed with a great deal of Greek; the characters it is written in being all Greek. It has a form and conſtruction peculiar to itſelf: it has no inflections of the nouns or verbs; but expreſſes number, caſe, gender, perſon, mood, tenſe, and poſſeſſive pronouns, by letters and particles prefixed.

F. Kircher is the firſt who publiſhed a grammar, and vocabularly of the *Cophtic*. There is not known any book extant in the *Cophtic*, except tranſlations of the Holy Scriptures, or of eccleſiaſtical offices; or others that have relation thereto, as dictionaries, &c.

The ancient *Cophtic* is now no longer found but in books; the language now uſed throughout the country is Arabic.

The old *Cophtic*, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek: for beſides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek.

Voſſius, indeed, aſſerts, that there was no *Cophtic* language till after Egypt became ſubject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were maſters of the country. But this, M. Simon obſerves, proves nothing; except that what was anciently called *Egyptian*, has ſince by the Arabs been called *Cophtic*, by a corruption of ſpeech. There are, it is true, Arabic words in the *Cophtic*; yet this by no means proves but that there was a language before that time, either *Cophtic* or Egyptian. Pietro de la Valle obſerves, that the Cophts have entirely loſt their ancient tongue; that it is now no longer underſtood among them; that they have nothing extant therein but ſome ſacred books; and that they ſtill ſay maſs in it.

All their other books have been tranſlated into Arabic, which is their vulgar tongue; and this has occaſioned the originals to be loſt: it is added, that they rehearſe the epiſtles and goſpels in the maſs, twice; once in Arabic, and once in *Cophtic*.

Indeed, if we believe F. Vanſleb, the Cophts ſay the maſs in Arabic, all but the epiſtles and goſpels, which they rehearſe both in that and *Cophtic*.

Cophtic *Bible*. See Bible.

Cophtic *Liturgies* are three; one attributed to Baſil, another to St. Gregory, and the third to Cyril: they are tranſlated into Arabic for the uſe of the prieſts and people.

COPIA *libelli deliberanda*, a writ which lies in caſe where a man cannot get the copy of a libel at the hands of the eccleſiaſtical judge.

Copia, *Cornu*. See Cornucopia.

COPIATA, under the *Weſtern Empire*, a *grave-digger*. In the firſt ages of the church, there were clerks deſtined for this employment. In the year 357, Conſtantine made a law in favour of the prieſts *copiatæ*, i. e. of thoſe who had the care of interments; whereby he exempts them from the luſtral contribution which all other traders paid.

It was under him alſo that they firſt began to be called *copiatæ*, q. d. clerks deſtined for bodily labour, from κοπος, of κοπτω, *ſcindo*, *cædo*, *ferio*, *I cut*, *beat*, &c. Before that time they were called *decani* and *lecticarii*; perhaps, becauſe they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING *of a wall*, the top or cover of a wall, made ſloping to carry off the water.

Coping *over*, in *Carpentry*, a ſort of hanging over, not ſquare to its upright, but bevelling on its under ſide till it end in an edge.

COPIST, in Diplomatic *Science*, ſignifies a tranſcriber or copier of deeds, books, &c.

COPOS, from κοπος, *labour*; in *Medical Writers*, is uſed for a wearineſs of the body, when the muſcles, or their fibres rather, are loaded and obſtructed with viſcous humours, ſo as to render them unfit for motion.

COPPA, in *Law*, a cop or cock of graſs, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in ſtrictneſs denotes the gathering or laying up the corn in copes or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and juſtly tithed: and in Kent they ſtill retain the word, a *cop* or *cap* of hay, ſtraw, &c.

COPPEL, Copel, or Cuppel, a veſſel uſed by *Chemiſts*, *Refiners*, and *Aſſayers*, to try, and purify their metals. See *Tab. Chemical Furnaces*, &c. *fig.* 24.

The *coppel of aſſay*, is a little flat veſſel, made of vegetable aſhes, and bones of ſheep's feet, calcined and lixiviated, to ſeparate the ſalts, which would otherwiſe make it crack, and the inflammable principle, which might revivify the ſcorified metals, and occaſion an ebullition.

At the bottom of the veſſel is a little cavity filled with a kind of white varniſh, compoſed of hartſhorn, or pike bones, calcined and diluted in water: the uſe of this liquor is, that the gold or ſilver to be aſſayed may be more conveniently lodged, and that the button of the aſſay may be ſeparated the more eaſily.

The hollow of the *coppels*, which is to contain the metal, muſt be a ſpherical ſegment, and not very deep: firſt, that the ſurface of the melted maſs, be it ever ſo ſmall, be diſtinctly viſible to the artificer's eye; and, ſecondly, that the metal left in that cavity, may melt together into one globule. But the outſides of the *coppel* muſt be only a ſmall matter convergent towards the baſis, like a truncated cone, that it may ſtand firmly on its baſe: and that this figure may be regularly given to theſe veſſels, it is convenient to have copper or braſs moulds for the making them.

The *coppel* is uſually formed in a braſs ring from three quarters of an inch to two inches in diameter, and not quite ſo deep, placed on ſome ſmooth ſupport. When the ring is filled with the moiſtened powder, a round-faced peſtle, called the *monk*, is ſtruck down into it, with a few blows of a mallet, by which the maſs is made to cohere, and rendered ſufficiently compact, and a ſhallow cavity formed in the middle: this cavity is made the ſmoother, by ſprinkling a little of the ſame kind of aſhes, levigated into an impalpable powder, through a ſmall fine ſieve, and the monk is again ſtruck down upon it.

Though metals may be tried otherwiſe than by *coppelling*; and though the touchſtone, graver, &c. are of ſome ſervice to the goldſmith in judging of their purity; yet, without the *coppel*, it is difficult, not to ſay impoſſible, to know their preciſe degree of purity.

The *refiner's coppel*, is a large freeſtone veſſel, lined withinſide with a kind of plaſter made of aſhes well lixiviated, cleanſed, dried, beaten, and ſifted.

In this kind of *coppel* it is that they purify their gold and ſilver, by adding lead to it, and expoſing the whole to a violent fire.

There is ſcarcely any other ſubſtance, which ſo ſtrongly reſiſts vehement fire, which ſo readily imbibes metallic ſcoriæ, and which is ſo little diſpoſed to be vitrified by them, as the aſhes of animal bones. The calcination of theſe bones is to be made in an open fire, for a few hours, according to their ſize; and ſuch ſhould be choſen as have leaſt fat about them. The calcination is known to be perfect, when there is not a black ſpot remaining, either on the outſide of the bone, or within it, when broken. When the bones are perfectly calcined, they muſt be reduced to a very fine powder, either by grinding on a porphyry, or ſifting through a fine ſieve, after beating. This powder muſt be alſo carefully waſhed in warm water; for during the calcination, the bones become almoſt always impregnated with the ſalt of the aſhes of the fewel.

This powder is called by ſome *clar*, and is an excellent ſubſtance for *coppels*. The bones of fiſhes, when ſmall, are yet more eaſily calcined than thoſe of other animals: this may be done with eaſe in an open earthen veſſel, and the powder of theſe is preferable even to the former. Parget, or plaiſter of Paris, made of various kind of ſpar, though all kinds will not do for this purpoſe, is alſo excellent: but as there are ſome ſorts of ſpar which will not afford a proper plaiſter, it is proper to try in a ſmall quantity firſt. The calcination is to be made in an earthen veſſel, covered with a tile, in an open fire. The ſpar crackles a little with the heat; and when this noiſe is over, the calcination is perfect.

As the preparation of bone aſhes for this uſe, however, is tedious, and the proper ſort of ſpar is not always or every where to be had, the want of them may be ſupplied with the aſhes of vegetables, properly prepared. When a proper powder is obtained, it is moiſtened with juſt ſo much water as is ſufficient to make it hold together, when ſtrongly preſſed between the fingers. Some give a greater tenacity to the powder by mixing it with glutinous liquids, as whites of eggs, or gum water, or with fine waſhed clay; but theſe ſhould be uſed very ſparingly, and with great caution. The calcined ſpar muſt be prepared with a ſolution of vitriol.

Coppels had better be too compact than too looſe in their texture, ſince the latter is always a miſchievous accident, whereas the former, by abſorbing the glaſs more ſlowly, is of no other hurt than the retarding the operation a little.

Coppels made of bone aſhes, or of calcined ſpar, are more valuable than thoſe of wood aſhes, as they require not ſo much caution and regularity in the management of the fire; but if wood aſhes enter the compoſition, the *coppel* muſt be made pretty hot before the metal is put into it, otherwiſe the aqueous vapours, forcing their way out, will cauſe the metal to be thrown out in drops; for *coppels* of this kind can never be perfectly dried by the air alone, there being always ſomething of an alkaline ſalt yet remaining in wood aſhes, which makes them attract the water out of the air, as the dark colour of theſe aſhes, and the ſolution of *ſal ammoniac* poured on them, alſo ſhew: for this reaſon, theſe aſhes are alſo more diſpoſed to vitrification than thoſe of bones, the latter approaching much nearer to the nature of the incombuſtible ſtones.

COPPELLING, in *Aſſaying* and *Chemiſtry.* Silver may be precipitated out of its ore by *coppelling* alone, in the following manner: roaſt a centner of the ſilver ore in the common way; when roaſted, powder and ſift it very fine, and if it melts with difficulty, mix with it one centner of litharge: when it is an ore that melts eaſily, this may be omitted. Divide the powder into five or ſix parts, and wrap up every one of them ſeparately in pieces of paper. Put a large coppel under a MUFFLE in the furnace; heat it thoroughly; then put into it ſixteen centners of lead. When the lead begins to ſmoke and boil, put upon it one of the ſmall parcels of powdered ore, in its paper; then diminiſh the fire a little. The paper will be immediately conſumed, and the ore caſt to the inſide of the coppel, in form of ſcoriæ. When this is done, increaſe the fire again, and add a ſecond parcel of the ore; and continue this method till all the ore is put in; after which, ſcorify the lead in a ſtronger fire. The ſilver contained in the ore, with that contained in the lead, will now be found in form of a bead in the coppel; and ſubtracting the known quantity yielded by the lead, the remainder of the weight gives the quantity of ſilver in that centner of ore.

Silver is not the only ore that can be thus worked; many others may be aſſayed in the ſame manner, by *coppelling* alone: thoſe are indeed to be excepted from this proceſs, which ſplit, or which corrode the coppels. Cramer. See alſo Lewis's Com. Phil. Tech. p. 129, &c.

COPPER, a hard, heavy, ductile, imperfect metal; found in mines, in ſeveral parts of Europe, but moſt abundantly in Sweden.

Copper is of all metals the moſt ductile and malleable after gold and ſilver; and it abounds very much in vitriol and ſulphur. It may be drawn into wire as fine as hair, or beaten into leaves as thin as thoſe of ſilver. Its tenacity is very conſiderable, as a wire of it one tenth of an inch in diameter, is capable of ſupporting a weight of 299¼ pounds without breaking. It has a very ſingular diſagreeable taſte and ſmell. In a great fire, with free acceſs of air, it ſmokes, loſes part of its weight, and gives beautiful green and blue colours to flame.

The chemiſts call it *Venus*; as ſuppoſing it to have ſome more immediate relation to that planet. By an analyſis it appears compoſed of a ſulphur ill digeſted, a yellowiſh mercury, and a red ſalt.

Copper is found in glebes or ſtones of various forms and colours; which are firſt beaten ſmall and waſhed, to ſeparate them from the earthy, &c. parts wherewith they are mixed.

After waſhing they are ſmelted, and the melted matter run into a kind of moulds, to form large blocks, by ſome called *ſalmons*, and by others *cakes of copper*. This is the ordinary *copper*.

To render it more pure and beautiful, they melt it again once or twice; ſome of its coarſe earthy parts being left behind at each fuſion, and a quantity of tin and antimony added in each. In this ſtate it is called *roſe copper*, in Latin ÆS *peloſum*.

Copper is ſometimes alſo found native and pure in the mines, either in form of threads, or in flakes, plates, grains, or other maſſes and lumps. This is called *virgin copper*.

The method of procuring the metal from the ore is this: mix one or two centners of the ore for an aſſay, beaten to a very fine powder, with ſix centners of the black flux; put the powder into a crucible, and cover it half an inch high with common ſalt; preſs the whole down with the finger, but let the capacity of the veſſel be ſuch, that it may be only half full; ſhut the veſſel cloſe with a lute, and put it into the furnace. Increaſe the fire ſlowly, till the common ſalt crackles; then increaſe it ſo far, that the veſſel may preſently be made red-hot, and after about a quarter of an hour's ſtanding in this heat, the metal will be ſeparated: then take out the veſſel, and ſetting it on the floor, ſtrike with a few blows of a hammer near where it ſtands, to make the metal get together at the bottom. Break the veſſel, when grown cold, in two, from top to bottom, as nearly as you can, and you will find a ſolid and malleable regulus at the bottom. Cramer's Art of Aſſaying, p. 301.

Copper, when hid, as it frequently is, in an ore full of the matter of the pyrites, may be diſcovered by a ſolution and liquid precipitation, in the following manner: make a ſolution of vitriol out of the ore, by a ſlight roaſting in an open fire, and by expoſing it afterwards to an air ſomewhat moiſt, and pouring warm water upon it. Put into this ſolution ſmall iron plates, perfectly clean, and free from greaſe; if there is any ſmall quantity of *copper* in the pyrites, it will now ſtick to the iron plates, in form of a ſubtle powder, of a deep yellow colour, and all of it will be thus fetched out of the ſolution, if there be time enough, and a moderate warmth.

This property which iron has of ſeparating *copper* from acids, ſerves alſo to extract the *copper* from the blue vitriol with which water in mines of this metal is impregnated. A conſiderable quantity of *copper* is obtained by means of iron bars laid in the ſtreams iſſuing from the *copper* ſprings of Wicklow in Ireland. Theſe bars are laid in oblong pits, into which the impregnated water paſſes; and the *copper*, attracted and fixed by the iron, ſubſides to the bottom of the pit. When the iron is diſſolved, the ſtream is turned from the pits, the reddiſh mud collected, and laid in a heap to dry; and the reddiſh duſt melted into *copper*. One ton of iron in bars produces a ton and nineteen hundred and a half of the *copper* mud or duſt; and each ton of the mud yields, when ſmelted, ſixteen hundred weight of the pureſt *copper*. Phil. Tranſ. vol. xlvii. p. 502. vol. xlviii. p. 94 and 101, &c.

When ſilver is contained in *copper*, it may be ſeparated in the following manner: reduce the *copper* into filings; put one centner of this by for the operation; then put the double and ſextuple quantity of granulated lead into a large, well-baked coppel; make the fire ſtrong, and continue it ſo till the lead begins to ſmoke and boil; then add the *copper* wrapped up in a paper, ſo that it may be immerſed together into the middle of the boiling lead. When all the *copper* is diſſolved, ſuppreſs the fire till there is a ſmoke ſeen wandering over the ſurface, and the maſs is not raiſed up very high in the middle, and the coppel looks brown as far as it has been penetrated by the litharge: take care, however, that the boiling of the lead does not entirely ceaſe. When the greateſt part of the metal is conſumed, increaſe the fire gradually, and make it very ſtrong toward the end. When the operation is finiſhed, the ſilver will be found pure in the center of the coppel, ſurrounded with yellow ſcoriæ in form of cryſtals. Cramer.

Copper put into the fire with iron promotes its fuſion, but it becomes more rigid and more pale by the mixture. It is often neceſſary, to render this fuſion the eaſier, to add as much tartar and common glaſs, as will cover the ſurface of the whole maſs.

As to the other metals, *copper* is well known to mix readily with ſilver and gold, and to give them a rigidity which renders them much more fit for the uſes of life, than they would be in their natural ſoft ſtate.

Copper melted with GOLD promotes the fuſion of the gold; it produces a gold colour with tin; ſtones are ſtained by ſolutions of it; it is always incompact after melting; gold is precipitated by it; it is diſſolved by vitriol of iron; glaſs coloured with it, on being baked with white earth, gave a red tinge to the earth; it is hardened and made leſs diſpoſed to tarniſh, by being melted with platina in different proportions. See Lewis's Com. Phil. Tech.

Copper reſiſts the fire more than any other *imperfect* METAL before it undergoes any great alteration; but being an imperfect metal, it may be burnt, deſtroyed, and calcined by the united action of fire and air: ſo that its quantity is always diminiſhed by melting it without covering its ſurface. The ſurface of clean poliſhed *copper*, when gradually heated, is covered with all the colours of the rainbow, produced by a more or leſs perfect CALCINATION of the ſurface of the metal expoſed to the fire.

The *ſpecific* GRAVITY of European *copper* is to that of water as 8843, and of Japoneſe *copper* as 9000 to 1000.

Copper is eaſily ſoluble by all ACIDS, and its ſolutions are green, or blue; it is alſo acted upon by almoſt all ſaline and metallic ſubſtances, and diſſolved by fixed and volatile alkalies. Macquer.

Copper, becauſe of its great ductility, and ſhining colour, is greatly employed in domeſtic uſes; but it is never uſed inwardly as a medicine, unleſs in tincture; becauſe this metal, and eſpecially its ruſt, are reckoned poiſons: and any kind of food, or even water, that has ſtood long in *copper* veſſels, is pernicious. The ſymptoms produced by this poiſon, are pains in the ſtomach and inteſtines, exceſſive vomitings, irritations to ſtool, ulcers in the inteſtines, ſometimes difficulty of breathing, and ſpaſmodic contractions of the limbs, and laſtly death itſelf; if the quantity of the poiſon be great. See a letter of Mr. Travis, endeavouring to ſhew that the uſe of *copper* veſſels in the navy is one principal cauſe of the ſea ſcurvy. Med. Obſerv. &c. vol. ii. p. 1. See alſo a letter on the ſame ſubject of *copper* veſſels. Ibidem, p. 146.

The remedies proper in ſuch caſes are, firſt, to take a great quantity of milk, oil, or melted freſh butter, then to drink warm water until the patient vomits plentifully. Clyſters made with oil, butter, or fat broths, are likewiſe proper; laſtly, ſtrengthening cordials and a milk diet. James.

The water iſſuing from the *copper* ſprings diſcovered in Penſylvania, Dr. Rutty obſerves, though poiſonous in its native ſtrength, is frequently uſed, when lowered with common water, for purging and vomiting the country people; and is uſeful in curing ulcers, and cutaneous diſorders, and particularly for ſore eyes. Phil. Tranſ. vol. xlix. p. 651.

The preparations of *copper* are, 1. *Flos æris*, or flowers of *copper*. 2. *Ærugo æris*, or verdigriſe. 3. *Æs uſtum*, or burnt *copper*. 4. *Squamma æris*, or the flake of *copper*. 5. The *ens Veneris* of Mr. Boyle. 6. *Aqua ſapphirina*, a famous eye-water, of a blue colour. See GRENAILLE, &c.

Of a mixture of *copper* and LAPIS CALAMINARIS, is formed BRASS, which the French call *cuivre jaune*, yellow *copper*, in contradiſtinction to natural *copper*, which they call *cuivre rouge*, red *copper*.

Copper melted together with twenty-two or twenty-three pounds of fine tin *per* quintal, makes BELL-*metal*.

Copper and braſs melted in equal quantities, make what the French call BRONZE, uſed for figures, ſtatues, &c.

Copper turns white by an unction of ſpirit of wine and orpiment. Pliny ſays there is a *copper* naturally white, found underneath the ſilver mines.

Chemiſts give the denomination *ſaffron of copper*, or *crocus Veneris*, to a preparation of *copper* plates ſtratified with decrepitated ſalt, in a crucible; after having extinguiſhed them in water, and ſcraped them with iron inſtruments. It is very red, and is uſed in emplaſters to cleanſe wounds, and ulcers.

Some chemiſts have pretended, that the ſpirit of *copper* is real ALKAHEST, capable of diſſolving wholly pearls, corals, crabs eyes, &c. without any diminution of its force; but experience has ſhewn the contrary.

Æs uſtum, i. e. burnt *copper*, ſometimes alſo called *ſaffron of Venus*, is nothing but *copper* calcined in a violent fire, and reduced to ſcales no longer poſſeſſed of brilliancy, ductility, or other metallic properties. If theſe ſcales are mixed with ſome matter capable of reſtoring phlogiſton to them, and expoſed to a great fire, a quantity of malleable *copper* is obtained nearly equal to that of the ſcales. Macquer. See ÆS.

VERDIGREASE is a ruſt of *copper*. Becher obſerves, that the drinking of acid liquors, even out of common ſilver plate, is very unwholeſome, becauſe of the mixture of *copper* therein; much more is it ſo out of veſſels of *copper*.

COPPER, *white*, a kind of metal white as ſilver, frequently brought from China, and ſuppoſed by many to be natural. But it is only an allay of *copper*, zinc, and arſenic, in certain proportions. It is made with difficulty, becauſe of the volatility of the two ſemi-metals; and, as its quality is noxious, it is not much uſed.

COPPER, *affinity of*. See AFFINITY.

COPPER, *engraving in*. See ENGRAVING.

COPPER, *granulation of*. See GRANULATION.

COPPER, *refining*. See REFINING.

COPPER-*plates*, for engraving, ſhould be choſen of the beſt red *copper*, as being generally the tougheſt and the moſt ductile; and therefore moſt capable of being extended with the hammer, or rolled out to the niceſt and ſmalleſt pieces. They ſhould be free from any veins, ſpecks, or diſſimilar parts, and throughout of an uniform texture. Their thickneſs may be in the proportion of a line to a foot by nine inches in breadth. They ſhould be well forged and planiſhed whilſt cold, becauſe the ſubſtance of the *copper* will thus be rendered leſs porous. The poliſhing of theſe plates is performed by laying them obliquely on a board, and rubbing them firſt with a piece of grind-ſtone, dipped in water, lengthways and breadthways, till the flaws and inequalities in the ſurface are removed; and then with a piece of good pumice-ſtone to take away the marks and ſcratches made by the grind-ſtone: when this is done, let them be waſhed clean, and rubbed with a piece of oil-ſtone, to remove the ſcorings of the pumice-ſtone, and again waſhed till they are perfectly clean. For the laſt operation, three or four large coals of ſallow wood, ſound and without clefts, ſhould be placed in a fire on a hearth, and covered with other burning coals and a quantity of red-hot aſhes; and left in this ſtate for about an hour and a half; but the time ſhould be proportioned to the ſize of the coals, that the fire may penetrate into their inmoſt ſubſtance, and expel all the ſmoke that can be driven out: the coals ſhould then be thrown into a veſſel of water, and there left to cool. With one of theſe coals, let the plate be rubbed, and the operation be continued till all the flaws left by the oil-ſtone are removed; and if the coal itſelf be too hard, and leave traces, a ſofter one muſt be uſed to remedy the defects of the former, ſo that the ſurface of the plate may be perfectly clear and even. This is the method recommended by Le Boſſe: but the end may be more expeditiouſly obtained, by rubbing out the marks of the planiſhing hammer with emery finely ground, and after waſhing the plate clean, bruſhing it over with the refiner's *aqua fortis*: let this lie on till the ebullition produced by it begins to decreaſe, and then waſhed off by immerſing the plate in water. The plate muſt be finiſhed by hard rubbing with a ſteel BURNISHER, ſo that every part of it may appear as bright as looking-glaſs.

Thoſe plates that are deſigned for etching, ſhould, after theſe operations, be well waſhed with clean water, dried by the fire, wiped with a linen cloth, and rubbed over with crumbs of very ſtale bread; and then rubbed well with the ſcrapings of very ſoft chalk. The perfection of the poliſh may be tried by rubbing the plate with printing ink, and pulling off a proof as if it had been engraved; if no impreſſion is made on the paper, the poliſhing is complete; but if any lines appear to be printed, the plate is faulty, and it muſt be repoliſhed. Encyclopedie, art. *Gravure*; and Handmaid to the Arts, vol. ii. p. 48, &c. See ENGRAVING, and ETCHING.

COPPER-*plate Printing*. See *Rolling-preſs* PRINTING.

COPPERAS, a name given to *green* VITRIOL, particularly to vitriol of iron. See CABRUSI.

Copperas is purified and prepared in the ſame manner as alum and ſaltpetre, by paſſing through ſeveral lixiviums, till it be wholly reduced to cryſtal.

Some make *copperas* to be the *chalcitis* of the ancients. But the more common opinion is, that their *chalcitis* was a ſtone, not a pure ſalt.

There is *copperas* of England, of Piſa, Germany, Cyprus, Hungary, and Italy, which differ from each other in colour, richneſs, and perfection.

White copperas, is a vitriol of iron, with a mixture of ſome other mineral, brought from Germany in cakes of forty or fifty pounds each: ſuch are thoſe brought from Goſlar in Saxony.

The Engliſh *copperas* is of a fine green; that of Cyprus and Hungary is of a ſky blue, and has copper for its baſis. It is in pieces cut like the point of a diamond. That of Piſa and Italy is likewiſe green; and the laſt as tranſparent as glaſs.

The Engliſh green *copperas* is of conſiderable uſe in many preparations; but eſpecially in dyeing. The hatters alſo uſe it in their dye; and this and galls are ingredients in writing ink.

The ordinary Engliſh *copperas* is made of a kind of ſtones found on the ſea-ſhore in Eſſex, Hampſhire, and ſo weſtward, ordinarily called *gold ſtones*, from their colour, or *pyritæ*: they abound much in iron.

To prepare the *copperas* from them, they are expoſed to the weather in beds above-ground, and receive the rains and dews, which in time break and diſſolve the ſtones: the liquor that runs off is pumped into boilers, in which is firſt put old iron, which in boiling diſſolves. When the boiling is finiſhed, the liquor is drawn off into coolers, where it ſhoots into cryſtals. See VITRIOL.

The works at Deptford for making it are known to moſt people. Many chemiſts diſſolve this, and ſhoot it again, to ſell it for the common ſalt of ſteel.

The alum workers in Yorkſhire have an opinion that if their liquor ſtands beyond the uſual time in the pans, it will turn to *copperas*. The maſters of the works have inculcated this ſtory to make them diligent, and it is as firmly believed among them as if it were a real truth.

COPPERAS *ſtone*. See PYRITES.

COPPICE, or COPSE, a little wood, conſiſting of underwoods; and ſuch as may be raiſed either by ſowing, or planting. See WOOD.

COPROCRITICA, from κοπρος, *excrement*, and κρινω, *ſeparate*; medicines which purge away the excrements in the guts.

COPROPHAGOS, from κοπρος, and φαγω, *I eat*; the *dung-fly*, in *Natural Hiſtory*, the name given by many authors to the common yellowiſh fly found on human excrements. There are ſeveral other ſpecies found on the excrements of various animals, and thence called *merdivoræ*.

COPULA, in *Logic*, a verb that connects any two terms in a propoſition, either negative or affirmative: as, *A roſe is ſweet*; where *is* is the *copula*.

COPULATION. See COITION, CONGRESS, and CONSUMMATION.

COPULATIVE *Propoſitions*, are thoſe which include ſeveral ſubjects, or ſeveral attributes joined together by an affirmative or negative conjunction.

Thus, v. gr. *Power and riches do not make a man happy.* Where *and* is the conjunction that couples *power* and *riches*.

COPULATIVE *Conjunction*. See CONJUNCTION.

COPY, in *Law*, a tranſcript of a writing or inſtrument, made for the uſe and ſatisfaction of ſome of the parties concerned; or in order to preſerve the memory thereof. See COPIA.

The *copy* of an inrolled deed is admitted in evidence; but not the *copy* of a will of lands nor the probates, nor of a common deed where the original may be procured. Few ancient documents do now ſubſiſt otherwiſe than in *copies*.

Copy is alſo uſed for an imitation of any original work; particularly a painting, draught, figure, &c.

Copy, among *Printers*, denotes the manuſcript, or original of a book given to print from.

To caſt off a copy, is to make a computation of the number of ſheets a manuſcript will make in print.

In the bookſeller's ſtyle, a *good copy* is that which produces a ſaleable book.

Tenant by Copy *of court-roll*. See Tenant.

COPY-HOLD, is a TENURE for which the tenant has nothing to ſhew but the *copy* of the roll made by the ſteward of the lord's court.

The ſteward of the court is, among other things, to inroll and keep a regiſter of all ſuch tenants as are admitted to any parcel of land, or tenement, belonging to the manor; and the tranſcript is called the *copy of the court-roll*, which the tenant keeps as his own evidence.

This tenure is called a *baſe tenure*, becauſe the tenant holds, in ſome ſort, at the will of the lord. Fitzherbert ſays, it was formerly called *tenure in villenage*; and that *copy-hold* is but a modern name.

This is the land which the Saxons called *folk-land*, as being held *ſine ſcripto*, in contradiſtinction to *bock-land*, or CHARTER-*land*, *terra ex ſcripto*, and now *free-land*, or FREE-HOLD.

However, it is not ſimply at the lord's will, but according to the cuſtom of the manor; ſo that if the *copy-holder* doth not break that cuſtom, and forfeit his tenure, he ſeems not to ſtand at the lord's courteſy. Theſe cuſtoms are infinite; varying in one point or other almoſt in every manor.

Copy-holders, upon admittance, pay a fine to the lord; which fines are in ſome manors certain, in others not; but yet, if the lord exceeds two years value, the court of chancery, king's bench, &c. have, in their ſeveral juriſdictions, power to reduce the FINE. See alſo Heriot and Relief.

In many places, the *copy-holds* are a kind of inheritance, and termed *cuſtomary*, becauſe the tenant dying, and the hold becoming void, the next of blood paying the cuſtomary fine, as two ſhillings an acre, or the like, may not be denied his admiſſion. Some *copy-holders* have by cuſtom the wood growing upon their own land; ſome, again, hold by the verge in ancient demeſne, ſo that though they hold by *copy*, they are yet accounted a kind of freeholders: laſtly, ſome others hold by common tenure, called *mere copy-hold*; whoſe land, upon felony committed, eſcheats to the lord of the manor.

Copy-hold land cannot be made at this day; for the foundation of a *copy-hold* is, that it hath been demiſed time out of mind, by copy of court-roll; and that the tenements are parcel of, or within the manor. 1 Inſt. 58. 4 Rep. 24. They are demiſable only by copy; and within the acts againſt bankruptcy and the ſtatutes of limitation.

Copy-holders are not allowed to vote for knights of the ſhire. 31 Geo. II. c. 14.

COPY-HOLDER, is defined by Weſt, a perſon admitted tenant of any lands, or tenements, within a manor, which, time out of mind, by the uſe and cuſtom thereof, have been deviſable to ſuch as will take the ſame by copy of court-roll, according to the cuſtom of the ſaid manor.

COQ. *ad med. conſumpt.* an abbreviature among *Phyſicians*, ſignifying that the thing is to be boiled till half of it be conſumed.—*Coq. in S. Q. Aq.* implies it to be boiled in a ſufficient quantity of common water.

COR, in *Anatomy*. See Heart.

Cor *Caroli*, in *Aſtronomy*, an extra-conſtellated ſtar of the ſecond magnitude in the northern hemiſphere, ſituated between the Coma Berenices and Urſa Major; ſo called by Sir Charles Scarborough, in honour of king Charles I.

Cor *Hydræ*, in *Aſtronomy*, a ſtar of the ſecond magnitude, in the heart of the conſtellation Hydra.

Cor *Leonis*, or *Regulus*, a fixed ſtar of the firſt magnitude, in the conſtellation Leo.

Cor *Scorpii*. See Antares.

Cor *Marinum*, in *Natural Hiſtory*, the name of one of the claſſes of the *echini marini*, the characters of which are, that the anus is placed in the ſide of that point of the ſhell which appears as if cut off; and the mouth has two lips, and is placed in the third region of the axis of the baſe. Klein's Echin. p. 34.

Cor *Veneris*, *Venus's heart*, a name given by authors who treat of ſhells, to a very elegant kind of the *cordiformis*, or HEART-*ſhell*, which has more of the ſhape of a real heart than the *bucardium*, or any other ſhell of this genus. There are only three known ſpecies of the *cor Veneris*. 1. A denticulated one, with very elegant, roſe-coloured ſpots. 2. The white boat-ſhell, furrowed on the inſide. And, 3. The little, roſe-coloured kind. Theſe are all very elegant ſhells.

CORAAGE, *coraagium*, in our *Old Cuſtoms*, a kind of impoſition extraordinary, growing upon ſome unuſual occaſion; and it ſeems to be of certain meaſures of corn: for *corus tritici* is a meaſure of wheat. Bracton, lib. ii. cap. 116. num. 6. who in the ſame chapter, num. 8. has theſe words: *Sunt etiam quædam communes præſtationes, quæ ſervitia non dicuntur, nec de conſuetudine veniunt, niſi cum neceſſitas intervenerit, vel cum rex venerit; ſicut ſunt hidagia, coraagia, & carvagia, et alia plura de neceſſitate et ex conſenſu communi totius regni introducta, &c.*

CORACIAS, in *Natural Hiſtory*, a name given by many writers to the BELEMNITES, called by others *lapis Lyncurius*, and *dactylus Idæus*.

Coracias, in *Zoology*, a name uſed by Linnæus for the *pica* or *pye*. This bird makes, in that author's ſyſtem, a diſtinct genus; the characters of which are, that the inner tail-feathers grow gradually one longer than another. See *Tab. of Birds*, N° 8.

This bird is called by ſome the *pyrrhocorax*, and in Engliſh the *Corniſh chough*. It is of the ſhape of the jackdaw, but of the ſize of the common crow. Its beak is red, long, and ſomewhat hooked at the end. It frequents rocks, and ruined buildings about the ſea-ſhores; and is found about the high cliffs, all along the weſtern ſhore of England. Its voice is much like that of the jackdaw, but is more hoarſe and rough. Ray's Ornithol. p. 86.

CORACINUS, in *Zoology*, the name of a ſea-fiſh caught in the Mediterranean, and called by ſome authors *ſkiæna*, and by Aldrovand and Salvian *umbra*. It is of the colour of the common tench, but in figure more approaches to the pearch: its ſcales are ſmall; its mouth not very large, but well furniſhed with teeth; and its tail is not forked, but, when extended, ſeems of a roundiſh figure; the ends of the rays or nerves of the tail-fin are black, and the other fins are all black, and ſeem as if dyed with ink.

CORACOBRACHIALIS, a muſcle which ariſes from the *proceſſus coracoides* of the *ſcapula*, by a tendinous beginning; and paſſing over the articulation of the *humerus*, is inſerted into the middle and internal part of that bone, and with the *deltoides* and *ſupra-ſpinatus*, lifts the arm upwards; and alone, obliquely outwards. See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 23.

It is fixed above to the point of the *coracoide* apophyſis, between the inſertions of the *biceps*, and the *pectoralis minor*, by a tendon, which as it deſcends, adheres a good way to the tendons of theſe two muſcles; afterwards it becomes fleſhy, and is inſerted by a broad thin extremity, with a ſmall mixture of tendinous fibres in the middle part of the *os humeri*, cloſe by the ligamentary *frænum* of the *latiſſimus dorſi*, and *teres major*. Its inſertion is continued down below the *frænum*, near the internal intermuſcular ligament, to which it likewiſe adheres a little. This muſcle paſſes behind the tendon of the *pectoralis major*; and as it is perforated in the middle to give paſſage to a nerve, it has by ſome been termed *perforatus Caſſerii*, that author being the firſt who gave a particular figure of it. Its other name is taken from its inſertions. Winſlow's Anatomy, p. 184.

CORACOHYOIDEUS, in *Anatomy*, a muſcle which has its origin from the *proceſſus coracoides* of the *omoplate*; or rather, according to Keil, from the upper edge of the *ſcapula*, near its neck; whence aſcending obliquely under the *maſtoidæus*, it is inſerted into the *os* HYOIDES; which it ſerves to pull obliquely downwards. See *Tab. Anat.* (*Myol.*) *fig.* 2. *lit.* o. *fig.* 1. *n.* 17.

The word is formed from *coracoides* and *hyoides*, the two parts.

It is alſo called *digraſticus*, as having two bellies at its two extremities, and a tendon in the middle to give room for the paſſage of the carotid and inner jugular artery.

CORACOIDES, in *Anatomy*, a ſmall, ſharp PROCESS of the SCAPULA; ſo called from its reſembling a crow's bill. See *Tab. Anat.* (*Oſteol.*) *fig.* 3. *n.* 5. 5.

The word comes from κοραξ, *corvus*, and ειδος, *imago*.

The *coracoides* is placed in the upper part of the neck, and projects over the head of the bone of the arm. It ſerves to ſtrengthen the articulation of the ſhoulder; and gives origin to one of the muſcles of the arm.

CORACOMANTES, from κοραξ, *crew*, and μαντεια, *divination*; in *Antiquity*, a kind of diviners, who made their predictions by obſerving the crows.

CORACORADIALIS, in *Anatomy*, a name given by ſome authors to a muſcle generally known by the name of the BICEPS; the *peſcetto* of the Italian authors; and the *primus flectentium cubitum* of Veſalius, and others of his time.

CORAL, *Corallium*, in *Natural Hiſtory*, a production of the ſea, formerly ranked among the number of marine plants, but now claſſed in the animal kingdom; ſince modern naturaliſts have diſcovered, that it is the ſtructure and habitation of certain ſea animals, and deſigned for their protection and ſupport. See *Tab*. V. *Botany*, *Claſs* 17. and *Tab*. II. *Foſſil*., *Claſs* 7.

Some have derived the term from the Greek κορειν, *to adorn*, and αλος, *the ſea*; becauſe there is no other production of equal beauty.

The nature and origin of *coral* has been as much diſputed as any ſubject in natural knowlege. Some, and particularly Dr. Woodward, conſidered this and the other harder productions of the ſea, as ſtones; and they thought themſelves juſtified in the opinion, from their exceſſive hardneſs, and their ſpecific gravity; and likewiſe from obſerving, that, when theſe bodies were calcined, they were converted into lime. Guiſonæus maintains, that *coral* is a real mineral, compoſed of much ſalt and a ſmall quantity of earth; and that it derives its form from precipitation much in the ſame manner with the ARBOR *Dianæ* of the chemiſts. Others, as Dioſcorides, Pliny, Cæſalpinus, Boccone, Ray, Tournefort, and Geoffroy, thought *coral* to be a plant. P. Kircher ſuppoſes, that there are entire foreſts of it at the bottom of the ſea: Tournefort maintains, that it is multiplied by ſeed like other plants, and enumerates fourteen different ſpecies of it. Boccone confirmed this opinion by obſerving a milky juice (firſt indeed taken notice of by Cæſalpinus) at the top and in the cells of *coral*: and Count de Marſigli, in 1706, diſcovered ſome parts in it, which, he conjectured, were its flowers. Agreeably to this notion, they deſcribed it as having roots, which are faſtened to the rocks or ſtones on which it grows, as thoſe of trees are to the earth: theſe roots, they ſay, are covered with a bark, often beſet with ſtarry pores which traverſe them from top to bottom: above the roots they obſerve the ligneous part of the plant, which rather ſeems to reſemble ſtone than wood. This trunk is divided into branches, having white ſtreaks, repreſenting a kind of fibre. The extremities are rounded with little bowls, ordinarily divided into ſix cells, filled with a fluid ſomewhat like milk, fat, ſharp, and aſtringent: and theſe bowls are eſteemed a kind of pods or capſulæ, containing the ſeed of the *coral*. It is even ſaid, that in what place or on what matter ſoever this juice is ſhed, it carries fecundity with it, and produces a plant of *coral*. Marſigli obſerves, that *coral* grows chiefly in caverns, whoſe aperture is towards the ſouth, and their concave arch nearly parallel to the ſurface of the earth; and that it vegetates, in a calm ſea, in a direction contrary to all other plants; its foot adhering to the top of the cavern, and its branches ſhooting downwards: the foot takes the exact form of the ſolid to which it grows, and covers it, like a plate, to a certain extent; which, he thinks, is a proof, that its ſubſtance was originally fluid: and he adds to the ſame purpoſe, that it ſometimes lines the inſide of a ſhell. Marſigli, from examining the ſeveral parts of *coral*, concludes, that all its organiſm, with regard to vegetation, conſiſts in its rind; that the tubules of this rind filtrate juice which fills the cellules, and runs along the canals as far as the extremities of the branches; and that this juice being petrified, both in the cells encompaſſing the coralline ſubſtance, and in thoſe of the extremities of the branches whoſe ſubſtance is not yet formed, makes the plant grow both in height and bulk. M. de Reaumur conſiders the coarſe viſible rind, which is different from that which is properly called *coral*, and alſo another much finer rind, which is not always diſtinguiſhed from the coralline ſubſtance covered by it, as the organized vegetating plant; and all the reſt, that is, almoſt the whole coralline ſubſtance, he conſiders as a mere ſtone without any organization, formed by the plant which inveſts it for its ſupport.

It has been long the received opinion, that *coral* was ſoft in the ſea, and that it was hardened by the air, upon taking it out of the water. Mr. Boyle was of this opinion; but Boccone examined *coral* in the water, before it was taken up into the air, and invariably found it hard, except at its extremities, whence, by preſſing it, flowed a ſmall quantity of milky fluid, already taken notice of. We may therefore infer, that there is more of imagination than of truth in the name *gorgonium*, which the ancients gave to *coral*, and deſigned to ſhew that Meduſa's head did not convert objects into ſtone, more ſurely than *coral* became petrified, as ſoon as it appeared in the air.

M. de Peyſſonnel of Marſeilles, has, in conſequence of a ſeries of experiments and obſervations from about the year 1720 to 1750, introduced a new ſyſtem, with reſpect to the nature and production of *coral*, and ſimilar marine ſubſtances. Thoſe bodies, which the Count de Marſigli imagined to be flowers, this ingenious naturaliſt diſcovered to be inſects inhabiting the *coral*; for, upon taking branches of it out of the water, the flowers, which proceeded from a number of white points anſwering to the holes that pierced the bark, and the radiation of which reſembled the flower of the olive-tree, entered into the bark and diſappeared; but, upon being again reſtored to the water, they were ſome hours after perceptible. Theſe flowers ſpread on white paper loſt their tranſparency, and became red as they dried. The holes in the bark correſpond to ſmall cavities upon the ſubſtance of the *coral*; and when the bark is removed, there may be ſeen an infinite quantity of little tubes connecting the bark with the inner ſubſtance, beſides a great number of ſmall glands adhering to them; and from theſe tubes and glands the milky juice of *coral* iſſues forth: the holes in the bark are the openings through which the inſects, that form theſe ſubſtances for their habitation, come forth; and thoſe cavities which are partly in the bark and partly in the ſubſtance, are the cells which they inhabit. The organs of the animal are contained in the tubes, and the glandules are the extremities of his feet, and the milky liquor is the blood and juice of the animal, which are more or leſs abundant in proportion to its health and vigour. When the inſects are dead, they corrupt and communicate to the water the ſmell of putrid fiſh. This juice or liquor runs along the furrows perceived upon the proper ſubſtance or body of *coral*, and ſtopping by little and little becomes fixed and hard, and is changed into ſtone; and being ſtopped in the bark, cauſes the *coral* to increaſe proportionably and in every direction. In forming *coral*, and other marine productions of this claſs, the animal labours like thoſe of the teſtaceous kind, each according to his ſpecies; and their productions vary according to their ſeveral forms, magnitudes, and colours.

The *coral* inſect, or POLYPE, M. Peyſſonnel obſerves, expands itſelf in water, and contracts itſelf in air, or when it is touched with the hand in water, or acid liquors are poured upon it: and he actually ſaw theſe inſects move their claws or legs, and expand themſelves, when the ſea-water containing *coral* was placed near the fire, and keep them in their expanded ſtate when ſeparated from the *coral* in boiling water. Broken branches of *coral* have been obſerved to faſten themſelves to other branches, and have continued to grow; and this is the caſe, when they are connected with detached pieces of rock and other ſubſtances, from which no nouriſhment could be derived. The *coral* inſects in their cells, not having been injured, continue their operations; and as they draw no nouriſhment from the ſtone of the *coral*, they are able to increaſe, in a detached and ſeparate ſtate. *Coral* was found to be equally red in the ſea as out of it; and it was more ſhining, when juſt taken out of the water, than even when it is poliſhed; and the bark by being dried becomes ſomewhat pale. M. Peyſſonnel found, that it grows in different directions, ſometimes perpendicularly downwards, ſometimes horizontally, and ſometimes upwards; and in the caverns of the ſea, open to every expoſure.

The principles obtained from *coral*, by a chemical analyſis, appeared to reſemble thoſe drawn from the human ſcull, hartſhorn, and other parts of animals. See an account of a manuſcript treatiſe, entitled Traité du Corail, preſented to the Royal Society by Sieur de Peyſſonnel in 1751. Phil. Tranſ. vol. xlvii. p. 445, &c.

This ſyſtem was little regarded, though firſt communicated to the Academy of Sciences at Paris in 1727, till Mr. Trembley's diſcovery of the freſh-water POLYPE; but ſince that time, it has been confirmed by the obſervations of M. Bernard de Juſſieu on the ſea-coaſts of Normandy, and thoſe of M. de Reaumur near Rochelle. M. Donati of Turin has alſo adopted the ſame hypotheſis, viz. that *coral* is a maſs of animals of the polype kind; and inſtead of repreſenting the polype-beds and cells which they contain as the work of polypes, he thinks it more juſt to ſay, that *coral* and other coralline bodies have the ſame relation to the polypes united to them, that there is between the ſhell of a ſnail and the ſnail itſelf; or the bones of an animal and the animal itſelf. Phil. Tranſ. vol. l. p. 58.

The ſame ſyſtem has alſo been excellently illuſtrated and eſtabliſhed by Mr. Ellis, in anſwer to the objections of Dr. Baſter of Zealand, and Dr. Pallas of Berlin, who ſtill refer *corallines* to the vegetable kingdom. Phil. Tranſ. vol. l. p. 280, &c. vol. lii. p. 111. vol lvii. p. 404, &c. See alſo his excellent Eſſay towards the Natural Hiſtory of the Corallines, and other Marine Productions of the like Kind, &c. 4to. 1775.

There are, properly, but three kinds of *coral*; *red*, *white*, and *black*: the black is the rareſt, and moſt eſteemed; but it is the red that is ordinarily uſed in medicine. It muſt be choſen thick, ſmooth, and ſhining, and of a beautiful red, not covered with any tartareous matter.

Coral, *black*, a ſpecies of the GORGONIA in the Linnæan ſyſtem. See Antipathes.

Coral, *red*, a ſpecies of the *iſis* under the claſs of *zoophytes* in the Linnæan ſyſtem. This appears to be formed of a ſucceſſion of ſmall tubes, many of which riſe together, and branch out in different directions. The tubuli, being compoſed of a cretaceous matter, mixed with a viſcid animal ſubſtance, ſhrink in and become ſolid as their inhabitant deſerts them. The effects of vegetable diſtilled oils on *coral*, by the help of a long digeſtion, are ſuch as could not have been imagined, till the experiments of Dr. Langelot ſhewed that they were a ſort of ſolvent for that refractory ſubſtance.

The common *red coral* yields, by diſtillation in a retort, a volatile vitreous ſpirit, in no inconſiderable quantity; this turns ſyrup of violets green, and makes an efferveſcence with acids, and renders a ſolution of corroſive ſublimate white and milky. And the fixed ſalt drawn from the reſiduum produces a white coagulum in the ſame ſolution; from which it is evident that it is not a mere alkali, but a *ſal ſalſum*, in ſome degree.

Red coral calcined, even in a very gentle fire, becomes white; the ſame change alſo happens to it when infuſed a long time in ſome oily ſubſtances, as the oils of aniſe, fennel, or in white wax kept in fuſion. The menſtrua in this caſe acquire a red colour in proportion as the *coral* loſes it. It appears from theſe, and ſeveral other experiments, that *coral* is not, as ſome ſuppoſe, a mere terreſtrial abſorbent, but that it contains a volatile urinous ſalt, and a bituminous oil combined with its earthy matter; and on theſe its virtues in medicine principally depend. The red colour of *coral* is evidently owing to its bituminous oil, which it is found not difficult to ſeparate, and wholly diveſt it of. It is obſerved, that *coral* newly taken up out of the ſea, contains both the ſalt and oil in greater abundance than that which has been long kept; and it is ſuſpected by many, that its external or cortical ſubſtance contains more of it than the interior, harder, and more ſtony matter.

The ancients uſed *coral* in many external medicines for diſtemperatures of the eyes; and internally as an aſtringent, and refrigerating medicine. We uſe it only internally, and that principally in diarrhœas, and bleedings, in too great evacuations of the menſes, and in the *fluor albus*. The vulgar attribute to it, beſide theſe virtues, many others; for which we have no ſufficient warrant. Geoffroy, Mat. Med. vol. ii. p. 254.

Coral, *white*. There is no part of the world where *white coral* is produced in ſuch abundance as on the ſhores of the iſland of Ceylon, and other of the neighbouring Indian coaſts. The lime uſed in that part of the world, for building houſes, fortifications, &c. is all made by burning this *coral*. It lies in vaſt banks which are uncovered at low water, and it is ſpungy and porous. While young, it grows erect, in form of little ſhrubs, and is then firm and ſolid, and ſmooth on the ſurface; but the branches continually ſhoot out more, and theſe other new ones, till the whole is one confuſed buſh. Theſe branches are all covered with a white viſcous matter, which, in time, hardens upon them, and becomes *coral*; and this filling up all the interſtices between the branches, when they become ſo numerous, and hardening between and over them, the whole becomes one coarſe rock, and the adjoining maſſes of this kind uniting to one another, form at laſt a continued bank, which has the appearance of a great white rock. Phil. Tranſ. N° 282. p. 1277. See Madrepora.

Coral, *foſſile*. It has been matter of ſurprize to naturaliſts, that as red *coral* is ſo common in the ſea, and is a ſubſtance of ſo firm and durable a nature, it is not frequently found among other remains of the ſea productions in the foſſile ſtate. This had long puzzled the naturaliſts, when Agoſtino Scilla attempted to account for it by ſome ſpecimens in his own cuſtody. This gentleman, living at Meſſina, had an opportunity of ſearching the quarries in the neighbourhood of thoſe ſeas, where red *coral* grows in abundance, and whither it might moſt eaſily be carried by any inundation. Accordingly he found, among a vaſt quantity of white *coral*, ſome ſpecimens, which doubtleſs had once been red; and theſe, though they had in a great meaſure loſt their colour on the outſide, yet they retained ſo much of it within, as plainly ſhewed that they had once been red; and the whole truth ſeems to conſiſt in this, that though the ſubſtance of the *coral* is permanent, the colour is not ſo.

Beſide the great variety of *corals* found in their natural ſtate, in the ſea, we find great numbers buried in the earth, and immerſed even in the bodies of ſolid ſtones, and marble; of theſe many are the ſame with the ſpecies now known to us at ſea, and many differ from all the known recent ones. The foſſile *corals* are found ſometimes nearly in their own natural ſtate; but much more frequently they have their pores filled up with ſtony particles, ſo as to ſeem mere ſtones. Thoſe which are not reducible to any of the known recent ſpecies, are probably the produce of ſeas and ſhores yet unſearched. Some naturaliſts talk of blue, green, and yellow *corals*; and we are apt to deſpiſe ſuch accounts, as knowing that all the *corals* preſerved in the cabinets, and found in the works of artiſts in all nations, are either white or red. Thoſe, indeed, which grow in deep water, are often covered completely over with a coat of a tough, gelatinous matter, reſembling glue. This is frequently coloured with thoſe elegant tinges which dye the bottom of the ſea in deep water; and they in this ſtate appear, as taken up out of the water, to be blue, green, purple, and the like. But this colour being only in the jelly that covers the plant, is not to be preſerved, but if this is rubbed off, the ſurface goes with it, and leaves the plant of its natural colour; and if the whole be attempted to be dried together, the colour vaniſhes as the moiſture evaporates, and the plant, when dried, is found only covered with a dirty yellowiſh cruſt. Marſigli, Hiſt. Phyſ. de la Mer.

Coral gives title to an officinal compoſition, called *ſyrup of coral*, ſometimes preſcribed by phyſicians; as is likewiſe the powder of *coral* finely ground, and afterwards levigated on a marble, and made up into a proper form. But there are few, except thoſe who are fond of medicines with gems in them, that make uſe of it. By means of its exceeding hardneſs, it is ſuſpected to take away with it a great deal of the levigating ſtone.

Diſpenſary writers have given us receipts for a great many preparations of *coral*, as magiſteries, tinctures, ſalts, &c. none of which enter the preſent practice.

Coral and *coralline* being the ſhells of marine animals of the POLYPE kind, poſſeſs the ſame chemical properties as the freſh ſhells of oyſters and other ſhell-fiſh, i. e. they are *calcareous* EARTHS impregnated with ſome animal principles.

Coral, *artificial*, is made of cinnabar well beaten; a layer whereof is applied on a piece of wood well dried, and poliſhed, firſt moiſtened with ſize: the whole is then again poliſhed; and for varniſh, rubbed over with the white of an egg. See Grotto.

Coral *fiſhery*. The time for fiſhing *coral* is from April to July: the places are the Perſian Gulf, Red Sea, coaſts of Africa towards the Baſtion of France, the iſles of Majorca and Corſica, and the coaſts of Provence and Catalonia.

The method of fiſhing is nearly the ſame in all places: that uſed at the Baſtion of France, where there is an eſtabliſhed fiſhery, under the direction of a company at Marſeilles, is as follows.

Seven or eight men go in a boat, commanded by the patron or proprietor; the caſter throws his net, if we may ſo call the machine wherewith he uſes to tear up the *coral* from the bottom of the ſea; and the other ſix manage the boat. The net is compoſed of two beams tied acroſs, with a leaden weight to preſs them down; to the beams is faſtened a great quantity of hemp looſely twiſted round, among which they mix ſome ſtrong nets. In this condition the machine is let down into the ſea; and when the *coral* is pretty ſtrongly embarraſſed in the hemp and the nets, they draw it out by a rope; which they unwind according to the depth, and which ſometimes requires half a dozen boats to draw. If the rope happen to break, the fiſhermen are in great danger of drowning. They have two machines, one for fiſhing up the *coral* where the bottom is ſmooth; and the other, called in the Provençal language the *ſalabre*, ſo conſtructed as to be employed where the bottom of the ſea is rocky and unequal.

Before the fiſhermen go out, they agree on the price of the *coral*, which is ordinarily at the rate of 4*ſ*. 6*d*. *per* pound.

When the fiſhery is over, which in a ſeaſon uſually amounts to twenty-five quintals of *coral* each boat, it is divided into thirteen parts; the patron whereof, or maſter *coraller*, has four, the caſter two, and each of the ſix companions one: the thirteenth being reſerved for the company, &c.

CORALLINES, *Corallina*, in *Natural Hiſtory*, were formerly reckoned a genus of plants, and Mr. Tournefort enumerates thirty-ſix ſpecies of them; but in the Linnæan ſyſtem they belong to the claſs of zoophytes, and are defined by modern naturaliſts to be ſubmarine plant-like bodies, that conſiſt of many ſlender finely divided and jointed branches, reſembling ſome ſpecies of moſs; or, animals growing in the form of plants, having their ſtems fixed to other bodies; theſe ſtems are compoſed of capillary tubes, whoſe extremities paſs through a calcareous cruſt, and open into pores on the ſurface. The branches are often jointed, and always ſubdivided into ſmaller branches, which are either looſe and unconnected, or joined as if they were glued together. They are diſtinguiſhed from plants by their texture and hardneſs: they alſo yield in diſtillation a conſiderable quantity of volatile ſalt, and their ſmell, in burning, reſembles that of burnt horns and other animal ſubſtances. Many of the *corallines* ſeem to conſiſt of a ſingle tube, containing a ſingle parent animal. Every branch emitted contains an offspring of this parent dependent upon it, and yet capable of producing its like in the emiſſion of a new branch. Others conſiſt of many ſuch tubes united, riſing up together, and encircling the deſerted tubes of their progenitors, whoſe exuviæ become the ſubſtratum of a riſing generation. Mr Ellis diſtributes *corallines* into the *veſiculated*, *tubular*, *celliferous*, and *articulated* kinds.

Veſiculated corallines are diſtinguiſhed by their horny hollow ramifications; moſt of them are furniſhed with little denticles on their branches, like leaves on moſſes; and at certain ſeaſons of the year they are furniſhed with ſmall bodies like bladders, proceeding from their ſtems and branches, and differing in form according to the different ſpecies. Their colour, when dry, is of a yellowiſh or pale brown, and their nature is elaſtic. They are found adhering to rocks, ſhells, and fucuſes, by ſmall root-like tubes: they recover their form in water, after having been dried; and when put into vinegar, they cauſe no effervefcence. See *Tab. of Corallines*, *fig.* 1. *a* which repreſents the ſea-tamariſk in its natural ſize, and A in which the denticles are magnified; *fig.* 2. *b*, B is the ſea-cypreſs; *fig.* 3. C *d*, C D the ſmall climbing *coralline* with well-ſhaped cups.

Tubular corallines are compoſed of a number of ſimple tubes, growing up nearly together; or of ſuch branched ones as have neither denticles nor veſicles. Theſe are horny and elaſtic like the former, and recover their original form in water. Some of them appear wrinkled like the wind-pipe, and others like the inteſtines of ſmall animals. See *fig.* 4. E.

Celliferous corallines are thoſe which appear, when magnified, to be fine thin cells, the habitations of ſmall animals connected together, and diſpoſed in a variety of elegant forms like branches. Theſe effervefce with acids. See *fig.* 5. *f* and F.

Articulated corallines conſiſt of ſhort pieces of a ſtony or cretaceous brittle matter, whoſe ſurface is covered with pores or cells, which are joined by a tough, membranous, flexile ſubſtance, compoſed of many ſmall tubes of the like nature, compacted together. The ſtony part is ſoluble in vinegar, and the other part remains entire. See *Tab.* II. *of Corallines*, *fig.* 1.

See the deſcription and drawings of a great variety of ſpecies belonging to each claſs, in Ellis's Nat. Hiſt. above cited. Beſides theſe, he enumerates other genera of marine productions; as the KERATOPHYTA, ESCHARA, SPONGES, and ALCYONIUM; all which are the neſts or matrices of ſea animals. See POLYPE. The laſt claſs of marine bodies is formed like funguſes of various figures, and with different ſorts of covering; ſome having a gritty, and ſome a callous ſkin, with a ſpongy ſubſtance in the inſide: other ſpecies are of a fleſhy ſubſtance.

Mr. Ellis intimates, that the more compact bodies, ſuch as ſtar-ſtones, brain-ſtones, petrified fungi, and the like, may be produced in the ſame manner with the ſubſtances above deſcribed: in favour of which conjecture he obſerves, that all the warmer latitudes near the ſhores abound ſo much with animal life, that no inanimate body can long remain unoccupied by ſome ſpecies.

The ancients have ſaid great things of the virtues of the common *coralline*. Dioſcorides preſcribes it for mitigating the pain of the gout, and for preventing ſtagnations of the humours in any part; he ſays nothing of its virtues againſt worms, which are what we alone eſteem it for. We give it in powder from ten grains to a ſcruple or half a dram twice a day in theſe caſes, and that with conſiderable good effect. Geoffroy, Mat. Med. vol. ii. p. 238.

CORALLINUM *arcanum*. See ARCANUM.

CORALLO-ACHATES, in the *Natural Hiſtory of the Ancients*, the name of a very beautiful ſpecies of agate, found at this time in the Eaſt Indies, but not in any plenty. It is very hard, and capable of a fine poliſh; and, when wrought, is an extremely elegant ſtone.

CORALLODENDRON, *erythrina*, *coral-wood*, in *Botany*, the name of a genus of trees, of the *diadelphia decandria* claſs; the characters of which are theſe: the flower is of the butterfly kind, compoſed of five petals; the ſtandard is ſpear-ſhaped, long, and riſes upward; the two wings are ſcarce longer than the empalement. The keel is compoſed of two petals, which are no longer than the wings. It hath ten ſtamina, which are joined below, and unequal in their length; with an awl-ſhaped germen, which afterward becomes a long ſwelling pod ending in an acute point, having one cell filled with kidney-ſhaped ſeeds. There are ſix ſpecies, natives of the warm parts of America.

Theſe plants, when they produce their flowers, are ſome of the greateſt ornaments of the ſtove; for their flowers are produced in large ſpikes, and are of a beautiful ſcarlet; but they do not often flower in the northern parts of Europe. Miller.

The inhabitants of Malabar make ſheaths of the wood, for ſwords and knives. They uſe the ſame, together with the bark, in waſhing a ſort of garments which they call ſaraſſas; and make of the flowers, the confection caryl. The leaves pulveriſed and boiled with the mature *nux Indica*, or cocoa-nut, conſume venereal buboes, and eaſe pains in the bones; bruiſed and applied to the temples, they cure the cephalea, and ulcers: mixed with the ſugar called jagra, they mitigate pains in the belly, eſpecially in women; and the ſame effect follows from the uſe of the bark levigated with vinegar, or ſwallowing the kernel ſtripped of its red pellicle. The juice of the leaves taken with oil ſergelim, mitigates venereal pains; drank with an infuſion of rice, it ſtops fluxes; made into a cataplaſm with the leaves of beteleira, it deſtroys worms in old ulcers; and worked with oil, it cures the pſora and itching. Ray.

CORALLOFUNGUS, in *Botany*, the name by which Vaillant has called the CLAVARIA, a genus of fungus, growing erect, and having every where one even and uniform ſubſtance. This is called *fungoides* by others.

CORALLOIDE *marble*. See *Coralloide* MARBLE.

CORALLOIDES, in *Botany*, a term uſed by Mr. Tournefort to expreſs a genus of muſhrooms; the diſtinguiſhing characters of which are, that they are of a fleſhy fungoſe texture, and are branched in the manner of coral.

The ſpecies of *coralloides* enumerated by Mr. Tournefort, are nineteen. Tourn. Inſt. p. 564. See CLAVARIA.

Their virtues in medicine are not much celebrated; they are ſaid, however, to be ſtrengthening and aſtringent.

CORALLOIDES is alſo uſed in a different ſenſe. Bauhine and Chabræus have made it the name of the great *dentaria heptaphyllos*; and Dillenius, that of a whole genus of the dry leafleſs moſſes. It is the *lichen* of Linnæus. See LIVER-*wort*.

It is alſo a name given by many authors to the *foſſile* CORALS. See KERATOPHYTA.

CORALLORHIZA, in *Botany*, a name given by Ruppius to the plant called by Linnæus *neottia*, and by others *nidus avis*.

CORALLUM, in *Mineralogy*, a name given by ſome of the writers on theſe ſubjects to the common PYRITES.

CORAM *non Judice*, in *Law*, is when a cauſe is brought into a court whereof the judges have no juriſdiction.

CORANA, or *Nai* CORANA, the name of a peculiar ſort of *phaſeolus*, or kidney-bean, the down of the pod of which is the couhage, or, as it is commonly called, cowitch.

CORANTO, *courant*, French; *corrente*, Italian; and *currens ſaltatio*, Latin; is a melody or air conſiſting of three crotchets in a bar, but moving by quavers, in the meaſure of $\frac{3}{4}$, with two ſtrains, each beginning with an odd quaver. The number of bars is no otherwiſe determinate than that it is a multiple of 8. Of dance tunes this is the moſt ſolemn.

CORAX *piſcis*, the *crow-fiſh*, in *Zoology*, the name of a fiſh of the *cuculus* kind, and much approaching to the ſwallow-fiſh in ſhape and figure. The bones which cover the gills in this fiſh, all terminate in ſharp thorns. See FLYING-*fiſh*.

CORBAN, a Scripture term, ſignifying an oblation, or offering, to God on the altar.

CORBAN alſo denotes a ceremony in uſe among the Mahometans, yearly performed at the foot of mount Ararat in Arabia, near Mecca. It conſiſts in flaying a great number of ſheep, and diſtributing them among the poor.

CORBEIL, in *Natural Hiſtory*, the name of a curious ſpecies of CHAMA. It is of the larger kind, and is deeply ſtriated, both longitudinally and tranſverſely; ſo that it has a ſort of reticulated ſurface, like baſket-work.

CORBEILS, in *Fortification*, little baſkets, about a foot and a half high, eight inches wide at the bottom, and twelve at the top; which, being filled with earth, are frequently ſet one againſt another upon the parapet, or elſewhere; leaving certain port-holes, from whence to fire upon the enemy under covert, without being ſeen by them.

CORBEL, in *Architecture*, the repreſentation of a baſket, ſometimes ſeen on the heads of caryatides.

The word is alſo uſed for the vaſe, or tambour, of the Corinthian column; ſo called from its reſemblance of a baſket, or becauſe it was firſt formed on the model of a baſket.

CORBEL, or CORBIL, is alſo uſed, in *Building*, for a ſhort piece of timber placed in a wall, with its end ſticking out ſix or eight inches, as occaſion ſerves, in manner of a ſhouldering-piece. The under-part of the end, thus ſticking out, is ſometimes cut into the form of a boultin; ſometimes of an ogee, and ſometimes of a face, &c. according to the workman's fancy; the upper-ſide being plain and flat. See *Tab. Architecture*, *fig.* 19.

Theſe *corbels* are uſually placed for ſtrength immediately under the ſemi-girders of a platform, and ſometimes under the ends of chamber-beams: in which latter caſe, they are commonly placed a foot or two below the beam, and have a piece of timber ſtanding upright cloſe to the wall from the *corbel* to the beam.

Corbel is alſo uſed by ſome architects for a niche, or hollow, left in walls for images, figures, or ſtatues to ſtand in.

CORBETT, in *Architecture*, is uſed by ſome, as Harris, in his Lexicon, for corbel.

CORCELET, in *Natural Hiſtory*, that part of the fly claſs which is analogous in its ſituation to the breaſt in other animals. Many have called it the breaſt in theſe alſo, but improperly; becauſe the breaſt of other animals is the place of the lungs and *trachea*; but theſe organs are in the fly claſs diſtributed through the whole body. The wings are affixed to this part of the fly claſs: and there are ſome diſtinctions of great conſequence, in regard to the arrangement and diſtribution of thoſe animals into genera. Reaumur's Hiſt. Inſect. tom. iv. p. 126.

CORCHORUS, in *Botany*. See *Jew's* Mallow.

CORCULUS, the *little heart*, in *Natural Hiſtory*, a name given by authors to a ſmall ſpecies of *cordiformis*, or heart-*ſhell*, of a roſe colour.

CORD, or Chord, an aſſemblage of ſeveral threads of hemp, cabled or twiſted together by means of a wheel.

The word comes from χορδὴ, which properly ſignifies an inteſtine, or gut, whereof *cords* may be made.

Cord *of St. Francis*, a kind of rope adorned with knots, wore by the brothers of the fraternity inſtituted in honour of that ſaint.

Some, as the Cordeliers, Capuchins, Minorites, and Recolets, wear it white; others, as the Pique-puces, black. Its deſign is to commemorate the bonds wherewith Jeſus Chriſt was bound.

Cord, *the ſociety of the*, includes a great number of people beſides religious. To obtain indulgences, they are only obliged to ſay five Paters, five Ave Maries and Gloria Patri's, and to wear this rope, which muſt have been firſt bleſſed by the ſuperiors of the order.

Cord *of wood*, a certain quantity of wood for burning; ſo called, becauſe formerly meaſured with a *cord*.

It is now meaſured between two ſtakes of wood, four feet high, and eight feet apart; and is to be four feet broad, or deep.

Cord-*wood* is properly new wood; and ſuch as, when brought by water, comes aboard a veſſel; in oppoſition to that which is floated. All burning wood, not exceeding eighteen inches circumference, is deemed *cord-wood*.

Cord, in *Geometry*, *Muſic*, &c. See Chord, and String.

Cord, *magical*, an inſtrument in great uſe among the Laplanders, and ſuppoſed to be of great virtues among them. It is a *cord* or rope, with three knots tied in it. They uſe many magical rites and ceremonies in the preparing and tying this *cord*; and when thus prepared, it is ſuppoſed to have power over the winds; and they will ſell, by means of it, a good wind, or at leaſt a promiſe of one, to a ſhip. If they untie only one of theſe knots, a moderate gale is to ſucceed; if two, it is to be much ſtronger; and if three, there is to be a ſtorm.

Cord, *umbilical*. See Umbilicalis *funiculus*.

CORDAGE, in the *Sea Language*, is uſed in general for all the ropes and cords, big and ſmall, uſed in the rigging and fitting out of a veſſel. See Cable.

The word is alſo uſed for the art of preparing and manufacturing the ropes, &c.

The *cordage* is ſaid to be *baked*, when, having paſſed a ſtove, or other hot place, it is drained of all its moiſture. *White cordage* is that not yet pitched. *Cordage pitched in the ſtove*, is that which is paſſed through hot pitch as it comes out of the ſtove. Each quintal of *cordage* may take up about twenty pounds of pitch. The *cordage* is ſometimes pitched in the thread.

When a rope is ſaid to be of *ſix inches*, it is underſtood of ſix inches around, or in circumference.

The number of ropes required in fitting out a veſſel, is almoſt inconceivable; each has its particular name and uſe.

The commerce of *cordage* is very conſiderable at Amſterdam: that made of Coningſberg hemp is valued at 20 *per cent.* more than that of Muſcovy hemp. They are ſold by weight.

The Spaniards make a kind of ſhoes of *cordage*, which they call *alpargates*, whereof they uſe great quantities at home, and yet drive a very conſiderable commerce to the Indies; ſo as to ſend away whole ſhip-loads thereof.

The Indians make their *cordage* of the bark of cocoas, maguay, and other trees.

As to the ſtrength of ropes, or *cordage*, M. Reaumur takes occaſion, in the Memoirs of the Royal Academy, to conſider the queſtion, whether a rope compoſed of ſeveral twiſts, or ſtrands, interwoven, v. gr. ten, have more ſtrength to ſuſtain a weight, than the ten twiſts would have ſeparately, placed parallel over one another; or, which is the ſame thing, whether, if each twiſt be capable of ſuſtaining the weight of a pound, the whole *cord* be able to ſuſtain more than ten?

On the one hand, 1. By virtue of the twiſting, the diameter of the rope is made larger than are thoſe of the ten twiſts together; but it is apparently by its thickneſs that a rope ſuſtains a weight, or reſiſts a fracture. 2. Twiſted ſtrands have not all, as when parallel, a vertical direction with regard to the weight: ſeveral of them, and even the greateſt part, have oblique directions, and of conſequence do not bear all the ſhare of the burden they would otherwiſe bear. In effect, they are inclined planes that are only preſſed with a part of the load.

Hence it would follow, that the ſurplus of the ſtrength of the twiſts might be employed in raiſing a larger weight.

On the other hand, it is true, that, in twiſting the ſtrands, ſome are ſtretched, and others left more looſe; and the new tenſion given the former, ſerves to weaken them, and has of itſelf the effect of a weight: thus they become leſs able to ſuſtain one ſo large. Thoſe more lax, on the contrary, evade, in ſome meaſure, the action of weight: for the action is diſtributed equally on the ten ſuppoſedly equal twiſts; and if ſome, by reaſon of their particular diſpoſition, receive leſs than their quota, the weight will act more forcibly on the reſt, and will break them firſt, as being more tenſe; after which, it will eaſily diſpatch the reſt, as not being in ſufficient number to oppoſe it.

This is the ſum of what can be urged for and againſt the twiſting: to decide between them, M. Reaumur had recourſe to experiment. The reſult was, that, contrary to all expectation, he ſtill found the twiſting diminiſhed the ſtrength of the rope: whence it is eaſily inferred, that it diminiſhes it the more, as the rope is the thicker. For inaſmuch as the twiſting diminiſhes; the more twiſting, the more diminution.

The reſiſtance or friction of *cordage* is very conſiderable; and by all means to be conſidered in calculating the power of machines. M. Amontons obſerves, in the Memoirs of the Royal Academy, that a rope is ſo much the more difficult to bend, 1. As it is ſtiffer, and more ſtretched by the weight it draws. 2. As it is thicker; and, 3. As it is to be more bent; i. e. as it is to be coiled, for inſtance, into a ſmaller ring.

The ſame author has thought of ways to prove, in what proportion theſe different reſiſtances increaſe: that ariſing from the ſtiffneſs or rigidity occaſioned by the weight which draws the rope, increaſes in proportion to the weight; and that ariſing from its thickneſs, in proportion to the diameter. Laſtly, That ariſing from the ſmallneſs of the gyres, or pulleys, about which it is to be wound, is indeed greater for ſmaller circumferences than large ones, but does not increaſe ſo much as in the proportion of thoſe circumferences.

On this footing, the loſs a machine ſuſtains by the *cordage*, being eſtimated in pounds, becomes, as it were, a new weight, to be added to that which the machine is to raiſe. This augmentation of weight will render the *cords* ſtill the more ſtiff; which exceſs is to be computed as before.

Thus we ſhall have ſeveral ſums ſtill decreaſing; which are to be added together, as in the article of friction: and it will be ſurpriſing to ſee what a ſum they will amount to. See Friction.

Where ropes are uſed in a machine, all the reſiſtance reſulting from their ſtiffneſs is to be put together; and all that occaſioned by the friction; which will make ſo conſiderable an augmentation to the difficulty of the motion, that a power which to raiſe a weight of 3000 pounds, by means of a fixed and moveable pully, needed only 1500 pounds, muſt, according to M. Amontons, have 3942 pounds, on account of the frictions, and the reſiſtance of the *cordage*.

CORDATED *leaf*, among *Botaniſts*. See Leaf.

CORDAX, in *Antiquity*, a gay ſort of dance.

CORDED, in *Heraldry*. *A croſs* Corded, ſome take for a croſs wound or wrenched about with *cords*: though others, with more probability, take it for a croſs made of two pieces of *cord*.

CORDELIER, a Franciſcan, or religious of the order of St. Francis.

The *Cordeliers* are clothed in thick grey cloth, with a little cowl, a chaperon, and cloak, of the ſame; having a girdle of rope, or cord, tied with three knots: whence the name.

The *Cordeliers* are otherwiſe called *Minor Friars*, their original name. The denomination *Cordelier* is ſaid to have been firſt given them in the war of St. Louis againſt the Infidels; wherein the *Friars Minor* having repulſed the Barbarians, and that king having enquired their name, it was anſwered, they were people *cordeliez, tied with ropes*. The *Cordeliers* are, to a man, profeſſed SCOTISTS.

CORDIA, in *Botany*, the name by which Linnæus and Plumier have called a genus of plants of the *pentandria monogynia* claſs, called *ſebeſtena* by Dillenius in his Hortus Elthamenſis. The characters are theſe: the flower hath one funnel-ſhaped petal, whoſe tube is the length of the empalement; the top is divided into four, five, or ſix parts. It hath five ſtamina, and in the center a roundiſh pointed germen, which afterward becomes a dry berry, which is globular and pointed, faſtened to the empalement, encloſing a furrowed nut with two cells. There are three ſpecies; which being natives of warm countries, are too tender to live through the winter in England, unleſs preſerved in a ſtove. A ſmall piece of the wood of the tree, being put on a pan of lighted coals, will ſend forth a moſt agreeable odour, which will perfume a whole houſe. Miller's Gard. Dict.

The fruit is accounted cooling and moiſtening; uſeful againſt ſharp thin defluxions upon the lungs, helping coughs and catarrhs, and taking off the heat of urine. Miller.

As in figure, ſo in virtue, they reſemble damſons.

CORDIAL, *Cardiac*, in *Medicine*. a comforting, or refreſhing remedy, that gives a ſudden ſtrength, and chearfulneſs, by raiſing the ſpirits when depreſſed by too much exerciſe, ſome diſeaſe, or the like cauſe.

Cordials act by giving a ſpringineſs and force to the fibres, and by ſome of their fine particles directly entering the tubuli, or pores, of the nerves and minute veſſels, and ſo mixing immediately with the fluids.

Thus, ſome of the particles of the ſpirit of lavender, when dropped into ſugar, and taken, are ſuppoſed to enter the nerves of the palate directly. Spirituous liquors, as brandy, cinnamon-water, &c. are ſuppoſed alſo to act immediately on the palate; but eſpecially on the nervous coat of the ſtomach, and not by the common current of the circulation: by which means they often prove an immediate *cordial*.

In faintings, where the circulation of the blood is languid, ſal volatile oleoſum, or ſpirit of hartſhorn dropt in cold water, and drank immediately, occaſion a contraction of the fibrillæ, the laſt by its coldneſs, and the firſt by entering the ſmall veſſels; and thus they inſtantly augment the circulation, or, in other words, prove *cordial*. In officinal compoſitions, the four *cordial* flowers are, burrage, bugloſs, roſes, and violets. The four *cordial* waters are, thoſe of burrage, bugloſs, endive, and chicory; ſome add, thoſe of *carduus benedictus* and ſcorzonera, ſcabioſa, ſorrel, &c. See CARDIAC.

CORDIAL *waters*. See *Compound* WATERS.

CORDIFORMES *conchæ*. See HEART-*ſhells*.

CORDIS *Capſula, Fovea, Mucro, Septum*. See CAPSULA, FOVEA, MUCRO, SEPTUM.

CORDON, in *Fortification*, a row of ſtones jutting out between the rampart and the baſis of the parapet, like the tore of a column. The *cordon* ranges round the whole fortreſs, and ſerves to join the rampart, which is aſlope, and the parapet, which is perpendicular, more agreeably together.

In fortifications raiſed of earth, this ſpace is filled up with pointed ſtakes, inſtead of a *cordon*.

CORDWAINERS, or CORDINERS, the term whereby the ſtatutes denominate *ſhoe-makers*.

The word is formed from the French *cordonnier*, which Menage derives from *cordouan*, a kind of leather brought from *Cordoua*, whereof they formerly made the upper-leathers of their ſhoes. Others derive it from *corde*, *rope*, becauſe anciently ſhoes were made of cords; as they ſtill are in ſome parts of Spain, under the name of *alpargates*. See CORDAGE. But the former etymology is better warranted: for, in effect, the French workmen who prepare the *cordouas* are ſtill called *cordouanniers*.

In Paris they have two pious ſocieties, under the titles of *Freres Cordonniers, Brothers Shoemakers*; eſtabliſhed by authority towards the middle of the ſeventeenth century; the one under the protection of St. Criſpin, the other of St. Criſpianus, two ſaints who had formerly honoured the profeſſion. They live in community, and under fixed ſtatutes and officers; by which they are directed both in their ſpiritual and ſecular concerns. The produce of their ſhoes goes into a common ſtock, to furniſh neceſſaries for their ſupport; the reſt to be diſtributed among the poor.

By ſtat. 1 Jac. I. c. 22. the maſters and wardens of the *cordwainers* company in London, are to appoint ſearchers and triers of leather; and leather is not to be ſold before it is ſearched and ſealed.

CORDYLA, or CORDYLUS, in *Zoology*, a name by which ſome authors call the *thynnus* or TUNNY-*fiſh*, whilſe young and ſmall. Willughby.

CORDYLUS, in *Zoology*, the name of a ſpecies of lizard, called alſo *uromaſtyx* and *caudiverba*. It is larger than the green lizard. Its tail is rounded, and is divided into a number of circles covered with ſcales, which coat them over, and cover the whole tail like the tiling of the roof of a houſe. Ray.

CORE, a diſorder incident to ſheep, occaſioned by worms in their liver, reſembling a plaiſe or flounder.

CORED *herrings*. See HERRINGS.

COREGONUS, in *Ichthyology*, the name of a genus of fiſhes of the malacopterygious, or ſoft-finned kind; the characters of which are theſe: the branchioſtege membrane on each ſide contains ſeven, eight, nine, or ten bones. The *pinna dorſi* is placed nearer the ſnout than the ventral fins are. The teeth are ſo ſmall, that in ſeveral of the ſpecies they are ſcarce diſcernible.

The ſpecies of this genus, enumerated by Artedi, are four.

The name *coregonus* is formed of κορη, *the pupil of the eye*, and γωνια, *an angle* or *corner*; and is given it from the ſingular ſtructure of this part of the eye, the pupil in this fiſh running out into an acute angular corner in the anterior part, and this regularly in all the ſpecies.

COREIA, in *Antiquity*, a feſtival in honour of Proſerpine, named *Core*, Κορη, which in the Moloſſian dialect ſignifies a beautiful woman.

COREOPSIS, in *Botany*, *tickſeed*; a genus of the *ſyngeneſia polygamia fruſtranea* claſs. Its characters are theſe: the common empalement of the flower is double; the diſk is compoſed of many hermaphrodite florets, which are tubular; theſe have each five hairy ſtamina: in their center is ſituated a compreſſed germen with two horns, which afterward becomes a ſingle orbicular ſeed. The border or rays is compoſed of eight female florets, which are tongue-ſhaped, indented in five parts; theſe have no ſtamina, but a germen like the other, and are abortive. There are five ſpecies, natives of North America. Miller.

CORETT, in *Zoology*, the name of a large Eaſt Indian fiſh, of the TUNNY kind, and ſuſpected to be no other than the common tunny. It grows to ſix or ſeven feet long. Its eyes are large, and their iriſes yellow: its tail is broad and forked, and in colour of a yellowiſh green: its belly-fins are yellowiſh, and its belly of a fine bright gloſſy blue, with a ſilvery caſt. It is generally caught with hooks, and is a very fine taſted fiſh. Ray.

CORIANDER, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it is a plant with an umbellated flower, the proper empalement of which is divided into five parts; the rays of the principal umbel are difform. The hermaphrodite flowers which form the diſk, have five equal heart-ſhaped petals, and have each five ſtamina. The germen which is ſituated under the flower, afterward becomes a ſpherical fruit divided into two parts, each having a hemiſpherical concave ſeed. There are two ſpecies; the firſt of which is the common kind, which is cultivated in the European gardens and fields for the ſeed, which is uſed in medicine: the ſecond is ſeldom found but in botanic gardens in theſe parts of Europe. They both grow naturally in the ſouthern parts of Europe.

This plant, while green, has a nauſeous diſagreeable ſmell, like bugs; but the ſeed, when dry, ſmells gratefully. It is reckoned ſtrengthening to the ſtomach, and carminative; and therefore frequently uſed with purging medicines. Matthiolus ſays it is antiſeptic. *Coriander* ſeeds have alſo a great acrimony, when freſh gathered, which they loſe with time.

It is much uſed by the brewers, both in England and Holland, to give a flavour to their ſtrongeſt beer. The ancients had a notion, that the juice of *coriander* would deprive people of their ſenſes, and even of life.

CORIARA, in *Botany*. See *Myrtle-leaved* SUMACH.

CORICEUM, in *Antiquity*, the undreſſing-room belonging to the GYMNASIUM.

CORIDOR, or CORRIDOR, in *Fortification*, a road, or way, along the edge of the ditch, without-ſide; encompaſſing the whole fortification.

The word comes from the Italian *coridore*, or the Spaniſh *coridor*.

It is alſo called the COVERT-*way*; becauſe covered with a glacis, or eſplanade, ſerving it as a parapet. The *coridor* is about twenty yards broad.

CORIDOR is alſo uſed, in *Architecture*, for a gallery, or long iſle, around a building, leading to ſeveral chambers at a diſtance from each other, ſometimes wholly incloſed, and ſometimes open on one ſide.

CORINDUM, or CARDIOSPERMUM, in *Botany*. See *Heart*-PEA.

CORINTHIAN *order*, the fourth, or, as Scamozzi and M. Le Clerc make it, the fifth, and laſt, of the orders of ARCHITECTURE. See *Tab. Archit. fig*. 27.

The invention of this order moſt of the moderns, after Vitruvius, aſcribe to Callimachus, a Corinthian ſculptor. See ACANTHUS, and COLUMN.

Villalpandus will have the Corinthian capital to have taken its origin from an order in Solomon's Temple, the leaves whereof were thoſe of the palm-tree.

The *Corinthian* order has ſeveral characters, whereby it is diſtinguiſhed from the reſt: its capital is adorned with two rows of leaves, between which riſe little ſtalks, or caulicoles, whereof the volutes are formed which ſupport the ABACUS, and which are in number ſixteen.

It has no ovolo, nor even abacus, properly ſpeaking; for the member which goes by that name, is quite different from the abacus in the other orders; being cut with a ſweep, in the middle of which is carved a roſe, or other ornament.

Vitruvius obſerves, that the *Corinthian* order has no particular ordonnance for its cornice, or any of the other ornaments of its entablature; nor does he give it any other proportions than thoſe of the Ionic order: ſo that if it appears higher than the Ionic, it is purely owing to the exceſs of the height of its capital.

He alſo makes the reſt of the entablature the ſame; and the Attic baſe he uſes indifferently for the one and the other.

But Vitruvius differs widely, in this order, from all the examples now remaining of antiquity; the moſt beautiful whereof have a particular baſe, and the whole order twenty modules in height; whereas the Ionic has but eighteen. Again, its capital is higher than that of Vitruvius by one third of a module; and its entablature, which has modillions, and ſometimes dentils together with modillions, is very different from the Ionic entablature.

Moſt of the modern architects ſet aſide Vitruvius's Corinthian ordonnance, and follow that of the ancient buildings; ſelecting from them according to their ſeveral taſtes: ſo that the modern *Corinthian* is a kind of compoſite; differing from any of the ancient buildings, and much more from Vitruvius's rules.

Vignola and M. Le Clerc make the *Corinthian* order 20 modules high; yet Serlio only makes it 18, and M. Perrault $18\frac{2}{3}$; retrenching ſomething from the 19 of Vitruvius.

The height of the ſhaft M. Perrault makes leſs than that of the Ionic, by reaſon of the exceſs of its capital.

CORINTHIAN *braſs*. See Æs *Corinthian*.

CORION, in *Botany*, a name given by ſome authors to the plant which produces the coriander ſeeds, uſed in the ſhops.

CORIS, in *Botany*, *Heathlow Pine*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath one ringent petal, whoſe tube is the length of the empalement; it is ſpread open at the top, where it is divided into five oblong ſegments, and hath five briſtly ſtamina. In the center is ſituated a round germen; the empalement afterward becomes a globular capſule, having five valves, encloſing ſeveral ſmall oval ſeeds. We have but one ſpecies, which grows in the ſouth of France. Other botaniſts have given the name of *coris* to the baſtard St. John's wort.

CORIS is alſo uſed in the Eaſt-Indies for a kind of ſhells which paſs for money. See BIA.

CORISPERMUM, in *Botany*, a genus of the *monandria digynia* claſs. This plant, as well as *coreopſis*, is by Millet called tickſeed. Its characters are theſe: the flower hath no empalement, but two compreſſed incurved petals; it hath one, two, or three ſtamina, and a compreſſed pointed germen, which afterward becomes one oval compreſſed ſeed, with an acute border. There are two ſpecies.

CORIZIOLA, in the *Materia Medica*, is a name given by ſome authors, particularly by Rhaſis, to the SCAMMONY.

CORK, the bark of a tree of the ſame name, a ſpecies of the *holm* OAK.

Its leaves are green above, and white underneath; and its fruit a real acorn, which ſeeds much more than that of the oak. It is found in great abundance in Spain, Italy, France, &c.

To take off the bark they make an inciſion from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the firſt. When ſtripped from the tree, which does not therefore die, the bark is piled up in a pond, or ditch, and loaden with heavy ſtones to flatten it, and reduce it into tables: hence it is taken to be dried; and when ſufficiently dry, put in bales for carriage. If care be not taken to ſtrip the bark, it ſplits and peels off itſelf; being puſhed up by another bark formed underneath.

The bark of *cork*, as well as the acorn, are of ſome uſe in medicine; being both reputed aſtringents, after being burnt and powdered when uſed externally; but the chief employ of the former is, to put in ſhoes, ſlippers, &c. and to ſtop bottles. The Spaniards burn it to make that kind of light black we call *Spaniſh black*, uſed by painters. Cups made of *cork*, are ſaid by ſome to be good for hectical perſons to drink out of. The Egyptians made coffins of *cork*; which being lined with a reſinous compoſition, preſerved dead bodies uncorrupted. The Spaniards line ſtone-walls with it, which not only renders them very warm, but corrects the moiſture of the air. The wood of the *cork-tree* is not only good for firing, but applicable to ſeveral other uſes.

Beſides the bark of a tree of the OAK kind, which grows in the ſouthern parts of Europe, commonly called *cork*, there is what naturaliſts call *foſſil* CORK, or *ſaber montanum*. This is a ſort of ſtone of the AMIANTHUS kind, the lighteſt of all ſtones. It is fuſible by fire, and forms a black glaſs.

CORK, or CORKING *of a ſaddle*, are pieces of wood upon which the BOLSTERS are made faſt.

This part of the ſaddle was formerly made of *cork*, whence it ſtill retains the name.

COR-MASS, the name of a grand proceſſion, ſaid to have been eſtabliſhed at Dunkirk during the dominion of Charles V. and renewed on St. John's day, the twenty-fourth of June. After the celebration of high maſs, the proceſſion, conſiſting of the ſeveral tradeſmen of the town, begins. Each perſon has a burning taper of wax in his hand; and after each company comes a pageant, followed by the patron-ſaint, uſually of ſolid ſilver, richly wrought and adorned. The companies are followed by muſic; and after the muſicians, the friars, in the habits of their order, the ſecular prieſts, and then the abbot magnificently adorned, and preceded by the hoſt. Machines likewiſe of various fantaſtical forms and devices, and as variouſly accoutred, form a part of the ſhew on this occaſion; which is deſcribed as one of the moſt ſuperb and magnificent in the world, by an eye-witneſs, in 1755. Gent. Mag. vol. xxix. p. 263.

CORMORANT, in *Zoology*, a large ſea-bird, of the order of the *anſeres*, or gooſe kind, called by authors CORVUS *aquaticus*, or the *ſea*-RAVEN. Our SHAGG is a true ſpecies of this bird.

CORN, a genus of plants, which produce a grain in an ear fit for bread, the ordinary food of man.

CORN is alſo uſed for the grain, or ſeed, of that plant, ſeparated from the ſpica, or ear.

In the commerce of grain, they diſtinguiſh three kinds; viz. *corn* properly ſo called, or WHEAT; RYE, which is a ſpecies very different, and of a quality far inferior; and a third kind reſulting from a mixture of the two, and called *maſlin*.

The farmers, indeed, rank among the number of *corns* ſeveral other grains; as barley, oats, and even pulſe; as peas, vetches, &c. which, however, they ſometimes diſtinguiſh by the denomination, *ſmaller corn*. Maiſe and ſarraſin are numbered among the *corns*; the firſt called *Turkey* and *Indian corn*, the ſecond *French*, or *black corn*. See *Buck*-WHEAT.

Europe, in every part of it; Egypt, and ſome other cantons of Africa, particularly the coaſts of Barbary; and ſome parts of America cultivated by the Europeans, particularly New England, New France, and Acadia, are the places which produce *corn*. Other countries have maiſe and rice, in lieu of it; and ſome parts of America, both in the iſlands and continents, ſimple roots; ſuch as potatoes, and manioc.

Egypt was anciently the moſt fertile of all other countries in *corn*; as appears both from ſacred and profane hiſtory. It furniſhed a good part of the people ſubject to the Roman empire, and was called the dry nurſe of Rome and Italy. England, France, and Poland, ſeem now in the place of Egypt, and with their ſuperfluities ſupport a good part of Europe.

For the firſt diſcovery and culture of *corn*, authors are much divided: the common opinion is, that in the firſt ages men lived on the ſpontaneous fruits of the earth; as acorns, and the nut, or maſt, produced by the beech; which, they ſay, took its name, *fagus*, from the Greek φαγω, *I eat*. It is added, that they had not either the uſe of *corn*, nor the art of preparing, or making it eatable. See BAKING.

Ceres has the credit of being the firſt that ſhewed the uſe of *corn*, on which account ſhe was placed among the gods; others give the honour to Triptolemus; others ſhare it between the two, making Ceres the firſt diſcoverer, and Triptolemus the firſt planter and cultivator of *corn*.

Diodorus Siculus aſcribes the whole to Iſis; in which Polydore Virgil obſerves, he does not differ from the reſt; Iſis and Ceres being, in reality, the ſame. The Athenians pretend, it was among them the art began; and the Cretans, or Candiots, Sicilians, and Egyptians, lay claim to the ſame. Some think the title of the Sicilians beſt ſupported, that being the country of Ceres: and authors add, ſhe did not teach the ſecret to the Athenians, till ſhe had firſt inſtructed her own countrymen. Others ſay, Ceres paſſed firſt into Attica, thence into Crete, and, laſt of all, into Sicily: many of the learned, however, maintain, it was in Egypt the art of cultivating *corn* firſt began; and it is certain, there was *corn* in Egypt and the Eaſt, long before the time of Ceres.

The great buſineſs of the farmer is to produce the largeſt crops he can, and, at the ſame time, to injure his land the leaſt. The common way of ſowing exhauſts the whole land, without giving half the nouriſhment that it might give the corn. Inſtead of the ſcattering way of ſowing corn by the hand, if it be let in with the drill, in ſingle, double, treble, or quadruple rows, and an interval of five feet of naked ground be left between theſe ſeries of rows, the uſe of horſe-hoeing in theſe intervals will be found to give all that the farmer requires: the crop will be larger, through ſo great a quantity of ground is left vacant, than if all were ſown over, as the plants will ſtand vaſtly thicker in the rows, and will have twenty or thirty ſtalks a-piece; and the more the ſucceſſive *crops* are planted, and the oftener the ground is hoed in this manner, the better will the plants be maintained, and every crop will be larger and larger from the ſame ground, without dunging, or without changing the ſort of plant, as is uſually neceſſary in other caſes. See HUSBANDRY, and INTERVAL.

This is very evident in ſeveral parts of the ſame field, where this ſort of huſbandry has been entered upon at different times, and ſome have a firſt crop, others a ſecond, and others a third, all growing up at the ſame time, the older worked land always invariably ſhewing the beſt crop. Dunging and fallowing are both neceſſary to recover the land to its virtue, in the common way, after a few crops. Theſe are both of them expences to the farmer; but the horſe-hoeing, when the *corn* is ſown in rows, anſwers all the intent of them, and is much leſs expenſive. It has, in ſhort, every year, the good effect of a ſummer fallow, though it every year produces a good crop, and no time, or uſe of it, is loſt to the farmer.

For the preſervation of corn: it muſt be well dried and cleaned; the granary muſt have its openings to the north or eaſt, and vent-holes a-top: for the firſt ſix months it muſt be well ſtirred every fifteen days; afterwards it will be ſufficient to ſift it once *per* month: after two years, it heats no more; nor is there any thing to fear, but from the air and foreign moiſture.

A little time after the ſiege of Metz, under Henry II. of France, in the year 1578, the duke d'Eſpernon laid up vaſt ſtores of *corn* in the citadel; which was preſerved in good plight to the year 1707, when the French king and his retinue, paſſing that way, ate bread baked thereof.

The chief thing that contributes to the preſervation of *corn* is, a cruſt which forms on its ſurface, by the germination of the grain next underneath, to the thickneſs of an inch and a half. On that at Metz people walked, without its giving the leaſt way. At Sedan was a granary cut in a rock, wherein a heap of *corn* was preſerved a hundred and ten years: it was covered with a cruſt a foot thick. At Chalons they have granaries where they ſtill keep *corn* thirty or forty years: over the heap they ſtrew quicklime, in fine duſt, to the thickneſs of three inches, and ſprinkle this over with water; whence ariſes a cruſt. The grain near the ſurface ſprouts to the height of a foot and a half: theſe the winter kills; and the heap is left untouched, till neceſſity obliges them to it. See GRANARY.

No *corn* was formerly to be tranſported, without the king's licence, except for the victualling of ſhips, and in ſome ſpecial caſes, from ſome ports only: and none may buy *corn* to ſell again, without licence from juſtices, &c. Stat. 5 Eliz. cap. 12. But now *corn*, as wheat, barley, oats, &c. may be tranſported to ſtates in amity, when they exceed not certain prices; viz. wheat, 40*s.* the quarter; barley, 24*s.* oats, 16*s.* &c. by many ſtatutes; and the exporters of it ſhall pay no duty or cuſtom, but be entitled to bounty money, or a certain allowance for exportation; viz. 5*s.* for every quarter of wheat, 2*s.* 6*d.* for barley, &c. 3 Car. I.—12, 15, and 22 Car. II.—2 W. and M. &c. The tranſportation of *corn* to foreign parts was prohibited by 8 Anne, cap. 2. See ſtat. 2. Geo. II. cap. 18. A cuſtom duty is granted on foreign *corn* imported, to be paid according to the price of Engliſh *corn*; and no foreign *corn* ſhall be tranſported from one port of Great Britain to another, on pain of forfeiture, and 20*s.* a buſhel. Stat. 5 Geo. II. cap. 12. See alſo 11 Geo. II. cap. 22.

CORN-*butterfly*. See PAPILIO.

CORN-*flag*, in *Botany*. See FLAG.

CORN, *Indian*. See MAIZE.

CORN-*meaſure*. See MEASURE.

CORN-*mill*. See MILL.

CORN-*rents*, in *Law*, denote thoſe third parts of the old rents on college leaſes, which were to be reſerved by the leſſees. Stat. 18 Eliz. cap. 6. Theſe were the invention of lord-treaſurer Burleigh, &c. for upholding the revenues of colleges.

CORN, *ſharping*. See SHARPING.

CORN, *trug*. See TRUG-*corn*.

CORN, *wood*. See WOOD-*corn*.

CORN-*bottle*, or BLUE-*bottle*, in *Botany*. See CENTAURY.

CORN-*marygold*. See *Corn*-MARYGOLD.

CORN-*parſley*. See SKIRRET.

CORN-*rocket*. See BUNIAS.

CORN-*ſallad*, a ſpecies of the valerian. See VALERIAN.

CORN-*violet*. See CAMPANULA.

CORN, in *Medicine* and *Surgery*. See CLAVUS.

CORNACHINE *powder*, a purging powder, called alſo *Earl of Warwick's powder*, and *pulvis de tribus*.

It is compoſed of equal parts of *antimonium diaphoreticum*, *diagrydium*, and cream of tartar.

CORNAGE, an ancient TENURE, the SERVICE whereof was to blow a horn, when any invaſion of the Scots was perceived.

This tenure was very frequent in the northern counties, near the Picts and the Roman walls; but by ſtat. 12 Car. II. all tenures are converted into free, and common ſocage.

An old rental calls *cornage*, *newtgeldt*, q. d. *neat-geld*. Lord Coke ſays, in old books, it is called HORNGELD.

CORNARISTS, in *Eccleſiaſtical Hiſtory*, the diſciples of Theodore Cornhert, an enthuſiaſtic ſecretary of the ſtates of Holland. He writ at the ſame time againſt the Catholics, Lutherans, and Calviniſts. He maintained that every religious communion needed reformation; but he added, that no perſon had a right to engage in accompliſhing it, without a miſſion ſupported by miracles. He was alſo of opinion, that a perſon might be a good Chriſtian, without being a member of any viſible church. Encyclop.

CORNEA *tunica*, in *Anatomy*, the ſecond coat of the EYE; ſo called from its ſubſtance reſembling the horn of a lantern, in Latin *cornu*.

It is ſituated in the fore-part; and is ſurrounded by the SCLEROTICA. It has a greater convexity than the reſt of the globe of the eye, forming, according to M. Petit, a portion of a ſphere, whoſe diameter is uſually 7, $7\frac{1}{4}$, or $7\frac{1}{2}$ lines; its chord 5, $5\frac{1}{4}$, or $5\frac{1}{2}$ lines, and its thickneſs $\frac{2}{12}$, or $\frac{3}{12}$ of a line. Others have given it the figure of the vertical part of a parabolic, or hyperbolic ſpheroid. It is compoſed of ſeveral parallel laminæ, which are nouriſhed by many blood-veſſels, ſo fine, as not to hinder even the ſmalleſt rays of light from entering the eye. It has a moſt exquiſite ſenſe, to the end that, upon the leaſt pain, the tears may be ſqueezed out of the lachrymal gland, to waſh off any filth, which, by ſticking to the *cornea*, might render it cloudy, or dim.

It is ſometimes neceſſary to make inciſions through this tunic, in order to diſcharge not only matter, but even blood, when extravaſated by external injuries, if it will not give way to the common methods of diſperſion, to prevent the ſtagnant blood from ſuppurating and deſtroying the eye. There have been inſtances when this has been done with great ſucceſs, and without any deforming cicatrix, the ſight having been alſo perfectly reſtored by it. Heiſter's Surgery, p. 427.

CORNELIAN, or CARNELIAN, CARNEOLUS, a precious ſtone, ordinarily red, bordering on orange; called alſo *ſardius*, or the ſardian ſtone.

The *cornelian* is otherwiſe called *carneola* and *corneola*: the Italians call it *corniolos*; it is ſaid, from *corno*, *horn*; on account of the reſemblance it bears to horn in its tranſparence.

The characters are, that they are ſemi-pellucid ſtones, compoſed of cryſtal with a ſmall admixture of earth, of a plain uniform ſtructure, not tubulated nor cruſtated, and uſually of one ſimple colour.

Of this genus there are three ſpecies. 1. The *red cornelian*, which is a very common ſtone among our jewellers, and is of all the degrees of red from a deep blood-colour, to that of the water in which raw fleſh has been ſoaked; and this laſt, if any can be called ſo, is its proper colour. It is uſually found in a roundiſh, or pebble-like form, and its moſt frequent ſize is between half an inch and two inches in diameter, and is found in the Eaſt and Weſt Indies, and in many parts of Europe. Our jewellers value none but the oriental, but there are very fine ones found in Sileſia and Bohemia, and on the ſhores of the Rhine. The ſecond ſpecies is the *yellow cornelian*.

cornelian. This is a ſtone, in the opinion of many, of greater value than the former, when in its moſt pure and perfect ſtate. We have it principally from the Eaſt Indies; there are ſome ſpecimens of it found in Germany, but they are neither very good nor very frequent; and in England we ſometimes meet with large maſſes of it, but they are never thoroughly coloured. The third ſpecies is the *white cornelian.* This, though leſs beautiful than either of the others, is, however, a very beautiful ſtone. It is found in the Eaſt Indies, and in many parts of Europe; France has afforded very fine pieces of it, and Germany produces it in great abundance; but the beſt next the oriental is that of New Spain.

It cuts eaſily; and we find moſt of the fine gravings of antiquity, whether in relievo, or indented, are on this ſtone.

To give theſe ſtones the greater luſtre, in ſetting them they uſually lay a piece of ſilver-leaf underneath.

The principal uſe made of *cornelians* is in ſeals; by reaſon they grave well, and take a fine poliſh.

Mr. du Fay, of the Academy of Sciences at Paris, accidentally hit upon a very fine way of turning any part of a red *cornelian* white, ſo as to form veins or clouds of that colour at pleaſure in it, by filling up the lines with white enamel in powder, then putting it over the fire to melt the enamel. Mem. Acad. Par. 1732.

The powder of the *cornelian* is preſcribed to be drank in all manner of hæmorrhages.

CORNER-*ſtones*, among *Builders*, the name of the two ſtones which ſtand one in each jaumb of a chimney. Their faces are hollowed in breadth, being a certain ſweep of a circle. The breadth of each ſtone is equal to that of the jaumb, and their height reaches from the hearth to the mantle-tree.

Corner-ſtones are commonly made of Ryegate or fire-ſtone.

Corner-*teeth*, are thoſe which appear in a horſe when he is coming five years old. See Age.

CORNET, Cornu, a horn, or muſical inſtrument, uſed by the ancients in their wars.

Vegetius informs us, that the legions had trumpets, *cornets*, and buccinæ; that when the *cornets* ſounded, only the enſigns regarded; none of the ſoldiers: that when the enſigns were to march alone without the ſoldiers, the *cornet* alone was ſounded: as, on the contrary, when the ſoldiers were to move without the enſigns, the trumpets alone were ſounded: that the *cornets* and buccinæ ſounded the charge and retreat; and the *cornets* and trumpets during the courſe of the battle.

This inſtrument was alſo uſed in eccleſiaſtical harmony to ſupply the acuter ſounds. See *Tab. Muſic, fig.* 2. The baſs of this is the serpent.

Cornet is alſo the name of one of the compound ſtops of an organ, in which five pipes are made to ſpeak at the touch of a ſingle key.

Cornet, in *Conchyliology*, a name given by ſome French writers to a genus of ſhells, called by others *cuculli*, and by the generality of writers volutæ.

Cornet, in *Farriery*, an inſtrument uſed in bleeding horſes.

Cornet, or Coronet, is ſometimes uſed to denote the loweſt part of the paſtern of a horſe round the coffin.

Cornet, in *Modern War*, denotes an officer in the cavalry, who bears the enſign, or colours, of a troop.

The *cornet* is the third officer in the company, and commands in the abſence of the captain and lieutenant. He takes his title from his enſign, which is ſquare, and is ſuppoſed to be called by that name, from *cornu*; becauſe placed on the wings, which form a kind of points, or horns, of the army.

Others derive the name from *coronet*; alleging, that it was the ancient cuſtom for theſe officers to wear coronets, or garlands, on their heads.

CORNICABRA, in *Botany*, a name by which the Spaniards call the turpentine-tree. The name is founded on the ſingular production of this tree, in form of a horn or pod. This is not the fruit of the turpentine-tree, as has been ſuppoſed by ſome; but it is a mere excreſcence, of the nature of the galls on the leaves and ſtalks of other trees and plants, and is inhabited by ſmall inſects of the puceron kind.

CORNICHE, Cornish, or Cornice, in *Architecture*, the uppermoſt member of the entablature of a column; or that which crowns and finiſhes the order.

The word is formed from the Latin *coronis*, *a crowning*.

The *corniche* is the third grand diviſion of the trabeation, commencing with the freeze, and ending with the cymatium.

The *corniche* is different in the different orders: in the Tuſcan order it is the moſt plain. Vignola makes it to conſiſt of an ovum, or quarter-round; an aſtragal, or baguette; a reglet, or fillet; a larmier, and a talon.—See *Tab. Archit. fig.* 24.

In the Doric, he uſes capitals to the triglyphs of the freeze with their bandelettes, a talon, mutules, or dentils; a larmier, with its guttæ underneath, a talon, fillet, cavetto, and reglet. See *Tab. Archit. fig.* 25.

In the Ionic, the members are in moſt reſpects the ſame as in the Doric; except that they are frequently enriched with carving, and there are always dentils. See *Tab. Archit. fig.* 26.

In the Compoſite there are dentils; its mouldings are carved, and there are channels under the foſſit. See *Tab. Archit. fig.* 28.

The Corinthian *corniche* is the richeſt; and is diſtinguiſhed by having both modillions and dentils: contrary to the opinion of Vitruvius, who looks on thoſe two ornaments as incompatible; and of M. Le Clerc, who regards the dentils as peculiar to the Ionic. See *Tab. Archit. fig.* 27.

For the heights and projectures of the corniches in the ſeveral orders. Goldman makes the height of the Tuſcan $1\frac{1}{7}$, and its projecture $2\frac{2}{5}$, modules; the height of the Doric $1\frac{1}{3}$, its projecture $2\frac{2}{5}$; height of the Ionic $1\frac{3}{5}$, its projecture $2\frac{2}{5}$; height of the Compoſite $1\frac{3}{5}$, projecture $2\frac{13}{30}$; height of the Corinthian $1\frac{2}{5}$, projecture $2\frac{13}{30}$. See a table of the meaſures of the ſeveral parts of the *corniche* in the different orders, under Column.

Corniche, *architrave*, is that immediately contiguous to the architrave; the freeze being retrenched.

Corniche, *mutilated*, is that whoſe projecture is omitted, or elſe interrupted, right to the larmier, or reduced into a plat-band with a cimatium.

Corniche, *cantaliver*, a term uſed, by the workmen, for a *corniche* that has cantalivers underneath it. See Cantaliver.

Corniche, *modillion*, a *corniche* with modillions under it. See Modillion.

Corniche, *coving*, a *corniche* which has a great caſement, or hollow, in it; ordinarily lathed and plaſtered upon compaſs, ſprokets, or brackets.

Corniche is alſo uſed, in the general, for any little projecture, either of maſonry, or joinery; even where there are no columns. Thus, we ſay, the *corniche* of a chimney, a buffet, &c.

Corniche is alſo applied to the crownings of pedeſtals. See *Tab. Archit. fig.* 24. 27. 25. 28. and 26.

This *corniche* is different in the different orders: in the Tuſcan, according to M. Perrault, it has a platband, which ſerves as a corona, and a cavetto with its fillet; in the Doric, it has a cavetto with a fillet, which bears a drip crowned with a ſquare; in the Ionic, a cavetto with its fillet above, and a drip or pendent ſquare crowned with an ogee and its fillet; in the Corinthian, an ogee with its fillet, a cymatium under the corona, which it hollows to make a drip, a corona, and an ogee, with its fillet: laſtly, in the Composite, a fillet with a ſweep over the dye, an astragal, cyma with its fillet, corona, and ogee with its fillet.

Corniche, *glacis of the.* See Glacis.

Corniche *ring* of a piece of ordnance, is that which lies next the trunnion ring; or the next ring from the muzzle backwards.

CORNICULA, an inſtrument made of horn, almoſt in form of a cupping-glaſs, except that at the more ſlender extremity there is a ſmall perforation. The wide end is laid upon emaciated parts, and a perſon applying his mouth to the perforation at the ſmall extremity, by ſuction draws out the air. In conſequence of this the part covered riſes into the hollow of the inſtrument; and by this means the nutritious juices are thought to be invited to the emaciated part. Hildanus, cent. 1. obſ. 80. relates a cure performed by this means, and gives a figure of the inſtrument. Tulpius, lib. iii. obſ. 49. gives another inſtance of a cure performed by this means.

This inſtrument was by the ancients eſteemed a ſpecies of cupping-glaſs.

CORNICULARIS *proceſſus*, the proceſs, or knob, of the ſhoulder-bone; thus called, as reſembling the figure of a crow's beak.

CORNICULARIUS, in *Antiquity*, an officer in the Roman army, whoſe buſineſs was to aid and aſſiſt the military tribune in quality of lieutenant.

The *cornicularii* went the rounds in lieu of the tribune, viſited the watch, and were nearly what the aids major are in the French army.

The denomination *cornicularius* was given them from a little horn, called *corniculum*, which they uſed in giving orders to the ſoldiers: though Salmaſius derives it from *corniculum*, the creſt of an head-piece; it being an obſervation of Pliny, that they wore iron or braſs horns on their helmets; and that theſe were called *cornicula*. In the *Notitia Imperii* we find a kind of ſecretary, or regiſter, of the ſame name. His buſineſs was to attend the judge, and enter down his ſentences and deciſions.

The critics derive the word, in this ſenſe, from *corniculum*, a little horn to put ink in.

CORNICULATE *flowers*. See FLOWER.

CORNICULATE *plants* are ſuch as, after they have blown into flower, produce many diſtinct and horned pods, or ſeed-veſſels, called *ſiliquæ*; for which reaſon, the plants are alſo, by ſome, denominated *ſiliquous plants*.

Such are, the *ſedum*, or *ſempervivum*, *telephium*, *juncus floridus*, *helleborus niger*, *pæonia*, *caltha paluſtris*, *althæa lutea*, &c.

CORNISH. See CORNICHE.

CORNISH *chough*, in *Zoology*. See CORACIAS.

CORNISH *diamond*, a name given by many people to the CRYSTALS found in digging the mines of tin in Cornwall. Theſe cryſtals are of the nature of the Kerry-ſtone of Ireland, but ſomewhat inferior to it: they are uſually bright and clear, except toward the root, where they are coarſe and foul, or whitiſh. They are uſually found in the common form of an hexangular column, terminated at each end by an hexangular pyramid.

CORNISH *ring*, or *aſtragal of a gun*, is the ſmall ring near the muzzle.

CORNISH, or *Britiſh Language*. Some remains of this language were met with in Cornwall, ſo lately as the year 1768. See Archæol. vol. iii.

CORNISH *hug*. See HUG.

CORNIX, in *Ornithology*. See CORVUS and CROW.

CORNU *Ammonis*, in *Natural Hiſtory*, an extraordinary kind of ſtone, ſome of which in vinegar, juice of lemons, &c. have a motion like that of an animal.

It is rough, knotty, of an aſh-colour, and twiſted in manner of a ram's horn; ſuch as thoſe wherewith the ancients repreſented Jupiter Ammon; whence its name.

It is diſputed, among naturaliſts, whether it be a native foſſil, a *nautilus*, or a rock-plant? Camerarius maintains the firſt; urging, that it is frequently dug out of the tops of mountains; and that it is ſeldom found near the ſea-ſhore.

Dr. Woodward aſſerts it a ſhell, and of the number of the nautili, formed in the ſea, and carried thence, by the waters of the deluge, into the countries whence it is dug. He argues, that, if it be rarely found on the ſea-coaſts, it is becauſe ſhells and other bodies lying in the bottom of the ſea, as moſt kinds of the *cornua Ammonis* muſt do, are only to be torn thence, and driven aſhore by tempeſts: but the moſt violent tempeſts never move the bottom of the ſea, as the divers have put paſt doubt; ſo that it is no wonder if none of theſe *cornua* be thrown up: but in the overturning of the earth by the deluge, theſe, with a thouſand more productions of the ſea, might be thrown from the bottom of the waters to the places where they are now found.

The *cornua Ammonis* are of different thickneſſes and lengths; ſome of them weigh twenty pounds. They are found in ſeveral places in Germany, and elſewhere. From ſome experiments that have been made, ſome of them are found to contain a little quantity of gold, which ſinks to the bottom upon pounding them ſmall, and ſtirring them in a running water, till all the earthy parts be carried off. Mr. Beaumont's account of them is to be ſeen in the Phil. Tranſ. N° 129. See SNAKE-*ſtones*.

CORNU *cervi*, *hartſhorn*, in *Medicine*, makes one of the TESTACEOUS powders. See *Hart's* HORN.

Among chemiſts, the ſame name is uſed for the mouth of an alembic.

CORNUA *uteri*. See UTERUS, and WOMB.

CORNUCOPIA, among the *Ancient Poets*, a horn, out of which proceeded plenty of all things; by a particular privilege which Jupiter granted his nurſe, ſuppoſed to be the goat Amalthea.

The real ſenſe of the fable is this: that in Lybia there is a little territory ſhaped not unlike a bullock's horn, exceeding fertile, given by king Ammon to his daughter Amalthea, whom the poets feign to have been Jupiter's nurſe.

In *Architecture*, and *Sculpture*, the *cornucopia*, or horn of plenty, is repreſented under the figure of a large horn, out of which iſſue fruits, flowers, &c. On medals, F. Joubert obſerves, the *cornucopia* is given to all deities, genii, and heroes.

CORNUCOPIÆ, in *Botany*, the name of one of the ſpecies of the graſs kind, which, in the Linnæan *Syſtem of Botany*, makes a diſtinct genus of plants, of the *triandria digynia* claſs: the characters of which are, that the cup is a common perianthum of one leaf, very large, and made in the faſhion of a funnel, indented at the edge, and obtuſe, and ſomewhat erect, and ſpread open. The glume has two valves, and contains only one flower: the valves are oblong, obtuſely pointed, and equal in ſize. The flower is compoſed of a ſingle valve, in figure and ſituation much reſembling the valves of the cup. The ſtamina are three capillary filaments, and the antheræ are oblong. The germen of the piſtil is of a turbinated form: the ſtyles are two in number, and very ſlender: the ſtigmata are fibroſe. The flower contains the ſeed, which is ſingle, of a turbinated form, and convex on one ſide, and plain on the other.

CORNUS, in *Botany*. See *Cornelian* CHERRY.

CORNUTA, in *Ichthyology*, a name given by Geſner and others to the fiſh called alſo *lyra*, and *lyra altera* by others. It is of the *trigla* kind, and is diſtinguiſhed by Artedi by the name of the *trigla*, with many *cirri*, and with an octagonal body.

CORNUTIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower has one petal, with a cylindrical tube, which is divided into four parts at the top. It hath four ſtamina, two of which are longer than the tube, and the other ſhorter. In the center is ſituated a roundiſh germen, which afterward becomes a globular berry, ſitting upon the empalement, and encloſing ſeveral kidney-ſhaped ſeeds. There is but one ſpecies, a native of the Weſt Indies.

CORNUTUM *argumentum*. See DILEMMA.

CORNUTUS *piſcis*, in *Zoology*, a name given by Mr. Ray to the fiſh commonly called by the Dutch in the Eaſt-Indies, where it is very common, *hoorn viſch*. It has a horn of a very ſingular kind in the back part of its head, or beginning of its back, and two others on the belly: theſe are crooked, and very brittle. They ſeem much of the nature of the ſpines, which ſeveral fiſh have placed before their back and belly fins; and it is dangerous to be wounded by them, the wound being generally very difficult of cure, eſpecially if any part of the horn or ſpine is left in it, which, from the brittleneſs of thoſe ſubſtances, is generally the caſe. See *Tab. of Fiſh*, N° 66.

COROCORO, in *Zoology*, the name of a Braſilian fiſh, ſomewhat reſembling the CORACINUS of the Mediterranean. It has a ſinus in the back, in which, at pleaſure, it can bury the fins. Marggrave's Hiſt. Braſil.

CORODIO *habendo*, a writ, whereby to exact a *corody* of an abbey or religious houſe.

CORODY, CORRODY, or CORREDY, in *Law*, (*corrodium*, from *corrodo*, alſo *conredium* and *corredium*) a ſum of money, or allowance of meat, drink, and cloathing, due to the king from an abbey, or other houſe of religion, whereof he is the founder, towards the reaſonable ſubſiſtence of any ſervant he thinks fit to beſtow it on.

The difference between a *corody* and penſion is ſaid to be, that a *corody* is allowed towards the maintainance of any of the king's ſervants in an abbey; but a penſion is given to one of the king's chaplains, for his better maintenance, till he may be provided with a benefice. See Fitzherb. Nat. Br. fol. 250. who ſets down all the *corodies* and penſions certain, that abbeys, when they ſtood, were bound to perform to the king.

COROLLA, among *Botaniſts*, is the moſt conſpicuous part of a flower. It expreſſes the coloured, tender part, which ſurrounds the organs of generation. The parts it is compoſed of are called *petals*; if it conſiſt only of one piece, it is called *monopetalous*; if of more, it is ſaid to be *dipetalous*, *tripetalous*, *tetrapetalous*, and ſo on, as it conſiſts of two, three, four, or more parts. See PETAL, &c.

COROLLARY, or CONSECTARY, in *Mathematics*, is uſed for a conſequence drawn from ſome propoſition already advanced or demonſtrated: as if from this theorem, *That a triangle which has two equal ſides, has alſo two equal angles*, this conſequence ſhould be drawn, *that a triangle, which hath the three ſides equal, has alſo its three angles equal.*

COROLLISTÆ, among *Botanical Authors*. See BOTANY.

COROLLULA, among *Botaniſts*, a term uſed to expreſs thoſe little partial flowers, which together conſtitute the whole compound ones. They are of two kinds, the tubulated, and ligulated; the former are always furniſhed with a campanulated limb, divided into four or five ſegments: the latter, or ligulated *corollulæ*, have a flat linear limb, terminated by a ſingle point, or by a broader extremity, divided into three or five ſegments.

CORON, a Jewiſh liquid meaſure, ſuppoſed to be the ſame with the HOMER.

CORONA, in *Anatomy*, is that edge of the *glans* of the *penis* where the *preputium* begins.

CORONA, *crown*, or *crowning*, in *Architecture*, a large, flat, maſſive member of the corniche; ſo called, becauſe it crowns not only the corniche, but the entablature, and the whole order. See *Tab. Archit. fig.* 9.

The French call it *larmier*, our workmen the *drip*, as ſerving, by its great projecture, to ſcreen the reſt of the building from the rain.

Some Latin authors call it *ſupercilium*; but that, as it ſhould ſeem, by miſtake for *ſtillicidium*. Certain French writers call it *mouchette*; and certain Latin ones, *mentum*, *chin*; from its keeping off the weather from the parts underneath.

Some call it abſolutely the *corniche*, as being the principal member thereof. Vitruvius frequently uſes the word *corona* for the whole corniche.

The *corona* is itſelf crowned, or finiſhed with a reglet, or fillet. There are ſometimes two *coronas* in a corniche; as in the Corinthian of the Rotundo.

Corona, in *Optics*, ſignifies a luminous circle, generally coloured, round the ſun, moon, or largeſt planets. See Halo.

Corona *Borealis*, or *Septentrionalis*, *Northern Crown*, or *Garland*, in *Aſtronomy*, a conſtellation of the northern hemiſphere; whoſe ſtars in Ptolemy's Catalogue, in Tycho's and in Hevelius's, are 8; in the Britannic Catalogue 21. Their order, names, longitudes, latitudes, magnitudes, &c. are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude.
			°	′	″	°	′	″

Corona, among *Botaniſts*, expreſſes any thing growing on the head of the ſeed. The *coronæ* of ſeeds are of various kinds; ſometimes ſimple, conſiſting only of a dentated membrane; ſometimes pappoſe, conſiſting of downy matter, which in ſome caſes is immediately fixed to the ſeeds; in others it has a pedicle growing from it. Sometimes the *coronæ* are compoſed of ſimple filaments, and ſometimes they are ramoſe.

Corona *clericalis*. See Crown, and Coif.

Corona *Æthiopica*, in *Natural Hiſtory*, the name of a ſea-ſhell of the dolium, or *concha globoſa* kind.

Corona *imperialis*, in *Botany*. See Crown *imperial*.

Corona *imperialis*, in *Conchyliology*, a name given by authors to a kind of voluta, differing from the other ſhells of that family, by having its head ornamented with a number of points, forming a ſort of crown.

There are four ſpecies of this ſhell found in the cabinets of the curious.

Coronæ, *Lucida*. See Lucida, and Corona *Borealis*.

Coronæ *jus*. See Jus.

Coronæ *placitorum cuſtos*. See Custos.

Corona *ſolis*, in *Botany*. See Sun-*flower*.

Corona *ſolis Americana*, the name of a marine inſect. See American, &c.

CORONALE *os*, in *Anatomy*, the bone of the forehead; called alſo *os* frontis, *os oppis*, and *verecundum*.

CORONALIS, denotes the firſt suture of the cranium, or ſkull.

The *coronal* ſuture reaches tranſverſly from one temple to the other; and joins the *os frontis*, with the *oſſa parietalia*. See *Tab. Anat.* (*Oſteol.*) *fig.* 1. *lit. g.* and *fig.* 2. *lit. h.*

It is open, the breadth of a finger or two, in the middle, in young children, but grows cloſer with age; though ſometimes by convulſion fits, or a bad conformation, it not only cloſes in children, but the edges ſhoot over one another; which is what the women call *head-mould-ſhot*; after which they ſeldom live long.

CORONARIA *vaſa*, Coronary *veſſels*, the arteries and veins which ſurround the heart to nouriſh and ſupply it with blood, &c. See *Tab. Anat.* (*Splanch.*) *fig.* 12. *lit. cc.*

Coronary *arteries*, are two arteries ſpringing out of the *aorta*, before it leaves the *pericardium*; and ſerving to carry the blood into the ſubſtance of the heart.

They are called *coronary*, becauſe of their ſpreading into branches, and encompaſſing the baſis of the heart, in manner of a crown, or garland. In their progreſs they ſend out ſeveral branches lengthwiſe of the heart; and, as Ruyſch obſerves, to the auricles, and into the very ſubſtance of the heart: after encompaſſing the baſis, and meeting again, they inoſculate with each other.

Coronary *ligament* unites the radius with the cubitus.

Coronary *vein*, is a vein diffuſed over the exterior ſurface of the heart. It is formed of ſeveral branches ariſing from all parts of the viſcus, and terminates in the vena cava, whither it conveys the remains of the blood brought by the *coronary* arteries.

At its riſe out of the heart, there is a valve to hinder the reflux of the blood; firſt diſcovered by B. Euſtachio, a native of San Severino.

Coronary, *ſtomachic*, is a vein inſerted into the trunk of the ſplenic vein; which, by uniting with the meſenteric, forms the *vena* porta.

CORONATION. See Crown, King, and Oath.

CORONATORE *eligendo*, in *Law*, a writ, which, after the death or diſcharge of any *coroner*, is directed to the ſheriff, out of the chancery, to call together the freeholders of the county, for the choice of a new *coroner*, to certify into chancery both the election, and the name of the party elected, and to give him his oath, &c.

Coronatore *exonerando*, in *Law*, is a writ for the diſcharge of a coroner, for negligence or inſufficiency in the execution of his duty: and where coroners are ſo far engaged in any other public buſineſs, that they cannot attend the office; or if they are diſabled by old age, or diſeaſe, to execute it; or have not ſufficient lands, &c. they may be diſcharged by this writ.

CORONE, in *Anatomy*, a ſharp-pointed eminence, or proceſs of a bone. See *Tab. Anat.* (*Oſteol.*) *fig.* 2. *lit. m.* See alſo Bone.

Of theſe there are ſeveral in the body, diſtinguiſhed, according to their figures, by different names; e. gr. one of the *os petroſum*, called *ſtyloides*, as being ſloped like a bodkin: another called *maſtoides*, from its reſembling a nipple; another of the *omoplata*, called *coracoides*, as being of the figure of a crow's bill: laſtly, another of the *os ſphenoides*, called *pterygoides*, from its ſhape, which reſembles the wings of a bat.

CORONEOLA, in *Botany*, a name given by ſome authors to the *lyſimachia*, or purple willow-herb, vulgarly called with us codlins and cream.

CORONER, an ancient officer in this kingdom, ſo called, becauſe he hath principally to do with pleas of the *crown*.

There are uſually four, ſometimes ſix, and ſometimes fewer, in each county. They are choſen by the freeholders of the county, by virtue of a writ out of chancery; and the choice is for life, unleſs they become ſheriffs or verderors, or are diſcharged by the writ *de coronatore exonerando*, or by ſtat. 25 Geo. II. cap. 29. for extortion, neglect, or miſbehaviour.

This officer, by the ſtatute of Weſtminſter, ought to be a knight; and there is a writ in the regiſter, now obſolete, called *niſi ſit miles*, whereby it appears to be a ſufficient cauſe for removal of a *coroner* choſen, if he were not a knight, and had not a hundred ſhillings *per ann.* freehold,

freehold. This qualification, however, is now diſregarded; and perſons are choſen into this office merely for the ſake of the fees annexed to it by 3 Hen. VII. cap. 1. and 25 Geo. II. cap. 29.

Mention is made of this officer as early as the time of king Athelſtan, anno 925.

Their authority is judicial and miniſterial; judicial, where a perſon comes to a violent death, and to take and enter appeals of murder, pronounce judgment upon outlawries, &c. and to enquire of lands and goods, and eſcapes of murderers, treaſure trove, wreck of the ſea, deodands, &c. The miniſterial power is where the *coroners* execute the king's writs, on exception to the ſheriff, as being party to a ſuit, kin to either of the parties, on default of the ſheriff, &c. In their former capacity the act of one has the ſame force as if they had all joined; in the latter, their acts are void, unleſs they join. 4 Inſt. 271. 1 Plowd. 73. And the authority of *coroners* does not determine by the demiſe of the king; as that of judges, &c. doth, who act by the king's commiſſion. 2 Inſt. 174.

The lord chief juſtice of the king's bench is the ſovereign *coroner* of the whole realm, or whereſoever he abides.

There are alſo certain *ſpecial coroners* within divers liberties, as well as the ordinary officers in every county; and ſome colleges and corporations are impowered by their charters, to appoint the *coroner* within their own precincts.

Coroner *of the king's houſhold*, hath an exempt juriſdiction within the verge, and the *coroner* of the county cannot intermeddle within it; as the *coroner of the king's houſe* may not intermeddle in the county, out of the verge. 2 Hawk. 45. If an inquiſition be found before the *coroner* of the county, and the *coroner* of the verge, where the homicide was committed in the county, and ſo it is entered and certified, it will be error. 4 Rep. 45. But if a murder be committed within the verge, and the king removes before any indictment be taken by the *coroner of the king's houſhold*; the *coroner* of the county, and the *coroner of the king's houſe*, ſhall enquire of the ſame: and according to Sir Edward Coke, the *coroner* of the county might enquire thereof at the common law. 2 Hawk. 45. 2 Inſt. 550. If the ſame perſon be *coroner* of the county, and alſo *of the king's houſe*, an indictment of death taken before him as *coroner*, both *of the king's houſe*, and of the county, is good. 4 Rep. 46. 3 Inſt. 134. See ſtat. 33 Hen. VIII. 12 Parl. 1 & 3.

Coroner *of London*, is eligible by the mayor and commonalty of the city, and no other *coroner* has any power there.

Coroner, *court of*. See Court.

CORONET, in *Farriery*. See Cornet.

Coronet, in *Heraldry*. See Crown.

CORONILLA, in *Botany*, *jointed podded colutea*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: it hath a butterfly-flower, with nine ſtamina, which are united, and one ſtanding ſingle, terminated by ſmall ſummits: in the center is ſituated an oblong taper germen, which afterward becomes a taper jointed pod, encloſing oblong ſeeds. There are ſeven ſpecies.

There have been pieces of amber found, with the pinnated leaves of *coronilla* included in them, and as elegantly expanded as the moſt curious botaniſt could have expected it, for preſerving them in his hortus ſiccus Breynius gives us an account of one of thoſe pieces of amber, in which the middle part of one of theſe leaves was thus elegantly preſerved; he examined the ſpecimen with the greateſt accuracy, but could not find the leaſt mark of fraud or deceit in it, and is very particular in the deſcription of the piece, and in the diſpoſition of the leaf in it. To this it is to be added, that the *coronilla* is a ſhrub commonly wild in Pruſſia, where amber is produced. Phil. Tranſ. Nº 396.

CORONOPUS, in *Botany*. See Plantain.

COROPITÆ. See Agonistici.

CORPORA *cavernoſa*, in *Anatomy*, two ſpongious bodies, called alſo *corpora nervoſa*, and *corpora ſpongioſa*. See Cavernosa *corpora*, &c.

Corpora *olivaria*. See Olivaria *corpora*.

Corpora *pyramidalia*, are two protuberances of the underpart of the cerebellum, about an inch long; ſo called from their reſemblance to a pyramid.

Corpora *ſtriata*, two protuberances of the *crura* of the medulla *oblongata*.

Corpora *habeas*, in *Law*. See Habeas.

CORPORAL, an inferior officer in a company of foot, who has charge over one of the diviſions: he places and relieves centinels, and keeps good order in the *corps de garde*; receiving, withal, the word of the inferior rounds that paſs by his *corps de garde*. There are uſually three *corporals* in each company.

The word comes from the Italian *caporale*, which ſignifies the ſame thing; and that from *caput*, *head*, *chief*; the *corporal* being the firſt of the company.

Corporal *of a ſhip*, is an officer who hath the charge of ſetting the watch and centries, and relieving them; and who ſees that all the ſoldiers and ſailors keep their arms neat and clean: he alſo teaches them how to uſe their arms, and hath a mate under him.

Corporal *oath*. See Oath.

Corporal, **Corporale**, is alſo an ancient church-term, ſignifying the ſacred linen ſpread under the chalice in the euchariſt and maſs, to receive the fragments of the bread, if any chance to fall. Some ſay, it was pope Euſebius who firſt enjoined the uſe of the *corporal*; others aſcribe it to St. Silveſter. It was the cuſtom to carry *corporals*, with ſome ſolemnity, to fires, and to heave them againſt the flames, in order to extinguiſh them. Philip de Comines ſays, the pope made Louis XI. a preſent of the *corporale*, whereon my lord St. Peter ſung maſs.

CORPORATE *county*. See County *corporate*.

CORPORATION, a body politic, or incorporate; ſo called, becauſe the ſeveral members thereof are formed into one body; and are qualified to take, purchaſe, grant, have a common ſeal, ſue and be ſued, &c. in their joint capacity.

Theſe political conſtitutions were firſt invented and introduced, according to Plutarch, among the Romans by Numa, in order to break the force of the two rival factions of Sabines and Romans; by inſtituting ſeparate ſocieties of every manual trade and profeſſion.

A *corporation* may be eſtabliſhed three ways, viz. by preſcription, by letters patent, and by act of parliament.

Corporations are either *eccleſiaſtical*, or *lay*. *Eccleſiaſtical* are either *regular*, as abbeys, priories, chapters, &c. or *ſecular*, as biſhopricks, deanries, archdeaconries, parſonages, &c. to which add, univerſities, colleges, hoſpitals, &c. ſee Hospital, &c.

Lay corporations are again ſubdivided into *civil* and *eleemoſynary*. Of the former ſort are ſuch as are eſtabliſhed for a variety of temporal purpoſes; as thoſe of cities, towns, mayoralties, bailiwicks, companies, or communities of commerce; and for the improvement of ſcience, churchwardens, and the two univerſities. Thus the king is made a corporation, to prevent an interregnum; for on his demiſe, his ſucceſſor is in full poſſeſſion of the regal rights and dignity.

Eleemoſynary corporations are ſuch as are eſtabliſhed for the diſtribution of the free alms of the founder, as hoſpitals and colleges.

Again, a *corporation* is either ſole, when conſiſting of a ſingle perſon, as the king, a biſhop, dean, &c. or an aggregate of many; as the mayor and commonalty, dean and chapter, &c. which laſt is what the civilians call a *college*. See College, Community, City, and Charters *of community*.

Corporation *courts* are ſuch as are held in *corporations*, by preſcription, charter, or act of parliament. See Court *of Huſtings*, and *Mayor's* Courts.

Corporation *act*, is that which prevents any perſon from being legally elected to any office relating to the government of any city or *corporation*, unleſs, within a twelvemonth before, he has received the ſacrament of the Lord's ſupper, according to the rites of the church of England; and which enjoins him to take the oaths of allegiance and supremacy when he takes the oath of office; otherwiſe his election is void. Stat. 13 Car. II. ſtat. 2. cap. 1.

CORPOREAL. See Incorporeal.

Corporeal *inheritance*. See Inheritance.

Corporeal *qualities*. See Quality.

CORPOREITY, the quality of that which is *corporeal*, or has body; or that which conſtitutes or denominates it ſuch.

The *corporeity* of God was the capital error of the Anthropomorphites. Some authors reproach Tertullian with admitting a *corporeity* in the Deity; but it is manifeſt, by *body* he means no more than *ſubſtance*.

The Mahometans reproach the Samaritans at this day, with a belief of the *corporeity* of God. Many of the ancients believed the *corporeity* of angels.

Corporeity, *form of*. See Form.

CORPORIFICATION, in *Chemiſtry*, the operation of recovering ſpirits into the ſame body, or at leaſt into a body nearly the ſame with that which they had before their ſpiritualization.

CORPS, in *Architecture*, is a term borrowed from the French, ſignifying any part that projects or advances beyond the naked of a wall; and which ſerves as a ground for ſome decoration, or the like.

Corps *de bataille* is the main body of an army, drawn up for battle. See Line, and Guard.

Corps *de garde*, a poſt in an army, ſometimes under covert,

vert, ſometimes in the open air, to receive a body of ſoldiery, who are relieved from time to time, and are to watch in their turns, for the ſecurity of a quarter, a camp, ſtation, &c.

The word is alſo uſed for the men who watch therein.

It is uſual to have, beſide the *great*, a *little corps de garde*, at a good diſtance before the lines; to be the more readily advertiſed of the approach of the enemy.

CORPSE, *ſtealing of*, is not felony, but puniſhable as a miſdemeanour by indictment at common law; but if a perſon in taking up a dead body ſteals the ſhroud, or other apparel, it is felony.

CORPULENCY, in *Medicine*, the ſtate of a perſon too much loaded with fleſh and fat.

Corpulency amounts to the ſame with what phyſicians call *obeſitas*, and we popularly *fatneſs*.

Etmuller defines it to be ſuch an increaſe both of the venter and limbs, as impede the actions of the body, eſpecially motion and reſpiration.

Corpulency, or *obeſity*, Boerhaave obſerves, does not conſiſt in the ſolids of the body being increaſed, but in their being diſtended to a greater pitch by the abundance of humours collected in them.

Corpulency, or *fatneſs*, ariſes from a laudable, copious, oily, ſoft blood, containing leſs than its ſhare of ſalt.

Such a conſtitution of blood occaſioning but a feeble fermentation, there is leſs conſumed, than is made; the lymph, which ſeems to be the matter of nutrition, preſerves its viſcid conſiſtence longer; and by that means adheres the more plentifully to the divers parts of the body. Add, that there is more fat ſeparated from the blood, than can well be depoſited in the adipoſe cells. Hence the body grows very conſiderably, and the parts ſometimes diſtend to a monſtrous bulk.

Corpulency is promoted by any thing that tempers and ſoftens the blood, and renders it leſs ſharp and ſaline; ſuch is want of exerciſe and motion, an indolent life, too much ſleep, nouriſhing foods, &c. It is prevented, or removed, by the contrary cauſes; and particularly by the uſe of ſaline and acid meats, and drinks.

Corpulency is the occaſion of divers diſeaſes, and particularly the apoplexy. It was held infamous among the ancient Lacedæmonians.

Etmuller affirms, that there is no better remedy againſt exceſſive fatneſs, than *acetum ſcilliticum*. Borelli recommends the chewing of tobacco; which Etmuller however diſſuades, leſt it induce a conſumption.

Sennertus mentions a man that weighed ſix hundred pounds; and a maid, thirty-ſix years of age, who weighed four hundred and fifty. Bright of Malden, who died at the age of twenty-nine years, in 1750, weighed ſix hundred and ſixteen pounds. Chiapin Vitelli, marquis of Cerona, a noted Spaniſh general in his time, from an exceſſive *corpulency*, is ſaid to have reduced himſelf, by drinking of vinegar, to ſuch a degree of leanneſs, that he could fold his ſkin ſeveral times round him.

Caſtile ſoap, in the form of a bolus, an electary, pills, or diſſolved in a gill or more of ſoft water, from one to four drachms, taken at bed-time, is ſtrongly recommended with a view of reducing *corpulency*, in a diſcourſe on its nature, cauſes, and cure, by Malcolm Flemyng, M. D. Lond. 1760. See ABSTEMIOUS.

CORPUS, *body*, in *Anatomy*, is applied to ſeveral parts in the animal ſtructure; as *corpus calloſum*, *corpus glanduloſum*, *corpus reticulare*, &c.

CORPUS *calloſum*, is the upper part, or covering, of the two lateral ventricles of the BRAIN, appearing immediately under the proceſs of the dura-mater, below the depth of all the circumvolutions; being formed by the union of the medullary fibres on each ſide.

CORPUS *cavernoſum urethræ*. See CAVERNOSUM.

CORPUS *glanduloſum*. See PROSTATÆ.

CORPUS *pampiniforme*. See PAMPINIFORME.

CORPUS *pyramidale*. See PYRAMIDALE.

CORPUS *reticulare*. See RETICULAR *body*.

CORPUS is alſo uſed in matters of learning, for ſeveral works of the ſame nature, collected, and bound together.

Gratian made a collection of the canons of the church, called *Corpus Canonum*. The *Corpus* of the civil law is compoſed of the Digeſt, Code, and Inſtitutes. See alſo CODE, and DIGEST.

We have alſo a *corpus* of the Greek poets; and another of the Latin poets. See BODY.

CORPUS-*Chriſti day*, a feaſt held always on the next Thurſday after Trinity Sunday. It was inſtituted in the year 1264, in honour of the bleſſed ſacrament, to which alſo a college in Oxford is dedicated. We find it mentioned in 32 Hen. VIII. cap. 21. By which ſtatute Trinity-term is appointed for ever to begin the morrow after this feaſt.

CORPUS *cum cauſa*, in *Law*, a writ iſſuing out of chancery, to remove both the body, and record, touching the cauſe of any man lying in execution upon a judgment for debt, into the king's bench, &c. there to lie till he has ſatisfied the judgment.

CORPUS *cepi*. See CEPI.

CORPUS *habeas*. See HABEAS.

CORPUSCLE, in *Phyſics*, a diminutive of *corpus*, uſed to expreſs the minute parts, or particles, that conſtitute natural bodies.

Corpuſcles amount to much the ſame with what the ancients called *atoms*; and differ both from the elementary and hypoſtatical principles of the chemiſts, and the materia ſubtilis of the Carteſians.

Sir Iſaac Newton ſhews a method of determining the ſizes of the *corpuſcles*, whereof the particles that compoſe natural bodies conſiſt, from their colours.

CORPUSCULAR *philoſophy*, that ſcheme or ſyſtem of phyſics, wherein the phænomena of bodies are accounted for, from the motion, reſt, poſition, arrangement, &c. of the minute *corpuſcles*, or atoms, whereof bodies are compoſed.

The *corpuſcular philoſophy*, which now flouriſhes under the title of the *mechanical philoſophy*, is exceedingly ancient. Leucippus and Democritus were the firſt who taught it in Greece; from them Epicurus received it, and improved it, inſomuch that it came at length to be denominated from him, and was called the *Epicurean philoſophy*.

Leucippus, again, is ſaid to have received it from Mochus, a Phœnician phyſiologiſt, before the time of the Trojan war, and the firſt who philoſophized about atoms: though Gale, who borrows all profane philoſophy from the ſacred philoſophy in the books of Moſes, is of opinion that he might take the hint from the Moſaic hiſtory of the formation of man out of the duſt of the earth.

Indeed, Caſaubon takes Μοκος, or Μοχος, to be the name of a Tyrian, who among his own countrymen was called מוֹח, *Moſche*, or according to the method of writing which then obtained, Moſes: whence it is conjectured that the *Moſche*, or *Moſchus* of the Tyrians, was, in effect, the Moſes of the Hebrews.

This appears to be the ſentiment of Selden, Arcerius, &c. But the opinion of Bochart is more probable, who from Poſidonius and others, takes Mochus for an inhabitant of Sidon, and his philoſophy to be nothing elſe but a phyſiological or natural hiſtory of the creation.

After Epicurus, the *corpuſcular philoſophy* gave way to the peripatetic, which became the popular ſyſtem.

Thus, in lieu of atoms, were introduced ſpecific and ſubſtantial forms, qualities, ſympathies, &c. which amuſed the world, till Gaſſendus, Charleton, Des Cartes, Boyle, Newton, and others, retrieved the old *corpuſcularian* hypotheſis; which is now become the baſis of the mechanical, and experimental philoſophy.

Mr. Boyle reduces the principles of the *corpuſcular philoſophy* to the four following heads.

1. That there is but one catholic, or univerſal matter, which is an extended, impenetrable, and diviſible ſubſtance, common to all bodies, and capable of all forms.

This Sir Iſaac Newton finely improves on: "All things "conſidered, ſays that great author, it appears probable "to me, that God, in the beginning, created matter in "ſolid, hard, impenetrable, moveable particles; of ſuch "ſizes and figures, and with ſuch other properties, as "moſt conduced to the end for which he formed them: "and that theſe primitive particles, being ſolids, are in"comparably harder than any of the ſenſible porous bo"dies compounded of them; even ſo hard as never to "wear, or break in pieces: no other power being able "to divide what God made one in the firſt creation. "While theſe *corpuſcles* remain entire, they may com"poſe bodies of one and the ſame nature and texture in "all ages: but ſhould they wear away, or break in "pieces, the nature of things depending on them would "be changed: water and earth, compoſed of old worn "particles, and fragments of particles, would not be of "the ſame nature and texture now, with water and "earth compoſed of entire particles at the beginning. "And therefore, that nature may be laſting, the changes "of corporeal things are to be placed only in the various "ſeparations, and new aſſociations, of theſe permanent "*corpuſcles*."

2. That this matter, in order to form the vaſt variety of natural bodies, muſt have motion in ſome, or all its aſſignable parts; and that this motion was given to matter by God, the creator of all things; and has all manner of directions and tendencies.

"Theſe *corpuſcles*, ſays Sir Iſaac Newton, have not only "a vis inertiæ, accompanied with ſuch paſſive laws of "motion as naturally reſult from that force; but alſo "are moved by certain active principles; ſuch as that

" of gravity, and that which cauſes fermentation, and " the coheſion of bodies."

3. That matter muſt alſo be actually divided into parts; and each of theſe primitive particles, fragments, or atoms of matter, muſt have its proper magnitude, figure, and ſhape.

4. That theſe differently ſized and ſhaped particles have different orders, poſitions, ſituations, and poſtures, from whence all the variety of compound bodies ariſes.

CORRECTED *calendar.* See CALENDAR.

CORRECTION, in the *Manege*, is uſed for aids given with ſeverity. See CHASTISEMENTS.

CORRECTION, in *Printing*, the act of retrenching the faults in a work; or the reading, which the corrector gives the firſt proofs, to point out and amend the faults, to be rectified by the compoſitor.

The *corrections* are placed on the margin of each page, right againſt the line where the faults are found. There are different characters uſed to expreſs different *corrections*, as D or ₰, *dele*, for any thing to be effaced, or left out. When any thing is to be inſerted, the place is marked in the line with a caret ʌ, and the inſertion added in the margin. When a word, ſyllable, &c. is to be altered, it is eraſed out of the prof, and that to be put in its room written in the margin; always obſerving, if there be ſeveral miſtakes in the ſame line, that the *corrections* in the margin be ſeparated by little bars, or ſtrokes, | . If a ſpace be omitted, its place is marked with a caret, and the margin with #. If a ſpace be wrong placed, as in the middle of a word, the two parts are connected with a cu ‿ rve, and the ſame character put in the margin. If a letter be inverted, it is expreſſed on the margin with Ɔ. If any thing be tranſpoſed, it is marked thus: *The ſhorteſt* |*are the*| *follies*| *beſt*; for *the ſhorteſt follies are the beſt*; and in the margin is added *tr.* in a circle. If Roman characters are to be changed for Italic, or *vice verſa*, a line is drawn under them thus, and *Roman* or *Italic* added in the margin; if to capitals, a double line. If a word, or ſentence, is entirely omitted, the place is marked with a *caret*, and in the margin is inſerted the word *out*. If the letters of a word ſtand too far aſunder, a line is drawn under them, and in the margin is put a crooked line, or hook, thus ‿.

CORRECTION, in *Rhetoric.* See EPANORTHOSIS.

CORRECTION, in *Pharmacy.* This word has ſeveral peculiar ſenſes: and firſt, draſtic medicines, or ſuch as operate with violence, are ſaid to be corrected, when in their compoſition ſome ingredient is added, which proves a kind of check to the operation, or prevents thoſe misfortunes which they generally bring, without ſuch correcting ingredient. Thus, for inſtance, ſome carminatives, as the ſeeds of fennel or aniſe, are added to ſena leaves, which, when exhibited alone, generally excite flatulencies and gripes. The ſubſtances or ingredients thus added, with an intention to render the medicines more ſafe, are called *corrigentia*, or *correctoria*, *caſtigentia*, or *infringentia.* Secondly, medicines which operate in a ſlow and languid manner, are ſaid to be corrected, when they are ſo prepared as to accelerate or augment their operation: when, for inſtance, ſalts are mixed with evacuating medicines of a gummous or reſinous nature, that by means of being more reſolved or attenuated, they may operate more powerfully. With this intention ſalt of tartar, or *ſal polychreſtus*, are added to infuſions of ſena. Ingredients added with this view are called *adjuvantia*; and when more draſtic ſubſtances of the ſame virtues are added, in order to augment the operation of the compoſitions, theſe are called *acuentia.* Thirdly, nauſeous and ungrateful medicines are ſaid to be corrected, when they are prepared in ſuch manner as to be more agreeable and acceptable to the palate. James.

CORRECTOR *of the ſtaple*, an officer, or clerk, belonging to the ſtaple, who makes and records the bargains of merchants there made, anno 27 Edw. III. ſtat. 2. cap. 22, 23. The Romans called them *menſarii.*

CORRECTORS, in *Medicine*, ſuch ingredients in a compoſition as guard againſt, or abate, the force, or dangerous qualities, of others. See CORRECTION.

CORREGIDOR, the name of an officer of juſtice in Spain, and countries ſubject to the Spaniſh government. He is the chief judge of a town or province.

CORRELATIVE, ſomething oppoſed to another in any certain relation.

Thus, father and ſon are *correlatives*; *pater & filius ſibi mutuo reſpondent.* Light and darkneſs, motion and reſt, are *correlative* and oppoſite terms.

CORRESPONDENCE, and *Correſpondency*, denotes the relation and reciprocal adaptation of one thing to another; and alſo intercourſe and friendſhip.

CORRIDOR. See CORIDOR.

CORRIGIOLA, in *Botany*, a genus of the *pentandria trigynia* claſs, with a five-leaved calyx, five petals, and a ſingle ſeed, of a triquetrous, or three-ſided form.

CORRIVAL, a relative term, ſignifying, originally, a perſon who derived water from the ſame ſource, or ſpring, with another; by means of ſome common canal, which carried it to both their lands; and which proved the occaſion of frequent diſputes. Hence the word came to be uſed for thoſe who have the ſame pretenſions; whether to glory, to love, or the like:-but uſe has abridged the word; and we now both write and pronounce, *rival.*

CORROBORANTS. See STRENGTHENERS.

CORROBORATIVE, in *Medicine*, any thing that increaſes ſtrength, or gives new force.

The word is likewiſe frequently applied to ſuch medicines as are of uſe in particular weakneſſes; as the fluor albus, gonorrhœas, &c. Such are terebinths, &c. All cardiacs are *corroborative.*

CORRODENTIA, or CORROSIVA, in *Medicine*, corroſives, or corroding medicines.

Theſe are medicines of much uſe in ſurgery, which *corrode* whatever part of the body they are applied to.

Corroſives act by their acrimony, by which they deſtroy not only foreign ſubſtances adhering to animal bodies, but alſo the ſolids themſelves, provided they meet with any moiſture when applied to them; and particularly when confined upon the part by any adheſive plaſter, ſo as to have their action excited by the heat of the body. In the two firſt caſes they are called catharetics, in the laſt potential cauſtics. See CAUSTICS.

Corroſives are uſed for opening abſceſſes, for making iſſues, or artificial ulcers, for conſuming tubercles, and callous excreſcences; for ſeparating and extirpating corrupted parts, and cleanſing ſordid ulcers; ſometimes for ſtopping hæmorrhages. James's.

CORROSION, the act of *corroding*, or gnawing away, by little and little, the continuity of the parts of bodies.

Acids *corrode* moſt natural bodies; and arſenic only kills, becauſe it *corrodes* the bowels with its ſharp-pointed particles.

CORROSION is uſed both in *Chemiſtry*, *Medicine*, and *Natural Hiſtory*; where it ſtands for a particular ſpecies of DISSOLUTION, by an acid, or ſaline menſtruum.

What *corroſion* has peculiar to it, is, that it is moſtly deſigned for the reſolution of bodies the moſt ſtrongly compacted, as bones and metals; ſo that the menſtruums employed require an uncommon moment, or force.

Now *corroſive* liquors, whether acid or urinous, are nothing but ſalts diſſolved in a little phlegm: therefore theſe being ſolid, and conſequently containing a conſiderable quantity of matter, do both attract one another the more, and are alſo more attracted by the particles of the body which is to be diſſolved. And as their attractions at equal diſtances are proportional to their bulks, *cæteris paribus*; ſo when the more ſolid bodies are put into ſaline menſtruums, the attraction is ſtronger than in other ſolutions; and the motion, which is always proportional to the attraction, is more violent.

Hence we eaſily conceive, how they ſhould drive thoſe ſalts, like ſo many darts, into the pores of the bodies, and open and looſen the coheſion of them, though ever ſo firm. See ACID.

Again, we know, the more minute the particles of the menſtruum are, the ſooner they penetrate, and with the greater force; the motion produced by attraction being always greateſt in the leaſt corpuſcles, and next to nothing in the large ones. Add to this another advantage gained by this minuteneſs of the particles; viz. that they approach nearer the body to be diſſolved, without which the attractive force would be inſenſible. Hence, thoſe very ſalts, which, diſſolved in water, will hardly touch metals, if once turned into acid ſpirits, eaſily penetrate them: for in diſtillation, not only a greater quantity of water remains, but the ſaline bodies are ſo minutely broken and divided by the fire, as to make them more readily capable of being moved by an attractive force; and therefore ſuch a diſtilled menſtruum is much more efficacious than any ſolution of ſalt made with water.

Corroſion is performed either by immerſion or CEMENTATION, ſprinkling, trituration, or mere contact with a proper MENSTRUUM.

CORROSIVE *ſublimate of mercury.* See MERCURY.

CORRUGATOR, or CORRUGENS *ſupercilii*, a muſcle ariſing from the great canthus of the orbit of the eye, and terminating in the ſkin about the middle of the eyebrows. See EYE.

Its name declares its uſe; being formed of *con*, *together*; and *ruga*, *wrinkle.*

Some reckon this muſcle only a prolongation of the *frontales.*

CORRUGATOR *coiteri*, or *muſculus frontalis verus*, in *Anatomy.* This muſcle ariſes fleſhy from the proceſs of the *os frontis*, next to the inner or great angle of the orbit, above the joining of the *os naſi*, and ſuperior proceſs of the *os maxillare* with this bone; from thence running obliquely outward and upward, it is inſerted in the fleſhy part of the *occipito-frontalis*; ſome of its fibrillæ paſſing through into the ſkin, a little higher than the middle region of the eyebrows.

Its uſe is to ſmooth the ſkin of the forehead, by pulling it down after the action of the *occipito-frontalis*; and when it acts more forcibly, it ſerves to wrinkle the ſkin of the front between the ſupercilia; as it happens when we frown, or knit the brows.

CORRUGATORIS *ordo exterior*, in *Anatomy*, a name given by Santorini to certain *faſciculi* of the great zygomatic muſcle, running under the fleſhy part of the lower lip. See LABIUM *attollens*, and ZYGOMATICUS *major*.

CORRUGATORIS *inferior ordo*, in *Anatomy*, a name given by Santorini, and ſome others, to that muſcle of the mouth called by Albinus *orbicularis oris*; by Cowper *conſtrictor labiorum*; and by Douglas *ſphincter labiorum*.

CORRUGENT *muſcle*, the ſame as *corrugator ſupercilii*.

CORRUPTIBLE. See INCORRUPTIBLE.

CORRUPTICOLÆ, a ſect who roſe out of the Monophyſites in Egypt about the year 519, under their chief, Severus, the pretended patriarch of Alexandria.

Their diſtinguiſhing doctrine, whence they derived their name, was, that the body of Jeſus Chriſt was *corruptible*; that the fathers had owned it; and that to deny it, was to deny the truth of our Saviour's paſſion.

On the other hand, Julian of Halicarnaſſus, another Eutychian, a refugee as well as Severus, in Alexandria, maintained that the body of Jeſus Chriſt had been always incorruptible; that to ſay it was corruptible, was to make a diſtinction between Jeſus Chriſt and the Word, and by conſequence to make two natures in Jeſus Chriſt.

The people of Alexandria were divided between the two opinions; and the partiſans of Severus were called *corrupticolæ*, q. d. worſhippers of ſomething *corruptible*: ſometimes they were denominated *corruptibiles*; and the adherents of Julian *incorruptibiles*, or *phantaſiaſtæ*. The clergy and ſecular powers favoured the firſt; the monks and the people the latter.

CORRUPTION, the extinction of any thing; or the act whereby it ceaſes to be what it was.

It is an axiom in philoſophy, that *the corruption of one thing is the generation of another*.

Corruption differs from *generation*, as two contraries differ from each other.

It differs from *alteration* as a leſs from a greater, or a part from the whole: a thing being ſaid to be *altered*, when it is not ſo far changed but it may be known, and ſtill keeps its old name; both which it loſes by *corruption*.

But, as in generation, no matter is produced that did not before exiſt; ſo in *corruption*, nothing is loſt, but that particular modification which conſtituted its form, and made it to be of ſuch a ſpecies.

Dr. Drake accounts for *corruption* in animal and vegetable bodies thus: "The principle of *corruption* is, perhaps, " the ſame which in a ſtate of circulation is the princi- " ple of life, viz. the air, which is found mixed in con- " ſiderable quantities with all ſorts of fluids; as neceſ- " ſary to vegetable, as to animal life. Now this air has " two motions, viz. an expanſive one, from its natural " elaſticity, by means whereof it communicates that in- " teſtine motion which all juices have, and by which " the containing parts are gradually extended and grow; " and a circulatory or progreſſive motion, which is not " eſſential to it, but is occaſioned by the reſiſtance of the " ſolid parts of thoſe bodies, which obliges it to take " that courſe which is moſt free and open, which is " through the veſſels of animals and plants.

" Now, this courſe being ſtopped, the expanſive motion " ſtill remains, and continues to act, till, by degrees, it " has ſo far overcome the including bodies, as to bring " itſelf to an equal degree of expanſion with the exter- " nal air; which it cannot do, without deſtroying the " texture and continuity, or ſpecific degree of coheſion, " of thoſe ſolids: which is that we call a *ſtate of cor-* " *ruption*.

" This expanſive or deſtructive quality of the air in bo- " dies, may be promoted two ways; and, therefore, *cor-* " *ruption* may be accelerated in as many, viz. either by " weakening the tone or coheſion of the including parts, " and ſo facilitating the work of the air; as is the caſe " when fruit is bruiſed, which is found to corrupt much " ſooner there than in any other part: or, by extending " the expanſive force of the air itſelf, by heat, or ſome " other co-operating circumſtance; and ſo helping it to " overcome the reſiſtance the ſooner." See PUTREFACTION.

CORRUPTION *of blood*, in *Law*, an infection accruing to a man's ſtate, attainted of felony, or treaſon, and to his iſſue.

For, as he loſes all to the prince, or other lord of the fee, ſo his heirs cannot be iſſue to him, or to any other anceſtor by him; and if he were noble, or a gentleman, he, and his heirs, are thereby ignobled and degraded. See ESCHEAT.

The king's pardon cleanſes the *corruption* of blood in thoſe children born after the pardon, not in thoſe born before it; theſe latter continuing ſtill incapable of inheriting the land of their father, purchaſed before the time of the pardon

But note, there are ſeveral offences now made treaſon by act of parliament, which do not *corrupt* the blood; nor ſhall the criminal forfeit any thing thereby, beſide what he has for life. See ATTAINDER.

CORSA, in *Architecture*, the ſame with plat-band. See PLAT-*band*.

CORSAIR, a pirate, or perſon who ſcours the ſeas, eſpecially the Mediterranean, with a veſſel armed for war, without commiſſion from any prince, or power; to plunder merchant-veſſels.

The word comes from the Italian *corſare*, of *corſo*, or *à curſibus*, by reaſon of their courſes, or excurſions.

The name is commonly given to the piratical cruiſers of Barbary, who had their riſe about the beginning of the ſixteenth century. See PIRATES.

A *corſair* is diſtinguiſhed from a *privateer* in this, that the latter does it under a commiſſion, and only attacks the veſſels of thoſe at war with the ſtate whence his commiſſion is derived. The puniſhment of a *corſair* is to be hanged, without remiſſion; whereas privateers are to be treated as priſoners of war. All *corſair* veſſels are good prizes. See PRIZE.

CORSELET, a little CUIRASSE, according to ſome; and, according to others, a coat, or cover for the whole trunk, anciently worn by the pikemen, commonly placed in the front and flanks of the battle, for the better reſiſtance of the enemies aſſaults, and the ſurer guard of the ſoldiers placed behind, or within them. Vaugelas obſerves, that the ſeamen were anciently armed with *corſelets*.

CORSEPRESENT, in *Ancient Authors*, denotes a *mortuary*.

The word is formed of the French, *corps preſent*; and the reaſon of the denomination is probably this: that where a mortuary, after a man's death, became due, the beſt, or ſecond beſt beaſt was offered, or *preſented* to the prieſt, and carried along with the *corpſe*.

CORSNED *bread*, *panis conjuratus*, or *curſed bread*, a ſuperſtitious manner of trial, uſed among our Saxon anceſtors, by a piece of barley-bread, firſt execrated by the prieſt, then offered the ſuſpected criminal to be ſwallowed, by way of purgation; from an opinion that a guilty perſon could not ſwallow a piece of bread ſo accurſed, or if he did, that it would choke him.

The ceremony was accompanied with a prayer, beſeeching God, "That the criminal's jaws might be ſhut, his " throat ſo narrow, that he might not ſwallow, and that " he might caſt it out of his mouth." Du-Cange.

CORSOIDES, in *Natural Hiſtory*, a name given by ſome authors to a ſpecies of agate of a greyiſh white, full of ſlender veins of a clearer white, reſembling hairs. It is one of the German agates, and ſometimes ſeen among our jewellers, cut into tops of ſnuff-boxes, and other toys, but is not much eſteemed.

CORTES, a term purely Spaniſh, properly ſignifying the *courts*, i. e. the ſtates, or aſſembly of the ſtates, at Madrid.

CORTEX, a Latin name, denoting the BARK, or outer coat of a tree, or ſhrub.

CORTEX *aurantiorum*, the powder of *cortex aurantiorum*, ſometimes cures quartan agues. Commerc. Norinb. 1735. Hebd. 11. § 3.

CORTEX *Peruvianus*, called alſo *quinquina*, *kinkinna*, *quinaquina*, *pulvis patrum*, and popularly the *Jeſuit's bark*, is the bark of a tree, growing in the Weſt Indies, called by the Spaniards *palo de calenturas*, q. d. *fever-wood*; by reaſon of its extraordinary virtue in removing all kinds of intermitting FEVERS and agues. See CINCHONA.

The Indians commonly call it the *fuddling tree*, from the property it has of intoxicating fiſhes, when either its wood or bark is beaten, and ſteeped in the water where they are.

The tree that yields this noble ſpecific, is only found in Peru; in the province of San Franceſco de Quitto, or Quinto, near the city of Loxa; though ſome ſay it is alſo found in that of Potoſi; and F. Labat, in the iſland of Guadeloupa. The bark, while on the tree, is ſtreaked, of a whitiſh yellow without ſide, and a pale tan colour within.

The Spaniards diſtinguiſh four ſorts of this precious bark, viz. the *caſcarilla colorada*, or reddiſh bark; *amarylla*, or yellowiſh; *creſpilla*, or curling; and *blanca*, or whitiſh. The *colorada* and *amarylla* are reckoned the beſt: the *creſpilla* is the produce of the ſame ſort of tree, only growing in a cold, froſty climate, which impairs the quality of the bark, and renders it whitiſh on the outſide, and cinnamon coloured within, and unfit for medicinal uſe.

As to the *blanca*, it is procured from another ſpecies of the tree of a much larger trunk, the leaves of a lighter green colour, and the bark of a very thick ſpongious ſubſtance, whitiſh on the outſide; being withal ſo tough, as to require the force of an ax to ſlice it from the tree. When firſt cut down it is as bitter as the beſt ſort, and has then the ſame virtue in the cure of intermitting fevers; but when dry and kept any length of time it grows inſipid, and good for nothing. In reality, both ſorts are found to have much ſurer and quicker effects when green, than when dry; ſo that the Europeans only come in for the ſecond rate virtues: what is worſe, the bad ſort is in great plenty, and the good is very ſcarce, and hard to come at: for which reaſon, with a little of the fine bark ſent yearly to Panama for Europe, large quantities of the worſe ſort are uſually mixed.

The *amarylla*, or ſmall bark, which curls up like ſticks of cinnamon, and which in England is much eſteemed as being ſuppoſed to be taken from the branches of the tree, and therefore more efficacious in the cure of fevers, is only the bark of the younger trees; which being very thin curls in this manner. For the bark of the branches is never gathered: it would not compenſate the charge of cutting.

The ſeaſon for cutting the bark is in Auguſt, the only ſettled dry time in the country. After a tree has been barked, it requires eighteen or twenty years for a good bark to grow again.

Mr. Arrot, a Scots ſurgeon, who had gathered the bark in the place where it grows, and from whom we received this account, by means of Mr. Gray, at Carthagena, is of opinion, that the gathering the better ſort of bark will ſoon be at an end, or at leaſt very much reduced, partly by reaſon of its diſtance from any inhabited place, and the impenetrability of the woods where it grows, and partly by the want of Indians to cut it, whoſe race, through the cruelties of the Spaniards, is like to be totally extinct.

The moſt accurate account we have ever received of the tree which produces the *quinquina*, or Peruvian bark, is from M. de la Condamine, who, in travelling through ſome parts of America, choſe the route of Loxa, where the fineſt bark is gathered, and where the greateſt number of the trees are found; and taking inſtructions from M. de Juſſieu, as to what inquiries were moſt neceſſary to be made, informed himſelf very much at large about it. The *quinquina-tree* never grows in the plains; it is a conſtant inhabitant of the mountains, and is eaſily known from the trees among which it grows by its erect growth, and its height when of any conſiderable age, as it always carries its head above the reſt. Theſe trees are never found in clumps or cluſters together, but always ſeparate and ſingle among other kinds. They grow to a very conſiderable ſize, when ſuffered to remain long enough; ſome are as thick as a man's body, but the more uſual about nine inches in diameter.

It is very rare, however, to find any large ones at this time on the mountain where the bark is gathered, the great demand for it having made them bark all the trees, and theſe having all periſhed by it; for the old trees never recover the barking, though the young ones frequently do.

There was once an opinion, that there were certain ſeaſons to be obſerved for the gathering the bark, and that it ought always to be done in the decreaſe of the moon; but experience has ſhewed theſe to be idle opinions, and it is now gathered at all times, if the weather be dry. When the bark is taken off, it is laid in the ſun till it is perfectly dry; the omitting this circumſtance, and packing up the bark while moiſt, has occaſioned it often to become mouldy, and ſpoil; and the merchants have attributed this to the taking it off in a wrong time of the moon, when it was wholly owing to its being put into the ſkins while too moiſt.

The leaves of the *quinquina-tree* ſtand on pedicles of about half an inch long: they are very ſmooth and gloſſy, and of a beautiful green; but ſomewhat paler on the under ſide than the upper. They are perfectly ſmooth at the edges, and are of an oblong figure, pointed at the end, and rounded at that part which joins to the ſtalk. They are from two and an half to three inches in length, and from an inch and an half to two inches in breadth. The middle rib of the leaf is rounded on the upper ſide, and is uſually of a reddiſh colour, eſpecially towards the pedicle; and the whole leaf often becomes red, when perfectly mature. All the ſmall branches towards the top of the tree terminate in one or more cluſters of flowers, which, before they are open, reſemble in their ſhape, and their bluiſh grey colour, thoſe of the common lavende Mem. Acad. Scienc. Par. 1738.

When theſe open, they change their colour: each ſtalk that ſuſtains one of theſe cluſters of flowers ariſes from the ala of one of the leaves, and divides into a great number of ſmall branches, each of which is terminated by a cup divided into five parts, which ſuſtains a flower reſembling that of the hyacinth. It is compoſed of a pipe of three quarters of an inch long, which at the end is divided into five, and ſometimes into ſix ſegments. Theſe are of a beautiful deep red within, and are ſerrated round the edges in a very elegant manner. From the bottom of the tube of the flower there ariſes a white piſtil, terminated by a long green head; this ariſes above the level of the ſegments of the flower, and is ſurrounded by five ſtamina, which ſuſtains apices of a pale yellow colour: theſe remain hid within the flowers. The tube is of a dirty red, and is covered with a ſort of whitiſh down. When the flower is fallen, the cup ſwells in the middle into the form of an olive, which by degrees grows into a fruit divided into two cells, which in drying become ſhorter, and the whole fruit rounder than in its natural condition.

This fruit finally opens longitudinally into two capſules, ſeparated by a membranaceous ſeptum, and coated by a thin yellowiſh ſkin; the ſeeds are of a reddiſh colour, and in ſhape are flattiſh, and, as it were, foliaceous; they are not more than a twentieth part of an inch in diameter, and are thickeſt in the middle, becoming thinner at each ſide. The plantula ſeminalis lies in the very center of the ſeed, between two pellicles: theſe ſeeds, which reſemble in ſome degree thoſe of the aſh in miniature, are faſtened in the manner of ſo many ſcales to a placenta of an oblong figure, pointed at the two extremities, ſo as ſomewhat to reſemble a ſeed of the common oat, but that it is longer and flatter. This is joined to the ſeptum, and has on that part a longitudinal furrow; but on the other ſide is convex, and ſomewhat rough all over. Mem. Acad. Scienc. Par. 1738.

By this deſcription it appears, that they were very ignorant of the nature and characters of this tree, who, when it was firſt introduced among us, called it a ſpecies of *ſebeſten*.

The uſe of this febrifuge ſeems to have been very long known to the natives, probably as early as 1500, and their manner of taking it was by pounding the bark, and laying it to infuſe in water, and drinking the infuſion; their hatred to the Spaniards, their conquerors, made them keep it a long time a ſecret from them; and when the thing became known among the inhabitants of Loxa, it ſtill remained a ſecret to the reſt of the world, and its great value was never generally known till the year 1633; when the lady of the viceroy of Peru, the counteſs de Chinchon, being long ill of an intermittent fever, which would give way to none of the known remedies, the corregidor of Loxa ſent to the viceroy a quantity of the *quinquina* bark, which he aſſured him would cure the lady, though all other means had failed. Upon this the corregidor was ſent for to Lima, and after having given the medicine to many other perſons with ſafety and ſucceſs, the lady at length took it, and was cured. She immediately on this ſent for a large quantity of the bark, had it powdered, and herſelf diſperſed it to thoſe who had occaſion for it; whence it obtained the name of the *counteſs's powder*: but this lady being ſoon tired of the office, gave it in charge to the Jeſuits; and they continuing to give it to the ſick with the ſame ſucceſs, it then was called the *Jeſuits powder*. Theſe reverend fathers ſoon found means to ſend a quantity of it to cardinal Lugo, who diſperſed it with the ſame ſucceſs at Rome; and after him the apothecary to the college gave it gratis to the poor with the ſame good effects, and under the name of the *Jeſuits*, or the *cardinal's powder*: afterwards the better ſort were made to pay its weight in ſilver for it, to defray the expences of its importation, while the poor ſtill had it gratis. Lewis XIV. at that time dauphin of France, was cured by it of a fever, which had not given way to other medicines.

In the year 1640, the count and counteſs of Chinchon being returned to Spain, their phyſician, Juan de Vega, who brought a great quantity of it over with him, ſold it at a conſiderable price; and ſoon after this, large quantities were ſent over by the galleons; but the great demands from Europe cauſing the inhabitants of Loxa to adulterate it with other barks, it had like to have loſt part of its juſt praiſe. The *quinquina-trees* are found at this time on all that chain of mountains adjoining to Cajanuma, and in many other parts of America.

When firſt introduced, it is ſaid to have been ſold for about eight ſhillings ſterling the doſe; which great price, with the little effects found from it, by reaſon of their ignorance of the manner of preparing and preſcribing it, occaſioned its being diſuſed, till about the year 1679, that Mr. Talbor, an Engliſh practitioner in phyſic, brought it into vogue again, by the great number of cures wrought about the court and city of Paris with this powder, prepared after his manner: the ſecret whereof was ſoon after made public by the munificence of Louis XIV. who rewarded Talbor for the communication with five thouſand crowns.

The *quinquina* is ſold either in bark, or in powder: thoſe who buy it in the bark, muſt chooſe it very dry and compact; ſuch as has never been moiſtened, and which will break cloſe and ſmooth, is friable between the teeth, is eaſily pulverized, and yields a powder of a pale cinnamon colour. It has a muſty kind of ſmell, and yet ſo much of the aromatic, as not to be diſagreeable. The inferior kinds, when broken, appear woody, and in chewing ſeparate into fibres. The female bark is conſiderably thicker, whiter on the outſide, redder within, and weaker in ſmell and taſte than the former, and much inferior in medical virtue. The ſmall, fine, quilled barks, ſhagreened without, and reddiſh within, of a bitter muſty taſte, are the moſt eſteemed. For the powder, it muſt be well ſifted, and care be taken it be bought of perſons that may be truſted; it being very eaſy to ſophiſticate it, and difficult to find it out.

The *cortex* is a bitter, abſorbent, and aſtringent, or ſtyptic: from its bitterneſs, M. Reneaume obſerves it becomes fit to ſoften ſour acrimonious juices; for a ſour and a bitter make a ſweet. Again, as an abſorbent, it blunts the points of acids, and prevents their action; and, of conſequence, preſerves the fluidity of the juices, which acids would coagulate. As a ſtyptic, it muſt have earthy parts to abſorb ſeroſities, by which the parts before moiſtened, and relaxed, will contract themſelves; and, by this means, the *cortex* augments the ſpring and tenſion of the fibres. As a bitter, it warms; and it facilitates perſpiration, by warming and augmenting the fluidity of the juices. Its primary operation is that of ſtrengthening the ſolids. On theſe properties it is that its medicinal uſes are aſcertained.

Its chief uſe is in curing of agues, and intermitting fevers; for which purpoſe it is applied in all ages, and moſt conſtitutions.

Dr. Cockburn ſays, it produces this effect better than any other medicine of the ſame intention, in the ratio of 365 to 1. It is uſual to give a gentle emetic of ipecacuanha before the exhibition of the *cortex*: by thus preparing the paſſages, the *cortex* has not only more ſucceſs, but alſo is not ſubject to cauſe thoſe indiſpoſitions, viz. ſwelling in the belly, nauſeas, &c. which often ariſe when ſuch preparation is neglected.

The *cortex* muſt never be exhibited in the paroxyſm of an ague, or intermitting fever; but given in ſuch a quantity, at times, between the paroxyſms, as to prevent a return of the fit.

The *cortex*, exhibited in continual fevers, is held dangerous; and care muſt be taken, that the remiſſion of a continual fever be not miſtaken for its intermiſſion: when there is a remiſſion, it uſually happens indifferently at any time; whereas an intermiſſion happens at particular, or ſtated times.

The *cortex* is given ſeveral ways, viz. in powder, in form of electary, extract, bolus, infuſion, tincture, &c. When the ſtomach will bear it, the preparation in very fine powder is the moſt uſeful and agreeable. The arcanum Talborianum is about two ounces of the *cortex* in powder, digeſted in a ſand-heat, with about a quart of red wine: after digeſtion, the wine muſt be poured off, and two or three ounces given every three or four hours between the paroxyſms, till the intention is anſwered.

If the bark take downward, Venice treacle, diaſcordium, conſerve of roſes, terra Japonica, doſes of laudanum, &c. muſt be added to its preparations. When there happens to be an obſtruction of the menſes from the exhibition of the *cortex*, or to prevent it, it is adviſeable to add to its preparations the black hellebore, æthiops mineral, cinnabar, &c. The *cortex* is often uſed for young children in agues, by way of clyſter; and alſo applied to the wriſts, and ſoles of the feet, wrought up into a ſtiff maſs, with turpentine, Venice treacle, &c. which uſually anſwers the purpoſe.

Dr. Helvetius, phyſician to the king of France, above twenty years ago, wrote a book entirely upon the ſubject of curing agues by giving the *cortex* clyſter-wiſe; in which he pretends, that this is more ſafe, and no leſs certain, than the *cortex* given by the mouth.

Dr. Cockburn, in his Treatiſe of Sea Diſeaſes, aſſerts the contrary: he alleges, that the *cortex* given inwardly is as ſafe, and much more certain and expeditious; and notes, that we know how to remedy all the inconveniencies the *cortex* may occaſion.

Dr. Sydenham, and after him M. Reneaume, and others, have preſcribed the *cortex*, with ſucceſs, in melancholic and hyſteric affections, commonly called *vapours*.

The virtues of this medicine are at this time ſufficiently known; but the largeneſs of its doſe in the common forms of powder, or infuſion in wine or in water, are great diſadvantages; and our common method of giving it in the extract or reſin, as we prepare them, not certain, and have their inconveniency.

Mr. Geoffroy has attempted a method of giving the bark in all its efficacy, without its ill taſte, and in one third of the uſual doſe, by means of his dry extract; twenty-four grains of which, it is very certain, contains the whole efficacy of a dram of the choiceſt bark in powder. Hence it appears very evident, that when we take the bark in ſubſtance, it is only about a third part of what we are forced to ſwallow that can be of any uſe to us; and that the ſame portion is all we can expect in the virtues of any decoction or infuſion of it. Mem. Acad. Sci. Par. 1758.

The reſin of the bark is of ſuch a nature, that it is capable of being penetrated by, and ſuſpended in boiling water, poured on the ſubſtance of fine powder; and ſo long as this water retains a certain degree of heat, it remains ſuſpended and inviſible in it, and the water is of a clear browniſh colour; but when the liquor becomes cooler, the reſin can be no longer ſuſpended, the whole becomes milky, and the reſin precipitates itſelf.

Wine, which is a liquor partly aqueous, partly ſaline, and partly ſpirituous, is a menſtruum much properer to extract the virtues of the bark than mere water, as it is much more able to diſſolve the juices or ſap condenſed and inſpiſſated in the bark of the tree; and for this reaſon a ſtrong infuſion of bark in this menſtruum remains clear, and keeps the reſin ſuſpended when cold. Thus it is the fire alone which can ſuſpend the reſin in a watery infuſion of the bark; and in a vinous one, the ſpirituous and inflammable part of the liquor does the ſame thing: and as the reſin of the bark, which there is great reaſon to believe poſſeſſes all the virtues of that medicine, is wholly precipitated from watery infuſions when cold, it is plain that there can be very little dependence placed on the common clear infuſions in this menſtruum: the remaining taſte in theſe infuſions is only a faint bitterneſs, which ariſes from the gummoſe and ſaline parts of the dried juices of the bark; the whole concrete, which alone poſſeſſes the virtue of the medicine, being of the nature of thoſe bodies properly called *gum reſins*; which are but very imperfectly ſoluble in water, and of which wine is the proper diſſolvent.

Peruvian bark has been found very effectual in preventing colds. The method in which it was uſed, in a caſe mentioned in the Philoſophical Tranſactions, was, after due preparation, by bleeding or purging, to take two ounces of it every ſpring and fall. By this method, an habitual taking of cold, and a conſequent ſore throat, was cured. Phil. Tranſ. Nº 478. p. 3.

The antiſeptic power of the bark hath been abundantly evinced, and we have many accounts of its great effects in the cure of gangrenes and mortifications. See Med. Eſſ. Edinb. vol. iii. art. 5. or its Abridgment, vol. i. p. 175, ſeq. We have alſo ſeveral accounts of the good effects of this medicine in ulcers and the ſmall-pox. See Med. Eſſ. vol. v. art. 10. or Abridgment, vol. i. p 187.

The bark probably in caſes of this kind throws off by fermentation a quantity of ſubtile vapour, or *fixed* AIR, which is ſufficient to ſaturate the acrimonious matter; and even when the putrefaction has made farther advances, larger quantities of this medicine will diſcharge more of the antiſeptic vapour, which, reaching the blood, will reſtore its conſiſtence, and correct its ſharpneſs. Macbride's Eſſays, edit. 3. p. 140, &c.

Many inſtances are recorded by medical writers of the jaundice, dropſy, aſthma, and all the train of nervous diſorders, brought on in a ſurpriſingly ſhort time after an injudicious adminiſtration of the bark: among others, the curious may conſult the Med. Eſſ. Edinb. vol. iv. art. 24.

The Peruvian bark is diſcovered to be effectual in the cure of mortifications from an internal cauſe. The hiſtory of this diſcovery is: in 1715, Mr. Ruſhworth, ſurgeon in Northampton, gave it to a patient labouring under a mortification; and having afterwards other proofs of its good effects in this diſeaſe, communicated his diſcovery in 1731. Mr. Amyand ſoon tried it in ſuch caſes, and found it ſucceſsful in ſeven. Mr. John Douglas confirmed this by the hiſtory of a patient of his, which he publiſhed in 1732; and Mr. Shipton ſoon after related his ſucceſs by this medicine, to the Royal Society. Mr. Ruſhworth and Mr. Amyand confined its uſe to mortifications from an internal cauſe; the former thinks it is not proper in all caſes of that kind, particularly where there is no intermiſſion of the fever. Mr. Douglas ſeems to think it will ſucceed in all mortifications. All theſe three gentlemen gave half a dram for a doſe every fourth hour. Mr. Shipton increaſed the doſe to two ſcruples, and gave it while the fever continued. He propoſed to have it tried in nomæ, phagedenæ, herpes, or other chironion ulcers.

Some call the gentian-root the European *quinquina*, becauſe good againſt intermitting fevers.

Cortex *Winteranus*, or *Winteri*, the bark of a tree brought from the Straits of Magellan, by captain Winter, in his voyage with Sir Francis Drake, in 1567. Cluſius calls the tree, *Magellanica aromatica arbor*.

The bark is aromatic, and found of good uſe at ſea againſt the ſcurvy: half a dram of it, boiled with ſome carminative ſeeds, ſweats, and relieves ſcorbutic patients. It has alſo proved an antidote againſt a poiſonous ſort of ſeal, called a *ſea lion*, frequent in thoſe parts.

The bark ſold in the ſhops under the name of *cortex Winteranus*, or wild cinnamon, Dr. Sloane obſerves, is not the true *cortex Winteranus*; they grow on different trees, and in different countries, and their appearance is very different: yet are they ſo like in taſte, that he thinks they may be uſed as ſuccedaneums to each other. The botanical characters of this latter are theſe: the trunk is about the thickneſs of one's thigh, riſing to about twenty or thirty foot high, having many branches and twigs hanging downwards, making a very comely top. The bark conſiſts of two parts, viz. outward and inward. The outward bark is as thin as a milled ſhilling, of a whitiſh aſh or grey colour, with ſome white ſpots here and there on it, and ſeveral ſhallow furrows of a darker colour, running variouſly through it, and making it rough; its taſte is aromatic. The inward bark is much thicker than cinnamon, being equal in thickneſs to a milled crown-piece, ſmooth, of a whiter colour than the outward, of a much more biting and aromatic taſte, ſomething like that of cloves, and not glutinous like cinnamon, but dry and crumbling between the teeth. The leaves come out near the ends of the twigs, without any order, ſtanding on inch-long foot-ſtalks; they are each of them two inches long, and one inch broad near the end where broadeſt, and roundiſh, being narrow at the beginning, and thence increaſing in breadth to near its end, of a yellowiſh green colour, ſhining and ſmooth, without any inciſſures about its edges, and ſomewhat reſembling the leaves of bay or *lauroceraſus*. The ends of the twigs are branched into bunches of flowers, ſtanding ſomething like umbels, each of which has a foot-ſtalk, on the top of which is a calyx made up of ſome foliola, within which ſtand five ſcarlet or purple petala, and within them is a large ſtylus. To theſe follow ſo many cauliculated berries, of the bigneſs of a large pea, roundiſh, green, and containing within a mucilaginous pale green thin pulp, four black ſhining ſeeds, or acini, of an irregular figure.

All the parts of this tree, when freſh, are very hot, aromatic, and biting to the taſte, which is ſo troubleſome as ſometimes to need a remedy from fair water. It grows in the low-land, or ſavanna-woods, in Jamaica, Antigua, and the other Caribbee iſlands.

The bark of this tree is what is chiefly in uſe, both in the plantations of the Engliſh between the tropics, in the Weſt Indies, and in Europe, and is, without any difficulty, cured by only cutting off the bark, and letting it dry in the ſhade.

The people of the Weſt Indies uſe it inſtead of all other ſpices, being thought very good to conſume the immoderate humidities of the ſtomach, help digeſtion, expel wind, &c.

It is likewiſe, as well there as in Europe, thought a very good remedy againſt the ſcurvy, and to cleanſe and invigorate the blood, being, among the apothecaries and druggiſts of London, uſed for thoſe purpoſes under this name, though differing from the true *cortex Winteranus*, as before obſerved.

Cortex *capparis*. See CAPER.

Cortex *cerebri*, the *cortical*, or cineritious ſubſtance of the BRAIN. This is the exterior part of the brain and cerebellum; or that part immediately under the pia mater; ſo called, becauſe of its inveſting the inner or medullary part, as a bark does a tree.

The ſame is alſo called the *cineritious ſubſtance*, from its greyiſh or aſh-colour.

Archangelo Piccolomini, a Ferrareſe, firſt introduced this diviſion of the brain into *cortical* or cineritious, and medullary or fibrous ſubſtance, in the year 1526.

The *cortical* ſubſtance is more ſoft and moiſt than the medullary; and follows or attends it through all its prominences and ſinuſes. It is formed from the minute branches of the carotid arteries, interwoven in the meninges, and thence continued hither in infinitely fine ramifications.

Moſt anatomiſts, after Malpighi, agree in its being glandulous, and that the medullary parts are only a continuation thereof; Ruyſch alone excepted; who, from his admirable ſkill in injections, and the diſcoveries he has made thereby, maintains that it has nothing glandular in it; and others have ſince adopted his opinion.

CORTIN, in *Fortification*. See CURTIN.

CORTUSA, in *Botany*. See *Bear's Ear* SANICLE.

CORU, in *Botany*, *arbuto vel malo aureæ ſimilis I. B. Luſitanis herba Malabarica*. This is a dwarf-tree like the quince-tree, with leaves like it, and a yellow flower, having little or no ſmell; but Garcias makes it have leaves like thoſe of the peach-tree, and a white flower ſmelling like the *periclymenum*. The bark of the root is of a watery green, light and thin, and if broken or wounded, diſtils a copious milky juice; more ropy and viſcid than what flows from the macer; inſipid, if not a little bitteriſh, cold and drying, but more drying than cold.

The inhabitants of Malabar, both pagans and Chriſtians, make much uſe of the liquor of the green bark, though it be very ungrateful to the taſte, on account of its ſurpriſing effects in all kinds of fluxes, as in the lientery, diarrhœa, and dyſentery, from whatever cauſe they proceed. The doſe is ſeven ounces in the morning, and as many in the evening, if neceſſity require it; but becauſe the juice is bitter and unſavoury, they waſh their mouths with whey, after taking it. James.

CORVET, or CURVET, from the Italian *corbetto*, a *crow*, in the *Manege*, an AIR, reſembling the hops of a crow, in which the horſe's legs are raiſed higher than in the demi-volt; being a kind of leap up and a little forwards, wherein the horſe raiſes both his fore-legs at once, equally advanced (when he is going ſtrait forward, and not in a circle); and as his forelegs are falling, he immediately raiſes his hind-legs, equally advanced, and not one before the other: ſo that all his four legs are in the air at once; and as he ſets them down, he marks but twice with them.

This air is performed, in equal time and meaſure, by keeping the horſe in, and with a good and juſt appuy; the rider keeping himſelf ſtrait, and well ſtretched down in the ſaddle, and lifting his hand about three fingers breadth above the pommel of the ſaddle, with his body a little forward, and putting no ſtreſs on his legs.

There are three actions to be uſed in making *curvets*; theſe are to raiſe the horſe, by the action of the hand, to ſupport him while he is in the air, and to make him go forward, while he is off the ground.

Horſes that are very dull, or very fiery, are improper for *corvets*; this being the moſt difficult AIR they can make, and requiring a great deal of judgment in the rider, as well as patience in the horſe, to perform it. See Berenger's Art of Horſemanſhip, vol. ii. p. 117, &c.

Some derive the term from the Spaniſh *corvo*, ſignifying the *hock* at the hinder leg, becauſe the horſe bends his hocks, and throws his weight upon them.

CORVINA, in *Zoology*. See GUATUCUSA.

CORVINDUM *nella*. See NELLA *corvindum*.

CORVINUS *lapis*, in *Natural Hiſtory*, a name given by ſome to the *belemnites*; but by others to a very different body of a whitiſh colour, and oval figure, convex on one ſide, and concave on the other, and in the middle of the concave ſide there ariſes a tubercle: this is ſaid to be taken out of the head of a fiſh; and it is very poſſible that the authors may mean by this no other than our crab's eyes.

CORVIPETA *avis*, in *Zoology*. See GUITGUIT.

CORVO, in *Zoology*, a name by which many call the UMBRA, or *chromis* of authors, a large ſea-fiſh, common in the Mediterranean, and, while young, brought to the markets of Italy.

CORUS, OMER, HOMER, or CHOMER, in the *Jewiſh Antiquities*, a meaſure containing ten baths, or ſeventy-five gallons, and five pints, as a meaſure of things liquid, and thirty-two pecks and one pint, as a meaſure for things dry. The *corus*, or *omer*, was moſt commonly a meaſure for things dry, and the greateſt that was uſed among the Jews. It contained, according to the rabbins, ten ephahs, or thirty ſata or ſeahs. *Corus* is the moſt uſual term in the hiſtorical writers, and *omer* or *chomer* among the prophets.

Corus is alſo uſed in ſome of our old writers for eight buſhels, or a quarter; *decem* coros *tritici, ſive decem quarteria*.

CORUSCATION, glittering, or flaſhing, a gleam of light emitted from any thing.

The term is chiefly uſed for a flaſh of lightning nimbly darting down from the clouds, in time of THUNDER.

There is a method of producing *artificial coruſcations*, or ſparkling fiery meteors, which will be viſible not only in the dark, but at noon day, and that from two liquors actually cold. The method is this: fifteen grains of the ſolid phoſphorus are to be melted in about a dram of water;

ter; when this is cold pour upon it two ounces of oil of vitriol; let theſe be ſhaken together, and they will at firſt heat, and afterwards they will throw up fiery balls in great numbers, which will adhere like ſo many ſtars to the ſides of the glaſs, and continue burning a conſiderable time; after this, if a ſmall quantity of oil of turpentine be poured in without ſhaking the phial, the mixture will of itſelf take fire, and burn very furiouſly. The veſſel ſhould be large, and open at the top. Phil. Tranſ. Nº 150. See INFLAMMABILITY.

Artificial *coruſcations* may alſo be produced by means of oil of vitriol and iron, in the following manner. Take a glaſs body, capable of holding three quarts; put into this three ounces of oil of vitriol, and twelve ounces of common water; then warming the mixture a little, throw in, at ſeveral times, two ounces or more of clean iron filings; upon this an ebullition, and white vapours, will ariſe: then preſent a lighted candle to the mouth of the veſſel, and the vapour will take fire, and afford a bright fulmination, or flaſh, like lightning. Applying the candle in this manner ſeveral times, the effect will always be the ſame; and ſometimes the fire will fill the whole body of the glaſs, and even circulate to the bottom of the liquor, and at others it will only reach a little way down its neck. The great caution to be uſed in this experiment is the making the matter of a proper heat; for, if too cold, few vapours will ariſe, and if made too hot, they will aſcend too faſt, and will only take fire in the neck of the glaſs, without any remarkable *coruſcation*.

CORUSCATULA, in *Natural Hiſtory*, a name given by Mr. Lhuyd to a ſpecies of *foſſile* PLANT of the fern-kind, which that gentleman happened to find covered with a ſhining or gloſſy coat.

CORVUS, in *Ornithology*, the *crow*, or *raven*. In the Linnæan ſyſtem of *Zoology*, this makes a diſtinct genus of birds of the order of the *picæ*, the diſtinguiſhing character of which are, that the bill is convex and ſharp, the noſtrils covered with recumbent briſtles, the tongue cartilaginous and bifid, and the feet formed for walking. Of this genus are the CROW, RAVEN, JACK-DAW, &c.

CORVUS, in *Ichthyology*, a name given by Paulus Jovius to the *faber*, or DOREE.

CORVUS, in *Antiquity*, a machine invented by the Romans at the time of their wars in Sicily, when they firſt engaged the Carthaginian fleet. According to Polybius, the *corvus* was framed after this manner.

On the prow of their ſhips they erected a round piece of timber about a foot and a half in diameter, and twelve feet in length, on the top of which was a block, or pulley; round this piece of timber was a platform of boards four feet in length, which was about eighteen feet long, and well framed and faſtened with iron; the entrance was longways, and it was moveable round the aforeſaid upright piece of timber, and could alſo be hoiſted up and down within ſix feet of the top: about this frame was a ſort of parapet, knee high, which was defended with upright bars of iron, ſharp at the ends, and towards the top there was a ring, by the help of which, and a pulley, or tackle, it was hoiſted and lowered at pleaſure; with this moveable gallery, they boarded the enemies ſhips (when they did not lie ſide by ſide) ſometimes on their bow, and ſometimes in the after-part of the ſhip; the ſoldiers keeping the boſs of their bucklers level with the top of the parapet, &c. and by the means of this new engine got a victory over the Carthaginians in their firſt ſea-fight with them, though the enemy were long before well ſkilled in naval affairs, and the Romans raw and ignorant.

CORVUS, *Raven*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere; whoſe ſtars in Ptolemy's Catalogue are 7; in Tycho's as many; in the Britannic Catalogue 9. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude			Magnitude
			°	′	″	°	′	″	
That in the beak	α	♎	7	55	35	21	44	26	4
In the neck nigh the head	ε		7	21	58	19	39	41	4

CORVUS *aquaticus*, *Pelecanus carbo* of Linnæus, in *Zoology*, the name given by authors to the bird commonly known by the name of the *cormorant*, or *corvorant*, on account of its voraciouſneſs, which is owing to a great quantity of ſmall worms filling its inteſtines, and cauſing a very ſudden digeſtion. This bird has a rank ſmell, diſagreeable form, and hoarſe, croaking voice. It is of the ſize of a gooſe, and is of a very deep duſky brown on the back, with ſome admixture of a greeniſh gloſs, and white on the belly and breaſt. It builds not only among rocks, but often alſo on trees. Theſe birds have been trained to fiſh, and are uſed by the Chineſe for this purpoſe. *Tab. of Birds*, Nº 9.

CORVUS *aquaticus*, the *water-raven*, is alſo a name given by ſome authors to the *acacalotl*, a very beautiful Mexican water bird, of a ſhining, greeniſh, blackiſh, and purpliſh hue. It feeds on fiſh, and is eaten, but is of a coarſe and fiſhy taſte.

CORVUS *aquaticus minor*, in *Zoology*, a name by which Mr. Ray has very properly called a bird common on our northern coaſts, and called there the SHAGGE, and in ſome places the *crane*, it being a genuine ſpecies of *cormorant*.

CORVUS *cornutus*, in *Zoology*, a name by which ſome have called the Indian raven, with the horned beak, more uſually called the RHINOCEROS-*bird*.

CORVUS *fluviatilis*, the *river-raven*, a name given by ſome writers to a very remarkable bird of the Philippine iſlands, reſembling the common raven, but being of the amphibious kind. It is called in the language of the place *caſſili*, or COLOCOLO.

CORVUS *Indicus*, in *Zoology*, the name of a bird of the raven kind, very common in the Molucca iſlands, very large, and armed with a very ſtrong beak and claws; it does not feed on carrion, as our raven, but eats the nutmegs, and does vaſt damage, in deſtroying that fruit. Its fleſh is very delicate, and has plainly the aromatic flavour of its food. Ray's Ornithol. p. 86.

CORVUS *ſylvaticus*, the *wood-raven*, in *Zoology*, the name of a bird deſcribed by Geſner, and ſuppoſed by Mr. Willughby to be no other than the *coracias*, or *pyrrhocorax*; but, if rightly deſcribed, it differs eſſentially from that bird in ſize, and in having a creſt on its head. Geſner ſays, it is of the ſize of the common hen; it appears at a diſtance of a deep black, but, when viewed nearer, and in the ſunſhine, it appears of a fine gloſſy green; its tail is ſhort; its toes very long, and not webbed; and it has a creſt on its head. It feeds on frogs, fiſh, and other ſmall animals, and builds in the ruins of old buildings, and lays two or three eggs. They fly very high; the young ones are accounted a very well taſted food. Ray's Ornithol. p. 566.

CORVUS *piſcis*, the *crow-fiſh*, a river-fiſh of the CHUB-*kind*, common in Italy, and in ſome parts of Germany, and called by Geſner, *capito fluviatilis rapax*, and by the common people *roppe*. It ſeldom grows to more than ſix or ſeven pounds weight; it is an extremely rapacious fiſh, not leſs ſo than the pike, and very frequently chaces its prey ſo hard as to drive them out upon the bank, and, in that caſe, he uſually follows them alſo, and both are frequently taken, ſtranded together. It is caught at all ſeaſons of the year, but never in any great abundance; it is eſteemed a very delicate fiſh. Geſner de Piſc. p. 1267.

CORYBANTES, in *Antiquity*, prieſts of Cybele, who danced and capered to the ſound of flutes and drums. See CROTALUM. Horace, lib. i. ode 16. ver. 8.

Catullus, in his poem called Atys, gives a beautiful deſcription of them; repreſenting them as madmen. Accordingly Maximus Tyrius ſays, that thoſe poſſeſſed with the ſpirit of *Corybantes*, as ſoon as they heard the ſound of a flute, were ſeized with an enthuſiaſm, and loſt the uſe of their reaſon. And hence, the Greeks uſe the word κορυϐαντειν, *to corybantize*, to ſignify a perſon's being tranſported, or poſſeſſed with a devil. See ENTHUSIASM.

Some ſay, that the *Corybantes* were all eunuchs; and that it is on this account Catullus, in his Atys, always uſes feminine epithets and relatives in ſpeaking of them.

Diodorus Siculus remarks, that Corybas, ſon of Jaſon and Cybele, paſſing into Phrygia with his uncle Dardanus, there inſtituted the worſhip of the mother of the gods, and gave his own name to the prieſts. Strabo relates it as the opinion of ſome, that the *Corybantes* were children of Jupiter and Calliope, and the ſame with the *Cabiri*. Others ſay, the word had its origin from this, that the *Corybantes* always walked dancing (if the expreſſion may be allowed) or toſſing the head, κορυπτοντες βαινοειν.

CORYBANTICA, a feſtival held in Crete, in memory of the *Corybantes*, who educated Jupiter when he was concealed in that iſland, from his father Saturn, who would have devoured him.

CORYCEUM, in *Antiquity*, that part of the *gymnaſium*, where people undreſſed. It was otherwiſe called APODYTERION.

CORYCUS, whence CORYCOMACHIA, among the Greeks, a kind of exerciſe with the hand-ball. The ſize of the ball, and the materials of which it was prepared, were adapted to the age and ſtrength of thoſe who uſed it. It was ſuſpended from the cieling, and thrown off with different degrees of force, ſo that on its return it might act with proportionable violence. It was recommended by the phyſicians as a ſalutary exerciſe. Hoffman.

CORYDALEPODIUM, in *Botany*, a name given by ſome authors to the *delphinium*, or *larkſpur*.

CORYDALES, in *Botany*, an order of plants in the *fragmenta methodi naturalis* of Linnæus.

CORYDALIUM, or CORYDALIS, a name uſed by ſome authors for the *fumaria*, or *fumitory*, a red-flowered little plant, improperly called by ſome *mayweed*.

CORYLUS. See HAZLE.

CORYMBIFEROUS *plants*; theſe are diſtinguiſhed into ſuch as have a *radiate* flower: as, the flos ſolis, calendula, &c. and ſuch as have a *naked* flower: as, the abrotaneum fœmina, eupatorium, and artemiſia; to which are added the *corymbiferis affines*, or thoſe akin hereunto; ſuch as ſcabious, dipaſcus, carduus, and the like.

CORYMBIUM, in *Antiquity*, an ornament of hair worn by the women. Its form was that of a CORYMBUS.

CORYMBIUM, in *Botany*, a genus of plants of the *ſyngeneſia monogamia* claſs: the calyx is priſmatic, conſiſting of two leaves, and a ſingle flower; the corolla is regular, and monopetalous. It contains one ſeed, crowned with wool-like down.

CORYMBUS, in the general, ſignifies the top or ſummit of any thing; but among the ancient botaniſts it was particularly uſed to expreſs the bunches or cluſters of ivy-berries, &c.

Some alſo call the top of the ſtalk of a plant, when ſo ſubdivided, and adorned with flowers or fruits, as to make a round ſpherical figure, by this name; as the tops of leeks, onions, and the like: others confound the word with *umbella*, which expreſſes the flowery tops of ſuch plants as have their branches and flowers ſpread round, into the form of what the women now call an *umbrella*.

But among the modern botaniſts, *corymbus* is chiefly uſed for a compound diſcous flower, whoſe ſeeds are not pappous, or winged with down: ſuch are the flowers of daiſies, common marigold, &c.

Mr. Ray, therefore, makes a diſtinct genus of plants of ſuch as have a compound diſcous flower, but without any downy wings to carry off their ſeeds.

CORYPHA, in *Botany*, a name by which Linnæus calls a genus of plants, of the claſs of *palmæ*, called *codda panna* in the Hortus Malabaricus, the characters of which are theſe: the cup of the flower is the whole compound *ſpatha*; the flower is divided into three obtuſe, oval ſegments, which ſtand in an expanded form; the ſtamina are ſix pointed filaments, which are longer than the flower, with antheræ growing to them; the germen of the piſtil is roundiſh; the ſtyle is ſubulated and ſhort; the ſtigma ſimple; the fruit is a large unilocular berry, containing a large hard ſeed.

CORYPHÆNA, in *Ichthyology*, the name of a genus of fiſh of the *malacopterygious* kind, of the *thoracic* order in the Linnæan ſyſtem, the characters of which are theſe: the branchioſtege membrane contains on each ſide five bones, beſides two others which lie under the bony coverings of the gills, and cannot be ſeen. The fins are ſeven in number, one upon the back, reaching from the top of the head to the tail; the head is very obtuſe at the end, or, as it were, perpendicularly declivious from the vertex to the mouth; the head and body are both ſomewhat compreſſed.

There are three ſpecies of this genus enumerated by Artedi, and twelve by Linnæus.

CORYPHÆUS, in the *Ancient Tragedy*, was the chief or leader of the company that compoſed the chorus.

The word is formed from κορυφη, *tip of the head*.

The *coryphæus* ſpoke for all the reſt, whenever the chorus took part in the action, in quality of a perſon of the drama, during the courſe of the acts.

Hence, *coryphæus* has paſſed into a general name for the chief or principal of any company, corporation, ſect, opinion, &c.

Thus, Euſtatius of Antioch is called the *coryphæus* of the council of Nice; and Cicero calls Zeno the *coryphæus* of the Stoics.

CORYPHE, in *Medical Writers*, is uſed for the crown of the head; as alſo for the interior extremity of the fingers next the nails.

CORYZA, in *Medicine*, a running at the noſe; or a defluxion of ſharp ſerous humours from the glands of the head; ariſing from a diminution of perſpiration, or catching of cold.

Signs of a coryza. This diſeaſe is generally preceded by an itching, and by ſneezing; ſometimes by what is called a *gravedo*, a congeſtion of matter without excretion; this is followed by the excretion of a ſerous and viſcous matter by the noſtrils and mouth, and ſometimes by the eyes; the more thin and acrid this matter is, the more ſeverely it affects the part through which it is evacuated, ſo that ſometimes it is attended with a ſenſation of pain, and ſoreneſs in them.

Cauſes. The general cauſes of theſe defluxions, are the obſtruction or ſuppreſſion of natural or cuſtomary evacuations, the cold and moiſt temperature of the air, or a ſudden chilling of the body in a hot and moiſt place: the leaving off a copious uſe of tobacco, and the abuſe of ſnuff, or other ſternutatory powders. To theſe are to be added, every thing that impedes natural perſpiration, and ſometimes ſuppreſſions of urine.

Prognoſtics. The ſimple *coryza* and *gravedo* are attended with no great danger, not even when they are of long ſtanding, provided that the conſtitution be ſtrong and healthy in other reſpects. But this is not the caſe in old and weak people; for in theſe, this continual defluxion upon the head too often brings on vertiginous complaints, and ſometimes paralytic, and even apoplectic diſorders, or elſe aſthmas, and ſuffocative catarrhs, are the conſequence: and if this matter, ſo copiouſly ſecreted from the blood, be thrown upon the lungs, it may occaſion exulcerations, and even a true phthiſis.

Method of cure. This is a diſeaſe which few people trouble a phyſician about, being uſually left to nature; but it is, however, in the power of medicine to do great ſervice, and, uſually, wholly to remove the complaint; which, even where it is not attended with danger, is ſo far troubleſome, as that any one would wiſh to be rid of it.

Proper evacuations, as bleeding, epiſpaſtics, ſternutatories, &c. are uſual in caſes of *coryzas*.

When the defluxion is very violent, Stahl recommends the uſe of gentle diaphoretics, and of a powder compoſed of cinnabar, and a gentle opiate. In caſes where the matter of a *coryza* is very acrid, and there is a violent pain in the head, the external uſe of camphor is of great ſervice; it is in this caſe to be applied to the temples; and the patient ſhould at the ſame time take internally powders compoſed of nitre and the common abſorbents, and diaphoretic antimony, and afterwards ſhould take ſome gentle purges, and frequently bathe the feet in warm water. See INFANT.

COS, in *Medicine*. See WHETSTONE.

COS, *whetſtone*, in *Natural Hiſtory*, a genus of ſand-ſtones, conſiſting of fragments of an indeterminate figure, ſubopake, and granulated. There are ſeveral ſpecies of this genus, which are uſed for MILL-ſtones, &c.

COSCINOMANCY, the art of divination, by means of a ſieve.

The word comes from κοσκινον, *cribrum*, a *ſieve*; and μαντεια, *divination*.

The ſieve being ſuſpended, after rehearſing a formula of words, it is taken between two fingers only; and the names of the parties ſuſpected, repeated: he at whoſe name the ſieve turns, trembles or ſhakes, is reputed guilty of the evil in queſtion.

This muſt be a very ancient practice: Theocritus, in his third Idyllion, mentions a woman very ſkilful in it. It was ſometimes alſo practiſed by ſuſpending the ſieve by a thread, or fixing it to the points of a pair of ſheers, giving it room to turn, and naming, as before, the parties ſuſpected: in which laſt manner, *coſcinomancy* is ſtill practiſed in ſome parts of England. It appears from Theocritus, that it was not only uſed to find out perſons unknown, but alſo to diſcover the ſecrets of thoſe that were known.

COSCYLIUM, in *Natural Hiſtory*, a name given by ſome of the old writers to the *kermes*, the true nature of which they did not know, but ſuppoſed it to be a ſort of ſcabrous excreſcence, formed of the abundant juices of the tree, and of the nature of the galls on the oak, and other trees.

CO-SECANT, in *Geometry*, the SECANT of an arch, which arch is the COMPLEMENT of another arch to 90 degrees.

COSENAGE, in *Law*, a writ that lies where the treſail, that is, the tritavus, the father of the beſail, or great grandfather, being ſeized in fee at his death of certain lands, or tenements, dies; a ſtranger enters, and abates; then ſhall his heir have this writ of *coſenage*; the form of which ſee in Fitzh. Nat. Br. fol. 221.

COSENING, in *Law*, an offence whereby any thing is done deceitfully, in, or out of, contracts, which cannot be fitly termed by any eſpecial name. In the civil law, it is called *ſtellionatus*. See STELLIONATE.

COSHERING, in the *Feudal Cuſtoms*, a kind of right of the lords to lie, and feaſt themſelves, and their followers, at their tenants houſes.

We find this term in Harris's Lexicon Technicum, and in Jacobs's Law Dictionary, which laſt quotes Spelman of parliaments MSS. for it. The word *coſhering* may perhaps be derived from the old Engliſh *coſhe*, a *cot*, or *cottage*.

CO-SINE, is the right SINE of an arch, which is the complement of another to 90 degrees.

COSMETIC, from κοσμειν, *to adorn*, a term in *Phyſic*, uſed for any medicine, preparation, or means, employed to beautify and embelliſh the face, and preſerve or improve the complexion; as ceruſs, and the whole tribe of fucuſes, waſhes, cold creams, lip-ſalves, &c. See WATER.

The Indians uſe the water of green CACAO-nuts as a grand *coſmetic*, which wonderfully improves their complexion.

COSMICAL, ſomething that refers, or has a relation to the world; in Greek κοσμος.

COSMICAL *aſpect*, among *Aſtrologers*, is the ASPECT of a planet with reſpect to our earth.

COSMICAL *qualities* are uſed by Mr. Boyle in the ſame ſenſe with ſyſtematical ones.

Though, in conſidering the qualities of natural bodies, we uſually only take in the powers any particular one has of acting on, or its capacity of ſuffering from the action of, another, wherewith it is obſerved to have ſome manifeſt commerce, by a communication of impreſſions; yet there may be ſeveral alterations to which it may be liable, not barely on account of thoſe qualities preſumed to be evidently inherent in it, nor of the reſpects it bears to thoſe other particular bodies, whereto it ſeems manifeſtly related; there may be many unheeded agents, which by unperceived means have great operations on the body we conſider, and work ſuch changes in it, as are not otherwiſe to be accounted for. And theſe are what Mr. Boyle calls *coſmical*, or *ſyſtematical qualities*.

To account for theſe *coſmical* qualities, the ſame author propoſes ſome *coſmical* ſuſpicions, as to ſome unobſerved laws and orders of nature; and refers them principally to the action of certain effluvia hitherto unobſerved.

COSMICAL is alſo uſed, in *Aſtronomy*, to expreſs one of the poetical riſings of a ſtar.

A ſtar is ſaid to riſe *coſmically*, when it riſes together with the ſun; or with that degree of the ecliptic wherein the ſun then abides.

Coſmical ſetting is, when a ſtar ſets and goes down in the weſt, at the ſame time the ſun riſes in the eaſt.

But, according to Kepler, to riſe or ſet *coſmically*, is only to aſcend above, or deſcend below, the horizon.

COSMOGONY, in *Phyſics*, ſignifies the ſcience of the formation of the univerſe. It is formed of κοσμος, the *world*, and γινομαι, *I am born*. It differs from *coſmography*, which is the ſcience of the parts of the univerſe, ſuppoſing it formed, and in the ſtate in which we behold it; and from *coſmology*, which reaſons on the actual and permanent ſtate of the world formed as it now is; whereas *coſmogony* reaſons on the variable ſtate of the world at the time of its formation. In our conjectures about the formation of the world there are two principles which we ought never to loſe ſight of. 1. That of *creation*; for certainly matter could not give itſelf exiſtence, it muſt have received it. 2. That of a *ſupreme* intelligence directing this *creation*, and the arrangement of the parts of matter, in conſequence of which this WORLD was formed.

COSMOGRAPHY, the deſcription of the world; or the art which teaches the conſtruction, figure, diſpoſition, and relation of all the parts of the world, with the manner of repreſenting them on a plane.

The word comes from κοσμος, *world*, and γραφω, *I deſcribe*.

Coſmography conſiſts chiefly of two parts. ASTRONOMY, which ſhews the ſtructure of the heavens, and the diſpoſition of the ſtars; and GEOGRAPHY, which ſhews thoſe of the earth.

COSMOLABE, from κοσμος, *world*, and λαμβανω, *I take*, an ancient mathematical inſtrument, ſerving to meaſure diſtances, both in the heavens, and on earth.

The *coſmolabe* is in great meaſure the ſame with the aſtrolabe. It is alſo called *pentacoſm*, or the *univerſal inſtrument*, by L. Morgard, in a treatiſe written expreſly upon it, printed in 1612.

COSMOLOGY, from κοσμος, *world*, and λογος, *diſcourſe*, the ſcience of the world in general. This Wolfius calls *general*, or *tranſcendental coſmology*, and has written a treatiſe on the ſubject, wherein he endeavours to explain how the world ariſes from ſimple ſubſtances; and treats of the general principles of the modifications of material things, of the elements of bodies, of the laws of motion, of the perfection of the world, and of the order and courſe of nature. Wolf. Coſmologia Generalis, Francfort. & Leipſic. 1731. 4to.

COSMOPOLITE, or COSMOPOLITAN, a term ſometimes uſed to ſignify a perſon who has no fixed living, or place of abode; or a man who is a ſtranger no-where.

The word comes from κοσμος, *mundus*, and πολις, *city*. One of the ancient philoſophers being interrogated what countryman he was, anſwered he was a *coſmopolite*, i. e. *an inhabitant or citizen of the world*. "I prefer, ſays another philoſopher, my family to myſelf, my country to my family, and the human kind to my country."

COSSART, or *Coſſet Lamb*, in *Huſbandry*, is a lamb left by its dam's dying, before it is capable of ſhifting for itſelf: or a lamb taken from an ewe that brings ſeveral at a yeaning. The term is alſo applied to a colt, calf, &c.

COSSE *de geniſte*, an order of knighthood inſtituted in 1234, by Lewis IX. at his marriage with Margaret of Provence. The motto on the collar of this order was, *exaltat humilis*.

COSTA *canina*, in *Botany*, a name given by ſome authors to the *plantago quinquenervia*, or narrow-leaved plantain, commonly called *ribwort*.

COSTÆ, in *Anatomy*. See RIBS.

COSTAL, in *Anatomy*. There are eight VERTEBRÆ diſtinguiſhed by the name of *coſtales*, or *pleurites*; becauſe ſerving to articulate the *coſtæ*, or ribs, which are lined with the *pleura*.

Theſe *vertebræ* are the eight which follow the ſecond, called the *axillary*; and are therefore the third, fourth, fifth, and to the tenth incluſive.

COSTARUM *depreſſores proprii*, in *Anatomy*, a name given by Douglas, from Cowper, to what Albinus affirms to be only that part of the internal INTERCOSTAL muſcles which lie neareſt the ribs.

COSTARUM *levatores*, a name given by Steno, Morgagni, and others, to the muſcles of the ribs, called by Albinus the *levatores breviores coſtarum*, and by others the *ſupracoſtales*, the *ſur coſtaux* of the French.

COSTS, in *Law*, are *expenſæ litis*, recovered by the plaintiff in a ſuit, together with his damages: and if the plaintiff be nonſuited or overthrown by lawful trial in any action, the defendant ſhall have *coſts*. 4 Jac. I. cap. 3. Alſo putting off trials, inſufficient pleas, &c. on their amendment, are liable to *coſts*.

Coſts are allowed in chancery, for failing to make anſwer to a bill exhibited; or making an inſufficient anſwer: and if a firſt anſwer be certified by a maſter to be inſufficient, the defendant is to pay 40*s*. coſts; 3*l*. for a ſecond inſufficient anſwer; 4*l*. for a third, &c. But if the anſwer be reported good, the plaintiff ſhall pay the defendant 40*s*. *coſts*. An anſwer is not to be filed (until when it is not reputed an anſwer) until *coſts* for contempt in not anſwering, are paid. Pract Attorn. 1 ed. p. 210. 212. If a plaintiff in chancery diſmiſſes his bill, or the defendant; or if a decree be obtained for the defendant, *coſts* are allowed, by ſtat. 4 and 5 Anne, c. 16.

COSTIVENESS, *obſtructio alvi*, in *Medicine*, a preternatural detention of the excrements, with an unuſual hardneſs and dryneſs thereof; and, thence, a difficulty of diſcharging them.

This is the oppoſite to a diarrhœa, or looſeneſs.

An *obſtructio alvi* is ſometimes idiopathic, where there is no other diſeaſe concurring to it; ſometimes it is ſymptomatic, and depends entirely on other diſeaſes, as on fevers, congeſtions, and the like.

COSTIVENESS, *ſigns of*. The firſt, and moſt obvious, of theſe is, the not going to ſtool in the ſpace of twenty-four-hours; this is uſually ſucceeded by a dizzineſs, and vertiginous diſorder of the head, painful congeſtions of blood about the head, flatulencies, oppreſſion of the ſtomach, and ſtraitneſs and anxiety about the præcordia. Junker's Conſp. Med. p. 590.

COSTIVENESS, *perſons ſubject to*. Men of ſedentary, and idle lives, are more ſubject than others to this complaint, eſpecially when ſubject to commotions of the blood, and of a dry choleric temperament, and ſuch as are ſubject to hypochondriac affections, and to the gout, or to nephritic complaints, and to acute fevers.

COSTIVENESS, *cauſes of*. Theſe are obſerved by writers to be of two kinds, the active, and the paſſive. The active cauſe is a certain ſtricture which comes on in the rectum in many different diſorders; as in the ſtone, in nephritic complaints, and, in general, in all the congeſtions of blood towards the upper parts of the body. What is called the paſſive cauſe of *coſtiveneſs*, is that occaſioned by a ſort of ſluggiſhneſs in nature, which leaves the periſtaltic motion of the guts too languid, on occaſion of which the fæces are eaſily indurated in the bowels. The occaſional and accidental cauſes which contribute to this induration of the fæces are the following: a neglecting the uſual time of going to ſtool, and checking the natural tendencies and motions toward it; an extraordinary heat of the body, and copious ſweats; a larger quantity of ſolid food taken into the ſtomach than is proper for the quantity of fluids ſwallowed, and a common uſe of ſuch food as is dry and hard of digeſtion.

Costiveness, *prognoſtics in* It is the origin of a great many diſorders; and, in particular caſes, is often attended with imminent danger. In choleric habits, in which perſons are ſubject to large quantities of bilious matter being lodged in the *primæ viæ*, *coſtiveneſs* is uſually attended with colics, and violent heats. The indurated excrements alſo, when they preſs upon the veins in the guts, very often prevent the circulation, and, by that means, bring on dangerous inflammations in the parts; and, in general, whatever diſeaſe is attended with *coſtiveneſs*, is rendered worſe, and more violent by it.

Costiveness, *method of treatment in.* An idiopathic *coſtiveneſs*, when grown into a habit by long ſufferance, is beſt cured by means of drinking more liquids than uſual, and giving the body a greater ſhare of motion; but this motion muſt, by no means, be violent, for that always increaſes the diſeaſe, but when placid and eaſy, it tends greatly to the reſtoring the periſtaltic motion of the bowels to its proper ſtate. To this it is to be added, that many people have reſtored themſelves from this diſtemperature to a good ſtate, only by going to the cloſe-ſtool every day, at a certain hour, and endeavouring for ſome time, but without great violence, to force a ſtool; the conſequence of a continual practice of this, for ſome weeks together, has brought nature to expect it, and, in fine, to be prepared for it, and always to have fæces at the time ready to be diſcharged. The eating a ſmall piece of bread with a large quantity of butter ſpread over it every day before dinner and ſupper is alſo a good cuſtom; and purges taken every ſpring and autumn are a method of bringing nature into a proper courſe. When the caſe is violent, and calls for the aſſiſtance of medicine, there is always more benefit obtained from clyſters, than from purging medicines given internally. Theſe laſt, when given, muſt never be violent.

In a ſymptomatic *coſtiveneſs*, the primary diſeaſe is always to be firſt regarded, and this is, generally, not a little relieved by a proper removal of the *coſtiveneſs*. In chronic caſes, the ſame rules are to be obſerved as in the cure of the idiopathic *coſtiveneſs*; but, in acute caſes, recourſe is to be had to clyſters, and large draughts of warm, and weak fluids, ſuch as barley-water, and the like.

When *coſtiveneſs* is attended with no other complaint, but people enjoy their perfect health with it, there is no occaſion for medicines, nature being in ſome conſtitutions habituated to it, and doing well with it. There are many perſons who, in general, do not go to ſtool oftener than once in three days; ſome once in a week; and there have been inſtances of people, who, while they have enjoyed a perfect health, and eat very heartily, have not gone above once in three or four weeks. When habitual *coſtiveneſs* is to be cured by motion, and drinking more fluids, theſe muſt be always uſed together; for otherwiſe drink alone more relaxes the bowels, and motion alone diſſipates the already too little humidity. Thus either of them alone muſt add to the diſeaſe, which, when given together, they cure. The common method of attempting to cure *coſtiveneſs* by repeated doſes of purges, brings on a great many inconveniencies, particularly they always leave the bowels more bound than before, and by that means add to the complaint they were meant to relieve; and even the gentleſt purging medicines have this effect. Junker's Conſp. Med. p. 391.

In caſes of this kind, Dr. Huxham recommends a medicine prepared with ſalt of hartſhorn, ſaturated with ſpirit of vinegar, which not only takes away the fœtid ſmell of the oil of the ſalt, but changes it into an agreeable aromatic. Obſ. de Aere, et Morb. epid.

Costiveness, in infants. See Infant.

Costiveness, in *Farriery*, is alſo a diſeaſe to which horſes are ſubject, from violent exerciſe, or the want of exerciſe, and long feeding on hard meat. An opening diet, and lenitive mild purges, as of Glauber's ſalts, with lenitive electary, four ounces of each diſſolved in warm ale or water, repeated every other day, and ſcalded bran, are recommended. But a natural or habitual *coſtiveneſs*, which is not uncommon, is not ſo eaſily removed. In this caſe the following purge is recommended; viz. ſuccotrine aloes ſix drams, ſpermaceti half an ounce, fenugreek ſeed in powder two ounces; the whole is to be made into two balls, with a ſufficient quantity of honey or treacle, and given to the horſe in a morning faſting. Scalded barley ſhould alſo be uſed inſtead of bran, and the liquor given milk-warm for his drink. The above purge ſhould be repeated once in four days, till he has taken ſix doſes. Gibſon's Farriery, vol. ii. p. 134.

COSTMARY, in *Botany*. See Tanzy.

COSTOHYOIDES, in *Anatomy*, a name given by Santorini to one of the muſcles of the mouth now generally called the *coracohyoidæus*.

COSTRANGULA, in *Botany*, a name uſed by ſome for the *ſcrophularia*, or *figwort*.

COSTUME. To obſerve the *coſtume*, among *Painters*, is to make every perſon and thing ſuſtain the proper character, by not only obſerving the ſtory, but the circumſtances, the ſcene of action, the country or place, habit, manners, &c.

The word is Italian, ſignifying *cuſtom*.

COSTUS, in *Botany*, a genus of the *monandria monogynia* claſs. Its characters are theſe: it hath a ſimple ſpadix and ſpatha, with a ſmall empalement, divided into three parts, ſitting on the germen: the flower hath three concave petals, which are erect and equal, with a large oblong nectarium of one leaf, having two lips; the upper is ſhorter, and turns to a ſtamen, which is faſtened to the upper-lip of the nectarium. The germen is ſituated within the receptacle of the flower, and afterward becomes a roundiſh capſule with three cells, containing ſeveral triangular ſeeds. We know but one ſort of this plant, which is the Arabian *coſtus*. This has a fleſhy jointed root like that of ginger, and propagates under the ſurface as that doth.

The roots of this plant were formerly imported from India, and were much uſed in medicine; but of late years they have not been regarded, the roots of ginger being generally ſubſtituted for them.

Coſtus Arabicus is an attenuant, and ſudorific; it is given in obſtructions of the menſes, and chronic caſes, ariſing from infarctions of the viſcera. Its doſe is from ten grains to half a dram, but is ſeldom preſcribed ſingly. Its chief uſe in medicine is as an ingredient in Venice treacle.

The beſt is heavy, of a cineritious colour withoutſide, a reddiſh one within, difficult to break, of a ſtrong ſmell, and an aromatic taſte.

This root was formerly called *coſtus verus*, and was divided into two kinds, the *ſweet* and the *bitter coſtus*: both of which are now uncommon. M. Charas, and others, are of opinion, there is but one kind of *coſtus*, which proves more or leſs ſweet or bitter, according to the ſoil where it is produced, and the time in which it has been kept.

The root always contracts a bitterneſs, and grows darker coloured in keeping, though freſh it was pale and ſweet; and hence the ſuppoſed difference, the deſcriptions of authors agreeing alike to each in all but theſe accidents.

Mr. Geoffroy has obſerved that this root ſeems to be a ſpecies of elecampane; and that our common elecampane, when plump, well fed, and carefully dried, after it has been kept a long time, aſſumes exactly the ſmell of the *coſtus*, and wholly differs from the common elecampane roots ſold and uſed in the ſhops. Mem. Acad. Scienc. Par. 1740.

Costus *Indicus*, an American bark, called alſo *coſtus corticoſus*, *coſtus corticus*, or *Winter's bark*. The iſlands of Madagaſcar in Africa, of Domingo and Guadaloupe in America, are the places where the moſt and beſt is found.

CO-TANGENT, is the tangent of an arch, which is the complement of another arch to 90 degrees.

COTATUA, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of parrot, called alſo *calangay*. It is all over white, and has a creſt of feathers on the head. It is of the bigneſs of a common pigeon.

Cotatua *major*, in *Zoology*, is a very beautiful ſpecies of parrot, common in the woods of the Philippine iſlands. This is of the ſize of a common hen. It is all over white, except that its beak and legs are black; its tongue alſo is black. This is the moſt eaſily taught to talk of any of the parrot-kind, and when taught, ſpeaks the moſt diſtinctly of all the kinds.

COTE, a term uſed in courſing, to expreſs the advantage one greyhound has over another, when he runs by the ſide of it, and, putting before it, gives the hare a turn. See Coursing.

Cote-*gare*, a kind of refuſe wool, ſo clung or clotted together, that it cannot be pulled aſunder. By 13 Rich. II. ſtat. 1. c. 9. it is provided, that neither denizen or foreigner make any other refuſe of wools but *cote-gare* and *villein*. So the printed ſtatute has it: but in the parliament-roll of that year, it is *cod-land* and *villein*. *Cot*, or *cote*, ſignifies as much as cottage in many places, and was ſo uſed by the Saxons, according to Verſtegan.

COTERELLUS, *Cotarius*, and *Coterellus*, according to Spelman and Du Freſne, are ſervile tenants: but in Domeſday, and other ancient MSS. there appears a diſtinction, as well in their tenure and quality, as in their name. For the *cotarius* hath a free ſocage tenure, and paid a ſtated firm or rent in proviſions or money, with ſome occaſional cuſtomary ſervices: whereas the *coterellus* ſeems to have held in mere villenage, and his perſon, iſſue, and goods, were diſpoſable at the pleaſure of the lord.

COTERIE, a term adopted from the French trading aſſociations or partnerſhips, where each perſon advances his quota of ſtock, and receives his proportion of gain; and which retains its original meaning, when applied to little aſſemblies or companies aſſociated for mirth and good humour; where each one furniſhes his quota of pleaſantry. Here they coin new words not underſtood elſewhere, but which it becomes faſhionable for others to uſe; and they are thought ridiculous who are ignorant of them. It has been uſed of late to ſignify a club of ladies.

COTESIAN *theorem*, in *Geometry*, an appellation uſed for an elegant property of the circle diſcovered by Mr. Cotes. The theorem is:

If the factors of the binomial $a^\lambda \pm x^\lambda$ be required, the index λ being any integer: let the circumference ABCD, (*Tab* II. *Analyſis*, *fig.* 42 and 43.) the center of which is O, be divided into as many equal parts as there are units in 2λ; and from all the diviſions let there be drawn to any point P in the radius OA, produced if neceſſary, the right lines AP, BP, CP, DP, EP, FP, &c. then ſuppoſing $OA = a$, $OP = x$, the product of all the lines AP, CP, EP, &c. taken from the alternate diviſions throughout the whole circumference, will be equal to $a^\lambda - x^\lambda$, or $x^\lambda - a^\lambda$, according as the point P is within or without the circle; and the product of the reſt of the lines BP, DP, FP, in the remaining alternate places will be equal to $a^\lambda + x^\lambda$.

For inſtance, if $\lambda = 5$, let the circumference be divided into 10 equal parts, and the point P be within the circle, then will $AP \times CP \times EP \times GP \times IP$ be equal to $\overline{OA}^5 - \overline{OP}^5$, and $BP \times DP \times FP \times HP \times KP = \overline{OA}^5 + \overline{OP}^5$. In like manner if λ be $= 6$, having divided the circumference into twelve equal parts, $AP \times CP \times EP \times GP \times IP \times LP$ will be equal to $\overline{OA}^6 - \overline{OP}^6$, and $BP \times DP \times FP \times HP \times KP \times MP = \overline{OA}^6 + \overline{OP}^6$.

The demonſtration of this theorem may be ſeen in Dr. Pemberton's Epiſt. de Coteſii inventis.

By means of this theorem the acute and elegant author was enabled to make a farther progreſs in the inverſe method of fluxions, than had been done before. But in the application of his diſcovery there ſtill remained a limitation, which was removed by Mr. De Moivre. See Dr. Smith's Theoremata Logometrica & Trigonometrica, added to Cotes's Harmonia Menſurarum, p. 114, 115. De Moivre, Miſcel. Analyt. p. 17.

COTESWOLD, ſeveral ſheep-cotes, and ſheep feeding on hills. It comes from the Saxon *cote*, i. e. *caſa*, a *cottage*, and *wold*, a place where there is no wood.

COTHURNUS, *buſkin*, a very high ſhoe, or patten, raiſed on ſoals of cork; worn by the ancient actors in tragedy, to make them appear taller, and more like the heroes they repreſented; moſt of whom were ſuppoſed to be giants. See BUSKIN.

COTICE', or COTISE', in *Heraldry*, is the fourth part of the bend; which, with us, is ſeldom or ever borne but in couples, with a bend between them: whence, probably, the name; from the French *coté*, *ſide*; they being borne, as it were, a-ſide of the BEND.

A bend thus bordered is ſaid to be *cotiſed*, *coticé*.—He bears ſable on a bend *cotiſed* argent three cinquefoils. See *Tab.* II. *Herald. fig.* 61.

COTICULA, in the *Natural Hiſtory of the Ancients*, the word by which the Romans expreſſed the ακονη of the Greeks; a ſtone of very great hardneſs, brought from Armenia, and uſed on many occaſions; one of which was the working on ſuch of the harder ſtones as iron inſtruments would not touch.

Many of the ancient Greeks, who had this ſtone from the iſland of Cyprus, called it, from its hardneſs, by the ſame name with the diamond, as they ſometimes did iron alſo; which manner of writing has much miſled thoſe who have copied too careleſly from them; and even Pliny, who after having in one part of his book given a right account of this ſtone, and called it *cos*, in another gives a different hiſtory of it, miſtaking it for a diamond.

This *coticula* was long in great eſteem with the ancient artificers on gems, and ſerved not only to work upon ſuch of the gems as iron could not touch, but was uſed to bore holes through ſuch as they ſtrung on threads, and hung in rows in their ornaments of the bracelet-kind. And Pliny's account of the other gems being bored with Cyprian diamonds, means no more, than that they were worked with this *coticula*, which was anciently had from the iſland of Cyprus, and afterwards from Armenia, and was called by ſome, in a metaphorical ſenſe, *adamas*, from its great hardneſs.

COTICULA is alſo a name given by many to the touchſtone; not from its being of the nature of the *coticula* of the Romans, but from its being, for the convenience of carriage and uſe, frequently found in the ſhape of a whetſtone.

COTILLON, the name of a well-known briſk-dance, in which eight perſons are employed. The term is French, and ſignifies an *under-petticoat*.

COTINUS was uſed by the ancients for the olive-tree, eſpecially the *olea ſylveſtris*, or wild olive, which is called κωτίνος by the Greeks. To diſtinguiſh this from the ſhrub uſed in dyeing, and called by the ſame name, the Latins have added the epithet *coriaria* to this laſt: but as this is often omitted, ſome confuſion has been occaſioned by that omiſſion. The *cotinus* of the Latins, or *cotinus coriaria*, is at preſent called by the Italians *ſcotano*, and is ſuppoſed by ſome to be the ſame with the SCYTHICUM *lignum*, but improperly.

COTONASTER, in *Botany*, a name given by ſeveral authors to a ſpecies of the *cratægus*, called by Mr. Tournefort the CRATÆGUS with oblong ſerrated leaves, green on both ſides.

COTT, in *Sea Language*, a ſort of bed-frame, ſuſpended from the beams of a ſhip, in which the officers ſleep between the decks. It is about ſix feet long, one foot deep, and between two and three feet wide. See HAMMOCK.

COTTAGE, *cottagium*, is properly a little houſe for habitation, without lands belonging to it. Stat. 4. Edw. I. But by a later ſtatute, 31 Eliz. c. 7. no man may build a *cottage*, unleſs he lay four acres of land thereto; except it be in market-towns or cities, or within a mile of the ſea, or for the habitation of labourers in mines, ſailors, foreſters, ſhepherds, &c. and *cottages* erected by order of juſtices of peace; for poor impotent people are excepted out of the ſtatute. The four acres of land to make it a *cottage* within the law, are to be freehold, and land of inheritance; and four acres holden by copy, or for life or lives, or for any number of years, will not be ſufficient to make a lawful *cottage*.

COTTON, *Goſſypium*, in *Botany*, a genus of the *monadelphia polyandria* claſs. Its characters are theſe: the flower has a double empalement, with five plain heart-ſhaped petals, which join at their baſe, and a great number of ſtamina joined at bottom in a column, and inſerted into the petals. It hath a round germen, ſupporting four ſtyles, joined in the column; the germen afterward becomes a roundiſh capſule, ending in a point, having four cells, which are filled with oval ſeeds wrapped up in down.

There are ſeveral varieties, and not a few diſtinct ſpecies of this plant, propagated in the gardens of the curious with us.

The moſt common ſpecies, which is the *xylon herbaceum*, or *herby cotton*, is cultivated very plentifully in Candia, Lemnos, Cyprus, Malta, Sicily, Naples, and alſo between Jeruſalem and Damaſcus, from whence the *cotton* is annually brought in large quantities to us in the northern parts of Europe. It is ſown on plowed lands in ſpring, and is cut down as our corn in harveſt-time, being an annual plant.

The *cotton* is a woolly or downy ſubſtance, which incloſes the ſeed, and which is contained in a brown huſk or ſeed-veſſel. It is from this plant that moſt of the *cotton* we uſe is produced, the difference of the ſeveral ſorts of it being owing to the different ſoil and climates it has grown in, and the different culture it has received.

The *cotton* in the wool, as it is uſually called, is what we have from Cyprus. Damaſcus *cotton* is called *cotton* in the yarn; and the Jeruſalem *cottons*, which are called *bazas*, are the fineſt kinds of all. There is alſo a ſilky *cotton* in the Antilles, called the white *cotton* of Siam, becauſe the grain was brought from thence. This is very fine and ſoft; and the hoſe made of it exceed thoſe of ſilk in luſtre and beauty.

All the kinds of *cotton* plants are propagated with us from ſeeds, which muſt be ſown on a hot-bed early in the ſpring; and when the young plants are come up, they ſhould be tranſplanted each into a ſeparate pot of light earth, which is to be plunged into a moderate hot-bed of tanners bark, obſerving to water and ſhade them till they have taken root; after this they ſhould be watered at times, and have as much air as the ſeaſon will permit. As they enlarge in ſize, they muſt be ſhifted into larger pots; but they muſt be kept in the ſtove, where the herbaceous kinds will annually flower in autumn; but they will ſeldom bring their pods to any perfection.

One ſort of *cotton* is a native of the Eaſt and Weſt Indies.

This is an annual plant, which periſhes ſoon after the ſeeds are ripe. The ſtaple of this is much finer than either of the other ſpecies; and is therefore well worth the attention of the Britiſh colonies in America, to cultivate and improve; ſince it will ſucceed in Carolina, where it has grown for ſome years. It might be a commodity worthy of encouragement by the public, could they contrive a proper gin to ſeparate the *cotton* from the ſeeds to which this ſort adheres much cloſer than any of the other ſorts. The *cotton* of this ſhrub is preferable to any other yet known. Miller's Gard. Dict.

The ſeed of the *cotton* being mixed in the fruit, together with the *cotton* itſelf, they have invented little machines, which being played by the motion of a wheel, the *cotton* falls on one ſide, and the ſeed on the other; and thus they are ſeparated.

Cotton makes a very conſiderable article of commerce: it is diſtinguiſhed into *cotton in the wool*, and *ſpun-cotton*. The firſt uſed for various purpoſes, is to be put between two ſtuffs, in quilts, night-gowns, &c. but it is the latter is more general; furniſhing various cloths, muſlins, callicoes, dimmities, and hangings; beſides that it is frequently joined with ſilk and flax, in the compoſition of other ſtuffs.

The firſt kind is ordinarily brought from Cyprus and Smyrna: near Smyrna its produce is greater than any where elſe. There are ordinarily brought from Smyrna ten thouſand bales of *cotton* per annum; and yet there is, at leaſt, as much more ſpent in the manufactures of the country.

As to the ſpun *cottons*, they are diſtinguiſhed by various names: beſides thoſe from Jeruſalem, called *bazas*, and thoſe of Damaſcus, called *cottons of the* OUNCE, already mentioned, there are others called *demi-bazas*, *baladins*, *payas*, *cottons joſeph*, *genegunſo*, &c.

Cotton anciently only grew in Egypt, and was uſed by the prieſts and ſacrificers for a very ſingular kind of gowns, worn by them alone.

Cotton applied to wounds in lieu of linen, produces an inflammation. Leewenhoek, examining into the reaſons of this with a microſcope, found its fibres to have each two flat ſides; whence he concludes, that each of its minute parts muſt have two acute angles, or edges; which acute edges being not only thinner and more ſubtile than the globules whereof the fleſhy filaments conſiſt, but alſo more firm and ſtiff than any of the globulous fleſh; it follows, that upon the application of *cotton* to a wound, its edges muſt not only hurt and wound the globules of the fleſh, but alſo cut inceſſantly the new matter brought to them to produce new fleſh, and that with more eaſe, as this matter, not having attained the firmneſs and conſiſtence of fleſh, is the leſs able to reſiſt its attacks: whereas the linen ordinarily uſed in wounds, being compoſed of little round parts, very cloſe to each other, forms large maſſes, and is thus incapable of hurting the globous parts of the fleſh.

COTTON-*graſs*. See ERIOPHORUM.

COTTON, *lavender*. See LAVENDER-*cotton*.

COTTON-*paper*. See PAPER.

COTTON, *philoſophic*, a name given by ſome chemical writers to the flowers of zinc, from their whiteneſs, and ſilky or cottony appearance.

COTTON-*tree*, *ſilk*. See BOMBAX.

COTTON-*weed*. See CUDWEED.

COTTONIAN *Library*, conſiſting of curious manuſcripts, &c. was founded by Sir Robert Cotton, who was forty years in collecting it; and at his death in 1631, left the property of it to his family, though deſigned for public uſe. A large acceſſion was made to this library by private benefactions before the death of the founder, and afterwards by the purchaſes of his heirs, and donations of others, who added to it a great number of books, chiefly relating to the hiſtory and antiquities of our own nation. An act of parliament was obtained, at the requeſt of Sir John Cotton, in 1700, for preſerving it after his deceaſe, under the above denomination, for public uſe. It is now fixed in the Britiſh Muſeum. For ſtatutes relating to it, ſee 12 and 13 W. III. c. 5. and 5 Anne, cap. 30.

COTTUS, in *Ichthyology*, the name of a genus of the acanthopterygious fiſhes, the characters of which are theſe: the branchioſtege membrane on each ſide contains ſix very diſtinct bones: the head is broader than the body, and is depreſſed and prickly; there are two fins on the back; the foremoſt has ſeveral flexile prickles in it. The fins of the belly are ſmall, and have only four bones in each, and the ſkin of the whole fiſh is ſmooth, not ſcaly. The ſpecies of this genus are three; one of which is the little fiſh known by the name of the miller's thumb. Artedi Gen. Piſc. 34. See DRACO *Marinus*.

COTULA. See CHAMOMILE.

COTULA *fœtida*, in *Botany*, a name given by ſome to the ſtinking CHAMOMILE.

The *cotula fœtida* has all the virtues of caſtor, but in a more remiſs degree. A decoction of it, when carefully dried, is of great uſe in all diſorders of the hyſteric kind. It is alſo uſed externally, by way of fomentation, in pains and tumours. Some alſo uſe the expreſſed juice of the freſh leaves, as a remedy in ſcrophulous caſes. The flowers have much the ſame virtues as thoſe of the common chamomile.

COTYLA, or COTULA, a liquid MEASURE in uſe among the ancients, equal to the Roman ſemi-ſextary.

Savot adds, that the Roman *cotyla* contained twelve ounces of any liquor: upon which principle there muſt have been as many *cotylæ* as there were liquors ordinarily ſold; which is nothing ſtrange, ſince, in ſeveral countries, we ſtill find meaſures of different capacity, called by the ſame name, when they contain the ſame weights, though under different bulks.

Fannius ſays, the *cotyla* was the ſame thing with the hemina, which was half a ſextary.

> *At* cotylas, *quas, ſi placeat, dixiſſe licebit*
> *Heminas, recipit geminas ſextarius unus.*

Chorier obſerves, that the *cotyla* was uſed as a dry meaſure, as well as a liquid one; from the authority of Thucydides, who in one place mentions two *cotylæ* of wine, and in another two *cotylæ* of bread.

COTYLA, or COTYLE, or COTYLOIDES, in *Anatomy*, is a name given the cavities at the extremities of large bones, encompaſſed with thick ſtrong edges, which receive the heads, or apophyſes of other bones articulated with them.

Such is the cavity in the *iſchion*, or hip-bone, which receives the head of the BONE of the thigh. It is alſo called *acetabulum*, i. e. *cup*.

COTYLEDON, in *Botany*, a name by which ſome authors call the *umbilicus veneris*, or NAVEL-*wort*, a round leafed plant, found on old walls.

COTYLEDONES, in *Anatomy*, little glands diſperſed throughout the outermoſt membrane of the fœtus, called *chorion*, and ſuppoſed to ſeparate a nutritious juice for the ſubſiſtence of the fœtus.

Cotyledones, in this ſenſe, are only found in ſheep, goats, and ſome other animals; the PLACENTA in the womb ſupplying the place thereof in women.

Other authors uſe *cotyledones* for the apertures of the veins in the inner ſurface of the womb. See MATRIX.

COTYLISCUS, or COTYLUS, in *Antiquity*, a veſſel with a narrow mouth, a very wide belly, and only one handle.

COTYTTIA, or COTYTTIS, in *Antiquity*, a nocturnal feſtival, in honour of *Cotys*, or *Cotytta*, the goddeſs of wantonneſs. They paſſed from Thrace to Athens, where they were introduced by Alcibiades.

COVALAM, in *Botany*, the name of a plant which grows in the Eaſt Indies, otherwiſe called *cucurbitifera trifolia Indica fructus pulpâ cydonii æmula*. *Cydonia exotica*. C. B.

This is a tall tree which grows in Malabar, and the iſland of Ceylon, the fruit of which reſembles a round apple in ſhape; it is covered with a greeniſh thin rind, under which lies another, which is hard and woody, encloſing a viſcid, yellowiſh, moiſt ſubſtance, of a ſweetiſh acid taſte, in which are placed flat, oblong, white ſeeds, turgid, with a gummy pellucid juice.

The fruit, while tender, is preſerved in ſugar or vinegar; when ripe, they are eaten by the inhabitants of the country; while unripe, they ſtop a diarrhœa, or dyſentery. A decoction is prepared of the bark and ſmall roots with common water, which cures hypochondriac melancholy, palpitations of the heart, and faintings. An electary made of the bark in powder, with honey, promotes digeſtion, takes away head-achs and vertigos. A decoction of the leaves cures an aſthma; from the flowers a water is diſtilled, poſſeſſed of cardiac and alexipharmic virtues. James.

COUARD, in *Heraldry*. See COWARD.

COUCH, in *Heraldry*, a term uſed to expreſs the ſhield of a coat of arms, when it does not ſtand erect, but hangs downward. The origin of this poſition of the ſhield ſeems to have been, that the perſons who were to fight in tournaments were compelled, from the time when proclamation was made, till the day of fighting, to hang up their ſhields, by one corner, from the windows or balconies of the neighbouring houſes, or on the trees or barriers of the ground, if the exerciſe was performed in the fields. The horſe combatants hung up their ſhields by the left corner, and the foot combatants by the right. Hence the left corner hanging became the moſt honourable; and we ſee, in all the ſons of the royal blood of England and Scotland, that the ſhields with their arms all hang that way. Some writers on heraldry expreſs this diſpoſition by the word *pendant*.

COUCH, in *Gaming*. See BASSET.

COUCH, in *Malting*. See WET-*couch*.

Couch, in *Painting*, denotes a lay, or impreſſion of colour, whether in oil or water, wherewith the painter covers his canvas, wall, wainſcot, or other matter to be painted.

The word is alſo uſed for a lay or impreſſion on any thing, to make it more firm and conſiſtent, or to ſcreen it from the weather.

Paintings are covered with a *couch* of varniſh; a canvas to be painted muſt firſt have two *couches* of ſize, before the colours be laid; two or three *couches* of white lead are laid on wood, before the *couch* of gold be applied: the leather-gilders lay a *couch* of water and whites of eggs, on the leather, before they apply the gold or ſilver leaf.

The gold wire-drawers alſo uſe the word *couch* for the gold or ſilver leaf wherewith they cover the maſs to be gilded or ſilvered, before they draw it through the iron that is to give it its proper thickneſs.

The gilders uſe *couch* for the quantity of gold or ſilver leaves applied on the metals in gilding or ſilvering. Each *couch* of gold is but one leaf, or two at moſt, and each of ſilver three, to gild: if the gilding be hatched, there are required from eight to twelve *couches*; and only three or four, if it be without hatching. To ſilver there are required from four to ten *couches*, according to the beauty of the work.

Couch-*graſs*. See **Grass**.

COUCHANT, in *Heraldry*, is underſtood of a lion, or other beaſt, when lying down; but with his head lifted up; which diſtinguiſhes the poſture of *couchant* from *dormant*, wherein he is ſuppoſed quite ſtretched out, and aſleep.

Couchant *and Levant*, in *Law*. See **Levant**.

COUCHE', in *Heraldry*, denotes any thing laid all along: thus, a *chevron couché* is a chevron lying ſidewiſe with the two ends on one ſide of the ſhield, which ſhould properly reſt on the baſe.

COUCHER, or **Courcher**, in our *Statutes*, is uſed for a factor, or one that continues in ſome place or country for traffic; as formerly in Gaſcoign, for the buying of wines. Anno 37 Edw. III. c. 16.

Coucher is alſo uſed for the general book, in which any religious houſe or corporation regiſter their particular acts. Anno 3 & 4 Edw. VI. c. 10.

COUCHING *of cataracts*. See **Cataract**.

Couching-*needle*. See **Needle**.

COU-DOU, or **Cu-du**, in *Zoology*, a ſpecies of **deer** ſo called at the Cape of Good Hope. It is diſtinguiſhed by the length of its body, which is diſproportioned to its height; the delicate ſlenderneſs of its limbs; the uncommon ſtatelineſs and beauty of its horns, which are ſmooth, hollow, and as beautifully tranſparent as tortoiſe-ſhell; the ſtripes of white upon its ſkin; a black horny ſubſtance in its upper jaw, inſtead of teeth; a ſtripe of hair paſſing from the midſt of the horns to the tail, which is white from the ſhoulder downwards; and a tuft of hair reaching from the neck to the breaſt. There are alſo animals of the ſame name, though different from each other, in Aſia and America.

COVE, a ſmall creek or bay, where boats and ſmall veſſels may ride at anchor, ſheltered from the wind and ſea.

COVENANT, the conſent or agreement of two or more parties to do or perform ſomething.

A *covenant* ſeems to be much the ſame with a *pactum*, or *conventum*, among the civilians.

Covenant is either *in law* or *in fact*.

Covenant, in *Law*, is that which the law intends to be made, though it be not expreſſed in terms: as, if the leſſor demiſe, and grant a tenement to the leſſee for a certain term; the law intends a *covenant* on the leſſor's part, that the leſſee ſhall, during the term, quietly enjoy the leaſe againſt all lawful incumbrances.

Covenant *in fact*, is that which is expreſsly agreed between the parties.

There is alſo a *covenant merely perſonal*, and a *covenant real*. Fitzherbert defines a **Covenant** *real* to be that whereby a man ties himſelf to paſs a thing real, as lands or tenements, or to levy a fine on lands, &c.

Covenant *merely perſonal*, is where a man covenants with another by deed to build him a houſe, or to ſerve him, &c.

Covenant *to ſtand ſeiſed to uſes*, is when a man that hath a wife, children, brother, ſiſter, or kindred, doth by *covenant* in writing under hand and ſeal, agree that for their, or any of their proviſion or preferment, he and his heirs will ſtand ſeiſed of land to their uſe, either in fee-ſimple, fee-tail, or for life. The uſe being created by the ſtat. 27 Hen. I. c. 10. which conveyeth the eſtate, as the uſes are directed; this *covenant to ſtand ſeiſed* is become a conveyance of the land ſince the ſaid ſtatute. The conſiderations of theſe deeds are, natural affection, marriage, &c. and the law allows, in ſuch caſes, conſiderations of blood and marriage to raiſe uſes, as well as money and other valuable conſideration when a uſe is to a ſtranger.

Covenant, in *Eccleſiaſtical Hiſtory*, denotes a contract or convention agreed to by the Scotch in the year 1638, for maintaining their religion free from innovation. In 1581, the general aſſembly of Scotland drew up a confeſſion of faith, or national *covenant*, condemning epiſcopal government, under the name of Hierarchy, which was ſigned by James I. and which he enjoined on all his ſubjects. It was again ſubſcribed in 1590 and 1596. The ſubſcription was renewed in 1638, and the ſubſcribers engaged by oath to maintain religion in the ſame ſtate as it was in 1580, and to reject all innovations introduced ſince that time. This oath annexed to the confeſſion of faith received the name of the *covenant*; as thoſe who ſubſcribed it were called Covenanters.

Covenant, in *Theology*, is much uſed in connection with other terms. Thus, the *covenant of grace* is that which is made between God and thoſe who believe the Goſpel, whereby they declare their ſubjection to him, and he declares his acceptance of them and favour to them. The Goſpel is ſometimes denominated a *covenant of grace*, in oppoſition to the Moſaic law.

Covenant of redemption denotes, a mutual ſtipulation, tacit or expreſs, between Chriſt and the Father, relating to the redemption of ſinners by him, previous to any act on Chriſt's part under the character of Mediator.

Covenant of works ſignifies, in the language of ſome divines, any *covenant* whereby God requires perfect obedience from his creatures, in ſuch a manner as to make no expreſs proviſion for the pardon of offences to be committed againſt the precepts of it, on the repentance of ſuch ſuppoſed offenders, but pronounces a ſentence of death upon them: ſuch, they ſay, was the *covenant* made with Adam in a ſtate of innocence, and that made with Iſrael at Mount Sinai.

Covenant, *Solemn League and*, was eſtabliſhed in the year 1643, and formed a bond of union between Scotland and England. It was ſworn and ſubſcribed by many in both nations, who hereby ſolemnly abjured popery and prelacy, and combined together for their mutual defence. It was approved by the parliament and aſſembly at Weſtminſter, and ratified by the general aſſembly of Scotland in 1645. King Charles II. diſapproved of it when he ſurrendered himſelf to the Scots army in 1646: but in 1650 he declared his approbation both of this and the national *covenant* by a ſolemn oath; and in Auguſt of the ſame year, made a farther declaration at Dumfermling to the ſame purpoſe, which was alſo renewed on occaſion of his coronation at Scone in 1651. The *covenant* was ratified by parliament in this year, and the ſubſcription of it required by every member, without which the conſtitution of the parliament was declared null and void. It produced a ſeries of diſtractions in the ſubſequent hiſtory of that country, and was voted illegal by parliament, and proviſion made againſt it. Stat. 14 Car. II. c. 4.

Covenant, *Suit*. See **Suit**.

Covenant, *Ark of the*. See **Ark**.

COVENTRY *bells*. See **Campanula**.

COVERED *Flank*, *Fountain*, *Medals*. See **Flank**, **Fountain**, **Medal**.

COVERING, in *Architecture*, one of the principal parts of a building. See **Roofing**.

Covering, in *Painting*. See **Body**.

CO-VERSED *ſine*, a term which ſome people uſe for the remaining part of the diameter of a circle, after the **versed sine** is taken from it.

COVERT, in *Law*.—*Feme* **Covert** denotes a woman married, and ſo *covered* by, or under the protection of, her huſband.

Covert-*way*, in *Fortification*, a ſpace of ground level with the adjoining country, on the edge of the ditch, ranging quite round the half-moons, and other works withoutſide the ditch. See *Tab. Fortification, fig.* 21. *lit. b b, &c.*

It is otherwiſe called *corridor*, and hath a parapet together with its banquette, and glacis, which form the height of the parapet.

One of the greateſt difficulties in a ſiege, is to make a lodgment on the *covert-way*; becauſe, uſually, the beſieged paliſade it along the middle, and undermine it on all ſides.

This is ſometimes alſo called the *counterſcarp*, becauſe it is on the edge of the ſcarp.

COVERTURE, in *Law*, is particularly applied to the ſtate and condition of a married woman; who, by the laws of our realm, is under *covert-baron*, or *ſub poteſtate viri*, and called a *feme covert*; and therefore diſabled to make bargains with any, to the prejudice of herſelf, or her huſband, without his conſent or privity; or at leaſt without his allowance and confirmation: and if the huſband alien the wife's lands, during the marriage, ſhe cannot gainſay it during his life.

By the law of England, *coverture*, in ſome caſes, will excuſe the woman from the pains of felony, &c. See Feme *covert.*

COUGH, in *Medicine*, a diſeaſe affecting the LUNGS, occaſioned by a ſharp ſerous humour, vellicating the fibrous coat thereof, and urging it to a diſcharge by ſpitting, &c.

Medical writers define a *cough* to be a diſcuſſory and eliſory motion of the breaſt, by means of which nature attempts to throw off ſomewhat that is offenſive to her.

Phyſicians diſtinguiſh *coughs* into the idiopathic and the ſymptomatic: the firſt is truly pectoral; the other only affects the breaſt, by means of the conſent of parts. Of the ſymptomatic, or, as ſome expreſs themſelves, the conſenſual *coughs*, ſome have a catarrhal diſpoſition, and have a coryza for their origin or attendant, or, more ſtrictly ſpeaking, a gravedo; ſometimes a bronchus, hoarſeneſs, and inflammation of the tonſils; others are called hypochondriacal, which ſometimes ariſe from diſorders of the ſtomach, and are therefore called dry ſtomachic *coughs*; and ſometimes from ſchirrhoſities of the liver, whence they are common to people in cachexies, and in hectics and dropſies.

A *cough*, which ariſes from internal cauſes, is to be carefully diſtinguiſhed from one that riſes from external. The dry and the moiſt *cough*, that is, thoſe in which matter is ſpit up, and thoſe in which nothing is evacuated, differ alſo greatly, as well in regard to their ſymptoms, as to the perſons they attack. The dry *cough* is always more tedious to cure than the moiſt, and more eaſily returns. The ſtomachic *cough*, which is owing to conſent of parts, is known by the quantity and thickneſs of the matter that is ſpit up, which is always moſt frequent after meals, and gives a tendency toward a reaching to vomit. This moiſt ſtomachic *cough* differs in this manner, in all particulars, from the dry *cough* of the ſame name and origin with it, as mentioned before.

The hypochondriac *cough* is abundantly diſtinguiſhed from the other kinds, by its dryneſs, and by its vehement violence, for it always leaves a hoarſeneſs behind it; it is always moſt violent after eating, and after drinking large draughts of cold liquors, or aſcending ſteep places: As alſo by its bearing very well a cold and humid air, and not being exaſperated by it, as the pectoral *coughs* are; and finally, by a ſenſation of a concuſſion of the diaphragm, when the effects in coughing are violent.

The common habitual dry *cough* is diſtinguiſhed from the other kinds by its remarkable dryneſs; and the common moiſt habitual *cough* by its abundant quantity of matter diſcharged, and by its appearing pulpy and greeniſh, and not ſanious, or ſtreaked with blood, and continuing in the ſame degree uſually for a conſiderable time. In this habitual *cough* there is no waſting of the fleſh, nor is there that violent exacerbation on the taking of opiates, which is always found in the phthiſical *coughs*, to which all opiates ſeem the greateſt enemies. This *cough* alſo always receives great benefit from purging medicines, but the phthiſical *cough* none at all: but both theſe differ greatly, according to the age and temperament of the body of the perſon afflicted with them.

Perſons ſubject to coughs. The ſimple idiopathic *cough*, ariſing from internal cauſes, whether it be of the moiſt or dry kind, is almoſt peculiar to young people, and thoſe of plethoric habits. The catarrhal ſymptomatic *cough*, which ariſes from external accidents, is common to perſons of all ſtates and ages; but is more frequent among old men than among others. The perſons moſt ſubject to the common dry *cough*, are young people of a florid conſtitution and dry habit of body; and men of the middle or more advanced ages are ſometimes alſo afflicted with it, from ſuppreſſions of the hæmorrhoidal diſcharges, or from omiſſion of habitual bleedings; as are alſo people who are badly conformed, gibboſe or crooked, and ſuch as are afflicted with the evil, or have calculi in the bronchia, or nodes of a ſchirrhous nature in the lungs; and finally, ſuch as have been ill treated in the ſmall-pox, or have had the itch, or any other violent cutaneous eruption ſtruck in upon them. People moſt ſubject to a common moiſt *cough*, are thoſe of a phlegmatic habit, ſuch as are apt to cool their neck and breaſt in autumn in damp cold air in evenings; ſuch as have omitted their habitual bleedings, and ſuch as have drank too freely of ſpirituous liquors, or taken too much of acids. The idiopathic pectoral *cough* ariſes from a congeſtion of humours in the breaſt; and the hypochondriac *cough* is either owing to a fault in the ſtomach, or to a ſchirrhoſity in the liver.

Prognoſtics in coughs. The ſimple idiopathic pectoral *cough* very frequently goes off of itſelf, without the aſſiſtance of medicines, or with no farther aſſiſtance to nature than bleeding, judiciouſly managed; but though thus gentle while recent, yet when it is become habitual, and fixed upon a perſon, it is very obſtinate; and though at firſt it is far from a conſumptive *cough*, yet there is no certainty but that it may, at ſome time or other, occaſion ulcerations in the lungs. A dry *cough* in young people is much to be feared, when of long ſtanding; for it not unfrequently degenerates into a ſpitting of blood, or into a conſumption: this kind ſometimes alſo changes into what authors call the *ferine cough*, which is ſo violent, that perſons afflicted with it are ſcarce able to recover themſelves after a fit of it. In general, any *cough* that ſeizes a perſon in the ſpring, is much eaſier cured than one that attacks in autumn. Periodic *coughs*, that have been long uſed to return upon people at certain times, are always to be ſuſpected of danger, if they leave them ſuddenly, and no natural or artificial evacuation is made in their place; for they too often bring on faults in digeſtion, and ſometimes ſuffocative catarrhs, and paralytic diſorders. A moiſt habitual *cough*, when it ſuddenly changes into a dry one, is alſo a bad prognoſtic. A violent dry hypochondriac *cough*, that frequently remits and recurs again, and is uſually worſt in the night, gives great reaſon to ſuſpect a ſchirrhoſity in the liver; and the more regularly it returns at ſtated times, the more certain is the defect of this or ſome other of the viſcera; ſo that the prognoſtic is very fatal and very certain from it.

Method of cure. In caſe of a moiſt pectoral *cough*, it is proper firſt to give a purge, not violent, but yet moderately ſtrong, to derive the matter from the breaſt; and the catarrhal matter muſt then be prepared for evacuation. When it is ſimply mucous, the common reſolvent and diſcutient catarrhal medicines are to be depended upon; ſuch are decoctions of the roots of pimpernel and iris, with the leaves of hyſſop, horehound, ſcabious, and ſpeedwell; with theſe are to be given the attenuant gums, as ammoniacum, benjamin, and ſagapenum, with the warm carminative ſeeds. When the matter is too tough and viſcous, the buſineſs then is, on the contrary, to incraſſate and reduce it to a ſoft pulpoſe body. This is effected by liquorice-root or juice, with gum Arabic, figs, ſtarch, together with all the ſulphureous medicines. If, on the contrary, the matter is thin and acrimonious, and irritates violently, then the cure is to be effected by ſuch things as obtund and ſweeten it; of this kind are emulſions of almonds, and the cold ſeeds, with barley-water, water-gruel, the mucilages of quince and fleawort ſeeds, and the like; and to theſe are to be added occaſionally, ſpermaceti, and oil of ſweet almonds. When the *cough* is habitual, laxatives are to be given after theſe, or in the intermediate times, during the taking them; and if the *cough* returns, when the matter of it is no longer the cauſe, it is to be quieted by gentle opiates, ſuch as the ſtorax pill; and finally, corroborants are to be given to reſtore the due tone of the lungs.

In the dry *cough*, the gentleſt purges only can properly have place, and nothing is ſo proper as to begin with ſmall doſes of rhubarb; after this, to diſcuſs the ſtagnating blood about the breaſt, decoctions of the pectoral herbs are to be taken in large quantity, ſuch as coltsfoot, ſcabious, maiden-hair, and the like. While the patient is taking theſe, he ſhould frequently waſh his feet in warm water; and finally, the cure is to be completed by ſuch corroborants as reſtore the due tone of the lungs; of this kind Stahl's tonico-nervine mixture is a very excellent medicine.

In the hypochondriacal *cough*, as there is generally a fault in the liver, the *cough* can never be cured, unleſs that defect can be removed The *cough* is therefore to be judged, in this caſe, only a ſymptom of the diſeaſe, and the method of treatment muſt be the ſame as in the infarctions of the liver. See Hepatis *infarctus.*

When this obſtruction is removed, the *cough*, occaſioned by it, goes off of itſelf. In caſes where the hypochondriac *cough* depends on a fault in the ſtomach, the firſt conſideration to be had, is, whether it be dry or moiſt: when it is dry, we may conclude that the fault is not ſo much in the ſtomach, as in the parts about it; and hence the motion of the congeſtions of blood toward the *vena porta* is to be regarded.

The moiſt ſtomachic *cough* always brings the breaſt into conſent, and is hence often called a *ſtomachico-pectoral cough*; for the mucous matter which lies in the fauces, and is daily evacuated rather by hawking than coughing, probably aſcends up the *æſophagus*, and cauſes a ſlight *cough* in the day-time; but in the night, when that excretion ceaſes, it is eaſy for ſome little humidity to ſlip down the *aſpera arteria*, and this will be again thrown up by coughing in the morning. In the cure of this, there muſt be firſt given ſome gentle purges; after theſe, ſuch medicines as reſolve viſcoſities in their firſt formation;

in which intention the roots of elecampane and pimpernel, with that of Florentine orrice, are of great effect; and in the food it will be proper to eat large quantities of ginger, pepper, and the other ſpices; and at night, going to bed, drink a ſmall glaſs of brandy. When the diſeaſe begins to mitigate, the eſſence of amber is a medicine that will do the greateſt ſervice.

Bleedings in *coughs* in general, when the conſtitution is plethoric, and they are done at proper times, are of great ſervice in breaking the force of the diſeaſe; nay, in caſes of a true phthiſis, bleeding often greatly retards, and keeps off the bad ſymptoms. It is to be obſerved, however, in all theſe caſes, that, when the conſtitution will bear it, the quantity taken away ſhould be large, for otherwiſe they only invite a larger afflux of blood to the breaſt, and ſo increaſe inſtead of mitigating the force of the diſeaſe.

Bleeding is always more neceſſary in a dry *cough* than in a moiſt one, unleſs the ſuppreſſion of ſome natural hæmorrhage, or the omiſſion of the habitual bleedings, have been the occaſion of it. Bleeding is alſo the more neceſſary in *coughs*, as they return at times with renewed violence, and hurt the breaſt and lungs; and in this caſe alſo, if cupping has been frequently uſed, and lately omitted, it muſt be had recourſe to again. Purging medicines have the moſt ſpeedy effects in moiſt *coughs*, and indeed in dry ones they are not always ſafe, or, at the moſt, very gentle purgations alone are proper in this laſt caſe, where there is not a load of attending matter to be evacuated, as in the firſt. Sweating medicines are by ſome preſcribed in *coughs*; but they have no proper place in any judicious regimen for theſe caſes, unleſs after the *cough* is cured, and the matter carried off, when they may perhaps be of ſome ſervice to complete the reſtoration of the conſtitution to its priſtine ſtate, by an equal diſtribution of the humours through the whole body. In ſimple *coughs* there is occaſion for very few medicines, and, in general, inciding things, which diſpoſe the matter to an eaſy evacuation, with gentle laxatives, do the whole buſineſs

The commotions occaſioned by humid *coughs* are never extremely violent, nor of any great danger, and therefore it is not neceſſary to be at any great pains to allay them by opiates; but theſe are very ſucceſsfully given in caſes where the emotions are greatly too violent for the quantity of matter, or where they continue after the matter is carried off and evacuated. In this caſe the ſtorax pill is of great ſervice. Juncker.

The method often followed in the convulſive *cough* is by evacuations; but this has been obſerved rather to prevent the diſeaſe from becoming fatal than to ſhorten it, ſuch *coughs* continuing ſeveral months notwithſtanding. However, a remiſſion for ſome days happens after bleeding and purging, eſpecially when the purgatives work upwards as well as downwards. Pectorals, balſamics, and attenuants, have been ſometimes found to do little or no good, and opiates rather to do hurt.

Cough, *in infants*. See Infant.

Cough, in *Farriery*, is a diſeaſe to which horſes are very ſubject. Some of theſe are ſymptomatic of a consumption, when they have been of long continuance, and are attended with loſs of appetite, waſting of fleſh, and weakneſs. Other *coughs* proceed from phlegm and ſlimy matter that ſtuff up the veſſels of the lungs: in this caſe, which is of the aſthmatic kind, the horſe's flanks have a quick motion; he breathes quick; his *cough* is ſometimes dry and huſky, ſometimes moiſt, before which he wheezes, rattles in the throat, and throws out of his noſe and mouth a quantity of white phlegm, eſpecially after drinking, or when he begins or ends his exerciſe. Theſe *coughs* ſhould be diſtinguiſhed from that thickneſs of wind, which is occaſioned by full or foul feeding, want of exerciſe, or their being taken up from winter's graſs. Theſe are eaſily cured by proper diet and exerciſe: and the other diſorder may be relieved, and totally cured if it happens to a young horſe, and is not of long continuance, by the following treatment. Bleeding ſhould be uſed, in proportion to the ſtate of the horſe with reſpect to fleſh: mercurial medicines are of great ſervice: a mercurial ball with two drams of calomel may be given at night, and a common purge in the morning; or the following, which is recommended by Mr. Gibſon: take gum galbanum, ammoniacum, and aſſa fœtida, of each two drams; fine aloes, one ounce; ſaffron, one dram; oil of aniſeed, two drams; oil of amber, one dram; with honey enough to form the whole into a ball. Theſe may be repeated at proper intervals; and during the intervals, and for ſome time after, one of the following balls may be given every morning: take cinnabar of antimony, finely levigated, ſix ounces; gum ammoniacum, galbanum, and aſſa fœtida, of each two ounces; garlic, four ounces; ſaffron, half an ounce; let the whole be mixed into a paſte with honey. Exerciſe and moderate diet are alſo eſſential to the effect of any remedy. In dry *coughs*, which are the nervous aſthmas of horſes, moderate bleeding is proper; two drams of calomel, mixed with an ounce of diapente, may be given for two nights, and a purging-ball in the morning. This purge may be repeated with one mercurial ball once in eight or ten days; after which one of the following balls, about the ſize of a pigeon's egg, may be taken every day for two months or longer: take native cinnabar, half a pound; gum guaiacum, four ounces; myrrh, and gum ammoniacum, of each two ounces; Venice ſoap, half a pound; mix the whole with honey, or oxymel of ſquills. In obſtinate dry *coughs*, the following has been found an uſeful remedy: take gum ammoniacum, ſquills, and Venice ſoap, of each four ounces; balſam of ſulphur, with aniſeeds, one ounce; beat them into a maſs, and give them as the former. Young horſes are ſubject to *coughs* in cutting their teeth; bleeding and warm maſhes are generally ſufficient for removing this complaint: but in ſuch ſubjects the *cough* often proceeds from worms; if this be the caſe, anthelmintic medicines ſhould be given. See Ascarides, and Horse-*worms*.

Cough, *Chin*. See Chin-*cough*.

Cough, called the huſk, is a diſeaſe to which young bullocks are ſubject. In this diſorder, the wind-pipe and its branches are loaded with ſmall taper worms. Farmers count the diſeaſe incurable; but fumigations with mercurials, as cinnabar, or with fœtids, as tobacco, might prove ſerviceable. Phil. Tranſ. vol. xlix. part ii. p. 247.

COUHAGE, or *ſtinking-beans*; theſe are a kind of kidney-beans imported from the Eaſt Indies, where they are uſed as a cure for the dropſy.

The down growing on the outſide of the pod is ſo pointed, as like a nettle to ſting the fleſh, though not with ſo painful a ſenſation. This, by a corruption of the word, is called *cowitch*.

COVIN, a deceitful compact, or agreement between two or more, to deceive or prejudice a third perſon.

As, if a tenant for life conſpire with another, that this other ſhall recover the land which the tenant holds, in prejudice of him in reverſion.

Dr. Skinner takes the word to be a corruption of the Latin *conventum*, and therefore writes it *coven*. See Conspiracy.

COVING, in *Building*. When houſes are built projecting over the ground plot, and the turned projecture arched with timber, lathed and plaſtered; the work is called *coving*.

Coving *corniche*, is a corniche with a great caſement, or hollow therein.

COVINUS, among the *Ancients*, a kind of chariot, in which the Gauls and Britons uſed to fight in battles.

COUL, or Cowl, a ſort of monkiſh habit worn by the Bernardines, and Benedictines.

The word is formed from *cucullus*, by confounding the two firſt ſyllables into one, as being the ſame twice repeated.

There are two kinds of *couls*; the one white, very large, worn in ceremony, and when they aſſiſt at the office: the other black, worn on ordinary occaſions, in the ſtreets, &c.

F. Mabillon maintains the *coul* to be the ſame thing in its origin with the ſcapular. The author of the apology of the emperor Henry IV. diſtinguiſhes two forms of *couls*; the one a gown reaching to the feet, having ſleeves, and a capuchin, uſed in ceremonies; the other a kind of hood to work in, called alſo a *ſcapular*, becauſe it only covers the head and ſhoulders.

COULTER, in *Huſbandry*, that part of a plough which forms the edge, ſtanding before the ſhare of the plough, and cutting the clods as the ſhare tears them up. The *coulter* is an iron inſtrument of two feet eight inches in length, of near two inches breadth, and near one inch thick. It is driven through the beam of the plough, and fixed in its proper direction by a wedge.

The modern improvement of the plough by Mr. Tull, gives it four *coulters*; the conſequence of which is, that the earth ploughed up is cut four times as ſmall as by the common plough, which has only one.

In all *coulters*, the length and direction are to be nicely regulated. The cutting the hole and driving the wedge, regulate the direction; and its length is altered from the beam by the driving it farther down, as its point wears away.

None of theſe *coulters* ought to deſcend ſo low as the ſhare, except when the land is to be ploughed very ſhallow; it is always ſufficient for them to cut through the turf, let the plough go as deep as it will. In ploughing ſhallow, the fin of the ſhare muſt alſo be broad enough to cut off the fourth piece or furrow; elſe that lying very faſt, will be apt to raiſe up the groundwriſt, and throw out the plough: but when the land is ploughed deeper, the groundwriſt will break off this fourth furrow, though the fin be not broad enough to reach it. Tull's Huſbandry.

Coulter-*neb*, or **Counter**-*neb*, in *Zoology*, a name by which the people in ſome parts of England call the *anas arctica cluſii*. See Duck.

COUNCIL, or Counsel, an aſſembly, or meeting of divers conſiderable perſons, or officers, to conſider and concert meaſures touching the adminiſtration of public affairs, rendering juſtice, or the like.

The king's *privy-council* is the primum mobile of the civil government of England; and that from which all the inferior orbs derive their motion. See Privy-*council*.

In the French polity, *councils* are very numerous; they have their *council of ſtate, council of the finances, council of diſpatches, council of directions, grand council, council of the regency, council of conſcience, &c.*

Council, *Aulic*. See Aulic.

Council, in *Church Hiſtory* and *Polity*, a ſynod or aſſembly of prelates and doctors, and deputies, met for the regulation of matters relating to the doctrine or diſcipline of the church. *Councils* of this kind were firſt introduced about the middle of the ſecond century.

Council, *Provincial*, is an aſſembly of the prelates of a province under the metropolitan. See Convocation.

Council, *National*, is an aſſembly of the prelates of a nation, under their primate, or patriarch.

Council, *Oecumenical* or *general*, is an aſſembly of all the prelates of Chriſtendom, or of commiſſioners from all the churches in the Chriſtian world, and repreſenting the church univerſal. Theſe were eſtabliſhed by Conſtantine the Great, who aſſembled the firſt at Nice in 325. See Oecumenical.

Indeed to conſtitute a *general council*, it is not required, that all the prelates ſhould be actually preſent; it is ſufficient, that the *council* be regularly appointed, and that they may be there, or are called thereto.

General councils are frequently called by eccleſiaſtical authors *plenary councils*. The Romaniſts reckon eighteen *general councils*: whereof only the firſt four are admitted by the reformed. The number is made out thus: two of Nice, four of Conſtantinople, one of Epheſus, one of Chalcedon, five of the Lateran, two of Lyons, one of Vienne, one of Florence, and the laſt of Trent, which held from 1545 to 1563. The *council* of Trent ordains *provincial councils* to be held every three years; yet the laſt held in France is that of Bourdeaux, a hundred years ago.

There have been various collections of the canons or decrees of *councils*; as that of Dr. Merlin at Paris in 1524; one of F. Crabbe, a Franciſcan, in 1536; another of Surius, in 1567; another at Venice, in 1585; another at Rome, in 1608; one of Binius, canon of Cologne, in 1606, in ten volumes; another at the Louvre, in 1664, in thirty-ſeven volumes; another of F. Labbé and F. Coſſart, Jeſuits, in 1672, in ſeventeen volumes, more ample than the reſt; laſtly, another by F. Hardouin. See Canon.

Council *of war*, is an aſſembly of the principal officers of an army, or fleet, occaſionally called by the general, or admiral, to conſider of the preſent ſtate of things, and concert meaſures for their conduct, with regard to ſieges, retreats, engagements, &c.

The ſame term is ſometimes alſo uſed for an aſſembly of the officers of a regiment, or ſhip; met to try ſoldiers or ſailors accuſed of any crime.

Council, *Common*. See *Mayor's* Courts.

Council *and Seſſion in Scotland*. See Sessions.

COUNSELLOR, *Conſiliarius*, in *Law*, is a perſon retained by a client to plead his cauſe in a court of judicature. A *counſellor* at law hath a privilege to enforce any thing of which he is informed by his client, if pertinent to the matter, and is not to examine whether it be true or falſe; for it is at the peril of him who informs him. Cro. Jac. 90. But after the court hath delivered their opinions of the matter in law depending before them, the *counſel* at the bar are not to urge any thing farther in that cauſe. 1 Lill. Abr. 355. It has been held that the king's *counſel* ought not to be admitted to argue any cauſe againſt the king; though this was oppoſed by Serjeant Maynard. Hill. 21 Car. II. 1 Mod. 38.

No *counſel* is allowed a priſoner upon a general iſſue, on indictment of felony, &c. unleſs ſome doubtful point of law ariſe; the court is the priſoner's only *counſel*; and the behaviour of the priſoner in his own defence, is one means of diſcovering the truth: but this ſeems to be a defect in our common law. Blackſt. Com. vol. iv. p. 349. In appeals and upon ſpecial pleadings, the priſoner ſhall have *counſel* aſſigned him by the court: though *counſel* is not to prompt the priſoner in matters of fact. 2 Hawk. 400, 401. Proviſion is made for *counſel* for priſoners in treaſon, by ſtat. 7 and 8 W. III. See Barristers and Serjeants.

Counsellors *of Honour*. See Honour.

COUNT, Countee, Comes, a nobleman who poſſeſſes a domain erected into a county. See Viscount.

Engliſh *counts* we diſtinguiſh by the title of *earls*; foreign ones ſtill retain their proper name.

The dignity of a *count* is a medium between that of a duke and a baron.

According to the modern uſe, moſt plenipotentiaries and embaſſadors aſſume the title of *counts*; though they have no county; as the *count d'Avaux*, &c.

Anciently, all generals, counſellors, judges, and ſecretaries of cities under Charlemagne were called *counts*; the diſtinguiſhing character of a duke and *count* being this, that the latter had but one town under him, but the former ſeveral.

A *count* has a right to bear on his arms a coronet, adorned with three precious ſtones, and ſurmounted with three large pearls, whereof thoſe in the middle and extremities of the coronet advance above the reſt.

Counts were originally lords of the court, or of the emperor's retinue, and had their name *comites, à comitando*, or *à commeando*: hence, thoſe who were always in the palace, or at the emperor's ſide, were called *counts palatine*, or *comites à latere*. See Palatine.—In the times of the commonwealth, *comites*, among the Romans, was a general name for all thoſe who accompanied the proconſuls and proprætors into the provinces, there to ſerve the commonwealth; as the tribunes, præfects, ſcribes, &c.

Under the emperors, *comites* were the officers of the palace. The origin of what we now call *counts* ſeems owing to Auguſtus, who took ſeveral ſenators to be his *comites*, as Dion obſerves, i. e. to accompany him in his voyages and travels, and to aſſiſt him in the hearing of cauſes; which were thus judged with the ſame authority as in full ſenate. Gallienus ſeems to have aboliſhed this council, by forbidding the ſenators being found in the armies: and none of his ſucceſſors re-eſtabliſhed it.

Theſe counſellors of the emperor were really *counts, comites*, i. e. companions of the prince; and they ſometimes took the title thereof, but always with the addition of the emperor's name whom they accompanied: ſo that it was rather a mark of their office, than a title of dignity.

Conſtantine was the firſt who converted it into a dignity; and under him it was, that the name was firſt given abſolutely.

The name once eſtabliſhed, was in a little time indifferently conferred, not only on thoſe who followed the court, and accompanied the emperor, but alſo on moſt kinds of officers; a long liſt whereof is given us by Du-Cange.

Euſebius tells us, that Conſtantine divided the *counts* into three claſſes: the firſt bore the title of *illuſtres*; the ſecond that of *clariſſimi*, and afterwards *ſpectabiles*; the third were called *perfectiſſimi*.

Of the two firſt claſſes was the ſenate compoſed; thoſe of the third had no place in the ſenate, but enjoyed ſeveral other of the privileges of ſenators.

There were *counts* who ſerved on land, others at ſea; ſome in a civil, ſome in a religious, and ſome in a legal capacity: as, *comes ærarii, comes ſacrarum largitionum, comes ſacri conſiſtorii, comes curiæ, comes capellæ, comes archiatrorum, comes commerciorum, comes veſtiarius, comes horreorum, comes opſoniorum* or *annonæ, comes domeſticorum, comes equorum regiorum* or *comes ſtabuli, comes domorum, comes excubitorum, comes notariorum, comes legum* or *profeſſor in jure, comes limitum* or *marcarum, comes portus Romæ, comes patrimonii, &c.*

The Francs, Germans, &c. paſſing into Gaul and Germany, did not aboliſh the form of the Roman government; and as the governors of cities and provinces were called *counts, comites*, and *dukes, duces*, they continued to be called ſo.

Theſe governors commanded in time of war; and in time of peace they adminiſtered juſtice. Thus, in the time of Charlemagne, *counts* were the ordinary judges and governors of the cities.

Theſe *counts* of cities were beneath the dukes and *counts* who preſided over provinces; the firſt being conſtituted in the particular cities under the juriſdiction of the latter. The *counts* of provinces were in nothing inferior to dukes, who themſelves were only governors of provinces. Under the laſt of the ſecond race of French kings, they got their dignity rendered hereditary; and even uſurped the ſovereignty when Hugh Capet came to the crown: his authority was not ſufficient to oppoſe their encroachments: and hence it is they date the privilege of wearing coronets in their arms; they aſſumed it then, as enjoying the rights of ſovereigns in their particular diſtricts, or *counties*. But, by degrees, moſt of the *counties* became re-united to the crown.

The quality of *count* is now become very different from what it was anciently; being now no more than a title, which a king grants upon erecting a territory into a county, with a reſerve of juriſdiction and ſovereignty to himſelf.

At firſt, there was no clauſe in the patent of erection, intimating the reverſion of the county to the crown in default of heirs male; but Charles IX. to prevent their being too numerous, ordained that duchies and counties, in default of heirs male, ſhould return to the crown.

The point of precedence between *counts* and marquiſes has been formerly much controverted: the reaſon was, that there are *counts* who are peers of France, but no marquiſes: but the point is now given up, and marquiſes take place; though anciently, when *counts* were governors of provinces, they were on a level even with dukes.

William the Conqueror, as is obſerved by Camden, gave the dignity of *counts* in fee to his nobles; annexing it to this or that county or province, and allotting for their maintenance a certain proportion of money, ariſing from the prince's profits in the pleadings and forfeitures of the provinces. To this purpoſe he quotes an ancient record, thus: Hen. II. *Rex Angliæ his verbis* comitem *creavit*; *ſciatis nos feciſſe Hugonem Bigot* comitem *de Norf. &c. de tertio denarii de Norwich & Norfolk*, *ſicut aliquis* comes *Angliæ*, *&c.*

The Germans call a *count*, *graf*, or *graff*; which, according to a modern critic, properly ſignifies *judge*; and is derived from *gravio*, or *graffio*, of γραφω, *I write*. They have ſeveral kinds of theſe *counts*, or *graffs*; as *landgraves*, *marchgraves*, *burg-graves*, and *palſgraves*, or *counts palatine*. Theſe laſt are of two kinds; the former are of the number of princes, and have the inveſtiture of a palatinate; the others have only the title of *count palatine*, without the inveſtiture of any palatinate.

Some aſſert, that by publicly profeſſing the imperial laws for twenty years, the perſon acquires the dignity of a *count palatine*; and there are inſtances of profeſſors in law, who have aſſumed the title accordingly: but there are others who queſtion this right.

Count, in *Law*, denotes the original declaration in a real action; as the declaration is in a perſonal one: the libellus of the civilians anſwers to both.

Yet, *count* and declaration are ſometimes confounded; and uſed for each other: as, *count in debt*, *count in appeal*, &c.

Count-wheel, in *Clock-Work*, a wheel which moves round in twelve hours; called alſo the *locking-wheel*. See Clock.

COUNTER, from *computare*, is the name of two priſons in London, for the uſe of the city, to confine debtors, breakers of the peace, &c.

Counters, in *Ship-Building*, are diſtinguiſhed into *upper* and *lower*. The *upper counter* is reckoned from the gallery to the lower part of the ſtraight piece of the ſtern. The *lower counter* is between the tranſom and lower part of the gallery.

Counter *of a horſe*, that part of a horſe's fore-hand which lies between the ſhoulders and under the neck.

Counter, of the Latin prepoſition *contra*, *againſt*, is uſed in the compoſition of divers words in our language; and generally implies the relation of oppoſition. As,

COUNTER-ALLEYS, in *Gardening*. See Alley.

COUNTER-APPROACHES, in *Fortification*, lines or trenches made by the beſieged, when they come out to attack the lines of the beſiegers in form.

Counter-approach, *line of*, a trench which the beſieged make from their covered-way to the right and left of the attacks, in order to ſcour or enfilade the enemy's works. It ſhould commence in the angle of the place of arms of the half-moon that is not attacked, and of the baſtion that is attacked; about fifty or ſixty fathoms from the attacks; and continued as far as ſhall be found neceſſary in order to ſee the enemy in his trenches and parallels. This line muſt be perfectly enfiladed from the covered-way and the half-moon, that if the enemy get poſſeſſion of it, it may be of no ſervice to him. In this line the governor muſt frequently in the night-time ſend ſmall parties of horſe, or foot, to drive the workmen from their poſts; and, if poſſible, to carry off the engineers, who have the direction of the works.

COUNTER-BARRY, or Contre-barre', is uſed by the French heralds for what we more ordinarily call *bendy ſiniſter per bend counterchanged*. See Barry.

COUNTER-BATTERY, a battery raiſed to play on another, in order to diſmount the guns.

COUNTER-BENDY, or Contre-bande', in *Heraldry*, is uſed by the French to expreſs what we ordinarily call bendy *of ſix per bend ſiniſter counterchanged*.

COUNTER-BOND, is a bond given to ſave a perſon harmleſs, who has given his bond for another. This is alſo called *counter-ſecurity*.

COUNTER-BRACING. See Tacking.

COUNTER-BREAST-WORK in *Fortification*, a fausse-braye.

COUNTER-CHANGE, in *Commerce*, a mutual exchange between two parties.

COUNTER-CHANGED, in *Heraldry*, is when there is a mutual changing of the colours of the field and charge in an eſcutcheon, by means of one or more lines of partition. Thus, in the coat of the famous Chaucer: he beareth, party per pale argent and gules, a bend *counter-changed*; that is, that part of the bend, which is in that ſide of the eſcutcheon which is argent, is gules; and that part of it which is on the other, is argent. Vide *Tab.* II. *Heraldry*, *fig.* 50.

COUNTER-CHARGE, is a reciprocal charge, or recrimination brought againſt an accuſer.

COUNTER-CHARM, a charm or spell, contrived to hinder the effect of another. See Ligature.

COUNTER-CHEVRONED, denotes a ſhield *chevronny*, or parted by ſome line of partition.

COUNTER-COLOURED. See Contrebend.

COUNTER-COMPONED, or Contre-compone', or Counter-company, is when a bordure is compounded of two ranks of panes: as repreſented in *Tab. Heraldry*, *fig.* 51. When it conſiſts but of one rank, it is called *componed*; and when of more than two, checky.

COUNTER-DEED, a ſecret writing, or a private act, either before a notary, or under a privy-ſeal; which deſtroys, changes, annuls, or alters, ſome more ſolemn and public act.

Counter-deeds are rather tolerated than permitted: in many caſes they are actually prohibited; as being uſually no better than frauds. The cuſtom of Paris annuls all *counter-deeds*, contrary to the tenor of a marriage.

COUNTER-DRAWING, in *Painting*, *&c.* the copying a deſign or painting, by means of a fine linen cloth, an oiled paper, or other tranſparent matter; whereon the ſtrokes appearing through, are followed and traced with a pencil, with or without colour.

Sometimes they *counter-draw* on glaſs, and with frames or nets divided into ſquares, with ſilk, or with thread; and alſo by means of inſtruments invented for the purpoſe, as the parallelogram. See Designing.

COUNTER-ERMINE. See Ermine.

COUNTERFEIT *Architecture*. See Architecture.

COUNTERFEITING *the King's Coin and Seals*. See Treason.

COUNTERFEITS, in *Law*. See Cheats.

COUNTER-FISSURE. See Contrafissure.

COUNTER-FOIL, or Counter-stock, is that part of a tally, ſtruck in the exchequer, which is kept by an officer of the court.

COUNTER-FORTS, *Buttreſſes*, or *Spurs*, are pillars of maſonry, ſerving to prop or ſuſtain walls, or terraces, ſubject to bulge, or be thrown down.

Theſe works are uſually turned archwiſe, and placed at a diſtance from each other, which is uſually three times their thickneſs; and their length is one fourth of the height of the wall. Mr. Vauban places them at the ſame diſtance, whether the wall be high or low. See Muller's Mathem. vol. iv. p. 5, &c. who directs that their thickneſs ſhould never be leſs than half their length.

When any thing is built on the deſcent of a mountain, it muſt be ſtrengthened with *counter-forts* well bound to the wall, and at the diſtance of about twelve yards from each other.

COUNTER-FUGUE, in *Muſic*, is when fugues proceed contrary to one another.

COUNTER-GAGE, in *Carpentry*, a method uſed to meaſure the joints, by transferring, v. gr. the breadth of a mortiſe to the place in the timber where the tenon is to be, in order to make them fit each other.

COUNTER-GUARD, in *Fortification*, a work generally ſerving to cover a bastion. It is compoſed of two faces, forming a ſaliant angle before the flanked angle of a baſtion. Next to the ravelin, it is one of the moſt uſeful outworks. They are ſometimes made before the ravelins. See Envelope.

COUNTER-HARMONICAL. See Contra-harmonical.

COUNTER-INDICATION. See Contra-indication.

COUNTER-LIGHT, a window, or light, oppoſite to any thing, which makes it appear to a diſadvantage. A ſingle *counter-light* is ſufficient to take away all the beauty of a fine painting.

COUNTERMAND, in a general ſenſe, a revocation of an order; or an excuſe for ſetting aſide, or deferring, a thing ordered to be done.

By the French law, a *countermand* differs from an *eſſoin*, 1. In that, in the *countermand*, the conſignment is propoſed to be deferred to a day certain, which is not in the *eſſoin.* 2. In the *eſſoin*, the cauſe of deferring the conſignment is expreſſed, and affirmed to be true; but in a *countermand* that affirmation is not required.

Countermand, in the *Engliſh Law*, is where a thing, formerly executed, is afterward, by ſome act or ceremony, made void by the party that firſt did it.

As, if a man make his laſt will, and deviſe his land to T. S. and afterwards enfeoff another of the ſame land; this feoffment is a *countermand* of the will, and the will void as to the diſpoſition of the land.

COUNTER-MANDATE. See Contramandatum.

COUNTER-MARCH, in *War*, a change of the face, or wings, of a battalion; whereby the men, who were in the front, come to be in the rear.

This is an expedient they have recourſe to, when the enemy attacks their rear; or when they change their march for a direction oppoſite to that wherein they had begun.

The *counter-march* is either made by files, or ranks: by files, when the men in the front of the battalion go into the rear; by ranks, when the wings, or flanks, of the battalion change ground with one another.

The term is alſo uſed at ſea, for the like change or motion of a ſquadron of ſhips.

COUNTER-MARK, a ſecond or third mark, put on any thing marked before.

The word is applied, in commerce, to the ſeveral marks put on a bale of goods belonging to ſeveral merchants; that it may not be opened but in the preſence of them all, or their agents.

In goldſmiths' works, &c. the *counter-mark* is the mark, or punchion of the hall, or company, to ſhew the metal is ſtandard, added to that of the artificer who made it.

Counter-mark of a horſe, is an artificial cavity, which the jockeys make in the teeth of horſes that have out-grown the natural mark; to diſguiſe their age, and make them appear as if they were not above eight years old.

Counter-mark of a medal, is a mark added to a medal, a long time after its being ſtruck.

Counter-marks appear to be faults, or flaws, in medals, disfiguring the ground, ſometimes on the ſide of the head, and ſometimes on the reverſe; particularly in the large and middle-ſized braſs: yet they are eſteemed as beauties among the curious, who ſet a particular value on ſuch medals, becauſe they know the ſeveral changes in value they have undergone; which are expreſſed by thoſe *counter-marks*.

Antiquaries, however, are not well agreed about the ſignification of the characters they find on them. On ſome, N. PROB. on others, N. CAPR. on others, CASR. RM. NT. AUG. SC. Some have, for their *counter-mark*, an emperor's head; ſome ſeveral; ſome a cornucopia.

Care muſt be taken not to confound the monograms with the *counter-marks*: the method of diſtinguiſhing them is eaſy. The *counter-marks*, being ſtruck after the medal, are dented, or ſunk in; whereas the monograms, being ſtruck at the ſame time with the medals, have rather a little relievo.

COUNTER-MINE, in *War*, a ſubterraneous vault, running the whole length of a wall, three feet broad, and ſix deep, with ſeveral holes and apertures therein: contrived to prevent the effect of mines, in caſe the enemy ſhould make any to blow up the wall.

This kind of *counter-mine*, however, is now little in uſe. The modern *counter-mine* is a well, or pit, and a gallery, ſunk on purpoſe, till it meet the enemy's mine, and prevent its effect: it being firſt pretty well known whereabouts that is.

COUNTER-MURE, Counter-wall, a little wall built cloſe to another, to fortify and ſecure it, that it may not receive any damage from the buildings contiguous to it.

By the cuſtom of Paris, if a ſtable be erected againſt a partition-wall, there muſt be a *counter-wall* added, eight inches thick. M. Bullet obſerves, that the *counter-wall* ought never to be bound, or connected, with the proper wall.

Counter-mure, in *Fortification*. See Contra-mure.

COUNTER-PALED, Contre-pale, in *Heraldry*, is when the eſcutcheon is divided into twelve pales parted per feſſe, the two colours being counter-changed; ſo that the upper are of one colour, or metal, and the lower of another.

COUNTER-PART, a part of ſomething oppoſite to another part.

Thus, in *Muſic*, the baſs and treble are two *counter-parts*, or oppoſite parts.

Counter-part, in *Law*, is the duplicate, or copy, of an indenture, or deed. That executed by the grantor is called the original, the reſt are *counter-parts*; though it is better for all the parties to execute all, which renders them originals.

COUNTER-PASSANT, in *Heraldry*, is when two lions are in a coat of arms, and one appears to be paſſing, or walking, quite the contrary way from the other. See Passant.

COUNTER-PLEA, in *Law*, a replication to a plea, or prayer.

When a tenant by courteſy, in dower, or other real action, prays the view or aid of the king, or him in the reverſion, for his better defence; or if a ſtranger to the action begun deſire to be admitted to ſay what he can for the ſafeguard of his eſtate: that which the demandant alleges againſt this requeſt, why it ſhould not be admitted, is called a *counter-plea*.

COUNTER-PLOT, a plot, or intrigue, contrived to thwart and overthrow another.

COUNTER-POINT, in *Muſic*, the art of compoſing harmony; or of diſpoſing and concerting ſeveral parts ſo together, as that they make an agreeable whole.

Counter-point is divided into *ſimple*, and *figurative*; agreeably to the diviſion of harmony, into the harmony of concords, and that of diſcords.

Counter-point took its name hence: when muſic in parts was firſt introduced, their harmony being ſo ſimple, they uſed no notes of different time, and marked their conſonances by *points* ſet *againſt* each other. Hence, becauſe of the equality of the notes of time, the parts were made to concord in every note.

This afterwards became denominated *ſimple* and *plain counter-point*; to diſtinguiſh it from another kind, wherein notes of different value were uſed, and diſcords brought in betwixt the parts; which they call *figurative counter-point*.

Simple counter-point, or the harmony of concords, conſiſts of the imperfect as well as the perfect concords; and may therefore be denominated *perfect* or *imperfect*, according as the concords are, whereof it is compoſed: thus, the harmony ariſing from a conjunction of any note with its fifth and octave, is perfect; but with its third and ſixth, imperfect.

Now to diſpoſe the concords, or the natural notes, and their octaves, into any key, in *ſimple counter-point*; obſerve, with regard to the diſtinction into perfect and imperfect harmony, this general rule; viz. to the key *ſ*, to the fourth *ſ*, and to the fifth *ſ*, a perfect harmony muſt be joined; to the ſecond *ſ*, the third *ſ*, and ſeventh *ſ*, an imperfect harmony is indiſpenſible; to the ſixth *ſ*, either an imperfect or perfect harmony.

In the compoſition of two parts, obſerve, that though a third appears only in the treble on the key *ſ*, the fourth *ſ*, and the fifth *ſ*; yet the perfect harmony of the fifth is always ſuppoſed, and muſt be ſupplied in the accompanyments of the thorough baſs to theſe fundamental notes.

More particularly, in the compoſition of two parts, the rules are, that the KEY *ſ* may either have its octave, its third, or its fifth; the fourth *ſ*, and fifth *ſ*, may have either their reſpective thirds or fifths; and the firſt may have its ſixth; as, to favour a contrary motion, the laſt may have its octave.

The ſixth *ſ* may have either its third, its fifth, or its ſixth. The ſecond *ſ*, third *ſ*, and ſeventh *ſ*, may have either their reſpective thirds or ſixths; and the laſt, on many occaſions, its falſe fifth: which rules hold the ſame both in flat and ſharp keys. For the rules of *counter-point*, with regard to the ſucceſſion of concords, it muſt be obſerved, that as much as can be in parts, may proceed by a contrary motion; i.e. the baſs may aſcend when the treble deſcends, and *vice verſa*. The parts moving either upwards or downwards the ſame way; two octaves, or two fifths, never to follow one another immediately. Two ſixths *l* never to ſucceed each other immediately. Whenever the octave or fifth is to be made uſe of, the parts muſt proceed by a contrary motion, except the treble move into ſuch octave or fifth gradually. If in a ſharp key, the baſs deſcend gradually from the fifth *ſ* to the fourth *ſ*; the laſt, in that caſe, muſt never have its proper harmony applied to it: but the notes that were harmony in the preceding fifth *ſ*, muſt be continued on the fourth *ſ*. Thirds and fifths may follow one another as often as one has a mind.

Figurative counter-point is of two kinds: in the one, diſcords are introduced occaſionally; ſerving only as tranſitions from concord to concord: in the other, the diſcord bears a chief part in the harmony.

For the firſt, nothing but CONCORDS are ever to be uſed on the accented parts of the meaſure: in the unaccented parts, diſcords may paſs tranſiently, without any offence to the ear. This the French call *ſuppoſition*; becauſe the tranſient diſcord always ſuppoſes a concord immediately following it: which is of infinite ſervice in muſic.

For the ſecond, wherein the DISCORDS are uſed as a ſolid and ſubſtantial part of the harmony; the diſcords that have place are the fifth when joined with the ſixth, to which it ſtands in the relation of a diſcord: the fourth when joined with a fifth; the ninth, which is in effect the ſecond; the ſeventh; and the ſecond and fourth.

Theſe diſcords are introduced into the harmony with due preparation, and are to be ſucceeded by concords: which is commonly called the *reſolution of a diſcord.*

The diſcord is prepared by firſt ſubſiſting in the harmony in quality of a concord; i. e. the ſame note which becomes the diſcord, is firſt a concord to the baſe note immediately preceding that to which it is a diſcord. The diſcord is reſolved by being immediately ſucceeded by a concord deſcending from it by the diſtance only of ſecond *g*, or ſecond *l*.

As the diſcord makes a ſubſtantial part of the harmony, ſo it muſt always poſſeſs an accented part of the meaſure. Now to introduce the diſcords into HARMONY, it muſt be conſidered what concords may ſerve for their preparation and reſolution; the fifth, then, may be prepared, either by being an octave, ſixth, or third. It may be reſolved either into the ſixth or third. The fourth may be prepared in all the concords, and may be reſolved into the ſixth, third, or octave. The ninth may be prepared in all the concords except the octave; and may be reſolved into the ſixth, third, or octave. The ſeventh may be prepared in all the concords, and reſolved into the third, ſixth, or fifth. The ſecond and fourth are uſed very differently from the reſt; being prepared and reſolved into the baſs. See farther under CLEF, and MODULATION.

It has been a queſtion which has given birth to many learned diſquiſitions and diſputes, whether the ancients had *counter-point*, or muſic in parts. See an account of what has been advanced on both ſides, with the author's opinion on the negative, in Dr. Burney's General Hiſtory of Muſic, vol. i. ſect. 8. p. 112. 4to. 1776.

COUNTER-POINTED, by the French called *contre-pointé*, is when two chevrons in one eſcutcheon meet in the points; the one riſing, as uſual, from the baſe; and the other inverted, falling from the chief: ſo that they are *counter*, or oppoſite to one another in the points.

They may alſo be *counter-pointed* the other way; that is, when they are founded on the ſides of the ſhield, and the points meet that way; called *counter-pointed in feſſe.*

COUNTER-POISE, any thing ſerving to weigh againſt another; particularly a piece of metal, ordinarily of braſs or iron, making a part of the *ſtatera Romana*, or STEEL-YARD. It is contrived to ſlide along the beam; and from the diviſion in which it keeps the balance in equilibrio, the weight of the body is determined.

It is alſo, by ſome, called the *pear*, on account of its figure; and *maſs*, by reaſon of its weight. Rope-dancers uſe a pole by way of *counter-poiſe*, to keep their bodies in equilibrio.

Counter-poise, in the *Manege*, denotes the liberty of the action and ſeat of a horſeman; ſo that in all the horſe's motions he continues in the middle of the ſaddle, bearing equally on the ſtirrups.

COUNTER-POISON, an antidote, or remedy, which prevents the effect of a poiſon.

Of this kind are Venice treacle, mithridate, orvietan, &c. *Counter-poiſons* are either *general*, or *ſpecific*: to the general kind belong angelica, carduus benedictus, the vincetoxicum, dittany, ſcorzonera, citrons, bezoar, hartſhorn, &c. For ſpecifics, citron-bark is ſuppoſed a *counter-poiſon* to nux vomica; Venice treacle to the bite of a viper; oil of ſcorpion to the bite of ſcorpions; oil of pine-apples to orpiment; gentian to the cicuta, &c.

Vander Linden, in his treatiſe De Venenis, ſays, that in every putrid indiſpoſition, whether ariſing from the bite of venomous beaſts, or from an alcali formed by putrefaction, vinegar drank is ſovereign, either ſimple or diſtilled; either with honey in form of oxymel, or with ſquills.

COUNTER-POTENT, or *potent counter-potent*, by the French heralds called *contre-potence*, is reckoned a fur, as well as vair and ermine; but compoſed of ſuch pieces as repreſent the tops of crutches, called in French *potences*, and in old Engliſh *potents*. See VAIRY-*cuppy*.

COUNTER-PROOF, in *Rolling-Preſs Printing*, a print taken off from another freſh printed; which, by being paſſed through the preſs, gives the figure of the former, but inverted.

To *counter-prove*, is alſo to paſs a deſign in black lead, or red chalk, through the preſs, after having moiſtened with a ſponge, both that, and the paper on which the *counter-proof* is to be taken.

COUNTER-QUARTERED, by the French called *contre-eſcartelé*, denotes the eſcutcheon, after being quartered, to have each quarter divided again into two: ſo that there are in it eight quarters, or diviſions.

COUNTER-ROLL, a copy of the ROLLS relating to appeals, inqueſts, &c.

COUNTER-ROUND, a body of officers going to viſit, and inſpect the rounds.

COUNTER-SALIENT, is when two beaſts are borne in a coat of arms in a poſture of leaping from each other, directly the contrary way.

COUNTER-SCARP, in *Fortification*, the exterior ſlope, or acclivity of the ditch, looking towards the champagne. See *Tab. Fortification, fig.* 21. *lit. c c.*

Counter-scarp is alſo uſed for the covert-way, and the glacis. *Counter-ſcarps* are ſometimes made of ſtone, and without any ſlope.

To be lodged on the counter-ſcarp, is to be lodged on the COVERT-*way*, or the GLACIS.

Counter-scarp, *angle of the.* See ANGLE.

COUNTER-SIGNING, the ſigning an order, or patent of a ſuperior, in quality of ſecretary; to render the thing more authentic.

Charters, &c. are ſigned by the king, and *counter-ſigned* by a ſecretary of ſtate, or the lord chancellor.

COUNTER-SWALLOW-TAIL, an outwork, in form of a ſingle tenaille, wider at the gorge, or next the place, than at the head, or next the champagne.

COUNTER-TALLY, one of the two tallies whereon any thing is ſcored.

COUNTER-TENOR, is one of the mean or middle parts of muſic: ſo called, as being oppoſite to the tenor. It is likewiſe applied to a voice which is of higher pitch than the tenor, but lower than the treble.

COUNTER-TIME, in the *Manege*, ſignifies the defence or reſiſtance of a horſe that interrupts his cadence, and the meaſure of his manege, occaſioned either by a bad rider or a malicious horſe.

COUNTER-TRENCH, in *Fortification*, a trench of twelve or fifteen feet wide, made againſt the beſiegers, and which, of conſequence, has its parapet turned towards them.

There are uſually a great many communications between this and the place, to prevent the enemy from making any uſe of it, in caſe they render themſelves maſters thereof.

COUNTER-TRIPPING, is when two beaſts are borne in a coat of arms tripping, i. e. in a walking poſture, and the head of the one to the tail of the other.

COUNTER-VAIR, in *Heraldry*, is when bells or cups of the ſame tincture are placed baſe againſt baſe, and point againſt point.

COUNTER-VALLATION. See CONTRAVALLATION.

COUNTER-VENTION. See CONTRAVENTION.

COUNTER-WORKING, in the *Military Art*, the raiſing of works, in order to oppoſe thoſe of the enemy.

COUNTING, or COMPTING-HOUSE. See COMPTING-HOUSE.

Counting-board. See ABACUS.

COUNTORS, CONTOURS, or COUNTERS, has been uſed for ſerjeants at law, retained to defend a cauſe, or to ſpeak for their client in any court of law.

It is of theſe Chaucer ſpeaks:

> —— A ſheriff had he been, and a *contour*,
> Was no where ſuch a worthy vavaſour.

They were anciently called ſerjeant *contours*.

COUNTRIES, among the *Miners*, a term or appellation they give to their works under ground. Phil. Tranſ. Nº 198.

COUNTRY-DANCE is of Engliſh origin, though tranſplanted into almoſt all the countries and courts of Europe. There is no eſtabliſhed rule for the compoſition of tunes to this dance, becauſe there is in muſic no kind of time whatever which may not be meaſured by the motions common in dancing; and there are few ſong-tunes of any note within the laſt century, that have not been applied to *country-dances*.

Country *faſt*. See SHELF.

Country, *trial by*, the ſame with trial by JURY.

Country *wakes*. See WAKES.

COUNTY, originally ſignifies the territory of a count, or earl. But now it is uſed in the ſame ſenſe with SHIRE; the one word coming from the French, the other from the Saxon.

In this view, a *county* is a circuit, or portion of the realm; into fifty-two of which, the whole land, England and Wales, is divided, for its better government, and the more eaſy adminiſtration of juſtice.

Theſe *counties* are ſubdivided into rapes, lathes, wapentakes, hundreds; and theſe again into tithings: a diviſion owing to king Alfred.

For the execution of the laws in the ſeveral *counties*, excepting Cumberland, Weſtmorland, and Durham, every Michaelmas term, officers are appointed, under the denomination of *ſheriffs*. This officer has a double function: firſt, *miniſterial*, to execute all proceſſes and precepts of the courts of law directed to him: and ſecondly, *judicial*; whereby he has authority to hold two courts, the one called the *ſheriff's tourn*, the other the *county court*. Other officers of the ſeveral *counties* are, a *lord lieutenant*, who has the command of the militia of the *county*: *cuſtodes rotulorum*, *juſtices of peace*, *bailiffs*, *high-conſtable*, and *coroner*. See farther under LORD LIEUTENANT, MILITIA, CUSTOS *rotulorum*, JUSTICE *of the peace*, *High*-CONSTABLE, BAILIFF, and CORONER.

Of the fifty-two *counties*, there are three of ſpecial note, which are therefore termed *counties palatine*, as Lancaſter, Cheſter, and Durham. The two latter are ſuch by preſcription, or immemorial cuſtom, at leaſt as old as the Norman conqueſt; the former was created by Edward III. in favour of Henry Plantagenet, firſt earl and duke of Lancaſter. Pembroke alſo, and Hexham, were anciently *counties palatine*; which laſt belonged to the archbiſhop of York, and was ſtripped of its privilege in the reign of queen Elizabeth, and reduced to be a part of the *county* of Northumberland: the former was aboliſhed in 27 Hen. VIII. the latter in 14 Eliz.

The chief governors of theſe *counties palatine*, heretofore, by a ſpecial charter from the king, ſent out all writs in their own names; and touching juſtice, did all things as abſolutely as the king himſelf in other *counties*; only acknowleging him their ſuperior and governor: whence *palatine*, *a palatio*, becauſe the owners of them had *jura regalia* as fully as the king hath in his palace. Theſe privileges were probably granted to them, becauſe they bordered on enemies countries, viz. Wales and Scotland. But in Henry the Eighth's time, the ſaid power was much abridged; though ſtill all writs are witneſſed in their names, and all forfeitures for treaſon by the common law accrue to them. The iſle of Ely has been ſometimes reckoned among the *counties palatine*, though it is properly only a royal franchiſe; the biſhop having, by grant of king Henry I. *jura regalia* within the iſle of Ely, whereby he exerciſes a juriſdiction over all cauſes, criminal and civil.

COUNTY-CORPORATE, is a title given to ſeveral cities, or ancient boroughs, on which the Engliſh monarchs have thought fit to beſtow extraordinary privileges; annexing to them a particular territory, land, or juriſdiction; and making them counties of themſelves, to be governed by their own ſheriffs and magiſtrates.

The chief of theſe is the CITY of London; with York, Canterbury, Briſtol, Cheſter, Norwich; the towns of Kingſton upon Hull, Newcaſtle upon Tyne, and Haverford Weſt in Wales, &c.

COUNTY-*court*. See *County* COURT.

COUNTY-*rates*, are thoſe ordered by juſtices of peace at their quarter ſeſſions; collected by high-conſtables of hundreds, and paid to treaſurers appointed by the juſtices, for repairing bridges, &c. 12 Geo. II. c. 29.

COUNTY, *Rier*. See RIER.

COUP *de bride*, in the *Manege*. See EBRILLADE.

COUP *de grace*, in the *French Muſic*, the ſame as what the Italians call TRONCO *per grazia*.

COUPED, COUPEE', in *Heraldry*, expreſſes a head, limb, or other thing in an eſcutcheon, which is borne as if cut clear and even off, from the trunk; in oppoſition to its being forcibly torn off, which they call *eraſed*.

Thus, the arms of Ulſter, which all baronets carry, is a dexter-hand *couped*, or cut off at the wriſt.

COUPED, *Coupée*, is alſo uſed to denote ſuch croſſes, bars, ends, chevrons, &c. as do not touch the ſides of the eſcutcheon, but are, as it were, cut off from them.

COUPEE, a motion in dancing, wherein one leg is a little bent, and ſuſpended from the ground; and with the other a motion is made forwards.

The word, in the original French, ſignifies a *cut*.

COUPLE *cloſe*, in *Heraldry*, the fourth part of a chevron: never borne but in pairs, except a CHEVRON be between, ſaith Guillim; though Bloom gives an inſtance to the contrary.

COUPLED *columns*. See COLUMN.

COUPLET, a diviſion of a hymn, ode, ſong, or the like, wherein an equal number, or equal meaſure, of verſes is found in each part.

The word is French, formed from the Latin *copula*.

In odes, theſe diviſions are more ordinarily called STROPHES.

By an abuſe, *couplet* is ſometimes uſed to ſignify a couple of verſes.

COURAGE, in *Ethics*, is that quality of the mind, derived either from conſtitution or principle, or both, that enables men to encounter difficulties and dangers.

COURANT, or CURRENT, a term uſed to expreſs the preſent time: thus, the year 1779 is the *courant* year; the fifteenth *courant*, the fifteenth day of the month now running.

The term is French, and properly ſignifies *running*.

With regard to commerce, the *price courant* of any merchandize, is the known and ordinary price accuſtomed to be given for it.

COURANT is alſo uſed for any thing that has courſe, or is received, in commerce: in which ſenſe, we ſay, *courant*, or *current* coin, &c.

COURANT is alſo a term in *Muſic* and *Dancing*; being uſed to expreſs both the tune or air, and the dance.

With regard to the firſt, *courant*, or *currant*, is a piece of muſic in triple time: the air of the *courant* is ordinarily noted in triples of minims; the parts to be repeated twice. It begins and ends, when he who beats the meaſure falls his hand; in contradiſtinction from the ſaraband, which ordinarily ends when the hand is raiſed.

With regard to dancing, the *courant* was long the moſt common of all the dances practiſed in England: it conſiſts, eſſentially, of a time, a ſtep, a balance, and a coupee; though it alſo admits of other motions.

Formerly they leaped their ſteps; in which point, the *courant* differed from the low dances and pavades. There are *ſimple courants*, and *figured courants*, all danced by two perſons.

COURAP, in *Medicine*, the Indian name for a diſtemper, which, as Bontius informs us, is very common in Java and other parts of the Eaſt Indies. It is a ſort of herpes or itch, which generally breaks out on the arm-pits, breaſt, groin, and face, with ſuch an intolerable itching, that the perſons affected cannot forbear ſcratching themſelves perpetually: but they pay very dear for the eaſe this gives them; as an unſufferable pain ſucceeds in thoſe parts which are rendered bare and denudated of the cuticula by the nails; theſe diſcharging an acrid humour which vellicates the parts, and cauſes the linen to adhere ſo faſt to them, as not to be ſeparated without tearing the cruſt formed thereon.

Courap is a general name for any ſort of itch, but the inhabitants call this diſtemper thus by way of eminence. It is ſo extremely contagious, that very few eſcape it; and though it is an unſeemly diſorder, cauſing a roughneſs of the ſkin with ſcales and furfures, yet the inhabitants imagine it is attended with this advantage, that while a perſon is affected with it, he is ſure to be troubled with no other dangerous diſtemper: and they look upon the diſappearing of this, as a prognoſtic of ſome worſe diſorder. They are therefore very eaſy under it for years together, without being very ſolicitous about curing it. It is remarkable that the vulgar in Scotland are poſſeſſed of the ſame opinion with reſpect to the itch; and even carry it ſo far as to affirm, that the catching this diſtemper proves a cure for any other previous to it; conſidering it in the ſame light as others do the gout, and perhaps with equal foundation. James.

COURBARIL, the name of a genus of plants. See LOCUST-*tree*.

COURIER, or CURRIER, from the French *courir*, *to run*, a meſſenger ſent poſt, or expreſs, to carry diſpatches.

Antiquity, too, had its *couriers*; we meet with two kinds, viz. thoſe who ran on foot, called by the Greeks *hemerodromi*, q. d. *couriers of a day*. Pliny, Corn. Nepos, and Cæſar, mention ſome of theſe, who would run twenty, thirty, thirty-ſix, and, in the circus, even forty leagues *per* day. And *riding couriers*, *curſores equitantes*, who changed horſes, as the modern *couriers* do.

Xenophon attributes the firſt *couriers* to Cyrus. Herodotus ſays, they were very ordinary among the Perſians, and that there was nothing in the world more ſwift than theſe kind of meſſengers. "That prince," ſays Xenophon, "examined how far a horſe would go in a day; "and built ſtables, at ſuch diſtances from each other, "where he lodged horſes, and perſons to take care of "them; and at each place kept a perſon always ready to "take the packet, mount a freſh horſe, and forward it to "the next ſtage: and thus quite through his empire."

But it does not appear, that either the Greeks or Romans had any regular fixed *couriers*, till the time of Auguſtus: under that prince they travelled in cars; though it appears from Socrates, they afterwards went on horſeback. Under the weſtern empire, they were called *viatores*; and under that of Conſtantinople, *curſores*: whence the modern name. See POST.

COURIERS *extraordinary*. See EXTRAORDINARY.

COURIERS, *Van*. See VAN *Couriers*.

COURSE, in *Navigation*, the point of the compaſs, or horizon, on which a ſhip ſteers; or the angle which the rhumb line on which it ſails makes with the meridian.

When a veſſel begins its *courſe*, the wind wherewith it is driven makes a certain angle with the meridian of the place; and, as it is here ſuppoſed, the veſſel follows exactly the direction of the wind; it makes the ſame angle with the meridian which the wind makes.

The wind is further ſuppoſed always the ſame; and becauſe each point, or inſtant of a *courſe*, may be regarded as the firſt; every moment of the *courſe* it makes the ſame angle with the wind.

Now a wind that is north-eaſt, v. gr. here (and by conſequence makes an angle of forty-five degrees with our meridian),

meridian), is north-eaſt wherever it blows, and makes the ſame angle of forty-five degrees with all the meridians it meets.

The *courſe* of a veſſel, therefore, driven by the ſame wind, makes the ſame angle with all the meridians on the ſurface of the globe.

If the veſſel run north and ſouth, it makes an angle infinitely ſmall with the meridian, i. e. is parallel to it, or never goes from it: if it run eaſt and weſt, it cuts all the meridians at right angles. In the firſt caſe it deſcribes a great circle; in the ſecond, either a great circle, which is the equator, or a parallel. But if the *courſe* be between the two, it does not then deſcribe a circle; becauſe a circle drawn in ſuch a manner, would cut all the meridians at unequal angles. It deſcribes therefore a ſpiral or curve, the eſſential condition whereof is to cut all the meridians under the ſame angle; called the *loxodromic curve*, or *loxodromy*, popularly *rhumb*.

The ſhip's *courſe*, therefore, except in the two firſt caſes, is always a loxodromic curve; and the hypothenuſe of a rectangle triangle, the two other ſides whereof are the ſhip's way in latitude and longitude.

The latitude is uſually had by obſervation.

The rhumb, or angle of the *courſe*, is had by the compaſs, together with the one or other of the two ſides; and what remains to be calculated in ſailing, is the quantity of the longitude, and of the rhumb, or *courſe*.

Course, *complement of the*. See Complement.

Course *of a river*. See River.

Course, in *Architecture*, denotes a continued range of ſtones, level, or of the ſame height, throughout the whole length of the building; and not interrupted by any aperture. It forms a parapet to the intermediate ſpace between the body of the building and the wings. See *Tab. Architecture*, *fig*. 16. and K, *fig*. 40. See alſo Building, Wall, and Masonry.

Course *of plinths*, is the continuity of a plinth of ſtone, or plaiſter, in the face of a building; to mark the ſeparation of the ſtories.

Course is alſo uſed for a collection, or body of laws, canons, or the like. See Corpus.

The *civil courſe*, is the collection of Roman laws, compiled by order of Juſtinian. See Civil *law*.—*Canonical courſe*, is the collection of the canon law, made by Gratian.

Course, again, is uſed for the time ordinarily ſpent in learning the principles of a ſcience, or the uſual points and queſtions therein. Thus, a ſtudent is ſaid to have finiſhed his *courſe* in the humanities, in philoſophy, &c.

Course is alſo uſed for the elements of an art exhibited and explained, either in writing, or by actual experiment. Hence our *courſes* of philoſophy, anatomy, chemiſtry, mathematics, &c. probably ſo called, as going throughout, or running the whole length or *courſe* of the art, &c.

Course *of the moon*. See Moon.

Course, *Paddock*. See Paddock.

COURSES, in *Sea-Language*, is uſed for a ſhip's main-ſail and fore-ſail. When ſhe ſails under them only, without lacing on any bonnets, they ſay, ſhe goes under *a pair of courſes*. Or more generally, all the principal ſails, viz. the main-ſail, fore-ſail, and mizen, are thus diſtinguiſhed: and ſometimes alſo the mizen ſtay-ſail and fore-ſail, and all the main ſtay-ſails of brigs and ſchooners.

COURSING. There are three ſeveral *courſes* with greyhounds. 1. At the hare. 2. At the fox. And, 3. At the deer.

For the deer there are two ſorts of *courſes*, the one in the paddock, the other either in the foreſt or purlieu. For the paddock *courſe*, there muſt be the greyhound and the terrier, and the mungril greyhound, whoſe buſineſs it is to drive away the deer before the greyhounds are ſlipped; a brace, or a leaſh, are the uſual number ſlipped at a time, ſeldom at the utmoſt more than two brace.

In *courſing* the deer in the foreſt or purlieu, there are two ways in uſe, the one is *courſing* from wood to wood, and the other upon the lawns by the keeper's lodge. In the *courſing* from wood to wood, the way is to throw in ſome young hounds into the wood, to bring out the deer; and if any deer come out that is not weighty, or a deer or antler, which is buck, ſore or ſorrel, then you are not to ſlip your greyhounds, which are held at the end of the wood, where the keepers, who can gueſs very well on theſe occaſions, expect that the deer will come out. If a proper deer come out, and it is ſuſpected that the brace or leaſh of greyhounds ſlipped after him, will not be able to kill him, it is proper to waylay him with a couple of freſh greyhounds.

The *courſing* upon the lawn is the moſt agreeable of all other ways. When the keeper has notice of this, he will lodge a deer for the *courſe*, and then by coming under the wind, the greyhound may be brought near enough to be ſlipped for a fair *courſe*.

The beſt method of *courſing* the hare, is to go out and find a hare ſitting, which is eaſily done in the ſummer, by walking acroſs the lands, either ſtubble, fallow, or corn grounds, and caſting the eye up and down; for in ſummer they frequent theſe places for fear of the ticks, which are common in the woods at that ſeaſon; and in autumn, the rains falling from the trees offend them. The reſt of the year there requires more trouble, as the buſhes and thickets muſt be beat to rouſe them, and often they will lie ſo cloſe, that they will not ſtir till the pole almoſt touches them: the ſportſmen are always pleaſed with this, as it promiſes a good *courſe*.

If a hare lies near any cloſe or covert, and with her head that way, it is always to be expected that ſhe will take to that immediately on being put up: all the company are therefore to ride up and place themſelves between her and the covert before ſhe is put up, that ſhe may take the other way, and run on an open ground. When a hare is put up, it is always proper to give her ground or law, as it is called, that is, to let her run twelveſcore yards or thereabouts, before the greyhounds are ſlipped at her; otherwiſe ſhe is killed too ſoon, and the greateſt part of the ſport thrown away, and the pleaſure of the ſeveral windings and turnings that the creature will make to get away, is all loſt. A good ſportſman had rather ſee a hare ſave herſelf, after a fair *courſe*, than ſee her murdered by the greyhounds as ſoon as ſhe is up.

In *courſing* the fox, no other art is required than ſtanding cloſe, and on a clear wind, on the outſide of ſome grove, where it is expected he will come out; and when he is come out, he muſt have head enough allowed him, elſe he will turn back to the covert. The ſloweſt greyhound will be able to overtake him after all the odds of diſtance neceſſary; and the only danger is, the ſpoiling the dog by the fox, which too often happens; for this reaſon, no greyhound of any value ſhould be run at this *courſe*, but the ſtrong, hard-bitten dogs, that will ſeize any thing.

For the laws of *courſing* eſtabliſhed by the duke of Norfolk, and the ſportſmen of the kingdom in the reign of queen Elizabeth, ſee Sportſman's Dict. in voc.

COURT, an appendage to a house, or habitation; conſiſting of a piece of ground incloſed with walls, but open upwards.

The word is formed from the French *cour*, and that from the Latin *cohors:* whence alſo *cortis* and *curtis* are ſometimes uſed for the ſame. In the laws of the Germans, there is one article, *De eo qui in curte regis furtum commiſerit*; and another, *De eo qui in curte ducis hominem occiderit*. Others derive *court* from the Gauliſh *cors*, formed of *cohors*, and *cohors* from χορτος. See Cohort.

The *court* before a houſe is properly called the *fore-court*; that behind, the *back-court*; that where country affairs, &c. are managed, i. e. where cattle, &c. come, the *baſſe-court*.

Court is alſo uſed for the palace, or place where a king, or ſovereign prince, reſides.

Court, *Curia*, in a Law *Senſe*, is the place where the judges diſtribute juſtice, or exerciſe their juriſdiction. Alſo the aſſembly of judges, jury, &c. in that place.

By the law of England, no *court* in this kingdom can claim any juriſdiction, unleſs it be ſome way or other derived from the crown; the king being the fountain of juſtice, and the ſupreme magiſtrate of the kingdom, intruſted with the whole executive power of the land.

Yet the king cannot give any addition of juriſdiction to an ancient *court*; but all ſuch *courts* muſt be held in ſuch manner, and proceed by ſuch rules, as their known uſage has limited and preſcribed. Whence it follows, for inſtance, that the *court* of king's bench cannot be authorized to determine a mere real action between ſubject and ſubject; nor can the *court* of common pleas enquire of treaſon or felony.

In this ſenſe, *courts* are divided into *ſovereign*, or *ſuperior*, and *ſubaltern*, or *inferior:* and, again, into *courts of record*, and *baſe courts*. Crompton deſcribes thirty-two *courts* in England, moſt of them *courts of record*.

Courts of record are created by act of parliament, letters patent, or preſcription.

The *ſupreme court* is the *court* of parliament.

Superior courts of record are diſtinguiſhed into *more principal*, and *leſs principal*.

The *more principal courts* are, the *houſe of lords*, the *court of chancery*, the *king's bench*, *common pleas*, and *exchequer*; and alſo, according to Sir Matthew Hale, the *juſtices itinerant ad communia placita*, and *ad placita foreſtæ*.

The *leſs principal courts of record* are ſuch as are held, 1. By commiſſions of *gaol-delivery*, *oyer* and *terminer*, *aſſiſe*, *niſi prius*, and ſome others. 2. By cuſtom, or charter; as the *courts* of the counties palatine of Lancaſter, Cheſter, Durham. 3. By virtue of an act of parliament, and the king's commiſſion; as the *court of ſewers*, *juſtices of the peace*, &c.

Inferior courts of record are, *corporation courts*, *courts leet*, and the *ſheriffs tourn*.

Every *court* of record is the king's *court*, though the profits may be another's. If the judges of ſuch *courts* err, a writ of error lies The truth of its records ſhall be tried by the records themſelves, and there can be no averment againſt the truth of the matter recorded. Coke, Litt. 117. b. 8. Coke, 38. b.

Courts not of record are, the *courts baron*, *county courts*, *hundred courts*, and others.

Theſe *courts* cannot impoſe any fine on an offender, nor award a capias, nor hold plea of debt or treſpaſs, if the debt or damages amount to forty ſhillings; nor of a treſpaſs done *vi & armis*, though the damage be laid under forty ſhillings. And their proceedings may be denied and tried by a jury, and a writ of falſe judgment, not of error, lies on their judgments.

The *court* of chancery proceeding by *ſubpœna*, is not a *court* of record.

On the ſubject of *courts*, ſee New Abr. of the Law, tit. *Courts*.

Again, *courts* are either ſuch as are held in the king's name, as all the ordinary *courts*; or thoſe held by his authority, where the precepts are iſſued in the judge's name, *virtute magiſtratus ſui*, as the admiral's *court*.

In England, we have four principal *courts* ſubſiſting; all eſtabliſhed by ancient cuſtom of the realm, rather than by any ſtatute; though their eſtabliſhments have been from time to time ſince confirmed by acts of parliament. Theſe are, the *courts of king's bench*; the *common bench*, or *pleas*; the *exchequer*; and the *court of chancery*. See each in its alphabetical order, infra.

COURT *of Admiralty*, is a *court* held by the high admiral, or commiſſioners of the admiralty; to which belongs the deciſion of all maritime controverſies, trials of malefactors, and the like.

The proceedings in this *court*, in all civil matters, are according to the civil law; becauſe the ſea is without the limits of the common law, and under the admiral's juriſdiction

In criminal affairs, which ordinarily relate to piracy, the proceedings in this *court* were anciently likewiſe by information and accuſation, according to the civil law; but that being found inconvenient, becauſe no perſon could be convicted without either their own confeſſion, or an eye-witneſs of the fact, ſo that the greateſt offenders often eſcaped with impunity, there were two ſtatutes made by Henry VIII. enacting, that criminals ſhould henceforth be there tried by witneſſes and a jury; and this by ſpecial commiſſion from the king to the lord admiral: wherein ſome of the judges of the realm are always to be commiſſioners; and the trial according to the laws of England, directed by thoſe ſtatutes.

The *court of admiralty*, is ſaid to have been firſt erected in 1357, by king Edward III. To the civil law, firſt introduced in it by the founder, were afterwards added, by his ſucceſſors, particularly Richard I. the laws of Oleron; and the marine uſes and conſtitutions of ſeveral people; as thoſe of Genoa, Piſa, Marſeilles, Meſſina, &c. The juriſdiction of this *court* was limited by Richard II.

Under this *court* is alſo a *court*-merchant, or *court* of equity; wherein all differences between merchants are decided, according to the rules of the civil law.

Between the *courts of admiralty* and common law, there ſeems to be *diviſum imperium*; for the ſea, ſo far as the low-water mark, is accounted *infra corpus comitatus adjacentis*; and the cauſes thence ariſing are determinable by the common law: yet when the ſea is full, the admiral has juriſdiction there alſo ſo long as the ſea flows, over matters done between the low-water mark and the ſhore.

The *admiralty court* is not allowed to be a *court* of record, becauſe it proceeds by the civil law; and the judge has no power to take ſuch a recognizance as a *court* of record may. The proceſs and proceedings are in the name of the lord admiral, and by libel; and the plaintiff and defendant enter into a ſtipulation or bond for appearance, and to abide the ſentence. 4 Inſt. 134, 135.

If an erroneous judgment be given in the admiralty, appeal may be had to DELEGATES appointed by commiſſion out of chancery, whoſe ſentence ſhall be final. Stat. 8 Eliz. c. 5.

Among the Hollanders, the five *admiralties* are ſo many chambers, compoſed of the deputies of the nobles, the provinces, and the towns; to whom belong the equipping out of fleets, the furniſhing proviſions for them, and directing what relates to maritime affairs.

COURT *of Aids*, in France. See AIDS.

COURT *of Arches*, *Curia de arcubus*, the chief and moſt ancient conſiſtory *court* belonging to the archbiſhop of Canterbury, for the debating of ſpiritual cauſes. It is ſo called from the church in London, commonly called St. Mary le Bow, where it was formerly held, which church had its name from the ſteeple, which was raiſed by pillars built archwiſe, like bent bows. Cowel.

The judge of this *court* is ſtyled *dean of the arches*, or official of the *arches court*. He hath extraordinary juriſdiction in all eccleſiaſtical cauſes, except what belong to the prerogative *court*; alſo all manner of appeals from biſhops, or their chancellors or commiſſaries, deans and chapters, &c. firſt or laſt are directed hither. He hath ordinary juriſdiction throughout the whole province of Canterbury in caſes of appeals; ſo that upon any appeal made, he without any farther examination of the cauſe, ſends out his citation to the appellee, and his inhibition to the judge, from whom the appeal was made. Of this ſee more, 4 Inſt. 337. But he cannot cite any perſon out of the dioceſe of another, unleſs it be on appeal, &c. 23 Hen. VIII. c. 9. In another ſenſe, the dean of *arches* has a peculiar juriſdiction of thirteen pariſhes in London, called a deanery (being exempt from the authority of the biſhop of London), of which the pariſh of Bow is the principal. The perſons concerned in this *court*, are the judge, advocate, regiſters, proctors, &c. and the foundation of a ſuit in theſe courts, is a citation for the defendant to appear; then the libel is exhibited, which contains the action, to which the defendant muſt anſwer: whereupon the ſuit is conteſted, proofs are produced, and the cauſe determined by the judge, upon hearing the advocates on the law and fact; when follows the ſentence and decree thereupon. Jacob. See AUDIENCE.

This *court* (as alſo the *court* of peculiars, the admiralty *court*, the prerogative *court*, and the *court* of delegates, for the moſt part) is now held in the hall belonging to the college of civilians, commonly called Doctors Commons. Floy. 21.

From this *court*, the appeal is to the king in Chancery, by 25 Hen. VIII. c. 19.

COURT *of Archdeacon*, is the moſt inferior *court* in the whole eccleſiaſtical polity. It is held before the archdeacon or his official, and appeal lies to the biſhop's court.

COURT *of Aſſiſe*. See ASSISE.

COURT *of Augmentation*, the name of a *court* erected, 27 Hen. VIII. for determining ſuits and controverſies, relating to monaſteries and abbey lands. The intent of this *court* was that the king might be juſtly dealt with, touching the profit of ſuch religious houſes, and their lands, as were given him by act of parliament the ſame year. This *court* was diſſolved under queen Mary, by the parliament held the firſt year of her reign; but the office of *augmentation* remains to this day, in which are many valuable records. Terms de Ley. 68.

COURT *of Barghmote*. See BARGHMOTE.

COURTS *Baron*, are *courts* that all lords of manors, who were anciently called *barons*, have within their reſpective precincts. It is an inſeparable incident to a manor; and muſt be held by preſcription, for it cannot be created at this day. 1 Inſt. 58. 4 Inſt. 268.

A *court baron* muſt be kept on ſome part of the manor; and is twofold. 1. *By cuſtom:* as, if a man having a manor in a town, grant the inheritance of the copyholds thereto belonging to another; this grantee may keep a *court* for the cuſtomary tenants, and accept ſurrenders to the uſe of others, and make both admittances and grants. 2. *By common law.* This is of freeholders, which is properly called a *court baron*, wherein the freeholders are judges: whereas of the other, the lord or his ſteward is judge.

COURT, *Biſhop's*, an eccleſiaſtical court held in the cathedral of each dioceſe; the judge whereof is the biſhop's chancellor, anciently called *eccleſiaſticus*, and *eccleſiæ cauſidicus*, q. d. the church-lawyer; who judges by the civil and canon law; and, if the dioceſe be large, has his commiſſaries in remote parts, who hold what they call *conſiſtory courts*, for matters limited to them by their commiſſion.

COURT *of Chancery*, the grand court of equity, and conſcience, inſtituted to moderate the rigour of the other courts that are tied to the ſtricteſt letter of the law.

The judge of this *court* is the lord high chancellor, whoſe function ſee under CHANCELLOR.

The proceedings of this *court* are either *ordinary*, like other *courts*, according to the laws, ſtatutes, and cuſtoms of the nation, by granting out writs remedial and mandatory, writs of grace, &c. or *extraordinary*, according to equity and conſcience, by bills, anſwers, and decrees, to examine frauds, combinations, truſts, ſecret uſes, &c. to ſoften the ſeverity of common law, and reſcue people from oppreſſion; to relieve them againſt cheats, unfortunate accidents, breaches of truſt, &c.

Out of the *court of chancery*, are iſſued writs or ſummonſes for parliaments and convocations, edicts, proclamations, charters, protections, patents, ſafe conducts, and writs of *moderata miſericordia*, &c.

Here are alſo ſealed and enrolled letters patent, treaties and leagues, deeds, writs, and commiſſions.

The officers of this *court*, beſide the lord chancellor, who is ſupreme judge, are, the maſter of the rolls, who, in the chancellor's abſence, hears cauſes, and gives decrees; and twelve maſters of chancery, one of whom is the maſter of the rolls, who are aſſiſtants, and ſit by turns on the bench.

For the equity part of this *court* there are ſix clerks, and their deputies, who have under them a number of others, called the ſixty ſworn clerks, in the nature of attorneys of the *court*; two chief examiners, for examining witneſſes, who have each five or ſix clerks apiece; one principal regiſter, who has four or five deputies; clerk of the crown, who makes writs, commiſſions, &c. warden of the Fleet; ſerjeant at arms, who bears the mace before the chancellor; and the uſher and crier of the *court*.

To the common law part belong the twenty-four curſitors, and their clerks, who make out original writs; clerks of the petty bag; clerks of the hanaper; comptroller of the hanaper; clerk of appeals; clerk of the faculties; ſealer; chafe-wax; clerks of the patents, of preſentations, diſmiſſions, licenſes to alienate, enrollments, protections, ſubpœnas, affidavits, &c. See each under its proper article.

Appeals from the decrees of the *court of chancery* may be brought into the HOUSE *of lords*.

The juriſdiction of this *court* was impugned about the time of its original creation, and even in the reign of queen Elizabeth it was ſtrongly holden by the judges of the common law courts, that the chancellor could not by his decree ſequeſter the party's lands, that is, he could only *agere in perſonam*, but not *in rem*; and agreeably thereunto it was reſolved, 16 Eliz. in the caſe of Coleſton and Gardener, that if a man killed a ſequeſtrator in the execution of ſuch proceſs, it was no murder. Vide New Abr. Law, vol. i. p. 588. Cro. Eliz. 651. 4 Inſt. 84. 1 Rol. Rep. 86. 190. Lit. Rep. 166.

Alſo in the reigns of queen Elizabeth, and king James the Firſt, there are ſeveral ſtrong opinions, that a *court* of equity could not examine, or give redreſs in a cauſe after judgment at law; and that ſuits in equity, to relieve againſt a judgment at law, are within the ſtatutes, which make it a præmunire to appeal to any foreign court, eſpecially if the end thereof be to controvert the very point determined at law, or to ſeek relief after judgment in a caſe wherein the law may relieve, as againſt exceſs of damages. But ſuch opinions ſeem now to be wholly exploded. Vid. Caſ. Eq. Abr. p. 130.

The ancient rule for the juriſdiction of the extraordinary *court of chancery*, was confined to frauds, accidents, and truſts; and though at this day, by its power of granting injunctions, it curbs the juriſdiction of other *courts*, and thereby has ſwallowed up the greateſt part of the buſineſs of the common law; yet it is ſtill under ſome of theſe notions, that it exerciſes a juriſdiction in relieving againſt forfeitures, penalties, where a compenſation can be made, in preventing multiplicity of ſuits, decreeing a ſpecific execution of agreements, aſſiſting defective conveyances, &c. But in no caſe will it relieve againſt an act of parliament, nor directly againſt a fundamental rule or maxim of the common law, nor retain a ſuit where the party appears to have a plain and adequate remedy at law. Three things, ſays lord Coke, are to be adjudged in a *court of equity*. 1. All covins, frauds, and deceits, for which there is no remedy by the ordinary courſe of law. 2. Accidents, as when a ſervant, obligor, or mortgagor, is to pay money on a certain day, and they happen to be robbed in going to pay it. 3. Breaches of truſt and confidence. 4 Inſt. 84.

Upon this foundation, that a *court of equity* could not relieve againſt a maxim of the common law, it was formerly holden, that one executor could not compel the other to account; that one joint-tenant could not ſue his companion; that if an obligee loſt his bond, he was without remedy: ſo where the leſſor entered upon his leſſee, and ſuſpended his rent, it was held that he had no remedy: ſo where the party became remedileſs by his own act, as by paying money without an acquittance: ſo where one on valuable conſideration promiſed to make a leaſe, it was held that the party could not ſue on this promiſe in equity, becauſe he might have an action on the caſe. But theſe laſt opinions are now of no weight or authority, as appears by daily experience.

All matters of truſt are particularly within the juriſdiction of the *court of chancery*.

COURT *of Chivalry*, or the *Marſhal's Court*; a *court* whereof the judges are, the lord high conſtable, and the earl marſhal of England. This *court* is the fountain of marſhal law; and the earl marſhal is not only one of the judges, but alſo to ſee execution done. 4 Inſt. 123. See CHIVALRY.

COURT *Chriſtian*, *Curia Chriſtianitatis*, is an eccleſiaſtical judicature, oppoſed to the *civil court*, or lay tribunal: and as in ſecular *courts*, human laws are maintained; ſo in the *court Chriſtian*, the laws of Chriſt ſhould be the rule. The judges therefore are divines; as archbiſhops, biſhops, archdeacons, &c. 2 Inſt. 488. *Courts Chriſtian* are ſo called, becauſe they handle matters eſpecially appertaining to Chriſtianity. See COURTS *Eccleſiaſtical*, infra. See alſo CONSISTORY.

COURTS *of Cinque-ports*. See CINQUE-PORTS.

COURT *of Common Pleas*, *Communia placita*, or *Bancus communis*, one of the king's *courts*, held in Weſtminſter-hall. Gwyn obſerves, that till the granting of Magna Charta, there were but two *courts* called the king's *courts*, viz. the exchequer, and the king's bench; and that upon the grant of that charter, the *court of common pleas* was erected, and fixed to a place certain, viz. Weſtminſter-hall: whence the writs which before ran *coram me vel juſticiariis meis*, ſimply, were now changed, and run *coram juſticiariis meis apud Weſtmon.*

The juriſdiction of this *court* is founded on original writs, iſſuing out of the chancery, which are the king's mandates for them to proceed on to determine ſuch and ſuch cauſes. But this is to be underſtood when the cauſe is between common perſons; for when an attorney, or any perſon belonging to the *court*, is plaintiff, he ſues by writ of privilege, and is ſued by bill, which is in nature of a petition; both which originally commence in the *common pleas*, and have no foundation in the chancery. 4 Inſt. 99.

The juriſdiction of each *court* is at this day ſo well eſtabliſhed, that as the *court* of king's bench cannot determine a mere real action, ſo neither can the *court of common pleas* enquire of felony or treaſon. Vide 2 Hawk. P. C. p. 2.

This *court*, without any writ, may, upon a ſuggeſtion only, grant prohibitions, to keep as well temporal as eccleſiaſtical *courts* within their bounds and juriſdiction. See 4 Inſt. 99. and Vaughan's Reports, p. 157.

In term time, this *court* may award a habeas corpus by the common law, for any perſon committed for any cauſe under treaſon or felony; and thereupon diſcharge him, if it ſhall clearly appear, by the return, that the commitment was againſt law, as being made by one who had no juriſdiction of the cauſe, or for a matter, for which, by law, no man ought to be puniſhed. Vide Vaughan, 154, ſeq. 2. Jones, 14.

All civil cauſes, both real, perſonal, and mixed, are tried in this *court*, according to the ſtrict law of the realm: Forteſcue repreſents it as the only *court* for real cauſes.

The chief juſtice hereof is called the *lord chief juſtice of the common pleas*, whoſe ſalary is 2500*l.* a year; who is accompanied with three of his aſſociates, at a ſalary of 2000*l.* each, created by letters patent, and as it were judges inſtalled or placed on the common bench by the lord chancellor, and the lord chief juſtice of the *court*.

The reſt of the officers belonging to this *court* are, the cuſtos brevium; three prothonotaries, or prænotaries, ſee PROTHONOTARY; a chirographer; ſeventeen filazers; exigenter; clerk of the warrants; clerk of the juries, or jurata writs; clerk of the treaſury; clerk of the king's ſilver; clerk of the eſſoigns; clerk of the outlawries; clerk of the errors, &c. whoſe ſeveral functions ſee in their places, CUSTOS *brevium*, CHIROGRAPHER, EXIGENTER, CLERK, &c.

COURT *of Conſcience*, *Curia conſcientia*. In the 9th of Henry VIII. the *court of conſcience* in London was erected: there was then made an act of common council, that the lord mayor and aldermen ſhould aſſign monthly two aldermen and four diſcreet commoners, to be commiſſioners to ſit in this *court* twice a week, to hear and determine all matters brought before them between party and party, between citizens and freemen of London, in all caſes where the debt or damage was under forty ſhillings. And this act of common council is confirmed by the ſtat. 1 Jac. I. which empowers the commiſſioners of this *court* to make ſuch orders between the parties touching ſuch debts, as they ſhall find ſtand to equity and good conſcience. Alſo the ſtat. 3 Jac. I. c. 15. ſince explained and amended by 14 Geo. II. c. 10. farther eſtabliſhes this *court*; the courſe and practice whereof is by ſummons, to which if the party appear, the commiſſioners proceed ſummarily; examining the witneſſes of both parties, or the parties themſelves on oath; and as they ſee cauſe, give judgment. If the party ſummoned appear not, the commiſſioners have power to apprehend and commit him: alſo the commiſſioners have power to commit a perſon refuſing to obey their orders, &c. Vid. ſtat. 3 Jac. I.

There are many other *courts of conſcience* lately eſtabliſhed by act of parliament, of a ſimilar nature; as that for Southwark, for Weſtminſter, the Tower Hamlets, &c. &c.

Court *of the Coroner*, is a *court* of record, to enquire when any one dies in priſon, or comes to a ſudden and violent death, by what manner he came to his end. See Coroner.

Court, *County*, is a *court* of juſtice held in each county by the ſheriff thereof, or his deputy, every month. See Sheriff.

This *county court* had anciently the cognizance of matters of great moment; but it was much abridged by Magna Charta, and more 1 Edward IV. But it has ſtill the determination of debts and treſpaſſes under forty ſhillings.

In effect, till the *courts* at Weſtminſter were erected, the *county courts* were the chief *courts* of the kingdom.

Among the laws of king Edgar is this, viz. Let there be two *county courts* in a year, and let there be preſent a biſhop and an alderman or earl; one whereof ſhall judge according to the common law, the other according to the eccleſiaſtical law.—The conjunction of theſe two powers to aſſiſt each other, is as ancient as the Engliſh government itſelf. They were firſt ſeparated by William the Conqueror, who brought all the eccleſiaſtical buſineſs into a conſiſtory, erected for that purpoſe; and the law buſineſs into the king's bench.

Court *of Delegates*, is a *court* where delegates or commiſſioners are appointed by the king's commiſſion, under the great ſeal, upon an appeal to him.

It is granted in three caſes: firſt, when a ſentence is given in an eccleſiaſtical cauſe, by the archbiſhop, or his official; ſecondly, when a ſentence is given in an eccleſiaſtical cauſe, in places exempt; thirdly, when ſentence is given in the admiralty *court*, in ſuits civil or marine, by order of the civil law. 4 Inſt. 339. Stat. 25 Hen. VIII. c. 19.

This is the higheſt *court* for civil affairs concerning the church; for the juriſdiction whereof it was provided, 25 Hen. VIII that it ſhall be lawful for the ſubject, in caſe of defect of juſtice in the eccleſiaſtical *courts*, to appeal to the ſovereign in his court of chancery; whence a commiſſion is directed under the great ſeal to particular perſons therein mentioned, for redreſs of judgment.

From the higheſt eccleſiaſtical *court* there lies no appeal, but to the *court of delegates*; and beyond this to no other, except to the houſe of lords. But the king, of his free will, may grant a Commission of review under the great ſeal. The citations run all in the king's name.

Court, *Duchy*, a *court* wherein all matters belonging to the duchy or county palatine of Lancaſter, are decided by decree of the chancellor of that *court*.

The original of this *court* was in Henry the Fourth's time, who obtaining the crown by depoſition of Richard II. and having the duchy of Lancaſter, by deſcent, in right of his mother, became ſeiſed thereof as king, not as duke. So that all the liberties, franchiſes, and juriſdictions of the ſaid county paſſed from the king, by his great ſeal, and not by livery, or attornment, as the earldom of March, and other poſſeſſions, which deſcended to him by other anceſtors than the king's, did.

Henry IV. by authority of parliament, ſevered the poſſeſſions, liberties, &c. of the ſaid duchy from the crown: but Edward IV. reſtored them to their former nature.

The officers belonging to this *court* are, a Chancellor, attorney-general, receiver-general, clerk of the court, and meſſenger; beſide the aſſiſtants, as an attorney in the exchequer, another in chancery, and four counſellors. See Attorney *of the Duchy*.

The duchy of Lancaſter, ſays Gwyn, grew out of the grant of Edward III. who gave that duchy to his ſon John of Gaunt, and endowed it with royal rights, equal to thoſe of the county palatine of Cheſter. And foraſmuch as it came afterwards to be extinct in the perſon of king Henry IV. by reaſon of its union with the crown; the ſame king ſuſpecting himſelf more rightfully duke of Lancaſter, than king of England, determined to ſave his right in the duchy, whatever ſhould befal the kingdom. Accordingly, he ſeparated the duchy from the crown; and ſettled it ſo in his own perſon, and heirs, as if he had been no king, or politic body at all: in which condition it continued during the reigns of Henry V. and VI. who deſcended from him; till Edward IV. who, by recovery of the crown, recontinuing the right of the houſe of York, appropriated the duchy to the crown again; yet ſo, that he ſuffered the court and officers to remain as he found them. In this manner, it came, together with the crown, to Henry VII. who taking Henry the Fourth's policy (by whoſe right, indeed, he obtained the kingdom), re-ſeparated the duchy, and ſo left it to his poſterity, who ſtill enjoy it.

Courts *Eccleſiaſtical*, *Curiæ eccleſiaſticæ*, are thoſe *courts* which are held by the king's authority, as ſupreme head of the church, for matters which chiefly regard religion. 4 Inſt. 321.

The ſuits in *ſpiritual* or *eccleſiaſtical courts*, are for the reformation of manners, for puniſhing of hereſy, defamation, laying violent hands on a clerk, and the like; and ſome of their ſuits are to recover tythes, legacies, contracts of marriage, &c. and in cauſes of this nature, the *courts* may give coſts, but not damages. Things that properly belong to theſe juriſdictions, are matrimonial and teſtamentary; and defamatory words for which no action lies at law, as for calling a perſon adulterer, fornicator, uſurer, or the like. 11 Rep. 54. Dyer, 240.

The proceedings in the *eccleſiaſtical courts* are according to the civil and canon law; by citation, libel, anſwer upon oath, proof by witneſſes, and preſumptions, &c. and after ſentence for contempt, by excommunication: and if the ſentence is diſliked, by appeal. The juriſdiction of theſe *courts* is voluntary or contentious; and the puniſhments inflicted by them, are cenſures and puniſhments *pro ſalute animæ*, by way of penance, &c. They are not *courts* of record. See Audience.

Court *of Exchequer*, is a *court* wherein are tried all cauſes relating to the king's treaſury, or revenue; as, touching accounts, diſburſements, cuſtoms, fines, &c.

It conſiſts of ſeven judges, viz. the lord treaſurer, the chancellor of the exchequer, the lord chief baron with a ſalary of 3000*l.* a year, and three other barons of the exchequer at a ſalary of 2000*l.* a year each, with one curſitor baron.

The lord chief baron is the principal judge of the *court*. See Barons *of the exchequer*.

The *court of exchequer* is divided into two: the one *of law*, the other *of equity*.

All judicial proceedings according to law, are ſtyled, *coram baronibus* only: but the *court* of equity held in the exchequer chamber, is *coram theſaurario, cancellario, & baronibus*; before the treaſurer, chancellor, and barons.

For a long time after the Conqueſt, there ſate in the exchequer, both ſpiritual and temporal barons of the realm: but of later times, there have ſat in their places other judges, who, though no peers of the realm, yet retain the original denomination.

The common opinion of our hiſtorians is, that *this court* was erected by William the Conqueror, ſoon after his having obtained the kingdom; and that it took its form from the *eſchequier*, or *ſcaccarium*, eſtabliſhed in Normandy long before that time. In effect, the two exchequers have this in common, that the Norman was the ſupreme *court* of that duchy, or a general aſſiſe whereat all the great lords attended, to judge finally of all concerns of the greateſt importance; and was ambulatory; and that the Engliſh exchequer was a *court* of the higheſt juriſdiction; that the acts thereof were not to be examined by any of the ordinary *courts*; that it was the repoſitory of the records of all the other *courts*; and that it was to be held in the king's *court*, and before him; and that it was concerned in the prerogative, as well as the revenue of the crown.

The immediate profits of the crown, as of franchiſes, lands, tenements, hereditaments, debts, duties, accounts, goods, chattels, all diſburſements, ſeizures, and fines impoſed on the ſubjects, &c. are all within the juriſdiction of the exchequer. And the king's attorney may exhibit bills, for any matter concerning the king in inheritance, or profits; ſo alſo may any perſon who finds himſelf aggrieved in any cauſe proſecuted againſt him on behalf of the king, or any patent by grant of the king, exhibit his bill againſt the king's attorney, &c. to be relieved by equity in this *court*.

To this *court* belong two officers; the king's remembrancer's office, and that of the lord treaſurer's remembrancer. See Remembrancer.

Authors are divided about the origin of the denomination of this *court*, exchequer. Du-Cange is of opinion, it came from a chequer-wrought carpet, covering the great table in that *court*; or from the pavement of the *court*, which was chequer-wiſe: others, from the accomptants in this office uſing chequers, or cheſs-boards, in their computations.

In the exchequer there are ſeven *courts*: 1. The *court* of pleas. 2. The *court* of accounts. 3. The *court* of receipt, otherwiſe called the *lower exchequer*, as alſo the *receipt of the exchequer*; and is the place wherein the king's revenue is received and diſburſed. The principal officers hereof are, the lord treaſurer, a ſecretary of the treaſury, a chancellor of the exchequer, two chamberlains of the exchequer, an auditor of the receipts of the exchequer, four tellers, a clerk of the pells, an uſher of the receipt, a tally cutter, &c. See farther under Treasurer, Chancellor *of the exchequer*, Secretary, Chamberlain, Underchamberlain, Teller, Pells, Tally, &c. 4. The *court of exchequer* chamber, being the aſſembly of all the judges of England for matters in law. 5. The *court of exchequer* chamber, for errors in the *court of exchequer*, eſtabliſhed by 31 Edw. III. c. 12. 6. The *court of exchequer* chamber, for errors in the king's bench, erected by 27 Eliz. c. 8. 7. The *court* of equity in the exchequer chamber. Vide New Abr. Law, vol. i. p. 597.

By the 33 Hen. VIII. cap. 39. the *court of exchequer* has power to diſcharge all debts and duties due to the king, upon an equity diſcloſed; and it is by virtue of this act, that they diſcharge recognizances: and it ſeems, by the ſaid act, they may diſcharge penal laws made before this ſtatute; but all penal laws made after the ſtatute cannot be diſcharged, but muſt be compounded.

The *court of exchequer* in Scotland, has the ſame power, authority, privilege, and juriſdiction over the revenue of Scotland, as the *court of exchequer* in England has over the revenues there; and all things and matters competent to the *court of exchequer* in England, ſo far as they relate to the king's revenue, are likewiſe competent to the *exchequer* of Scotland. The judges are likewiſe inveſted with the power of paſſing ſignatures, gifts, and tutories, and to reviſe and compound them in the ſame manner as was done by the lord high treaſurer, commiſſioners of the treaſury, and *court of exchequer* in Scotland, before the union. All ſerjeants at law, barriſters at law, of five years ſtanding, in any of the four inns of court of England; and advocates of five years ſtanding, in the college of juſtice in Scotland, are qualified for being barons of this *court*; whoſe commiſſions are *quam diu ſe bene geſſerint*.

Court *of Faculties*, in England, belongs to the archbiſhop of Canterbury, and his officer is called *magiſter ad facultates*. His power is to grant diſpenſations, as to marry, for the ſon to ſucceed his father in his benefice, one to have two or more benefices incompatible, &c.

The office where ſuch diſpenſations are taken out, is alſo called the *Faculty office*.

Courts *of Foreſt*. See **Attachments**, **Regard**, **Swanimote**, and **Justice** *of the foreſt*.

Court, *Hundred*, is a larger *court baron* held for all the inhabitants of a particular hundred, inſtead of a manor.

Court *of Huſtings*, a *court* of common pleas held before the lord mayor and aldermen of London, in Guild-hall. 4 Inſt. 247.

Of the great antiquity of this *court* we find this mention in the laws of king Edward the Confeſſor. *Debet etiam in London quæ eſt caput regni & legum, ſemper curia domini regis ſingulis ſeptimanis, die Lunæ* huſtingis *ſedere & teneri: fundata erat olim & ædificata ad inſtar & ad modum & in memoriam veteris magnæ Trojæ, & uſque in hodiernum diem, leges, & jura & dignitates, & libertates regiaſque conſuetudines ſuas una ſemper inviolabilitate conſervat.* Taylor, Hiſt. of Gavel-kind.

The *court of huſtings* is the principal and higheſt of all the *courts* of the city. This *court* determines all pleas, real, perſonal, and mixt: and here all lands, tenements, and hereditaments, rents and ſervices within the city of London and ſuburbs of the ſame, are pleadable in two huſtings; the one called huſtings of the plea of lands, and the other called huſtings of common pleas. Error or attaint lies there of a judgment or falſe verdict in the ſheriffs' *courts*.

Other cities and towns had alſo *courts* of the ſame name; as Wincheſter, Lincoln, York, &c.

Court *of King's Bench, Bancus Regius*, a *court*, or judgment-ſeat, ſo called, becauſe the king is ſuppoſed to ſit in perſon as judge of the *court*, which was formerly the caſe, and may do ſo whenever he pleaſes; for which reaſon all writs, and other proceſs in this *court*, are made returnable *coram nobis*, that is, before the king himſelf, and not *coram juſticiariis noſtris*, as is the form in the common pleas. 4 Inſt. 73.

The judges of this *court* are the lord chief juſtice, whoſe annual ſalary is 4000*l.* and three other puiſne juſtices at 2000*l.* a year each.

In this *court* are principally determined matters relating to the crown, and the peace. When any perſon is aggrieved by an order of juſtices, or quarter-ſeſſions, they have recourſe hither; the rights of elections of mayors, bailiffs, conſtables, &c. are often upon mandamuſes, brought before this *court* to be ſettled; and prohibitions are hence iſſued out to ſtay proceedings in the eccleſiaſtical, admiralty, or any inferior *court*, where the matter appears to be triable at common law. The ſubject has alſo a right to ſue in this *court* for any debt or contract, as well as in any other *court*, and may as advantageouſly and expeditiouſly proceed.

The chief juſtice is conſtituted by writ, and he is to hold, *quamdiu ſe bene geſſerint*, and ſo cannot be diſplaced without ſome great miſdemeanor; though formerly the chief juſtice, and other inferior judges, were made only *durante beneplacito*, and accordingly were turned out at the king's pleaſure. He preſides under his majeſty in this *court*; but when the *court* divides, in giving judgment upon any ſpecial argument, he hath but one voice; ſo that if the opinion of the *court* ſhould be equally divided, the matter muſt reſt till one of the judges ſhall ſee juſt reaſon to alter his opinion. He is to attend the lords in parliament, though he has no vote, unleſs he be a peer himſelf, but is to give his opinion and advice to the houſe by virtue of a writ of aſſiſtance; and is frequently therefore conſulted by them, both in making and repealing laws, and in altering or explaining them. He makes a return of all writs of error in parliament directed to this *court*; and with his own hand delivers the writ of error, and a tranſcript of the proceedings in the cauſe into the houſe of lords.

The three puiſne, or inferior judges of this *court*, go the circuits, and are in commiſſion of oyer and terminer at the Old Bailey. They, as well as the chief juſtice, are entitled to their ſalary, though they happen not to ſit one day in *court* in the term, unleſs they give their aſſent ſo ſlightly, as, on a *ſcire facias*, to be charged with negligence: theſe alſo hold by *quamdiu ſe bene geſſerint*.

There are ſeveral officers belonging to this *court*, as two chief clerks, or prothonotaries, who are ſuppoſed to enter all the pleadings and judgments between party and party; although this is in reality done by an entering-clerk under them; and all writs of *latitat*, *non omittas*, bills of Middleſex, *habeas corpus*, &c. are ſubſcribed with the names of theſe chief clerks.

The ſecondary acts as maſter of the office on the pleas ſide, and is the chief clerk's deputy; his buſineſs is to examine any perſon, who is to be ſworn an entering-clerk, or attorney at large, whether he be duly qualified, and to preſent him to the chief juſtice. He alſo ſigns all judgments, and gives coſts upon them; and the *court*, upon any motion, in relation to the irregular practice of any clerk or attorney, generally refers the examination thereof to him. He alſo takes all affidavits in *court* (unleſs on the crown-ſide); and the acknowlegement of all deeds in *court*.

This *court* was always ambulatory, and removed with the king wherever he went: hence the writs returnable in this *court* are *coram nobis ubicunque fuerimus in Anglia*; and all records there are ſtyled *coram rege*, as it is ſtill ſuppoſed to have always the king himſelf in perſon ſitting in it; from whence it obtained the name of the *court of king's bench*, and hath always retained a ſupreme original juriſdiction in all criminal matters, for in theſe the proceſs both iſſued, and was returnable into this *court*: but in treſpaſs it might be made returnable into either the *king's bench*, or common pleas; becauſe the plea was criminal as well as civil. Vide 4 Inſt. 70. 2 Inſt. 24. Cok. Lit. 71. Cromp. of Courts, 78. 1 Rol. Abr. 94.

This *court* is often termed the *cuſtos morum* of all the realm; and wherever it meets with an offence contrary to the firſt principles of juſtice, and of dangerous conſequence, if not reſtrained, it may adapt a proper puniſhment to it. For the better reſtraining ſuch offences, it has a diſcretionary power of inflicting exemplary puniſhment on offenders, either by fine, impriſonment, or other infamous puniſhment, as the nature of the crime, conſidered in all its circumſtances, ſhall require. It may make uſe of any priſon which ſhall ſeem moſt proper; and it is ſaid, that no other *court* can remove or bail perſons condemned to impriſonment by this *court*. 2 Hawk. P. C. p. 6.

An act of parliament, appointing, that all crimes of a certain denomination ſhall be tried before certain judges, does not exclude the juriſdiction of this *court*, without expreſs negative words; and therefore it has been reſolved, that 33 Hen. VIII. c. 12. which enacts, that all treaſons, &c. within the king's houſe, ſhall be determined before the lord ſteward of the king's houſe, does not reſtrain the *court of king's bench* from proceeding againſt ſuch offences. 2 Inſt. 549.

But when a ſtatute creates a new offence, which was not taken notice of by the common law, and erects a new juriſdiction for the puniſhment of it, and preſcribes a certain method of proceeding, it ſeems queſtionable how far this *court* has an implied juriſdiction in ſuch a caſe.

The judges of this *court* are the ſovereign juſtices of oyer and terminer, gaol-delivery, conſervators of the peace, &c. As alſo the ſovereign coroners; and therefore, where the ſheriffs and coroners may receive appeals by the bill, *a fortiori*, this *court* may. Alſo this *court* may admit perſons to bail in all caſes according to their diſcretion. 4 Inſt. 73. 9 Co. 118. b. 4 Inſt. ibid. 4 Inſt. 74. Vaugh. 157.

This *court* has not only a power to reverſe erroneous judgments, for ſuch errors as appear the defect of the underſtanding; but alſo to puniſh all inferior magiſtrates, and all officers of juſtice, for wilful and corrupt abuſes of their authority againſt the obvious principles of natural juſtice.

This *court* being the ſupreme court of oyer and terminer, gaol-delivery, and eyre, its preſence ſuſpends the power, and avoids the proceedings of all other *courts* of the ſame nature in the county where it ſits, during its ſitting there. 4 Inſt. 73. 3 Inſt. 27.

The civil ſide of the king's bench commences on a ſuppoſition of a treſpaſs committed by the defendant in the county where it reſides, and that he is taken up by proceſs of this *court*, as the ſovereign eyre, and being committed to the marſhal, he may be declared againſt in any civil action whatſoever. The firſt proceſs, therefore, is a bill either real or feigned; and ſo called, becauſe its foundation was the bill of complaint in *court*, touching the treſpaſs: in this is founded the *latitat*, which ſuppoſes that the defendant has eſcaped, and therefore iſſues in the king's name, to apprehend the party wherever he may be found. Vide New Abr. Law, vol. i. p. 595. and title *Proceſs*.

Court *Leet, Leta viſus franci plegii*, is a *court* of record, ordained for puniſhing offences againſt the crown; and is ſaid to be the moſt ancient *court* of the land. 2 Danv. Abr. 289. It enquires of all offences under high treaſon; but thoſe who are to be puniſhed with loſs of life or member, are only enquirable and preſentable here, and to be certified over to the juſtices of aſſiſe. Stat. 1 Edw. III. And this *court* is called the view of frank pledge, becauſe the king is to be there certified by the view of the ſteward, how many people are within every leet, and have an account of their good manners and government; and every perſon of the age of twelve years, who hath remained there for a year and a day, may be ſworn to be faithful to the king, and the people are to be kept in peace, &c. A leet is incident to a hundred, as a court baron to a manor: for by grant of a hundred, a leet paſſeth; and a hundred cannot be without a leet. Kitch. 70.

The uſual method of puniſhment in the *court leet*, is by fine and amercement; the former aſſeſſed by the ſteward, and the latter by the jury.

Court *of the Legate*, was a *court* obtained by cardinal Wolſey of pope Leo X. in the ninth year of Henry VIII. wherein he, as legate of the pope, had power to prove wills, and diſpenſe with offences againſt the ſpiritual laws, &c. It was but of ſhort continuance.

Court *of Marſhalſea*, a *court* of record to hear and determine cauſes, between the ſervants of the king's houſehold, and others within the verge: and hath juriſdiction of all matters within the verge of the *court*, and of pleas of treſpaſs, where either party is of the king's family; and of all other actions perſonal, wherein both parties are the king's ſervants. This is the original juriſdiction of the *court of marſhalſea*.

Court *Martial, Curia Martialis*, is a *court* for puniſhing the offences of officers and ſoldiers, in time of war: and it appears by our books, that if any perſon in commiſſion, in time of peace, put to death any man by martial law, it is againſt Magna Charta, and murder. 3 Inſt. 52. Though temporal acts of parliament have of late enabled our kings to hold *courts martial*, in times of peace, &c. Deſertion and mutiny are puniſhable by this *court*; which muſt conſiſt of at leaſt thirteen commiſſion officers; nine of whom muſt concur in order to ſentence of death. A field officer is not to be tried by any under the degree of a captain.

Courts, *Mayor's*. To the lord mayor and city of London, belong ſeveral *courts* of judicature. The higheſt and moſt ancient is that called the *huſtings*, deſtined to ſecure the laws, rights, franchiſes, and cuſtoms of the city. The ſecond is a *court of requeſt*, or *of conſcience*; of which, before. The third is the *court of the lord mayor and aldermen*, where alſo the ſheriffs ſit: to which may be added, two *courts of ſheriffs*; and the *court of the city orphans*, whereof the lord mayor and aldermen have the cuſtody. Alſo, the *court of common council*, which is a *court* or aſſembly, wherein are made all by-laws which bind the citizens of London. It conſiſts, like the parliament, of two houſes: an *upper*, conſiſting of the lord mayor and aldermen; and a *lower*, of a number of common council men, choſe by the ſeveral wards, as repreſentatives of the body of the citizens. In the *court of common council*, are made laws for the advancement of trade; and committees yearly appointed, &c. But acts made by them are to have the aſſent of lord mayor and aldermen, by ſtat. 11 Geo. I. Alſo, the *chamberlain's court*, where every thing relating to the rents and revenues of the city, as alſo the affairs of ſervants, &c. are tranſacted. Laſtly, to the lord mayor belong the *courts of coroner*, and *of eſcheator*; another *court* for the *conſervation of the river of Thames*; another of *gaol-delivery*, held uſually eight times a year, at the Old Bailey, for the trial of criminals, whereof the lord mayor is himſelf the chief judge. There are other *courts* called *wardmotes*, or meetings of the wards; and *courts of halymote*, or aſſemblies of the ſeveral guilds and fraternities.

Court, *Palace, Curia Palatii*, was erected by letters patent of 6 Charles I. and made a *court* of record to try all perſonal actions, as debt, treſpaſs, ſlander, &c. between party and party within twelve miles of Whitehall. The judges of this *court* are, the ſteward of the king's houſehold, the knight marſhal, and the ſteward of the *court* or his deputy. This *court* is held with that of the marſhalſea once a week in Southwark, and appeal lies to the *court* of king's bench. The proceedings here are either by capias or attachment, which is to be ſerved on the defendant, by one of the knight marſhal's men, who takes bond with ſureties for his appearance at the next *court*: upon which appearance he muſt give bail, to anſwer the condemnation of the *court*; and the next *court* after the bail is taken, the plaintiff is to declare, and ſet forth the cauſe of his action, and afterward proceed to iſſue and trial by a jury, according to the cuſtom of the common law *courts*.

Court *of Peculiqrs*, is a ſpiritual *court*, held in ſuch pariſhes as are exempt from the juriſdiction of the biſhops, and are peculiarly belonging to the archbiſhop of Canterbury. 4 Inſt. 338. Stat. 22 and 23 Car. II.

There are royal peculiars, and archbiſhop's peculiars; the king's chapel is a royal peculiar, exempted from all ſpiritual juriſdiction, and reſerved to the immediate government of the king himſelf: and there are alſo ſome peculiar eccleſiaſtical juriſdictions belonging to the king, which formerly appertained to monaſteries and religious houſes.

There are ſome peculiars which belong to deans and chapters, or a prebendary exempted from the archdeacon only; they are derived from the biſhop, of ancient compoſition, and may be viſited by the biſhop in his primary or triennial viſitation: in the mean time, an official of the dean and chapter, or prebendary, is the judge; and from hence the appeal lies to the biſhop of the dioceſe. Wood. 504. Appeal lieth from other *peculiar courts* to the king in chancery. Stat. 25 Hen. VIII.

The dean and chapter of St. Paul's have a peculiar juriſdiction; and the dean and chapter of Saliſbury have a large peculiar within that dioceſe; ſo have the dean and chapter of Litchfield, &c. 2 Nelſ. Abr. 1240, 1241.

Where a man dies inteſtate, leaving goods in ſeveral peculiars, it has been held that the archbiſhop is to grant adminiſtration. Sid. 90. 5 Mod. 239. Appeal lies to the king in chancery.

Court, *Pie pouder*, an ancient *court* mentioned in many of our ſtatutes, to be held in fairs, for the rendering of juſtice to buyers and ſellers, and the redreſs of grievances ariſing therein.

It had its name either becauſe moſt ordinarily held in ſummer, and that the ſuiters hereat were chiefly country clowns, with duſty feet, called by the French, *pieds poudreux*; or from the expedition intended in the hearing of cauſes proper thereto, before the duſt went off the plaintiff and defendant's feet: or rather, from the old French *pied puldreaux, a pedlar*; ſignifying the *court* of ſuch petty chapmen as reſort to fairs or markets.

The Saxons called it *ceapung-gemot*, i. e. *court of merchandiſe*; or a *court* for the deciſion of diſputes relating to buying and ſelling. It is a *court* of record held during the continuance of the fairs. The ſteward, who has the toll of the market, is the judge; and the trial is by merchants and traders in the fair. A writ of error lies to the *courts* at Weſtminſter.

Court, *Prerogative*, is a *court* belonging to the archbiſhop of Canterbury; wherein all wills are proved, and all adminiſtrations granted, that belong to the archbiſhop by his prerogative; that is, where the party at his death had *bona notabilia*, five pounds or upwards, out of the dioceſe where he died, and within the archbiſhop's province.

All citations and decrees of this *court* run in the name of the archbiſhop.

This *court*, for the province of Canterbury, is kept in the common hall in Doctors Commons, in the afternoon, next day after the arches

The judge is attended by the regiſter, who ſets down the decrees and acts of *court*; and keeps records, &c. all original wills and teſtaments of parties dying, having *bona notabilia*.

The place is uſually called the *Prerogative office*: it is now kept in Dean's court; where, for a moderate fee, a copy may be had of any ſuch will. See Will.

Appeal lies from this *court* to the king in chancery, who appoints delegates, &c. 25 Hen. VIII. c. 19. though if the delegates revoke a will, &c. they cannot grant letters of adminiſtration; for their power is to hear and determine the apppeal. 2 Bulſt. 2. Roll. Abr. 233. The archbiſhop hath probate of every biſhop's teſtament, &c. though he hath not *bona notabilia* out of the dioceſe: ſo where a perſon dies beyond ſea. 4 Inſt. 335.

The archbiſhop of York hath alſo the like *court*, called his *exchequer*.

Court *of Requeſts*, was a *court* of equity, of the ſame nature with the *court* of chancery, but inferior to it; being principally inſtituted for the help of ſuch petitioners, as, in conſcionable caſes, dealt by ſupplication to his majeſty.

Of this *court* the lord privy-ſeal was chief judge; aſſiſted by the maſters of requeſts. It had its beginning about 9 Hen. VII. according to Sir Julius Cæſar's tract on this ſubject. Mich. 40 and 41 Eliz. in a *court* of common pleas, it was adjudged, upon ſolemn argument, that this *court of requeſts*, or the *Whitehall*, was no *court* that had the power of judicature, &c. Coke Inſt. fol. 97. It had aſſumed ſo great power to itſelf, that it grew burdenſome and grievous, and was therefore taken away, with ſome others, by a ſtatute made 16 and 17 Car. I. cap. 10.

Courts, *Stannary*. See Stannaries.

Court *of Star-chamber*, *Camera Stellata*, or *Chambre de Eſtoiels*, ſo called becauſe the roof was originally painted with ſtars; or more probably becauſe the contracts and obligations of the Jews, before their baniſhment under Edward I. which were called *ſtarrs*, from a corruption of the Hebrew word *ſhetar*, *a covenant*, were kept in cheſts in the king's exchequer. This is of an ancient ſtanding; but its authority was very much heightened by Henry VII. and Henry VIII. who appointed, by two ſeveral ſtatutes, that the chancellor, aſſiſted by others there named, ſhould have power to hear complaints againſt retainers, embracers, miſdemeanors of officers, and other like offences, which through the power and authority of thoſe who committed them did lift up the head above other faults; and for which inferior judges were not ſo meet to give correction, and the common law had not ſufficiently provided.

By the ſtatute 16 Car. I. the *court* called *ſtar-chamber*, and all juriſdiction, power, and authority thereto belonging, are abſolutely diſſolved.

Court *Supreme*. See Peer.

Court *of Verge*. See Court *Palace*.

Courts, *Univerſity*. The *courts* of the univerſities of Oxford and Cambridge, are of a particular nature: they were granted by charters, and confirmed by authority of parliament. See ſtat. 13 Eliz. 4 Inſt. 227. Theſe *courts* are called the chancellor's *courts*, and are kept by the vice-chancellors of the univerſities. Their juriſdiction extends to all cauſes eccleſiaſtical and civil (except for maihem, felony, and relating to freeholds); where a ſcholar, ſervant, or miniſter of the univerſities, is one of the parties to the ſuit.

Courts *of Wales*, are eſtabliſhed over the principality chiefly by 12 Edw. I. and 34 and 35 Hen. VIII. c. 26. Beſides *courts* baron, hundred and county *courts*, like thoſe in England, a ſeſſions is held twice every year in each county, by judges appointed by the king; in which pleas and perſonal actions ſhall be held in the ſame manner, and with the ſame extent, as in the *court* of common pleas at Weſtminſter; and writs of error ſhall lie from judgment in them to the *court* of king's bench. And the proceedings are according to the laws of England.

Court *of Wards*, a *court* firſt erected by king Henry VIII. and after augmented by him with the office of liveries: but now abſolutely taken away and aboliſhed, by a ſtatute made 12 Car. II. cap. 24.

For the nature of this *court*, ſee Coke on Litt. tit. *Knight's ſervice*.

Court, *Bouche of*. See Bouche.

Court, *Deſpight of the*. See Departure.

Court, *Forejudged the*. See Forejudged.

Court, *Inns of*. See Inn.

Court, *Perquiſites of*. See Perquisite.

Court, *Suit of*. See Suit.

Court, *Ambulatory*. See Ambulatory.

Court, *Baſe*. See Base.

Court, *Honour*. See Honour.

Court, *Lawleſs*. See Lawless.

Court, *Wood-plea*. See Wood.

COURT-DAYS, are days when the courts of judicature are open, and pleas held.

COURT-LANDS, ſuch as the lord of the manor keeps in his own hands, for the uſe of his family, and for hoſpitality. See Manor.

COURT-ROLL, a roll which contains an account of the number, &c. of lands, depending on the lord of the manor; with the names of the TENANTS, &c.

Tenants holding by copy of this roll, are denominated COPY-HOLDERS.

COURTAIN. See Curtin.

COURTESY, or Curtesy *of England*, a TENURE, whereby a man marrying an inheritrix, or a woman ſeiſed of lands in fee-ſimple, or fee-tail general, or ſeiſed as heir of tail-ſpecial, and getting a child by her which cometh alive into the world, though both wife and child die forthwith; yet, if ſhe were in poſſeſſion, he ſhall keep the land during his life, and be called *tenant by the courteſy of England*; this privilege being not allowed in any other country, except Scotland, where it is called *curialitas Scotiæ*.

This tenure was introduced by the Conqueror, and borrowed by him from his own country, Normandy, where it obtained before, under the name of *veuveté*. It is ſaid in the Mirrour to have been introduced by Henry I.

Courtesy, *Arms of*. See Arms.

COURTIN, or Courtain, in *Fortification*. See Curtin.

COURTISAN, a term of infamy, applied to women who expoſe their perſons, and make a trade of proſtitution.

Lais, the famous Theban *courtiſan*, ſtands on record for requiring no leſs than ten thouſand crowns for a ſingle night. Of all places in the world, Venice is that where *courtiſans* abound the moſt: it is near three centuries ſince the ſenate, which had expelled them, was obliged to recall them; to provide for the ſecurity of women of honour, and to keep the nobles employed, leſt they ſhould make innovations in the ſtate.

COUSIN, a term of relation and kinſhip, applied to thoſe who are iſſued from two brothers, or two ſiſters.

The word is ordinarily derived from *conſanguineus*; though Menage brings it from *congenius*, or *congeneus*, q. d. *ex eodem genere*.

In the firſt generation they are called *couſin germans*, i. e. next *couſins*: in the ſecond, *ſecond couſins*: in the third and fourth, *couſins in the third and fourth degrees*.

In the primitive times, it was allowed *couſin germans* to marry, to prevent their making alliances in heathen families: but Theodoſius the Great prohibited it, under pain of death; on pretence that they were, in ſome ſort, brothers and ſiſters, with regard to each other.

Paternal couſins, are thoſe ſprung from relations on the father's ſide. *Maternal*, thoſe on the mother's.

Cousins, *Quater*. See Quater.

Cousin is alſo a title of honour, which kings beſtow on peers, or nobles, foreign princes of the blood, cardinals, and the principal perſons of their ſtate.

COUSSINET, *cuſhion*, in *Architecture*, the ſtone that crowns a piedroit, or pier; or that lies immediately over the capital of the impoſt. Its under-ſide is level, and its upper curved; receiving the firſt riſe or ſpring of the arch, or vault.

The word is uſed alſo to ſignify an ornament, in the Ionic capital, between the ABACUS and ECHINUS, or quarter-round; and which ſerves to form the volutes. It is thus denominated from its repreſenting a pillow, or cuſhion, preſſed by the weight over it, and bound with the ſtrap, or girdle, called, by Vitruvius, *baltheus*.

COUSU, in *Heraldry*, is uſed in the ſame ſenſe as *remply*; viz. for a piece of another colour, or metal, placed on an ordinary as if it were ſewed on; which the word, in the French language, naturally implies: becauſe the additional piece is not properly on the field, but in the nature of a thing ſewed on, *adſutus*. This is generally of colour on colour, or metal on metal, contrary to the general rule of heraldry.

COUTHUTLAUGH, from the Saxon *couth*, *knowing*, and *utlaugh*, *outlaw*; he that wittingly receives a man outlawed, and cheriſhes or conceals him: for which offence he was, in ancient time, ſubject to the ſame puniſhment with the outlaw himſelf.

COUVERT, in *Heraldry*, denotes ſomething like a piece of hanging, or a pavilion, falling over the top of a chief, or other ordinary; ſo as not to hide, but only be a ſhading thereto.

COW, in *Zoology*. See Bull, and Bos.

The *cow* ought to have a broad forehead, black eyes, large clean horns, a long thin neck, a large deep belly, thick thighs, round legs, large feet, ſhort joints, and a white large udder with four teats.

The uſe of the *cow* is either for the dairy, or for the breed. The red *cow* is generally ſuppoſed to give the beſt milk, and the black *cow* to bring the beſt calves. The *cow* that gives the milk longeſt is the beſt both for the breed and dairy; and, for the latter uſe, it is moſt convenient that the *cow* ſhould calve in the ſpring.

This *court* has not only a power to reverſe erroneous judgments, for ſuch errors as appear the defect of the underſtanding; but alſo to puniſh all inferior magiſtrates, and all officers of juſtice, for wilful and corrupt abuſes of their authority againſt the obvious principles of natural juſtice.

This *court* being the ſupreme court of oyer and terminer, gaol-delivery, and eyre, its preſence ſuſpends the power, and avoids the proceedings of all other *courts* of the ſame nature in the county where it ſits, during its ſitting there. 4 Inſt. 73. 3 Inſt. 27.

The civil ſide of the king's bench commences on a ſuppoſition of a treſpaſs committed by the defendant in the county where it reſides, and that he is taken up by proceſs of this *court*, as the ſovereign eyre, and being committed to the marſhal, he may be declared againſt in any civil action whatſoever. The firſt proceſs, therefore, is a bill either real or feigned; and ſo called, becauſe its foundation was the bill of complaint in *court*, touching the treſpaſs: in this is founded the *latitat*, which ſuppoſes that the defendant has eſcaped, and therefore iſſues in the king's name, to apprehend the party wherever he may be found. Vide New Abr. Law, vol. i. p. 595. and title *Proceſs*.

COURT *Leet*, *Leta viſus franci plegii*, is a *court* of record, ordained for puniſhing offences againſt the crown; and is ſaid to be the moſt ancient *court* of the land. 2 Danv. Abr. 289. It enquires of all offences under high treaſon; but thoſe who are to be puniſhed with loſs of life or member, are only enquirable and preſentable here, and are to be certified over to the juſtices of aſſiſe. Stat. 1 Edw. III. And this *court* is called the view of frank pledge, becauſe the king is to be there certified by the view of the ſteward, how many people are within every leet, and have an account of their good manners and government; and every perſon of the age of twelve years, who hath remained there for a year and a day, may be ſworn to be faithful to the king, and the people are to be kept in peace, &c. A leet is incident to a hundred, as a court baron to a manor: for by grant of a hundred, a leet paſſeth; and a hundred cannot be without a leet. Kitch. 70.

The uſual method of puniſhment in the *court leet*, is by fine and amercement; the former aſſeſſed by the ſteward, and the latter by the jury.

COURT *of the Legate*, was a *court* obtained by cardinal Wolſey of pope Leo X. in the ninth year of Henry VIII. wherein he, as legate of the pope, had power to prove wills, and diſpenſe with offences againſt the ſpiritual laws, &c. It was but of ſhort continuance.

COURT *of Marſhalſea*, a *court* of record to hear and determine cauſes, between the ſervants of the king's houſehold, and others within the verge: and hath juriſdiction of all matters within the verge of the *court*, and of pleas of treſpaſs, where either party is of the king's family; and of all other actions perſonal, wherein both parties are the king's ſervants. This is the original juriſdiction of the *court of marſhalſea*.

COURT *Martial*, *Curia Martialis*, is a *court* for puniſhing the offences of officers and ſoldiers, in time of war: and it appears by our books, that if any perſon in commiſſion, in time of peace, put to death any man by martial law, it is againſt Magna Charta, and murder. 3 Inſt. 52. Though temporal acts of parliament have of late enabled our kings to hold *courts martial*, in times of peace, &c. Deſertion and mutiny are puniſhable by this *court*; which muſt conſiſt of at leaſt thirteen commiſſion officers; nine of whom muſt concur in order to ſentence of death. A field officer is not to be tried by any under the degree of a captain.

COURTS, *Mayor's*. To the lord mayor and city of London, belong ſeveral *courts* of judicature. The higheſt and moſt ancient is that called the *huſtings*, deſtined to ſecure the laws, rights, franchiſes, and cuſtoms of the city. The ſecond is a *court of requeſt*, or *of conſcience*; of which, before. The third is the *court of the lord mayor and aldermen*, where alſo the ſheriffs ſit: to which may be added, two *courts of ſheriffs*; and the *court of the city orphans*, whereof the lord mayor and aldermen have the cuſtody. Alſo, the *court of common council*, which is a *court* or aſſembly, wherein are made all by-laws which bind the citizens of London. It conſiſts, like the parliament, of two houſes: an *upper*, conſiſting of the lord mayor and aldermen; and a *lower*, of a number of common council men, choſe by the ſeveral wards, as repreſentatives of the body of the citizens. In the *court of common council*, are made laws for the advancement of trade; and committees yearly appointed, &c. But acts made by them are to have the aſſent of lord mayor and aldermen, by ſtat. 11 Geo. I. Alſo, the *chamberlain's court*, where every thing relating to the rents and revenues of the city, as alſo the affairs of ſervants, &c. are tranſacted. Laſtly, to the lord mayor belong the *courts of coroner*, and *of eſcheator*; another *court* for the *conſervation of the river of Thames*; another of *gaol-delivery*, held uſually eight times a year, at the Old Bailey, for the trial of criminals, whereof the lord mayor is himſelf the chief judge.

There are other *courts* called *wardmotes*, or meetings of the wards; and *courts of halymote*, or aſſemblies of the ſeveral guilds and fraternities.

COURT, *Palace*, *Curia Palatii*, was erected by letters patent of 6 Charles I. and made a *court* of record to try all perſonal actions, as debt, treſpaſs, ſlander, &c. between party and party within twelve miles of Whitehall. The judges of this *court* are, the ſteward of the king's houſehold, the knight marſhal, and the ſteward of the *court* or his deputy. This *court* is held with that of the marſhalſea once a week in Southwark, and appeal lies to the *court* of king's bench. The proceedings here are either by capias or attachment, which is to be ſerved on the defendant, by one of the knight marſhal's men, who takes bond with ſureties for his appearance at the next *court*: upon which appearance he muſt give bail, to anſwer the condemnation of the *court*; and the next *court* after the bail is taken, the plaintiff is to declare, and ſet forth the cauſe of his action, and afterward proceed to iſſue and trial by a jury, according to the cuſtom of the common law *courts*.

COURT *of Peculiqrs*, is a ſpiritual *court*, held in ſuch pariſhes as are exempt from the juriſdiction of the biſhops, and are peculiarly belonging to the archbiſhop of Canterbury. 4 Inſt. 338. Stat. 22 and 23 Car. II.

There are royal peculiars, and archbiſhop's peculiars; the king's chapel is a royal peculiar, exempted from all ſpiritual juriſdiction, and reſerved to the immediate government of the king himſelf: and there are alſo ſome peculiar eccleſiaſtical juriſdictions belonging to the king, which formerly appertained to monaſteries and religious houſes.

There are ſome peculiars which belong to deans and chapters, or a prebendary exempted from the archdeacon only; they are derived from the biſhop, of ancient compoſition, and may be viſited by the biſhop in his primary or triennial viſitation: in the mean time, an official of the dean and chapter, or prebendary, is the judge; and from hence the appeal lies to the biſhop of the dioceſe. Wood. 504. Appeal lieth from other *peculiar courts* to the king in chancery. Stat. 25 Hen. VIII.

The dean and chapter of St. Paul's have a peculiar juriſdiction; and the dean and chapter of Saliſbury have a large peculiar within that dioceſe; ſo have the dean and chapter of Litchfield, &c. 2 Nelſ. Abr. 1240, 1241. Where a man dies inteſtate, leaving goods in ſeveral peculiars, it has been held that the archbiſhop is to grant adminiſtration. Sid. 90. 5 Mod. 239. Appeal lies to the king in chancery.

COURT, *Pie pouder*, an ancient *court* mentioned in many of our ſtatutes, to be held in fairs, for the rendering of juſtice to buyers and ſellers, and the redreſs of grievances ariſing therein.

It had its name either becauſe moſt ordinarily held in ſummer, and that the ſuiters hereat were chiefly country clowns, with duſty feet, called by the French, *pieds poudreux*; or from the expedition intended in the hearing of cauſes proper thereto, before the duſt went off the plaintiff and defendant's feet: or rather, from the old French *pied puldreaux*, *a pedlar*; ſignifying the *court* of ſuch petty chapmen as reſort to fairs or markets.

The Saxons called it *ceapung-gemot*, i. e. *court of merchandiſe*; or a *court* for the deciſion of diſputes relating to buying and ſelling. It is a *court* of record held during the continuance of the fairs. The ſteward, who has the toll of the market, is the judge; and the trial is by merchants and traders in the fair. A writ of error lies to the *courts* at Weſtminſter.

COURT, *Prerogative*, is a *court* belonging to the archbiſhop of Canterbury; wherein all wills are proved, and all adminiſtrations granted, that belong to the archbiſhop by his prerogative; that is, where the party at his death had *bona notabilia*, five pounds or upwards, out of the dioceſe where he died, and within the archbiſhop's province.

All citations and decrees of this *court* run in the name of the archbiſhop.

This *court*, for the province of Canterbury, is kept in the common hall in Doctors Commons, in the afternoon, next day after the arches

The judge is attended by the regiſter, who ſets down the decrees and acts of *court*; and keeps records, &c. all original wills and teſtaments of parties dying, having *bona notabilia*.

The place is uſually called the *Prerogative office*: it is now kept in Dean's court; where, for a moderate fee, a copy may be had of any ſuch will. See WILL.

Appeal lies from this *court* to the king in chancery, who appoints delegates, &c. 25 Hen. VIII. c. 19. though if the delegates revoke a will, &c. they cannot grant letters of adminiſtration; for their power is to hear and determine the apppeal. 2 Bulſt. 2. Roll. Abr. 233. The archbiſhop hath probate of every biſhop's teſtament, &c. though he hath not *bona notabilia* out of the dioceſe: ſo where a perſon dies beyond ſea. 4 Inſt. 335.

The archbiſhop of York hath alſo the like *court*, called his *exchequer*.

Court *of Requeſts*, was a *court* of equity, of the ſame nature with the *court* of chancery, but inferior to it; being principally inſtituted for the help of ſuch petitioners, as, in conſcionable caſes, dealt by ſupplication to his majeſty.

Of this *court* the lord privy-ſeal was chief judge; aſſiſted by the maſters of requeſts. It had its beginning about 9 Hen. VII. according to Sir Julius Cæſar's tract on this ſubject. Mich. 40 and 41 Eliz. in a *court* of common pleas, it was adjudged, upon ſolemn argument, that this *court of requeſts*, or the *Whitehall*, was no *court* that had the power of judicature, &c. Coke Inſt. fol. 97. It had aſſumed ſo great power to itſelf, that it grew burdenſome and grievous, and was therefore taken away, with ſome others, by a ſtatute made 16 and 17 Car. I. cap. 10.

Courts, *Stannary*. See Stannaries.

Court *of Star-chamber*, *Camera Stellata*, or *Chambre de Eſtoiels*, ſo called becauſe the roof was originally painted with ſtars; or more probably becauſe the contracts and obligations of the Jews, before their baniſhment under Edward I. which were called *ſtarrs*, from a corruption of the Hebrew word *ſhetar*, *a covenant*, were kept in cheſts in the king's exchequer. This is of an ancient ſtanding; but its authority was very much heightened by Henry VII. and Henry VIII. who appointed, by two ſeveral ſtatutes, that the chancellor, aſſiſted by others there named, ſhould have power to hear complaints againſt retainers, embracers, miſdemeanors of officers, and other like offences, which through the power and authority of thoſe who committed them did lift up the head above other faults; and for which inferior judges were not ſo meet to give correction, and the common law had not ſufficiently provided.

By the ſtatute 16 Car. I. the *court* called *ſtar-chamber*, and all juriſdiction, power, and authority thereto belonging, are abſolutely diſſolved.

Court *Supreme*. See Peer.

Court *of Verge*. See Court *Palace*.

Courts, *Univerſity*. The *courts* of the univerſities of Oxford and Cambridge, are of a particular nature: they were granted by charters, and confirmed by authority of parliament. See ſtat. 13 Eliz. 4 Inſt. 227. Theſe *courts* are called the chancellor's *courts*, and are kept by the vice-chancellors of the univerſities. Their juriſdiction extends to all cauſes eccleſiaſtical and civil (except for maihem, felony, and relating to freeholds); where a ſcholar, ſervant, or miniſter of the univerſities, is one of the parties to the ſuit.

Courts *of Wales*, are eſtabliſhed over the principality chiefly by 12 Edw. I. and 34 and 35 Hen. VIII. c. 26. Beſides *courts* baron, hundred and county *courts*, like thoſe in England, a ſeſſions is held twice every year in each county, by judges appointed by the king; in which pleas and perſonal actions ſhall be held in the ſame manner, and with the ſame extent, as in the *court* of common pleas at Weſtminſter; and writs of error ſhall lie from judgment in them to the *court* of king's bench. And the proceedings are according to the laws of England.

Court *of Wards*, a *court* firſt erected by king Henry VIII. and after augmented by him with the office of liveries: but now abſolutely taken away and aboliſhed, by a ſtatute made 12 Car. II. cap. 24.

COUVERT, in *Heraldry*, denotes ſomething like a piece of hanging, or a pavilion, falling over the top of a chief, or other ordinary; ſo as not to hide, but only be a ſhading thereto.

COW, in *Zoology*. See Bull, and Bos.

The *cow* ought to have a broad forehead, black eyes, large clean horns, a long thin neck, a large deep belly, thick thighs, round legs, large feet, ſhort joints, and a white large udder with four teats.

The uſe of the *cow* is either for the dairy, or for the breed. The red *cow* is generally ſuppoſed to give the beſt milk, and the black *cow* to bring the beſt calves. The *cow* that gives the milk longeſt is the beſt both for the breed and dairy; and, for the latter uſe, it is moſt convenient that the *cow* ſhould calve in the ſpring.

Either in the month of March or April, when a *cow* is near calving, ſhe ſhould be put into good graſs three or four weeks before the time; or if it happen in winter, ſhe is to be fed well with hay. The day and night after ſhe has calved, ſhe ſhould be kept in the houſe, and the water that ſhe drinks ſhould be a little warmed. The next day, at noon, ſhe may be turned out; but ſhe ſhould be taken in at night, for three or four days afterwards, and then ſhe may be left to herſelf. Every night that ſhe is taken in, ſhe ſhould be kept till the cold of the morning is over, and a drink of warm water given her before ſhe goes out.

The largeſt *cows*, in general, give the greateſt quantity of milk: and it is always a good rule to take the cattle from a worſe ground than that on which they are to be kept; for if from a better, they are apt to degenerate. The beſt time of a *cow*'s life for breeding of calves, is from three years oſd till twelve.

Cow, *Sea.* See Sea *Cow.*

Cow-*parſnep.* See Parsnep.

Cow-*weed.* See Chervil.

Cow-*wheat.* See Wheat.

COWARD, in *Heraldry.* A lion borne, in an eſcutcheon, with his tail doubled, or turned in between his legs, is called a *lion coward.*

COWITCH. See Couhage.

COWL, or Coul, *Cuculla*, a ſort of hood, wore by certain monks. See Coul.

Cowl, *Friar's*, in *Botany.* See Wake *Robin.*

COWPER'*s Glands*, in *Anatomy*, a pair of glands diſcovered by Mr. Cowper in 1699, and lying upon each ſide of the perinæum. See Urethra.

COWRING, in *Falconry*, the quivering of young hawks, who ſhake their wings, in ſign of obedience to the old ones.

COWSLIP, in *Botany.* See Primrose.

Cowslip *of Jeruſalem.* See Lungwort.

Cowslip, *French.* See Auricula.

COXÆ *os.* See Coccygis.

Coxæ, Coxendicis, *oſſa*, and in Engliſh the *hip-bones*, called alſo *oſſa innominata*, are two large bones, ſituate on either ſide the *os ſacrum.* See *Tab. Anatomy* (*Oſteol.*) *fig.* 3. *n.* 16, 17, 18, 19.

In infants, each of theſe conſiſts of three diſtinct bones, ſeparated by cartilages; which, in adults, grow up, and conſtitute one firm, ſolid bone; whoſe parts, however, retain three diſtinct names, according to their former diviſion, viz. the *os ilium*, *os iſchium*, by ſome peculiarly called *os coxendicis*, and the *os pubis.*

Coxæ *muſculus*, according to Dr. Drake, is a pair of muſcles ariſing fleſhy from the *os iſchium*, between the *muſculi marſupialis*, and *pyriformis*; and which, deſcending obliquely, terminate on each ſide the *os coccygis*, and adjoining part of the *os ſacrum*; ſerving to draw the *os coccygis* upwards and inwards, as antagoniſts to two ligaments ſpringing from the back part of the *os ſacrum*, and terminating in the external ſurface of the *os coccygis.*

COXENDIX, in *Anatomy*, the *hip.* See its bones and muſcles under Coxæ.

COXSWAIN, on board a ſhip. See Cockswain.

COYA, or Coyba, a venomous inſect in South America, of a fiery red colour, and about the ſize of a bug. The poiſonous juices of this inſect, when burſt upon the ſkin of any animal, are often fatal. However, the Indians have an antidote againſt it, in the dried ſtems of an herb.

COYOLCOZQUE, in *Zoology*, the name of an American bird, deſcribed by Hernandez and Nieremberg, as a ſpecies of quail, or partridge. Its back is of a mixt white and yellow colour; its breaſt and belly wholly yellow; and its head and neck are ornamented with ſpots of black and white: its eyes are black; and its legs yellow. It is very common in many parts of New Spain, and is a very well taſted bird. Ray.

COZCACOAUHTLI, in *Zoology*, the Mexican name of a large bird of the eagle kind, deſcribed by Nieremberg; and called *regina aurarum*, *the queen of the winds*, from its being able to fly againſt any wind.

CQUILAQUIL, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands, to the ſpecies of parrot common with them; and diſtinguiſhed from all the other kinds, by being very large, and all over of a fine green.

CRAB, in *Zoology*, a genus of aptera in the claſs of inſects in the Linnæan ſyſtem, comprehending no leſs than eighty-ſeven ſpecies. See Squilla.

The *cancer major*, or common large *crab*-fiſh, has its abode from twenty to forty fathom water. Theſe animals herd together in diſtinct tribes, and have their ſeparate haunts for feeding and breeding, and will not aſſociate with their neighbours. This has been carefully tried, by marking the ſhell of a *crab*, and carrying it to two or three miles diſtance, and there leaving it among the ſame ſpecies: this *crab* has, after this, found its way home, and been caught in its old abode by the ſame fiſhermen.

The fiſhermen find the *crabs* of this ſpecies from the ſize of a cheſnut to twelve pound weight.

The *cancer major*, and all ſpecies of *crabs*, caſt their ſhells; though at what ſeaſon of the year, or how frequently, is not exactly to be determined; but it is believed to be annually, at the beginning of the ſummer, ſooner or later, according to the greater or leſs ſtrength of the *crab.* A membrane, like wet parchment, with which the carcaſs is enveloped, hardens by degrees into a new ſhell.

Nothing, in the hiſtory of the *crab*, is ſo ſingular as its breaking off its own limbs, which it occaſionally does, in the following manner: the creature is able to do this in any poſition, but the moſt advantageous way of making the experiment is to lay it on its back; then, with a pair of iron pincers, break the ſhell, and bruiſe the fleſh of one of the outer joints of a ſmall leg: the wound will bleed, and the creature ſhew ſigns of pain, by moving it about; afterwards it holds it quite ſtill, in a direct and natural poſition, without touching any part of its body, or other legs with it; then, on a ſudden, with a gentle crack, the wounded part of the leg drops off, at the internodium of the ſecond joint, from the body. If a hole be pierced in the great claws, or legs, and an iron put in to lacerate the muſcle, the effect is the ſame, and this large limb is thrown off in the ſame manner, only with more violence.

When the leg is off, a mucus overſpreads the wound, and ſtops the bleeding; and a ſmall leg is, by degrees, produced, which afterwards attains to the ſize of the former. Nature ſeems to have given this ſingular power to this creature for the preſervation of its life, in the mutual quarrels it very frequently has with others of its own ſpecies: in theſe one *crab* lays hold of the claws of another, and cruſhes it in ſuch a manner, that it would bleed to death, had it not this power of giving up the limb, and healing the wound. Phil. Tranſ. Nº 478. S. 14. and vol. xlvii. Nº 8. See Exuviæ.

Crab, in *Mechanics*, an engine uſed for mounting guns on their carriages. See Gin.

Crab, in *Sea-Language*, a wooden pillar, whoſe lower end is let down through the ſhip's decks, and reſts upon a ſocket like the capstan: in its upper end are three or four holes at different heights, through the middle of it, above one another; into which long bars are thruſt, whoſe length is nearly equal to the breadth of the deck. It is employed to wind in the cable, and for other purpoſes requiring a great mechanical power.

The *crab* with three claws is uſed to launch ſhips, and to heave them into the dock or off the key. See *Tab.* II. *Mechanics*, *fig.* 30.

Crab'*s claws*, or Crab'*s eyes*, *Chelæ Cancrorum*, in the *Materia Medica*, the tips of the common *crab* broken off at the verge of the black part; ſo much of the extremity of the claws only being uſed in medicine, as is tinged with this colour. The blackneſs, however, is only ſuperficial; they are of a greyiſh white within, and, when levigated, furniſh a tolerably white powder: this is of the number of the alkaline abſorbent powders, but ſuperior to moſt of them. It makes the baſis of the famous Gaſcoign powder, the *lapis contrayerva*, and many other of the compound ſudorific powders; and is ſometimes, though rarely, preſcribed ſingly.

It is the common opinion, that theſe *crab's eyes* act as mere abſorbents in the *primæ viæ*, and extend their efficacy no farther than thoſe paſſages. The French Memoirs, however, give us an account of their certainly paſſing into the blood, in a remarkable caſe. Mem. Acad. Par. 1709.

Crab'*s eyes*, *Oculi Cancrorum*, or *Lapides Cancrorum*, in *Natural Hiſtory* and *Medicine*, are little, white, round ſtones, ordinarily flat; ſo called, though really taken out of the cray-fiſh, or river lobſter: and bearing no great reſemblance to eyes, though reſembling them more than any other part. They are much uſed in medicine, as a powerful alkali, or abſorbent.

The moſt able naturaliſts long imagined them formed in the brain of the animal. Van Helmont firſt found them in the region of the ſtomach: M. Geoffroy the younger has obſerved the manner of their formation much more accurately. Whilſt the ſhell of the cray-fiſh, which it caſts every year, is hardening, a white nutritious juice, ſecreted in two portions of the ſtomach, forms by degrees a ſoft calculous ſubſtance, of a cruſtaceous texture, from ſucceſſive appoſitions of the juice. Before the caſting of the ſhell, the animal is in a weak and ſickly ſtate; takes no food for ſome days; and in this period the calculi ſeem to ſerve for its nouriſhment. And on this account the *crab's eyes* are met with only whilſt the fiſh are loſing their ſhells, and for a few days afterwards, and not for a conſiderable time after this period. Neumann.—See CRAY-*fiſh*.

CRAB-*lice*, a troubleſome kind of vermin, which ſtick ſo faſt with their claws to the ſkin, as to render it difficult to diſlodge them. Being viewed with a glaſs, they nearly reſemble the ſmall crab-fiſh; whence they obtained their popular name. They are alſo called *pluſtulæ*, *morpiones*, *petolæ*, and *peſſolatæ:* they uſually infeſt the arm-pits, eye-lids, eye-brows, and *pudenda*.

They will be quickly deſtroyed, and drop off dead, upon the application of a rag wet with the milk of ſublimate. This ſort of vermin is reckoned to prognoſticate ſpeedy mortality to thoſe whom they abandon, without being removed by medicine.

CRAB-*tree*, *Malus ſylveſtris*, in *Botany*. See APPLE-*tree*.

CRABRO. See HORNET.

CRACKER, in *Zoology*. See DUCK.

CRADLE, a well-known machine, in which children are rocked to ſleep.

It alſo denotes that part of the ſtock of a croſs-bow, in which the bullet is put.

CRADLE, in *Engraving*, is the name of an inſtrument uſed in ſcraping mezzotintoes, and preparing the plate. It is formed of ſteel, reſembling a chiſſel, with one ſloping ſide, upon which are cut hollow lines very near each other, and at equal diſtances. The acting part of this tool is made circular, and the corners are rounded. After being properly tempered, it muſt be ſharpened on the whetſtone. There are various ſizes of this inſtrument.

CRADLE, in *Huſbandry*, a part often added to a ſcythe, in order to gather the corn into ſwaths, when it is mowed.

CRADLE, in *Ship-building*, a frame of timber raiſed along the outſide of a ſhip, by the bildge, for the more commodious and ſecure launching of the veſſel. The *cradle* is much uſed in Italy, Spain, and Turky; where they alſo trim great veſſels in the *cradle*.

CRADLE, in *Surgery*, a caſe in which a broken leg is laid, after being ſet.

CRAFT, a ſea term, ſignifying all manner of lines, nets, hooks, and the like, which ſerve for fiſhing. See FISHING.

Hence, as thoſe who uſe the fiſhing-trade, uſe ſmall veſſels, ſuch as ketches, hoys, ſmacks, &c. they call ſuch little veſſels *ſmall craft*.

CRAKE, in *Ornithology*. See *Land* RAIL.

CRAKE-*berries*, in *Botany*, *empetrum*. See *Berry-bearing* HEATH.

CRAMA, in *Metallurgy*, a name given by the ancients to braſs, made by the mixture of copper and the *lapis calaminaris*, as at this time. They had alſo a kind of white braſs, or mixt metal, made of copper, in uſe among them, which they eſteemed much above the yellow. We find mention of this in Virgil, under the name of *album orichalcum*; and the other old writers often call it *album crama*. We know of many ways of turning copper white: arſenic and many other minerals will do it; and the ſpoons, and other utenſils, which ſome years ago uſed to be made of a mixt metal, called alchymy metal, were a ſort of white braſs. But it does not appear, that any of our methods have been the ſame with that of the ancients: the copper is rendered more brittle, and in ſome ſort debaſed, in all our compoſitions of this kind; but in thoſe of the ancients, it ſeems to have been rendered more ductile than at firſt.

CRAMA, CROMA, and CHRAMA, in *Medical Writers*, are uſed to ſignify a mixture of things, whether medicines or elements.

CRAMBE, in *Botany*, the *ſea-cabbage*, a genus of the *tetradynamia ſiliquoſa* claſs. Its characters are theſe: the flower hath four petals, placed in form of a croſs; and ſix ſtamina, two of which are the length of the empalement, the other four being longer. The petals have honey glands on their inſides, which are longer than the ſtamina. It hath an oblong germen, which afterward becomes a round dry capſule, with one cell encloſing a roundiſh ſeed. There are five ſpecies; the firſt of which is found wild upon ſea ſhores in divers parts of England, but particularly in Suſſex and Dorſetſhire, where the inhabitants gather it in ſpring to eat, preferring it to any of the cabbage kind. As it generally grows upon the gravelly ſhores, where the tide flows over it, the inhabitants obſerve where the gravel is thruſt up by the roots of this plant, and cut the ſhoots before they are expoſed to the open air; whereby they appear as if they were blanched, and are very tender and ſweet: but if they are ſuffered to grow until they are green, they become tough and bitter.

This plant may be propagated in a garden, by ſowing the ſeed ſoon after it is ripe, in a ſandy or gravelly ſoil, where it will thrive exceedingly, and its creeping roots will ſoon overſpread a large ſpot of ground; but the heads will not be fit to cut, until the plants have had a year's growth. In order to have it good, the bed, in which the plants grow, ſhould at Michaelmas be covered over with ſand or gravel about four or five inches thick, which will allow a proper depth for the ſhoots; and if this be repeated every autumn, in the ſame manner as is practiſed in earthing aſparagus beds, they will require no other culture.

The other ſorts are only preſerved in curious gardens for variety. Miller.

It is eſteemed more hot and dry than the cabbage. Dale informs us that the leaves heal wounds, and diſcuſs inflammatory, and other tumours.

CRAMP, a kind of numbneſs, or convulſion, occaſioned by a thick viſcid vapour entering the membranes of the muſcles, which contracts or extends the neck, arms, legs, &c. with a violent, but tranſitory pain; being uſually driven off with friction alone.

The word comes from the German *krampſe*, which ſignifies the ſame.

A glaſs of tar water, to be drank night and morning, has been recommended; a rod of brimſtone, when held in the hand, has given preſent relief.

CRAMP-*fiſh*, or NUMB-*fiſh*, in *Ichthyology*, the Engliſh name of the TORPEDO. See alſo RAJA.

CRAMP-*iron*, a piece of iron, bent at each extreme, ſerving to bind together pieces of wood, ſtones, or other things.

Some derive the word, by corruption, from the French *agrapon*, or the Italian *rampone*, which ſignify the ſame thing.

CRAMPER, in *Zoology*, a name given by ſome to the BRAMA *ſaxatilis*, or *pagrus Indicus*, a large and broad ſea-fiſh, caught among the rocks on the ſhores of many parts of the Eaſt Indies.

CRAMPONEE', in *Heraldry*. A *croſs cramponeé*, is that which at each end has a *cramp*, or ſquare piece coming from it: as repreſented in *Tab.* II. *Heraldry*, *fig.* 52.

CRAMPOONS, CRAMPONS, pieces of iron, hooked at the ends; for the drawing or pulling up of timber, ſtones, &c.

CRANAGE, a liberty to uſe a crane, for drawing up wares out of a ſhip, or hoy, &c. at a wharf; and to make profit thereof.

The word alſo ſignifies the money taken, or paid for the ſame.

CRANBERRY, in *Botany*. See WHORTLE-*berry*.

CRANE, *Ardea grus*, in the Linnæan ſyſtem of *Zoology*, a ſpecies of the ARDEA, or HERON. The characteriſtic of this genus is, that the head is criſtated or creſted, and almoſt bare of feathers.

Theſe birds are very tall, and remarkable for the length of their legs and neck, of which there are three known ſpecies. 1. The common *crane*, the body of which is ſo large, as ſometimes to weigh ten or twelve pounds; and when meaſured from the tip of the beak to the toes extended, is ſix feet long. Its beak is of a greeniſh black, and is long and pointed; its wings are large; and its legs and feet black; its toes very long. But what is moſt obſervable in this bird, is the conſtruction of its wind-pipe, or *aſpera arteria*, which runs deep into the breaſt, by means of a foramen prepared for it; and there ſuffering ſome windings and turnings, goes out again at the ſame paſſage, and then deſcends into the lungs. Phil. Tranſ. vol. lvi. p. 204.

It is a very common bird in Italy, and other places; and formerly viſited England, large flocks of them having been ſometimes ſeen in Lincolnſhire, and Cambridgeſhire, in ſummer. But they have now forſaken our iſland, though formerly natives. It is ſuppoſed by many, that this bird eats fiſh, but erroneouſly; the ſtructure of its ſtomach plainly ſhows it a granivorous bird; and its fleſh is very delicate, and much valued in the Italian markets. The whole of this bird, its fat, gall, head, and eyes, its ſtomach, and the marrow of its legs, are uſed in medicine. The bird itſelf, becauſe nervous, is ſaid to be highly beneficial to the nervous and membranous parts; hence the uſe of it is recommended in colics. Its fat, dropped into the ears, leſſens deafneſs, ſoftens hardneſs, and obſtinate tumours of the ſpleen: it quickly relieves a ſtiffneſs of the neck; and is ſaid to be of the ſame nature with the fat of the gooſe. The gall is beneficial to the eyes. The head, eyes, and ſtomach, when reduced to a powder, are ſprinkled upon fiſtulas, cancers, and varicoſe ulcers. An ophthalmic ointment is prepared of the marrow of the legs.

2. The Indian *crane*. This is ſmaller than ours, and of the ſame grey colour; its tail is ſo ſhort that the wings hide it, and it is not ſeen. Its beak is longer than that of our *crane*; but its moſt obvious diſtinction is, that it

has on the top of its head, from the inſertion of the beak to the crown, a rough red ſkin, beſet with a few looſe hairs.

3. The laſt ſpecies is the *grus Balearica*, the Majorca *crane*; this is of the ſhape of the ſtork, but inſtead of its long beak, has that of the *crane*, and is diſtinguiſhed by a fine thick ſhewy creſt which it carries on its head. This is not made up of feathers, but of hairs like hog's briſtles. It runs very ſwiftly, and feeds on herbs and corn like the hens and turkeys. Ray's Ornithol. p. 200, 201.

The general diſtinctions of the *crane* kind from the herons, are theſe: 1. The claw of the middle toe is not ſerrated. 2. They are much larger. 3. Their beak is ſhorter. Beſide theſe, the make of their ſtomach, guts, and above all, of their *aſpera arteria*, greatly diſtinguiſh them.

Crane is alſo improperly applied to the ſhag, or ſmall cormorant, a bird common about our ſhores.

Crane, *Numidian*. See Demoiselle.

Crane, a machine uſed in *Building* and in *Commerce*, for raiſing large ſtones, and other weights.

M. Perrault, in his notes on Vitruvius, makes the *crane* the ſame with the *corvus*, or raven, of the ancients.

The modern *crane* conſiſts of ſeveral members, or pieces, the principal whereof is a ſtrong perpendicular beam, or arbor, firmly fixed in the ground, and ſuſtained by eight arms, coming from the extremities of four pieces of wood laid acroſs, through the middle whereof the foot of the beam paſſes. About the middle of the arbor the arms meet, and are mortiſed into it: its top ends in an iron pivot, whereon is borne a tranſverſe piece, advancing out to a good diſtance in manner of a *crane*'s neck; whence the name. The middle and extremity of this are again ſuſtained by arms from the middle of the arbor: and over it comes a rope, or cable, to one end whereof the weight is fixed; the other is wound round the ſpindle of a wheel, which turned, draws the rope, and that heaves up the weight; to be afterwards applied to any ſide or quarter, by the mobility of the tranſverſe piece on the pivot.

There are ſeveral improvements of this uſeful machine mentioned in Deſagulier's Experim. Philoſ. p. 178, ſeq. particularly how to prevent the inconveniencies ariſing from ſudden jerks, as well as to increaſe its force by uſing a double axis *in peritrochio*, and two handles.

The *crane* is of two kinds; in the firſt kind, called the *rat-tailed crane*, the whole machine, with the load, turns upon a ſtrong axis: in the ſecond kind, the gibbet alone moves on its axis. We ſhall refer to Deſaguliers *ubi ſupra* for a particular account of the different *cranes*, and of the gradual improvements they have received; and give a deſcription of one, in which moſt of them are combined, invented by the late Mr. Padmore of Briſtol. It conſiſts of wheels, axles, pulleys, ropes, and a gib or gibbet. When the rope H is hooked to the weight K, a man turns the winch A, on the axis whereof is the trundle B, which turns the wheel C, on whoſe axis D is the trundle E, which turns the wheel F with its upright axis G, on which the great rope H H winds as the wheel turns; and going over a pulley I at the end of the arm *d* of the gib *c c d e*, it draws up the heavy burden K; which, being raiſed to a proper height, as from a ſhip to the quay, is then brought over the quay by pulling the wheel Z round by the handles *z*, *z*, which turns the gib by means of the half wheel *b* fixt on the gib-poſt *c c*, and the ſtrong pinion *a* fixt on the axis of the wheel Z. This wheel gives the man that turns it an abſolute command over the gib, ſo as to prevent it from taking any unlucky ſwing, ſuch as often happens when it is only guided by a rope tied to its arm *d*; and people are frequently hurt, ſometimes killed, by ſuch accidents.

The great rope goes between two upright rollers *i* and *k*, which turn upon gudgeons in the fixed beams *f* and *g*; and as the gib is turned towards either ſide, the rope bends upon the roller next that ſide. Were it not for theſe rollers, the gib would be quite unmanageable; for the moment it were turned ever ſo little towards any ſide, the weight K would begin to deſcend, becauſe the rope would be ſhortened between the pulley I and axis G; and ſo the gib would be pulled violently to that ſide, and either be broke to pieces, or break every thing that came in its way. Theſe rollers muſt be placed ſo, that the ſides of them, round which the rope bends, may keep the middle of the bended part directly even with the center of the hole in which the upper gudgeon of the gib turns in the beam *f*. The truer theſe rollers are placed, the eaſier the gib is managed, and the leſs apt to ſwing either way by the force of the weight K.

A ratchet-wheel Q is fixt upon the axis D, near the trundle E; and into this wheel falls the catch or click R. This hinders the machine from running back by the weight of the burden K, if the man who raiſes it ſhould happen to be careleſs, and ſo leave off working at the winch A ſooner than he ought to do.

When the burden K is raiſed to its proper height from the ſhip, and brought over the quay by turning the gib about, it is let down gently upon the quay, or into a cart ſtanding thereon, in the following manner. A man takes hold of the rope *t t* (which goes over the pulley *v*, and is tied to a hook at S in the catch R), and ſo diſengages the catch from the ratchet-wheel Q; and then, the man at the winch A turns it backward, and lets down the weight K. But if the weight pulls too hard againſt this man, another lays hold of the handle V, and by pulling it downward, draws the gripe U cloſe to the wheel Y, which, by rubbing hard againſt the gripe, hinders the too quick deſcent of the weight; and not only ſo, but even ſtops it at any time, if required. By this means, heavy goods may be either raiſed or let down at pleaſure, without any danger of hurting the men who work the engine.

When part of the goods are craned up, and the rope is to be let down for more, the catch R is firſt diſengaged from the ratchet-wheel Q, by pulling the cord *t*; then the handle *q* is turned half round backward, which, by the crank *n n* in the piece *o*, pulls down the frame *b* between the guides *m* and *m* (in which it ſlides in a groove), and ſo diſengages the trundle B from the wheel C: and then, the heavy hook β at the end of the rope H deſcends by its own weight, and turns back the great wheel F with its trundle E, and the wheel C; and this laſt wheel acts like a fly againſt the wheel F and hook β; and ſo hinders it from going down too quick; whilſt the weight X keeps up the gripe U from rubbing againſt the wheel Y, by means of a cord going from the weight, over the pulley *w* to the hook W in the gripe; ſo that the gripe never touches the wheel, unleſs it be pulled down by the handle V.

When the *crane* is to be ſet at work again, for drawing up another burden, the handle *q* is turned half round forwards; which, by the crank *n n*, raiſes up the frame *b*, and cauſes the trundle B to lay hold of the wheel C; and then, by turning the winch A, the burden of goods K is drawn up as before. See *Tab.* II. *Mechanics*, *fig.* 31.

The crank *n n* turns pretty ſtiff in the mortiſe near *o*, and ſtops againſt the farther end of it when it has got juſt a little beyond the perpendicular; ſo that it can never come back of itſelf: and therefore, the trundle B can never come away from the wheel C, until the handle *q* be turned half round.

The great rope runs upon rollers in the lever L M, which keep it from bending between the axle at G and the pulley I. This lever turns upon the axis N by means of the weight O, which is juſt ſufficient to keep its end L up to the rope; ſo that, as the great axle turns, and the rope coils round it, the lever riſes with the rope, and prevents the coilings from going over one another.

The power of this *crane* may be eſtimated thus: ſuppoſe the trundle B to have 13 ſtaves or rounds, and the wheel C to have 78 ſpur cogs; the trundle E to have 14 ſtaves, and the wheel F 56 cogs. Then, by multiplying the ſtaves of the trundles, 13 and 14, into one another, their product will be 182; and by multiplying the cogs of the wheels, 78 and 56, into one another, their product will be 4368, and dividing 4368 by 182, the quotient will be 24; which ſhews that the winch A makes 24 turns for one turn of the wheel F and its axle G on which the great rope or chain H I H winds. So that, if the length or radius of the winch A were only equal to half the diameter of the great axle G, added to half the thickneſs of the rope H, the power of the *crane* would be as 24 to 1: but the radius of the winch being double the above length, it doubles the ſaid power, and ſo makes it as 48 to 1: in which caſe, a man may raiſe 48 times as much weight by this engine as he could do by his natural ſtrength without it, making proper allowance for the friction of the working parts. Two men may work at once, by having another winch on the oppoſite end of the axis of the trundle under B; and ſo make the power ſtill double.

If this power be thought greater than what may be generally wanted, the wheels may be made with fewer cogs in proportion to the ſtaves in the trundles; and ſo the power may be of whatever degree is judged to be requiſite. But if the weight be ſo great as will require yet more power to raiſe it (ſuppoſe a double quantity), then the rope H may be put under a moveable pulley, as δ, and the end of it tied to a hook in the gib at ε; which will give a double power to the machine, and ſo raiſe a double weight hooked to the block of the moveable pulley.

When only ſmall burdens are to be raiſed, this may be quickly done by men puſhing the axle G round by the handſpokes *y*, *y*, *y*, *y*; having firſt diſengaged the trundle B from the wheel C: and then, this wheel will only act as a fly upon the wheel F; and the catch R will prevent its running back, if the men ſhould inadvertently leave off puſhing before the burden be unhooked from β.

Laſtly, when very heavy burdens are to be raiſed, which might endanger the breaking of the cogs in the wheel F; their force againſt theſe cogs may be much abated by men puſhing round the hanſpokes *y*, *y*, *y*, *y*, whilſt the man at A turns the winch. Ferguſon's Lectures on Select Subjects, 4to. p. 52, &c.

If the axis GG be placed horizontally, and inſtead of the wheel F a larger wheel be fixed to it, which may be turned by men walking in it, we ſhall have another kind of *crane*; the rope will coil round the axle as the wheel turns, and the gib-work is the ſame as in the other ſort of *crane*. Mr. Padmore contrived to prevent the danger attending the uſe of this conſtruction, by putting cogs all round the outſide of the wheel, and applying a trundle to turn it; by which addition the power is increaſed in the proportion of the number of cogs to the number of ſtaves in the trundle: and in order to hinder its running back by the force of the weight, ſhould the men within it ſlip, or leave off walking, he added a ratchet-wheel to the axis of the trundle, like that already deſcribed. Two winches may alſo be fixed to the ends of the axle, by working which the men in the wheel would be much aſſiſted. On the axle he likewiſe fixed a gripe-wheel, ſuch as has been already deſcribed, by means of which heavy burdens may be let down without the leaſt danger.

Mr. Ferguſon has contrived and deſcribed a new and ſafe *crane*, with four different powers adapted to different weights. In this *crane* (ſee *Tab. II. Mechanics*, *fig.* 32.) A repreſents the great wheel, and B its axle, on which the rope C winds. This rope goes over a pulley D in the end of the arm of the gib E, and draws up the weight F, as the winch G is turned round. H is the largeſt trundle, I the next, and K is the axis of the ſmalleſt trundle, which is ſuppoſed to be hid from view by the upright ſupporter L. A trundle M is turned by the great wheel, and on the axis of this trundle is fixed the ratchet-wheel N, into the teeth of which the catch O falls. P is the lever, from which goes a rope QQ, over a pulley R to the catch; one end of the rope being fixed to the lever, and the other end to the catch. S is an elaſtic bar of wood, one end of which is ſcrewed to the floor: and, from the other end goes a rope (out of ſight in the figure) to the further end of the lever, beyond the pin or axis on which it turns in the upright ſupporter T. The uſe of this bar is to keep up the lever from rubbing againſt the edge of the wheel U, and to let the catch keep in the teeth of the ratchet-wheel: but, a weight hung to the farther end of the lever, would do full as well as the elaſtic bar and rope.

When the lever is pulled down, it lifts the catch out of the ratchet-wheel, by means of the rope QQ, and gives the weight F liberty to deſcend: but if the lever P be pulled a little farther down than what is ſufficient to lift the catch O out of the ratchet-wheel N, it will rub againſt the edge of the wheel U, and thereby hinder the too quick deſcent of the weight; and will quite ſtop the weight if pulled hard. And if the man, who pulls the lever, ſhould happen inadvertently to let it go; the elaſtic bar will ſuddenly pull it up, and the catch will fall down and ſtop the machine.

WW are two upright rollers, above the axis or upper gudgeon of the gib E: their uſe is to let the rope C bend upon them, as the gib is turned to either ſide, in order to bring the weight over the place where it is intended to be let down: which ought to be ſo placed, that if the rope C be ſtretched cloſe by their outmoſt ſides, the half thickneſs of the rope may be perpendicularly over the center of the upper gudgeon of the gib; for then the length of the rope between the pulley in the gib and the axle of the great wheel, will be always the ſame, in all poſitions of the gib, and the gib will remain in any poſition to which it is turned.

The powers of this machine may be eaſily calculated: the horizontal wheel has ninety-ſix cogs, the largeſt trundle twenty-four ſtaves, the next largeſt has twelve, and the ſmalleſt has ſix. So that the largeſt trundle makes four revolutions for one revolution of the wheel; the next makes eight; and the ſmalleſt makes ſixteen. When a winch is occaſionally put upon the axis of either of theſe trundles for turning it, the handle of the winch deſcribes a circle in every revolution equal to twice the circumference of the axle of the wheel; and therefore the length of the winch doubles the power gained by each trundle. So that if the winch be applied to the axle of the largeſt trundle, and turned four times round, the wheel and axle will be turned once round, and the power will move through eight times as much ſpace as the weight riſes through: in which caſe, the power will be to the weight as eight to one; i. e. a man may raiſe eight times as much weight by the *crane*, as he might by his natural ſtrength without it. If the ſecond trundle be uſed, the proportion of the power to the weight will be as ſixteen to one; and with the ſmalleſt trundle, as thirty-two to one. The power may again be doubled, by drawing up the weight by one of the parts of a double rope, going under a pulley in the moveable block which is hooked to the weight below the arm of the gib; for then the power will be as ſixty-four to one: and by increaſing the number of pullies, the power will be proportionably increaſed. See Supplement to Ferguſon's Lectures, p. 3, &c. or Phil. Tranſ. vol. liv. art. 3. p. 24.

Crane is the name of a ſouthern conſtellation. See Grus.

Crane is alſo a popular name for a siphon.

Crane's *bill*, a kind of forceps uſed by ſurgeons, and ſo named from its figure.

Crane's *bill*, in *Botany*, *&c.* See Geranium.

Crane-*fly*, a name given by ſome to the creature we commonly call *father long-legs*; and the authors of hiſtories of inſects, *tipula terreſtris*. This creature affords the microſcopic obſerver many curious particulars; but the moſt remarkable is, the ſurpriſing contraction of the muſcular fibres in the legs. Theſe being diſſected in a drop of water, and placed before the microſcope, the fleſhy fibres contract and diſtend themſelves in a manner not to be imagined, and continue this motion for ſeveral minutes; and this is conſtantly to be obſerved in this inſect, and never in any other, ſo far as has been yet obſerved. Lewenhoek, Arcan. Nat. tom. iii. p. 109.

The inteſtines of this creature are alſo very wonderful, conſiſting of numberleſs veſſels and organs, which may be ſeen as plainly by the microſcope, as the bowels of larger animals can by the naked eye. The tails both of the male and female are alſo of an amazing ſtructure; the female's ends in a ſharp point, with which ſhe perforates the ground, and depoſits her eggs under the graſs in meadows.

Crane-*lines*, in a ſhip, are lines going from the upper end of the ſprit-ſail-top-maſt, to the middle of the fore-ſtays; ſerving to keep the ſprit-ſail-top-maſt upright and ſteady. See *Tab. Ship. fig.* 1. 137.

Crane-*neck of a carriage*. See Perch.

CRANIOLARIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Martynia, Houſt. Gen. Its characters are theſe: the flower hath a permanent empalement, compoſed of four ſhort narrow leaves and a ſwollen hood, which is cut longitudinally on the ſide. The flower hath one petal, which is unequal, having a very long tube, whoſe brim is divided into two lips. It hath four ſtamina, two of which are the length of the tube, and two are ſhorter. At the bottom of the tube is ſituated an oval germen, which afterward becomes an oval leathery fruit, pointed at both ends, opening with two valves, encloſing a depreſſed woody nut, pointed at both ends and recurved, having two or three furrows, ſo as to reſemble a ſkull opening in two parts. There are two ſpecies, natives of Spaniſh America.

CRANIUM, in *Anatomy*, an aſſemblage of ſeveral bones, which cover and encloſe the brain and *cerebellum*; popularly called the skull. See *Tab. Anatomy (Oſteol.) fig.* 1 and 2.

The word comes from the Greek κρανιον, of κρανος, *galea*, *helmet*; becauſe it ſerves to defend the brain, like a head-piece. Pezron again, derives κρανιον from the Celtic *cren*, becauſe of its roundneſs.

Cranium, in *Natural Hiſtory*, the name of a ſpecies of the *echinus marinus*, of the genus of the brissoides.

CRANK, a contrivance in machines, in manner of an elbow, only of a ſquare form; projecting out from an axis, or ſpindle; and ſerving, by its rotation, to raiſe and fall the piſtons of engines for raiſing water, or the like.

Crank, in *Sea-Language*. A ſhip is ſaid to be *crank-ſided*, when, for want of a ſufficient quantity of ballaſt or cargo, ſhe cannot bear her ſails, or can bear but ſmall ſail for fear of overſetting.

She is ſaid to be *crank by the ground*, when her floor is ſo narrow, that ſhe cannot be brought on ground without danger.

Crank is alſo an iron brace which ſupports the lanthorns on the poop-quarters, &c.

CRANNY, in the *Glaſs Trade*, a round iron, whereon the workmen in the glaſs-houſes roll the glaſs, to make the neck of it ſmall.

CRAPE, a light tranſparent ſtuff, in manner of gauze; made of raw ſilk, gummed and twiſted on the mill; woven without croſſing, and much uſed in mourning.

Crapes are either *craped*, i. e. *criſped*; or *ſmooth*: the firſt *double*, expreſſing a cloſer mourning; the latter *ſingle*, uſed for that leſs deep. Note, White is reſerved for young people, or thoſe devoted to virginity.

The ſilk deſtined for the firſt is more twiſted than that for the ſecond; it being the greater or leſs degree of twiſting, eſpecially of the warp, which produces the criſping given it when taken out of the loom, ſteeped in clear water, and rubbed with a piece of wax for the purpoſe.

Crapes are all dyed raw. The invention of this ſtuff came originally from Bologna: but the chief manufacture hereof is ſaid to be at Lyons.

Hiſtory tells us, that St. Bathilda, queen of France, made fine *crape*, *crepa*, of gold and ſilver, to lay over the body of St. Eloy. The Bollandiſts own they cannot find what this *crepa* was. Binet ſays, it was a frame to cover the body of the ſaint; but others, with reaſon, take it to be a tranſparent ſtuff, through which the body might be ſeen; and that this was the *crepa* whence our word *crape* was formed.

CRAPULA, a SURFEIT by over-eating and drinking.

CRASIS *of the blood*, denotes a due temperament or conſtitution of that humour; wherein the ſeveral principles, viz. ſalt and oil, whereof it is compoſed, are found in their juſt proportion and purity: in contradiſtinction to *dyſcraſy*, which conſiſts in an improper mixture of the principles, or an unnatural ſtate of ſome of the ingredients thereof.

The word is Greek, κρασις, from κεραννυμι, *I mix*; ſignifying *mixture*, *temperament*.

The chief dyſcraſies the blood is ſuſceptible of, whence flow moſt of the diſeaſes of the body, are coagulation, diſſolution, oilineſs, fizineſs, and ſaltneſs.

CRASIS, in *Grammar*, is a figure, whereby two different letters are either contracted into one long letter, or a diphthong. Such, e. g. is οφις for οφιας; αληθη for αληθεα, &c. τυχης for τυχεος, &c. where ι and α are contracted into ι; ε and α into η; and ε and ο into ȣ.

CRASPEDARIA, from κρασπεδον, *fringe*; in *Zoology*, a genus of animalcules, without any viſible limbs or tails; but with an apparent mouth, and a ſeries of fimbriæ round it in the manner of a fringe.

Of this genus there are three ſpecies: 1. The *craſpedarium* with a roundiſh body. 2. The *craſpedarium* with an oval body. 3. The *craſpedarium* with a cylindric body.

CRASSAMENTUM, a term uſed by ſome *Anatomiſts*, for the CRUOR of the blood; or that part which, upon ſtanding to cool, and ſeparate, forms the coagulum: in oppoſition to the *ſerum*, or whey, wherein it ſwims.

Some authors have ſuppoſed the *craſſamentum* to be ſpecifically lighter than the *ſerum*; but Dr. Jurin ſhews the contrary from repeated experiments.

Some have ſuppoſed that the immediate cauſe of animal heat is the action of the *craſſamentum* in attracting and retaining the fire which is diſperſed through the earth. On the due proportion of the *craſſamentum* or red globules depends the health and life of man. This conſiſts of two parts, one of which gives it ſolidity, and is called the fibrous part of the blood, but more properly the *coagulable* LYMPH, and of another which gives the red colour to the blood. See an account of Dr. Hewſon's curious experiments and obſervations, in Phil. Tranſ. vol. lx. art. 32, 33, 34.

CRASSIROSTRÆ, in *Zoology*, the name of a genus of ſmall birds, diſtinguiſhed by the thickneſs of their beaks; as the ſparrow, greenfinch, and the like.

CRASSULA, in *Botany*; Dillen. Hort. Elth. 14. *leſſer orpine*, *live for ever*, and *baſtard navel-wort*; a genus of the *pentandria pentagynia* claſs. Its characters are theſe: the flower conſiſts of five narrow petals, joined at their baſe, but reflexed and ſpread open at their brim: in the bottom of the tube are ſituated five nectaria, and five ſtamina ſituated round theſe. At the bottom of the tube are ſituated five oblong pointed germina, which, after the flower is paſt become five capſules, opening lengthways, and filled with ſmall ſeeds. There are eleven ſpecies.

CRATÆGUS, in *Botany*. See SERVICE-*tree*.

CRATCHES, in *Farriery*, a ſwelling on the paſtern under the fetlock, and ſometimes under the hoof.

CRATER, *Cup*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere; whoſe ſtars, in Ptolemy's Catalogue, are ſeven; in Tycho's, eight; in Hevelius's, ten; in the Britannic Catalogue, thirty-one. The order, names, longitudes, latitudes, &c. whereof are as follow.

Names and ſituations of the ſtars.	Bayer's Char.	Signs.	Longitud.			Latitude.			Magnitude.

CRATER, in *Falconry*, denotes a line on which hawks are faſtened when reclaimed.

CRATERITES, in *Natural Hiſtory*, the name of a gem mentioned by Pliny, and ſaid to be extremely hard, and of a middle colour between that of the chryſolite, and of the common yellow amber. This was plainly a ſpecies of CHRYSOLITE.

CRATEVA, in *Botany*, a genus of the *dodecandria monogynia* claſs; the *garlic pear*. Its characters are theſe: the flower hath four oval petals, which are narrow at the baſe, and broad at the top. It hath many briſtly ſtamina, which are longer than the petals; and a long incurved ſtyle, upon which ſits an oval germen, which afterward becomes a large fleſhy globular fruit with one cell, including many kidney-ſhaped ſeeds. There are two ſpecies, natives of both the Indies.

CRATICULA, a chemical inſtrument, made of ſquare pieces of iron of about a finger's thickneſs, placed ſo as to have half a finger's ſpace betwixt them. It is uſed in making of fires to keep up the coals.

The word is Latin, importing a roaſter, or gridiron.

CRATICULAR *Ectype* and *Prototype*. See ANAMORPHOSIS.

CRAVANT, in *Zoology*, a name by which Bellonius and ſome others have called the BARNACLE, a ſmall ſpecies of wild gooſe, common in winter on the coaſts of Lancaſhire.

CRAVEN, or CRAVENT, in *Britiſh Antiquity*, a term of reproach uſed in trials by battle.

The law was, that the victory ſhould be proclaimed, and the vanquiſhed acknowledge his fault, in the preſence of the people, or pronounce the word *cravent* in the name of recreantice, or cowardice, &c. and, preſently, judgment to be given; and the recreant *amittere legem terræ*, i. e. become infamous.

Coke obſerves, that if the appellant join battle, and cry *craven*, he is to loſe *liberam legem*. If the appelled cry *craven*, he is to be hanged.

CRAW, *Crop*, or *Ingluvies*, a part in granivorous fowls which ſerves for the immediate reception of the food; where it remains ſome time for maceration, before it be tranſmitted to the ſtomach.

This *ingluvies* is furniſhed with glands, which, the patrons of fermentation maintain, convey a menſtruum thither, that impregnates the aliment, and ſerves inſtead of maſtication.

CRAX, in *Zoology*, a name given by the ancients to the *ortygometra*, or DAKER-*hen*, a bird larger than the quail, and common in Ireland and ſome of the northern counties of England. Ray's Ornithology, p. 122.

CRAX, in the Linnæan ſyſtem of *Zoology*, the name of a diſtinct genus of birds, the diſtinguiſhing character of which from the reſt of the *gallinæ* is, that the feet have each four toes, and the head is ornamented with a kind of feathery crown, bending backwards. Linnæi Syſt. Nat. p. 47. Phil. Tranſ. vol. lvi. p. 204.

CRAY-*fiſh*, in *Zoology*, a ſpecies of the SQUILLA.

Cray-fiſh are found in rivers and freſh water; their fleſh is cooling, moiſtening, and adapted to nouriſh ſuch as labour under atrophies. There are various methods of preparing theſe animals; they may be either boiled or fried, and then taken out of their ſhells, and made up in variety of diſhes: but no parts of them are eatable except their claws and tails. Preparations and broths of *cray-fiſh* are celebrated not only for a palatable aliment, but alſo for anſwering ſome medicinal intentions, as being of a moiſtening quality, and ſheathing up and correcting acrimony. The broth is prepared of four or five *craw-fiſh*, which having their heads cut off, and their inteſtines extracted, are to be bruiſed and boiled in the broth of fleſh or poultry, until they become ſufficiently red; after which the liquor is to be ſtrained off and ſeaſoned, as the caſe may require. This broth may be rendered ſtill more medicinal by the addition of herbs, ſnails, or other ſubſtances; according to the intention of the phyſician. Their fleſh is counted beſt in the ſummer months.

The delicate flavour of theſe fiſh depends in a great meaſure on their food. When they have well-taſted food, their fleſh preſerves the reliſh of it: but when they feed on other things, they are often rendered of no value, by the flavour communicated to their fleſh by them. There are great quantities of theſe fiſh in the river Obra, on the borders of Sileſia; but the people find them ſcarce eatable, becauſe of a bitter aromatic flavour, very diſagreeable in food. It has been ſince obſerved, that the *calamus aromaticus* grows in vaſt abundance on the banks of that river, and that theſe creatures feed very greedily upon its roots. Theſe have a very remarkable bitterneſs mixed with their aromatic flavour, while freſh, which goes off very much in the drying; and on comparing the taſte of theſe roots with that of the *cray-fiſh*, there remains no doubt of the one being owing to the other. Act. Leipſ. 1690.

They abound in the river Don in Muſcovy, where they are laid in heaps to putrefy; after which the ſtones, called crab's eyes, are picked out.

Theſe animals are very greedy of fleſh, and flock in great numbers about carcaſes thrown into the water where they are, and never leave it while any remains. They alſo feed on dead frogs when they come into their way. James.

In Swiſſerland, there are ſome *cray-fiſh* which are red, while they are alive, and others bluiſh. Some kinds of them alſo will never become red, even by boiling, but continue blackiſh.

The *cray-fiſh* diſcharges itſelf of its ſtomach, and, as M. Geoffroy thinks, of its inteſtines too. Theſe, as they putrefy and diſſolve, ſerve for food to the animal; during the time of the reformation, the old ſtomach ſeems to be the firſt food the new one digeſts. It is only at this time, that the ſtones are found called CRAB'*s eyes*; they begin to be formed when the old ſtomach is deſtroyed, and are afterwards wrapped up in the new one, where they decreaſe by degrees till they entirely diſappear.

CRAYER, a kind of ſmall ſea-veſſel or ſhip. It is mentioned in the ſtat. 14 Car. II. c. 27. and in old records, *Et tranſitus* craerarum *& batellorum cum victualibus & aliis neceſſariis, &c.* Parl. 6 Ric. II. Par. 2. M. 13.

CRAYON, a general name for all coloured ſtones, earths, or other minerals and ſubſtances, uſed in deſigning, or painting in paſtel; whether they have been beaten and reduced to a paſte, or are uſed in their primitive conſiſtence, after ſawing or cutting them into long narrow ſlips.

In this laſt manner are red *crayons* made, of blood-ſtone, or red chalk; black ones, of charcoal and black lead. The beſt charcoal is that of willow, on account of its ſoftneſs. *Crayons* of all other colours are compoſitions of earths reduced to paſte.

CRAZE-*mill*, or CRAZING-*mill*, a mill in all reſpects like a griſt-mill to grind corn, and is ſo called by the tin-miners, who uſe it to grind their tin, which is yet too great, after trambling, and then it is trambled only.

CREAM is a name applicable to all ſubſtances, which ſeparate from a liquor, and collect on its ſurface: but it is particularly applied to the following.

CREAM *of lime*, is that matter which ſeparates from lime-water by cryſtallization, during the evaporation of the water; forming on the ſurface a ſemi-tranſparent pellicle, which gradually thickens, till at length it ſubſides in the form of ſcales. This is a calcareous earth, which, having once loſt its GAS or *fixed* AIR by calcination, is recombined with it after being diſſolved in water, and expoſed again to the air: and hereby becomes mild, cryſtallizable, unſoluble in water, and recovers its original ſtate before calcination. Macquer, Dict. Chem. Eng. ed. 1777.

CREAM *of milk*, is the moſt oily part of it, which being ſpecifically lighter than the other parts, collects and ſwims on the ſurface; being that of which BUTTER is made.

The word is derived from *cremor*, which ſignifies the ſame; though in the lower Latin we find *crema lactis*.

CREAM *of tartar*, *cremor tartari*, is that part of the concrete acid of tartar which cryſtalliſes firſt, and forms a pellicle on the ſurface of water in which tartar has been boiled. This has been a general name comprehending this ſaline pellicle and the *cryſtal of* TARTAR.

CREASE-TYLES. See TYLE.

CREAT, in the *Manege*, an uſher to a riding-maſter.

CREATION. See GENESIS.

CREATION, *epocha of the*. See EPOCHA.

CREDENTIALS, letters of credit and recommendation; eſpecially ſuch as are given to ambaſſadors, plenipotentiaries, &c. ſent to foreign courts.

CREDIBILITY, a quality in objects whereby they become fit to be believed. See FAITH.

A thing is ſaid to be *credible*, which is not apparent of itſelf, nor is certainly to be inferred either from the cauſe or effect; and yet has the atteſtation of a truth. Things which appear immediately true, as the whiteneſs of ſnow, or that the whole is equal to its parts; are not ſaid to be *credible*, but evident. Thoſe to which we only give our aſſent in virtue of ſome competent authority, or teſtimony of others, are, by the ſchoolmen, ſaid to be *credible*. In the Philoſophical Tranſactions, we have a mathematical computation of the *credibility* of human teſtimony. See EVIDENCE.

CREDIT, in *Commerce*, a mutual truſt or loan of merchandize or money, on the reputation of the probity and ſolvability of a dealer.

Credit is either *public* or *private*.

Every trader ought to have ſome eſtate, ſtock, or portion, of his own, ſufficient to carry on the traffic he is engaged in: they ſhould alſo keep their dealings within the extent of their capital, ſo that no diſappointment in their returns may incapacitate them from ſupporting their *credit*. Yet traders of worth and judgment may ſometimes lie under the neceſſity of borrowing money for carrying on their buſineſs to the beſt advantage; but then the borrower ought to be ſo juſt to his own reputation and to his creditors, as to be well aſſured that he has ſufficient effects within his power, to pay off his obligations in due time. But if a trader ſhould borrow money to the extent of his *credit*, and launch out into trade, ſo as to employ it with the ſame freedom as if it was his own proper ſtock; ſuch a way of management is very precarious, and may be attended with dangerous conſequences. Merchants ought never to purchaſe their goods for exportation upon long *credit*, with intent to diſcharge the debt by the return of the ſame goods; for this has an injurious influence on trade ſeveral ways: and if any merchant has occaſion to make uſe of his *credit*, it ſhould always be for the borrowing of money, but never for the buying of goods; nor is the large *credit* given to wholeſale traders, a prudential or juſtifiable practice in trade.

The public *credit* of a nation is ſaid to run high, when the commodities of that nation find a ready vent, are ſold at a good price, and when dealers may be ſafely truſted with them: alſo when lands and houſes find ready purchaſers; when money is to be borrowed at a low intereſt; when people think it ſafe and advantageous to venture large ſtocks in trade; and when notes, mortgages, &c. will paſs for money. Poſt. Dict. Com.

CREDIT, *letters of*, are thoſe given to perſons in whom a merchant, &c. can truſt, to take money of his correſpondent abroad, in caſe he happens to need it.

CREDIT is alſo uſed for the currency which papers, or bills, have in the public, or among dealers.

In this ſenſe, *credit* is ſaid to *riſe*, when in negotiating the ſhares of a company, they are received and ſold at prices above *par*, or the ſtandard of their firſt creation.

Diſcredit is oppoſed to *credit*, and is uſed where money, bills, &c. fall below *par*.

CREDIT was alſo anciently a right which lords had over their vaſſals; conſiſting in this, that during a certain time they might oblige them to lend them money.

In this ſenſe, the duke of Britanny had *credit* during fifteen days on his own ſubjects, and thoſe of the biſhop of Nantes; and the biſhop had the ſame *credit* or right among his ſubjects, and thoſe of that prince.

CREDITOR, a perſon to whom any ſum of money is due, either by obligation, promiſe, or otherwiſe.

The laws of the Twelve Tables, which were the foundation of the Roman juriſprudence, allowed the *creditor* to tear or cut his debtor to pieces, in caſe he proved inſolvent.

Creditor, in *Book-keeping*. See BOOK-KEEPING.

CREDULITY denotes a weakneſs of mind, by reaſon of which a perſon yields his aſſent to propoſitions or facts, before he has conſidered their EVIDENCE.

CREED, **Credo**, a ſhort, or ſummary account of the chief articles of the Chriſtian faith; thus called from the firſt word thereof in Latin, *credo, I believe*. See SYMBOL.

The principal of theſe are the *Apoſtles'*, the *Athanaſian*, and the *Nicene*.

Creed, *Apoſtles'*, is ſo called, becauſe for many ages it was believed to have been framed by the apoſtles before they left Jeruſalem. The firſt perſon who gave this account of its original was St. Ambroſe, towards the latter end of the fourth century; in which he is followed by Ruffinus, Jerom, and ſeveral others: and ſome have even aſſerted, that each apoſtle ſupplied his particular article. See SYMBOL. But there are many reaſons why this account cannot be admitted: if a *creed* of ſuch high authority had exiſted in the Chriſtian church, it is reaſonable to ſuppoſe that it would have been mentioned by St. Luke in the hiſtory of the Acts of the Apoſtles, or by ſome of the earlier writers in the four firſt centuries, before the time of St. Ambroſe; that it would have been referred to as a ſtandard of doctrine by the more ancient councils; and that it would have ſuperſeded the neceſſity of compoſing new *creeds*, which was done on many occaſions. Beſides, the ſeveral copies of this *creed*, of which the principal are the vulgar or Roman, the Aquileian, and the Oriental, differ from one another in many articles; and this difference cannot eaſily be reconciled with the notion, that it was framed by the apoſtles, and tranſmitted from them to their ſucceſſors. To which we may add, that ſome of the articles contained in it were inſerted in oppoſition to errors that ſprung up in the Chriſtian church, long after the time of the apoſtles. However, this *creed* is a very ancient compoſition, and upon the whole an unexceptionable ſummary of the Chriſtian doctrine, and much ſuperior to compoſitions of a ſimilar kind of later date. It might in part have been tranſmitted down from the apoſtles, and afterwards gradually enlarged in its preſent form as occaſion required. Lord King's Crit. Hiſt. of the Apoſtles' Creed. See SYMBOL.

Creed, *Athanaſian*, has been falſely attributed to Athanaſius biſhop of Alexandria, who lived and wrote in the fourth century: it is neither mentioned nor referred to in any of his genuine works; no notice is taken of it by writers who immediately ſucceeded him; it was never appealed to for the deciſion of the controverſy relating to the proceſſion of the Spirit between the Eaſtern and Weſtern churches, in the ſeventh and ninth centuries; nor is it quoted, ſay ſome, till one thouſand years after Chriſt. Fabricius is of opinion, that it was firſt writ in Latin long after the fifth century, and afterwards tranſlated into Greek. It is appointed to be read in the ſervice of the church of England thirteen times in the year. Voſſii Diſſ. de Symbolis. Fabr. Bib. Græc. vol. v.

Creed, *Nicene*, was compoſed and eſtabliſhed as a proper ſummary of the Chriſtian faith by the council at Nice, A. D. 325, againſt the Arians. This is alſo called the Conſtantinopolitan *creed*, becauſe it was confirmed with ſome few alterations by the council of Conſtantinople, A. D. 381.

Theſe three *creeds* are uſed in the public offices of the church of England; and ſubſcription to them is required of the clergy, and of diſſenting teachers properly qualified by the TOLERATION act, as the eighth ARTICLE declares that they may be proved by the ſureſt teſtimonies of Scripture.

CREEK, a part of a haven, where any thing is landed from the ſea.

So many landing-places as there are in a HARBOUR or port, ſo many *creeks* there are.

It is alſo ſaid to be a ſhore or bank whereon the water beats, running in a ſmall channel from any part of the ſea; from the Latin *crepido*. This word is uſed in the ſtat. 4 Hen. IV. c. 20. and 5 Eliz. c. 5.

CREENGLES, *Cringles*, probably derived from *krinckelen* (Belg.), *to run into twiſts*; in *Naval Architecture*, are ſmall ropes ſpliced into the bolt-ropes of the ſails of the main-maſt and fore-maſt, into which the bowling bridles are made faſt; and are alſo to hold by when a bonnet is ſhaken off. Harris, in his Lexicon Technicum, has the ſame deſcription under *Crenyles*; and the Gentleman's Dictionary under *Crencles*.

CREEPER, the Engliſh name of a ſpecies of ISPIDA, which, though very unlike the common KING's *fiſher* both in colour and figure, yet is comprehended under that genus on account of the ſtructure of its feet.

This ſmall bird, which is hardly larger than a WREN, has likewiſe been called the *certhia* and *certhius*, by authors, and in Engliſh the *ox-eye*.

It climbs trees exactly like the woodpecker, in which it is greatly aſſiſted by the rigidity of its tail. It builds in holes of trees, and lays a great number of eggs, ſometimes eighteen or twenty. Ray's Ornith. p. 100.

Creeper, in *Sea Language*, a ſort of grapnel, having a ſhank and four hooks or claws, but without flooks; uſed for recovering things that may be caſt overboard.

CREMASTERS, in *Anatomy*, an epithet given to two muſcles, otherwiſe called *ſuſpenſores*; ſerving to raiſe, or draw up the teſticles. See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 32.

The word comes from the Greek *κρεμαω*, *ſuſpendo, I ſuſpend*.

CREMATION is ſometimes uſed for burning, particularly when applied to the ancient cuſtom of burning the dead. This cuſtom is well known to have prevailed among moſt eaſtern nations, and continued with their deſcendants after they had peopled the different parts of Europe. Hence we find it prevailing in Greece, Italy, Gaul, Britain, Germany, Sweden, Norway, and Denmark, till Chriſtianity aboliſhed it. Phil. Tranſ. Nº 458. ſect. 3.

CRENATED *leaves*. See LEAF.

CRENELLE', *embattled*, in *Heraldry*, is when any honourable ordinary is dented, after the manner of battlements of a wall. See *Tab.* II. *Heraldry*, *fig.* 59.

The French word comes from *crena, a notch*, or *interval*; the Engliſh from its being a place of fighting, or battle. Upton, in Latin, calls this *imbatallatum*, a word forged from the Engliſh; but moſt others term it *pinnatum*, from *pinna, a battlement*.

The origin hereof is, doubtleſs, from the figures of ſuch walls being given to warriors, either for having been the firſt at mounting, or the chief in defending them.

CRENOPHYLAX. The *crenophylaces* at Athens were magiſtrates who had the inſpection and management of fountains under their care.

CREODIBA, in the *Cuſtoms of the Middle Age*, a robbery and murder committed in a wood, where the body of the perſon killed was burnt, in order to prevent any diſcovery of the crime. The word, ſays Wendelinus, is compounded of *cruy* and *diven*, that is, *wood-robbers*.

CREOLES, a name given to the families deſcended from the Spaniards who firſt ſettled at Mexico in America. Theſe are much more numerous than the Spaniards properly ſo called, and the Mulattoes, which two other ſpecies of inhabitants they diſtinguiſh; and are excluded from all conſiderable employments.

CREPANU, in the *Manege*, a chop in a horſe's leg, made by the ſpunges of the ſhoes of one of the hinder feet, croſſing and ſtriking againſt the other.

CREPIDÆ, among the Romans, a kind of ſlippers or ſhoes, which were always worn with the *pallium*, as the *calcei* were with the *toga*.

CREPIS, in *Botany*, baſtard hawkweed. See HAWKWEED.

CREPITATION, that noiſe, which ſome ſalts make over the fire in CALCINATION; called alſo *detonation*.

Crepitation is alſo uſed in *Surgery*, for the noiſe made by the ends or pieces of bones, when the ſurgeon moves a limb to aſſure himſelf by his ear of the exiſtence of a fracture.

This is one of the evident indications of a fracture of bones; and to judge by it with the greater eaſe to the patient, it is neceſſary that the upper part of the limb be held faſt, while the lower part is gently moved. The jar of the bones will likewiſe be ſometimes felt by the hand, when nothing is heard.

CREPITUS *lupi*, in *Natural Hiſtory*, a kind of fungus, popularly called *puff-ball*.

Mr. Derham obſerves, that upon examining the powder thereof with a microſcope, he found the ſeeds to be ſo many exceeding ſmall puff-balls, with round heads, and long, ſharp-pointed ſtalks; as if made on purpoſe to prick into the ground.

The ſeeds become hurtful to the eyes, probably by their ſharp ſtalks pricking and wounding them.

CREPUNDIA, in *Antiquity*, tokens left with expoſed children, by which they might be afterwards known. Theſe were of conſiderable value, if the child happened to be nobly born, in order to defray part of the expence of its education.

Crepundia was alſo uſed in a leſs proper ſenſe, for the ſwaddling cloths in which children were expoſed; becauſe by them they might be known again. See **Exposing** *of children.*

CREPUSCULUM, in *Aſtronomy*, *twilight*; the time from the firſt dawn or appearance of the morning, to the riſing of the ſun; and again, between the ſetting of the ſun, and the laſt remains of day.

Papias derives the word from *creperus*; which, he ſays, anciently ſignified *uncertain*, *doubtful*, q. d. *a dubious light*.

The *crepuſculum* is uſually computed to begin and end when the ſun is about eighteen degrees below the horizon; for then ſtars of the ſixth magnitude diſappear in the morning, and appear in the evening. It is of longer duration in the ſolſtices than in the equinoxes, and longer in an oblique than in a right ſphere.

The *crepuſcula* are occaſioned by the ſun's rays refracted in our atmoſphere, and reflected from the particles thereof to the eye. For ſuppoſe an obſerver in O (*Tab. Aſtronomy*, *fig.* 41.), the ſenſible horizon AB, and the ſun under the horizon in HK; and let the ray SE fall in the atmoſphere below the horizon. Since it paſſes out of a rarer into a thicker medium, it will be refracted, and that towards the perpendicular, i. e. towards the ſemidiameter CE. It will not, therefore, proceed to T, but touching the earth in D, it will fall upon A, the eaſtern part of the ſenſible horizon: nor can any other ray beſides AD, of all thoſe refracted in E, arrive at A. But now, ſince the particles of the atmoſphere reflect the ſun's rays (ſee **Reflection**); and ſince the angle DAC is equal to CAO; the rays reflected in A will be carried to O, the place of the ſpectator; who will therefore ſee the particle A ſhining in the ſenſible horizon, and conſequently the beginning of the morning *crepuſculum*.

And in the ſame manner might be ſhewn the refraction and reflection of the ſun's rays in the atmoſphere, in the evening *crepuſculum*.

Kepler, indeed, aſſigns another cauſe of the *crepuſculum*; viz. the luminous matter around the ſun; which, ariſing near the horizon, in a circular figure, exhibits the *crepuſculum*; in no wiſe, as he would ſhew, owing to the refraction of the atmoſphere.

The ſun's luminous atmoſphere, though neither the ſole nor principal cauſe of twilight, may lengthen its duration, by illuminating our air, when the ſun is too low to reach it with his own light. Greg. Aſt. book ii. prop. 8.

The depth of the ſun below the horizon, at the beginning of the morning crepuſculum, *or end of the evening one*, is determined in the ſame manner as the arch of viſion; viz. by obſerving the moment wherein the air firſt begins to ſhine in the morning *crepuſculum*, and that wherein it ceaſes in the evening; and finding the ſun's place for that moment.

Alhazen found it 19°; Tycho, 17°; Rothmannus, 24°; Stevenius, 18°; Caſſini, 15°; Ricciolus, in the equinox in the morning 16°, in the evening 20° 30′; in the ſummer ſolſtice in the morning 21° 25′, in the winter ſolſtice in the morning 17° 25′.

Nor need we wonder at this difference among aſtronomers; the cauſe of the *crepuſculum* being inconſtant: for, if the exhalations in the atmoſphere be either more copious, or higher, than ordinary; the morning *crepuſculum* will begin ſooner, and the evening hold longer than ordinary: for the more copious the exhalations are, the more rays will they reflect, conſequently the more will they ſhine; and the higher they are, the ſooner they will be illumined by the ſun. On this account, the evening twilight is longer than the morning, at the ſame time of the year in the ſame place. To this it may be added, that in a denſer air, the refraction is greater; and that not only the brightneſs of the atmoſphere is variable, but alſo its height from the earth: and therefore the twilight is longer in hot weather than in cold, in ſummer than in winter, and alſo in hot countries than in cold, other circumſtances being the ſame. But the principal differences are owing to the different ſituations of places upon the earth, or to the difference of the ſun's place in the heavens. Thus, the twilight is longeſt in a parallel ſphere, and ſhorteſt in a right ſphere, and longer to places in an oblique ſphere in proportion to their nearneſs to one of the poles: a circumſtance which affords relief to the inhabitants of the more northern countries, in their long winter nights. And the twilights are longeſt in all places which have north latitude, when the ſun is in the tropic of Cancer; and to thoſe in ſouth latitude, when he is in the tropic of Capricorn. The time of the ſhorteſt twilight is different in different latitudes; in England, it is about the beginning of October and of March, when the ſun is in the ſigns ♎ and ♓. For the method of determining it trigonometrically, ſee Greg. Aſtron. book ii. prob. 41.

Hence, when the difference between the ſun's declination and the depth of the equator is leſs than 18°, ſo that the ſun does not deſcend more than 18° below the horizon; the *crepuſculum* will continue the whole night.

The elevation of the pole PR (*fig.* 42.), *and the ſun's declination* OS, *being given; to find the beginning of the morning* crepuſculum, *or end of the evening*. Since in the triangle PSZ the ſeveral ſides are given; viz. PZ the complement of the elevation of the pole PR, and PS the complement of the declination OS, and SZ the aggregate of the quadrant ZD, and the ſun's depth DS; find the angle ZPS, whoſe meaſure is the arch AO. See **Triangle**.

Convert AO into ſolar time: thus have you the **time** elapſed from the beginning of the morning *crepuſculum*, to noon.

To find the crepuſculum *by the artificial globe*; ſee **Globe**.

Suppoſing the depreſſion of the ſun at which twilight begins or ends to be 18°, it is eaſy to determine the height of the **atmosphere**. Let AEFG (*Tab.* II. *Aſtronomy*, *fig.* 65.) be the earth, the pointed circle ſurrounding it the outward ſurface of the atmoſphere, the height of which DB is to be found: let A be the place of an obſerver, *ho* his ſenſible, HO his rational horizon; let IKLM be the ſun, ENG the ſhadow of the earth, IB a ray from the upper edge of the ſun, touching the earth in E, and falling upon the outward ſurface of the atmoſphere at B, whence it is reflected to the eye of the obſerver at A in the line of his ſenſible horizon BA: ſince the ſun is larger than the earth, he enlightens a little more than a hemiſphere, or that part repreſented by the arc EFG = 180° 32′, becauſe ECF + ECN = two right angles, and ECN is leſs than a right angle by the angle ENC = 16′; conſequently, the half of EFG or the angle ECS = 90° 16′; and therefore taking away OCS the ſun's depreſſion = 18°, there will remain ECO = 72° 16′; and as ACO = 90°, ACE will be = 17° 44′, and DCA, its half = 8° 52′. Then in the right-angled triangle BAC, the angles and one ſide AC are known, therefore the ſide BC may be found. AC being made radius, BC will be the ſecant of the angle BCA = 8° 52′: therefore 10000000 : 10120948 :: $3967\frac{1}{2}$ the miles in the earth's ſemidiameter : $4015\frac{1}{2}$ the diſtance from the center to the outward ſurface of the atmoſphere, from which ſubtract the ſemidiameter, and the remainder 48 miles will be the height of the atmoſphere. If allowance of 34′ is made for the horizontal refraction, the angle BCA will be 8° 18′, the ſecant of which is 10105851, whence the height of the atmoſphere will be 42 miles. Long's Aſt. vol. i. p. 260. See **Atmosphere**.

CRESCENT, the new moon, which, as it begins to recede from the ſun, ſhews a little rim of light, terminating in points, or horns, which are ſtill increaſing, till it become full, and round in the oppoſition.

The word is formed from *creſco*, *I grow*.

The term is alſo uſed for the ſame figure of the moon in its wane, or decreaſe, but improperly; becauſe the points or horns are then turned towards the weſt, whereas they look to the eaſt in the juſt *creſcent*.

Crescent, in *Heraldry*, is a bearing in form of a half-moon. The Ottomans bear ſinople, a *creſcent* montant, argent.

The *creſcent* is frequently uſed as a difference in coat-armour, to diſtinguiſh it for that of a ſecond brother, or junior family.

The figure of the *creſcent* is the Turkiſh ſymbol; or rather, is that of the city Byzantium, which bore this device from all antiquity; as appears from medals ſtruck in honour of Auguſtus, Trajan, &c.

The *creſcent* is ſometimes *montant*, i. e. its points look towards the top of the chief, which is its moſt ordinary repreſentation; whence ſome contend, that the *creſcent*, abſolutely ſo called, implies that ſituation; though other authors blazen it *montant*, when the horns are towards the dexter-ſide of the eſcutcheon, in which poſition others call it *incroiſſant*.

Creſcents are ſaid to be *adoſſed*, when their backs or thickeſt parts are turned towards each other; their points looking to the ſides of the ſhield.

Creſcent inverted, is that whoſe points look towards the bottom: *turned creſcents*, are placed like thoſe *adoſſed*; the difference is, that all their points look to the dexter-ſide of the ſhield: *conturned creſcent*:, on the contrary, look to the ſiniſter ſide: *affronted* or *appointed creſcents*, are contrary to the *adoſſed*, the points looking towards each other.

Crescent is alſo the name of a military order, inſtituted by Renatus of Anjou, king of Sicily, &c. in 1448; ſo called from the badge, or ſymbol thereof, a *creſcent* of gold enamelled.

What gave occaſion to this eſtabliſhment was, that Renatus took for his device a *creſcent*, with the word *loz*, *praiſe*; which, in the ſtyle of rebus, makes *loz in creſcent*, q. d. *by advancing in virtue, one merits praiſe.*

CRESCENTIA, in *Botany*. See CALABASH-*tree*.

CRESSA, in *Botany*, a genus of the *pentandria digynia* claſs, with a five-leaved calyx, a ſaucer-ſhaped corolla, and a two-valved capſule containing a ſingle ſeed.

CRESSES, in *Botany*, *naſturtium*. In the Linnæan ſyſtem this is joined to LEPIDIUM. The characters are theſe: the flower hath a four-leaved empalement, and four petals placed like a croſs, with ſix awl-ſhaped ſtamina, four of which are the ſame length of the empalement, two being ſhorter. In the center is ſituated a heart-ſhaped germen, which afterward turns to a heart-ſhaped ſhort capſule, with acute borders, having two cells, each containing one or two oval ſeeds. There are only three ſpecies cultivated in gardens.

The common *creſs* is a plant ſo well known as to need no deſcription. There is a variety of this, whoſe lower leaves are much curled on the edges, and was formerly cultivated in greater plenty than at preſent. Whether this is a diſtant ſpecies, or only a variety, is not yet determined; though it has been found to retain its difference for ſome years.

It is commonly cultivated in gardens as a ſallad-herb, and being one of the warm kinds, is chiefly eſteemed during the winter and ſpring. During the winter ſeaſon it muſt be ſown upon a gentle hot-bed, covered from rains and froſts. In the ſpring it may be ſown in warm borders, where if it be defended from cold winds it will thrive very well: but if it is intended to continue it in ſummer, it muſt be ſown every third day in ſhady borders; otherwiſe it will grow too faſt for uſe.

Creſſes are good for the ſcurvy, for which the Dutch commonly eat them in May, with bread and butter.

A cataplaſm of the leaves with hog's lard, cures ſcald heads; the ſeed likewiſe helps the ſcurvy and dropſy, ſwelling of the ſpleen, and opens obſtructions of the female ſex. Miller's Bot. Off.

The herb, but eſpecially the ſeed, are hot and acrimonious; whence they are attenuating, abſterſive, and aperitive.

CRESSES, *Indian*, *tropæolum*, in *Botany*, a genus of the *octandria monogynia* claſs. Its characters are theſe: the empalement of the flower is of one leaf, ending in five points; it is erect, ſpreading, and falls off. The two under ſegments are narrow, their tail ends in a nectareous horn, which is larger than the empalement. The flower has five roundiſh petals inſerted in the ſegments of the empalement; the two upper ſit cloſe to the footſtalk, but the lower have oblong hairy tails. It has eight ſhort awl-ſhaped ſtamina, which decline, and are unequal; terminated by oblong riſing ſummits, having four cells, and a roundiſh germen with three lobes which are ſtreaked, ſupporting a ſingle erect ſtyle, crowned by an acute trifid ſtigma. The germen afterward becomes a ſolid fruit in three parts, convex on the outſide, angular within, having many furrows; each part or cell including one furrowed ſeed, convex on one ſide, and angular on the other. There are two ſpecies, natives of South America.

Both kinds of this plant are eaſily propagated, by ſowing their ſeeds in March or April, in a good ſoil, and warm ſituation; and ſhould be planted near a hedge or wall, being great climbers, and their lying on the ground being ſubject to rot them. They flower in June, and continue flowering till October, when the froſts ſoon deſtroy the whole plant.

The double-flowered kind produces no ſeeds, and muſt therefore be propagated by planting cuttings of it. This may be done in any of the ſummer months; but the plants muſt be carefully preſerved in winter, being very ſubject to rot. If this be confined in pots, and thoſe filled with a poor ſoil, it will ramble leſs in the branches, and will produce more flowers. The flowers of this kind, though very beautiful, are not nearly ſo well taſted in ſallads as thoſe of the ſingle kind, which are very warm, and agreeable; and are eſteemed very wholeſome. The ſeed is pickled, and by ſome preferred to moſt kinds of pickles for ſauce.

CRESSES, *Meadow*. See CARDAMINE.

CRESSES, *Sciatica*, *iberis*, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the flower hath an empalement of four oval leaves, which ſpread open, are hollowed, and fall away. It hath four unequal, oval, obtuſe petals, which are ſpread open; and ſix awl-ſhaped erect ſtamina, terminated by roundiſh ſummits: the germen is in the center of the tube, round and compreſſed; and ſupporting a ſhort ſingle ſtyle, crowned by an obtuſe ſtigma, which afterwards becomes a roundiſh compreſſed veſſel, having two cells, each containing one oval ſeed. Miller enumerates eight ſpecies. See DITTANDER.

CRESSES, *Spaniſh*, *vella*, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the empalement of the flower is cylindrical, and compoſed of four linear obtuſe leaves, which drop off. The flower has four petals placed in form of a croſs, whoſe tails are the length of the empalement; and ſix ſtamina of the ſame length, two of which are a little ſhorter, terminated by ſingle ſummits, and an oval germen, ſupporting a conical ſtyle, crowned by a ſingle ſtigma. The germen afterward turns to a globular capſule with two cells, divided by an intermediate partition twice as large as the pod, oval, erect, ſtretching beyond the capſule, each cell containing one ſeed. There are two ſpecies. Miller.

CRESSES, *Swine's*. See COCHLEARIA.

CRESSES, *Wall*. See TURRITIS.

CRESSES, *Water*, *ſiſymbrium*, in *Botany*, a genus of the *tetradynamia ſiliquoſa* claſs. Its characters are theſe: the flower has a ſpreading empalement, compoſed of four linear, ſpear-ſhaped, coloured leaves, which fall off: it has four oblong ſpreading petals, placed in form of a croſs, and ſix ſtamina, four of which are longer than the empalement, the other two which are oppoſite are ſhorter, terminated by ſingle ſummits. It has an oblong ſlender germen, with ſcarcely any ſtyle, crowned by an obtuſe ſtigma. The germen afterward becomes a taper, oblong, incurved pod, having two cells opening with two valves, which are ſhorter than the intermediate partition, filled with ſmall ſeeds. There are nine ſpecies; the firſt of which is the common *water-creſſes*, which grows naturally in ditches and rills of water in moſt parts of England, in which places they are generally gathered for market. But it may be eaſily cultivated, by taking ſome of the plants early in the ſpring, from the places of their natural growth; preſerving the roots as entire as poſſible, and planting them into mud, and then letting the water in upon them by degrees. When they have taken root, they will ſoon flouriſh and ſpread over a large compaſs of water; but ſhould not be cut the firſt ſeaſon, but ſuffered to run to ſeed, which falling into the water, will furniſh a ſufficient ſupply of plants afterward.

But where the water is ſo deep that it will not be eaſy to plant them, the beſt method will be to get a quantity of the plants juſt as their ſeed is ripening, and throw them on the ſurface of the water where they are wanted to grow; here the ſeeds will ripen and fall to the bottom, where they will take root, and produce a ſupply of theſe plants.

Some of thoſe people who gather this herb for uſe, either through ignorance, or ſome worſe deſign, have frequently taken the creeping water-parſnip, and ſold it for *water-creſſes*; whereby many perſons have been injured by eating it: but they may eaſily be diſtinguiſhed by the ſhape of the leaves; thoſe of the *water-creſſes* being roundiſh, almoſt heart-ſhaped lobes, with a few indentures on their edges, and are of a dark green; but thoſe of the water-parſnip have oblong lobes ending in points, which are of a light green ſawed on their edges. Miller.

Water-creſſes are frequently eaten in ſpring as a ſallad. The whole plant is of a very acrid taſte, and is a powerful attenuant and reſolvent. It is recommended as a kind of ſpecific in the ſcurvy, and is eaten in great quantities by many with that intent. It is good againſt all obſtructions of the *viſcera*; and conſequently in jaundices, and other chronic diſeaſes. It is alſo a powerful diuretic, and promoter of the *menſes*. People have pretended to preſerve the virtues of this plant in waters, ſyrups, and conſerves; but the beſt way of taking it is either to eat it as a ſallad, or to drink its expreſſed juice ſingly, or mixed with that of the other antiſcorbutic plants, as brook-lime, &c. which is often done.

CREST, in *Armoury*, the uppermoſt part of the defenſive armour of the head; riſing over the reſt, in manner of the comb or tuſt of a cock; to ſuſtain the effort of very keen ſcimitars, &c. It has its name from *criſta*, *cock's comb*.—Hence, alſo,

CREST, in *Heraldry*, denotes the uppermoſt part of an armoury; or that part riſing over the CASK, or helmet.

Next to the mantle, ſays Guillim, the *creſt* or *cognizance* claims the higheſt place, being ſeated on the moſt eminent part of the helmet; yet ſo, as to admit an interpoſition of ſome eſcrol, wreath, chapeau, crown, &c.

The ancient warriors wore *creſts* to ſtrike terror in their enemies, as the ſight of the ſpoils of animals they had killed; or to give them the more formidable mien, by making them appear taller, &c.

In the ancient tournaments, the cavaliers had plumes of feathers, eſpecially thoſe of oſtriches and herons, for their *creſts*; theſe tufts they called *plumarts*; and were placed in tubes, on the tops of high caps, or bonnets. Some had their *creſts* of leather; others of parchment, paſteboard, &c. painted or varniſhed, to keep out the weather; others of ſteel, wood, &c. on which were ſometimes repreſented a member or ordinary of the coat; as, an eagle, fleur de lys, &c. but never any of thoſe called honourable ordinaries, as pale, feſſe, &c. The *creſts* were changeable at pleaſure; being reputed no other than as an arbitrary device, or ornament.

Herodotus attributes the riſe of *creſts* to the Carians, who firſt bore feathers on their caſks, and painted figures on their bucklers; whence the Perſians called them *cocks*.

The *creſt* is eſteemed a greater mark of nobility than the armoury, as being borne at tournaments; to which none were admitted, till they had given proof of their nobility. Sometimes it ſerves to diſtinguiſh the ſeveral branches of a family. It has alſo ſerved, on occaſion, as the diſtinguiſhing badge of factions. Sometimes the *creſt* is taken from the device; but more uſually it is formed of ſome piece of the arms: thus, the emperor's *creſt* is an eagle; that of Caſtile, a caſtle, &c. Families that exchange arms, as the houſes of Brunſwick and Cologne have done, do not change their *creſts*; the firſt ſtill retain the horſe, and the latter the mermaid.

The *creſt* of the arms of England, is a lion paſſant gardant, crowned with an imperial crown; that of France, a fleur-de-lys.

CREST, among *Carvers*, an imagery, or carved work, to adorn the head, or top, of any thing; like our modern corniche.

CRESTED, in *Heraldry*, is a term applied to a cock, or other bird, whoſe creſt is of a different tincture from other parts.

CRESTED *graſs*. See GRASS.

CRESTED *ſtalk*. See STALK.

CREST-FALLEN, is ſpoken of a horſe, when the upper part of the neck, on which the mane grows, does not ſtand upright, but hangs either to one ſide or the other

CRETA, in *Natural Hiſtory*, and in *Medicine* See CHALK.

CRETIO, in *Antiquity*, a certain number of days allowed the heir to conſider, whether he would act as heir to the deceaſed, or not; after which time, if he did not act, he was excluded from the eſtate.

CREUX, a term in *Sculpture*, much uſed by the French; though not yet, that we know of, naturalized among us: but the want of a word of equal import in Engliſh, as it has frequently put us under a neceſſity of uſing this in the courſe of the preſent work; ſo it pleads ſtrongly for its admiſſion into our language.

Creux originally ſignifies a *hollow*, *cavity*, or *pit*, out of which ſomething has been ſcooped, or dug: hence it is uſed to denote that kind of ſculpture, and graving, where the lines and figures are cut and formed within the face, or plane of the plate, or matter engraven on.

In which ſenſe, it ſtands oppoſed to *relievo*; where the lines and figures are imboſſed, and appear prominent above the face of the matter.

CREW, the company of ſailors belonging to a ſhip, boat, or other veſſel.

The ſailors that are to work and manage a ſhip are regulated by the number of laſts it may carry; each laſt making two tun.

The *crew* of a Dutch ſhip, from 40 to 50 laſts, is ſeven ſailors and a ſwabber; from 50 to 60 laſts, the *crew* conſiſts of eight men and a ſwabber; and thus increaſes at the rate of one man for every ten laſts; ſo that a ſhip of 100 laſts has twelve men, &c. Engliſh and French *crews* are uſually ſtronger than Dutch; but always in about the ſame proportion.

In a ſhip of war there are ſeveral particular *crews*, or gangs, as the boatſwain's *crew*, the carpenter's *crew*, the gunner's *crew*, &c.

CREX, in *Zoology*, the name of a bird, common about the Nile, and remarkable for the noiſe which it makes, which is no other than *crex*, *crex*, whence it has its name. Its beak is moderately long and black, as are alſo its head and its legs; its neck, back, and breaſt, are white, but the back a little greyiſh; the wings are black, variegated with white. It feeds on inſects, and generally makes a very loud noiſe all the time it is on the wing. Bellonius de Avibus.

CRIB, in the Engliſh *Salt-Works*, the name given to a ſort of caſe uſed in ſome places inſtead of the DRAB, to put the ſalt into as it is taken out of the boiling-pan.

Theſe *cribs* are like hay-racks, wide at the top, and tapering to a narrow bottom, with wooden ribs on each ſide, placed ſo cloſe, that the ſalt cannot eaſily fall through them. Through theſe apertures, however, the ſuperfluous ſaline liquor drains out, and leaves the ſalt, after a few days, dry enough to be added to the heaps that ſtand ready for ſale. At Limington, and in ſome other places, they uſe, inſtead of theſe *cribs*, a ſort of wooden troughs with holes in the bottom, through which the ſaline liquor drains from the ſalt, and falls into veſſels placed underneath to receive it; and in other places they uſe barrows or wicker baſkets, out of which the liquor runs with great eaſe on all ſides at once.

CRIBBAGE, a game at cards, wherein no cards are thrown out, and the ſet makes ſixty-one: it being an advantage to deal, by reaſon of the crib, it is proper to lift for it; and he who has the leaſt card, deals.

CRIBRATION, in *Pharmacy*, *ſifting*; the act of ſeparating the finer parts of a medicine, whether dry or humid, from the groſſer; the latter by means of a pulping-ſieve, the former by a fine ſearce.

With reſpect to *cribration*, Quincy, a very good judge of pharmacy, makes the following remark, in order to obviate the miſchiefs and inconveniencies which through inadvertency or haſte, frequently happen in the practical ſhops: which is, that whatſoever is to be powdered, the whole ingredient or ingredients, with all their parts to be uſed, ſhould paſs the ſieve, and be all mixed equally together, before any be uſed. For through neglect of this caution, ſeveral medicines which come under this kind of management, will, in their different parts, be of different efficacies, according as that part of moſt virtue, being more or leſs friable, may paſs through firſt, which will make that much too ſtrong, or remain behind to the ſame prejudice. In compoſitions likewiſe of ingredients of different textures or coheſions, ſome run through much ſooner than others; ſo that there is an abſolute neceſſity of mixing the whole carefully after all is paſſed.

CRIBROSUM *os*, or *Os* CRIBRIFORME, in *Anatomy*, a little bone at the top of the noſe, pierced like a ſieve, to let paſs ſeveral little fibres, ariſing from the mamillary productions, and terminating in the membrane that lines the cavity of the noſtrils; called alſo *os ethmoides*.

CRICELASIA, formed of κρικος, *ring*, and ελαυνω, *I drive*, among the Greeks, the exerciſe of rolling the circle or *trochus*. This was a ſpecies of exerciſe in uſe among the ancients; and is, though not very diſtinctly, deſcribed by Oribaſius, in his Medicinal Collections, lib. vi. cap. 26. from Antyllus. It ſhould ſeem to be little more than driving the hoop, as is now practiſed by boys. The hoop was ſo large as to reach as high as the breaſt of the perſon who uſed it; the inſtrument by which it was driven along was of iron, with a wooden handle; and ſmall rings, κρίκοι, were faſtened to the hoop, to jingle and divert the perſon who exerciſed himſelf with it; which Oribaſius conſiders as of importance. This exerciſe was recommended for rendering the limbs pliable, and ſtrengthening weak nerves.

CRICETUS, in *Zoology*, the name of an animal of the MOUSE kind. Its ſize is between that of a common rat and a rabbit. Its legs are very ſhort; its back is of the colour of a hare's; its ſides have more redneſs; and its belly is black; each ſide is variegated alſo with three large white ſpots. The hairs of this creature are ſo firmly rooted in the ſkin, that they can by no means be pulled out, but ſooner tear away the ſkin with them; and for this reaſon, as well as for the variety of colours, the ſkins are much valued. It is a very bold and deſperate creature; and if a man on horſeback moleſt it, will fly up at the noſe of the horſe, and hold him very faſt. It lives in holes in the earth, as the rabbit, and heaps up large quantities of vegetable fruits and corn for its ſtore, and is uſually found very fat. It is very apt to ſit on its buttocks, and in that poſture looks like a little bear, whence ſome have called it *arctomys Palæſtinorum*. It has two large teeth in the front of each jaw, and it uſes its fore-feet by way of hands, like the ſquirrel. Ray's Syſt. Quad. p. 201.

CRICKET, *Gryllus*, in *Natural Hiſtory*, the name of a genus of inſects of the *hemiptera* claſs, nearly allied to the locuſt kind. The two principal kinds are the houſe and field-*cricket*, and they are hoſtile to each other. The firſt of theſe is ſmaller, and is of a brown colour ſpotted with black. The latter is more than an inch long, and has a great head and very large eyes. The antennæ in this ſpecies have no articulations.

Crickets are thought to be ruminating animals, and certainly are furniſhed with ſeveral different ſtomachs. In medicine they are believed to be diuretic, and leſs dangerous than cantharides; for which intention they are dried and powdered, and given in doſes from twelve grains to a ſcruple. The houſe-*cricket* only flies from the light, as many other inſects do; it feeds almoſt on every thing; the males only chirp; and their monotony, however diſagreeable to ſome people, is pleaſant enough to their own females, for it is the voice of love; and it is continual, night and day, except in very cold weather. They become habituated to bear all kinds of noiſe, but the field-*cricket* is very timorous, and chirps only in the heat of the fineſt days of ſummer. Coll. Acad. tom. vii. P. E. 3. p. 209.

Cricket, *balm*. See Cicada.

Cricket, *mole*, *Gryllotapha*, a ſpecies of the *gryllus*, in *Natural Hiſtory*, a creature approaching to the locuſt kind, and very properly called by this name by Mouffett, as it has much the form of the *cricket*, and makes a noiſe like it in the evening, and is like the mole, continually employed in digging the ground. It is an inſect of a very unpleaſant form. It is of the length and thickneſs of a man's little finger, and is of a brown colour, which is darker in the male than in the female. There are on each ſide of the anus two hairy proceſſes, reſembling the tails of mice; its belly is compoſed of eight joints, and is covered with as many ſcales, which are of a pale fleſh-colour, and are covered with ſhort hair. The back is covered by a pair of pointed wings, along each of which there runs a black ſtreak or line. Theſe wings fold any way at the creature's pleaſure, and when fully expanded are very large. Over theſe lie the antennæ; theſe are variegated alſo with black, and reach about half the length of the wings. It has only four legs; the hinder pair are long and fit for hopping; the anterior pair are ſhort, and furniſhed with a ſort of hands for digging in the manner of the mole. The breaſt is covered with a cruſtaceous ſubſtance, which is blackiſh, and hairy on the outſide, and ſmooth and pale within. The eyes are very bright and black, and are very hard, and the mouth is wide, and has two tonſils, and teeth in both jaws. This creature lives under ground, and is principally found in damp and boggy places. They come out in the duſk of the evening, and make a very loud noiſe of the nature of that of the *cricket*.

The *mole-cricket* moves very ſlowly; and Goedartius is of opinion, that its wings were given it rather as an ornament, than as a thing of uſe; or if they have any real uſe, that it is the covering and defending the tender body of the creature, which is very ſoft, and eaſily liable to accidents; and Mouffett ſays, that its flights are no more than long leaps. But we have a very different account of the uſe this creature makes of its wings, in the German Ephemerides. Mentzelius, in a paper there, declares this to be one of the moſt miſchievous inſects of the creation. He ſays it is a kind of amphibious creature, and that it lives equally well under ground, in the air, or under water; that while it is under ground, it does infinite miſchief by burrowing under the beds of a garden, and eating the roots of flowers, and that in the night it comes out, and taking wing ſettles upon the fruit-trees, where it does little miſchief; and all this the author affirms from his own experience, in the gardens which he obſerved.

This creature is very nice in the conſtruction of its neſt. This is always under ground, and it chooſes a ſolid clay for the purpoſe. All its precautions ſeem to be neceſſary to ſecure its eggs from becoming a prey to a kind of black fly, which conceals itſelf under ground. The noiſe of the *cricket* is variouſly accounted for by naturaliſts; but is moſt probably effected by the play of organs in their belly, of a ſingular conſtruction. This is certain, that if the head of the animal be taken off, or if it be ſevered in the middle, it continues to live, and even to chirp for ſome conſiderable time.

It is remarkable of this creature, that it can move backward as faſt as forward, and often does ſo when frighted.

Cricket is alſo the name of an exerciſe, or game, with bats and a ball.

CRICOARYTÆNOIDÆUS, in *Anatomy*, a name given to two pair of muſcles, ſerving to open the larynx.

The *cricoarytænoidæi* are either *poſterior* or *lateral*: the former are the firſt pair of openers of the larynx; the latter, the ſecond pair.

The *lateral* have their origin in the edge of the lateral and ſuperior part of the cartilage cricoides, and are inſerted into the lateral and ſuperior part of the arytænoides.

The *poſterior* have their origin in the poſterior and lower part of the cricoides: and hence the reaſon and etymology of the name is evident.

CRICOIDES, in *Anatomy*, a cartilage of the larynx; ſo called, as being round, like a ring, and encompaſſing the whole larynx.

The word is formed from κρικος, uſed by tranſpoſition for κιρκος, *circle*, and ειδος, *form*.

The *cricoides* is the ſecond cartilage of the larynx; it is narrow before, thick behind; and ſerves as a baſe to all the other cartilages; being, as it were, let into the thyroides.

It is by means of this, that the other cartilages are joined to the trachea; on which account it is immoveable.

CRICO-PHARINGEI, muſcles which ariſe from the lower part of the ſide of the cricoid cartilage.

CRICOTHYROIDÆUS, in *Anatomy*, a name given to the firſt pair of muſcles proper to the larynx.

Their name is derived hence, that they have their origin in the lateral and interior part of the *cricoides*; and are inſerted into the inferior part of the thyroides.—Their uſe is to dilate the ſcutiform cartilage.

CRIER, *common*, an officer in the city of London, to whom, and to the ſerjeant at arms, it belongs to ſummon all executors and adminiſtrators of freemen to appear, and to bring in inventories of the perſonal eſtates of freemen, within two months after their deceaſe; who is alſo to have notice of the appraiſements. He is alſo to attend the lord-mayor on ſet days, and at the courts held weekly by the mayor and aldermen.

CRIME, a breach or tranſgreſſion of a law, or an action contrary to the purport of a law, either natural or divine, civil, or eccleſiaſtic: to which a penalty is annexed.

The term *crime* includes in it the idea of a determination and deſign formed to do an injury. It is derived from the Latin *crimen*, of κρινω, *judico*, *I judge*.

The Romans diſtinguiſhed two kinds of *crimes*; viz. *private*, which only affected particular perſons; the proſecution whereof was not allowed by the laws to any but thoſe intereſted therein; as *adultery*, &c. and *public crimes*; the proſecution whereof was permitted to all perſons, though in no-wiſe immediately intereſted.

With us, *crimes* are diſtinguiſhed into *capital*; as *treaſon*, *murder*, *robberies*, &c. and *common*, as *perjuries*, &c.

They are again divided into crimes cognizable by the king's judges; as thoſe above mentioned: and ſuch as are only cognizable in the ſpiritual courts, as ſimple *fornication*, &c.

There is an excellent book on the ſubject of *crimes* and punishments, publiſhed by the marquis de Beccaria.

Crime, *quaſi*. See Quasi *crime*.

Crimen *falſi*. See Falsi.

CRIMINAL *law*, is that which diſcuſſes the nature of crimes, and inflicts ſuitable penalties; or, as it is more uſually denominated in England, the doctrine of the pleas *of the crown*.

CRIMNOIDES, or **Crimoides**, formed of κριμνον, *bran*, in *Medical Writers*, is uſed for urine with thick ſediments at the bottom, like bran.

CRIMSON, one of the ſeven red colours of the dyers.

The word comes from the Arabic *kermiſi*, of *kermes*, *red*.

The Bollandiſts inſinuate, that *crimſon* comes from *Cremona*, and is uſed for *Cremonois*.

The ſtuffs to be dyed in *crimſon*, after they have been cleared of their ſoap, and ſtrongly alumed, are put in a decoction of cochineal, each according to its colour.

In a leſs durable *crimſon* by brazil-*wood*, and for the colour called by dyers *demi-crimſon*, the root of madder is mixed with cochineal.

To dye a lively *crimſon*; firſt wet the goods well, and for every pound of ſtuff, to make the ſuds, uſe two ounces and a half of tempered aqua fortis, three ounces and a half of tartar, an ounce and a half of cochineal, and eight ounces of alum. Boil the goods with all theſe for half an hour, let them cool, and rince them out. To finiſh the dye, boil four ounces of cochineal, three ounces of ſtarch, three ounces of white wine tartar, and half an ounce of white arſenic together, for a quarter of an hour; then put in the goods, and let them boil for above half an hour, or until they have taken the dye well and equally. See Dying.

Crimson *graſs vetch*, in *Botany*. See *Chichling* Vetch.

CRINONES, from *crinis*, *hair*, in *Medicine*, a ſort of worms, ſometimes found under the ſkin, in children; reſembling ſhort thick hairs, or briſtles.

They are called *dracunculi*, and *comedones*, from the Latin *comedere*, *to eat*; from their preying upon the ſubſtance of the child, or conſuming its nouriſhment. See Dracunculi.

The common way of getting out theſe worms is by the point of a needle; and to prevent their forming there again, the uſual cuſtom is to waſh the parts with wine or vinegar, with alum, nitre, or common ſalt, or with a ſtrong lixivium of oak aſhes, and afterwards anointing them with an ointment of the common kind, uſed for ſcorbutic eruptions, with a ſmall mixture of quickſilver.

CRINONIA, a kind of cap, worn by the emperors of Conſtantinople on ſolemn occaſions.

CRINUM, in *Botany*. See *Aſphodel* Lilly.

CRISIS, from κρινω, *I judge*, in *Medicine*, a change, or turn, in acute diſeaſes; wherein the morbific matter is ſo altered, as to determine the patient either for recovery or death; the doctrine of which formed a principal part of ancient medicine.

The cauſe of ſuch change is owing to the remaining vital forces being irritated by the matter of the diſeaſe ſo or ſo conditioned; i. e. fit either to be evacuated, or tranſlated, or to kill.

If the matter be diſpoſed for evacuation or tranſlation, but is not ſalubrious, it produces a change called a *critical perturbation*, or *imperfect criſis*.

If the change become ſenſible, they are called *critical ſymptoms*, or *ſigns of a criſis*, either future or preſent. See SIGN.

The ſymptoms of the *criſis* are frequently confounded with thoſe ariſing from the cauſe of the diſeaſe, and the diſeaſe itſelf, or the matter of the diſeaſe; whence have ſprung the moſt unhappy conſequences.

The differences between critical ſymptoms and morbific ones are, that the firſt proceed from the vital powers prevailing over the force of the diſeaſe; but the latter from the diſeaſe prevailing over the vital faculty: that the firſt are preceded by a manifeſt concoction, but the latter are formed even in crudities: that the former happen about the critical times, but the latter at all times of the diſeaſe, chiefly during its increaſe.

The principal ſymptoms of an approaching *criſis* are, after digeſtion, and about the critical time, a ſudden ſtupor, drowſineſs, waking, delirium, anxiety, dyſpnœa, grief, redneſs, titillation, pricking, heavineſs, darkneſs, light, ſpontaneous tears, nauſea, heat, thirſt, trembling of the lower lip, &c.

The ſymptoms and effects of a preſent *criſis* are, after the preceding ones, a vomiting, ſalivation, looſeneſs, thick ſediment in the urine, bleeding at the noſe, hæmorrhoids, ſweat, abſceſſes, puſtules, tumours, buboes, purules, aphthæ, &c.

Dr. Albertinus obſerves, that all feveriſh, nay, almoſt all diſeaſes, are followed by *criſes*, and that particularly after intermitting fevers are ſtopped by the bark, critical evacuations are to be expected. If they do not come timely, the patient is in danger of ſome other diſeaſe, eſpecially if any uſual evacuation has been hindered; in which caſe it is dangerous to give the bark, unleſs we promote a ſuitable excretion, if a *criſis* does not ſoon come.

Dr. Martine defends the ancients in the rules they have laid down concerning the periods and *criſes* of diſeaſes, endeavouring to prove that they are founded on accurate obſervations.

CRISP *leaf*, *criſpum folium*, among *Botaniſts*. See LEAF.

CRISTA *galli*, in *Anatomy*, an eminence in the middle of the *os ethmoides*, advancing within the cavity of the cranium; and to which is faſtened that part of the dura mater which divides the brain, called *falx*.

It has its name from its figure, which reſembles that of a cock's comb. In adults, this proceſs appears of a piece with the *ſeptum narium*.

CRISTA, *galli*, in *Conchyliology*, the name of a peculiar ſpecies of oyſter, called alſo by ſome *auris porci*, or the hog's ear-ſhell.

CRISTÆ is alſo a term uſed, in *Surgery*, for certain preternatural excreſcences ariſing about the fundament, reſembling cocks combs.

Theſe, M. Dionis ſays, are taken off either by ligature, cauterization, or amputation. When they have other figures, they have other names, as ficus, &c. See CONDYLOMA.

CRISTA is alſo uſed for a crooked, twiſted, ſpiral eminence, in the middle of the ſpine of the *omoplata*.

CRISTA *pavonis*, in *Botany*, a name by which ſome authors have called the POINCIANA.

CRISTA *pavonis* is alſo a name given to the tree, the wood of which is uſually denominated LOGWOOD.

CRITERIUM, or CRITERION, formed of κρινω, *I determine*, a rule or ſtandard, whereby to compare propoſitions and opinions, in order to diſcover their truth or falſhood.

The doctrine of *criteria*, and the characters and rules thereof, make the firſt part of the Epicurean philoſophy. EVIDENCE is the grand *criterion* of truth.

CRITHE, Κριθη, in *Medicine*, a ſmall tubercle, hard, red, and immoveable, ſeated upon the eye-lid, above the cilia, or range of hairs. It is always included in a kind of cyſt, and by inflammation degenerates into a thickiſh matter, from whence frequently proceed intenſe pains, and various diſorders of the ſight. It is ſometimes ſeated immediately under the ſkin of the eye-lid; ſometimes it is within, under the muſcle. When this tubercle is moveable, it is generally called *chalazium*, or in Engliſh *ſtye*, or *ſlithe*. Heiſter's Surgery, p. 365.

CRITHMUM, *ſamphire*, in *Botany*. See SAMPHIRE.

CRITHOMANCY, a kind of divination, performed by conſidering the dough, or matter of the cakes offered in ſacrifice; and the meal ſtrewed over the victims to be killed.

Hence, in regard they ordinarily uſed barley-meal in theſe ceremonies, this kind of divination was called *crithomancy*, from κριθη, *barley*, and μαντεια, *divination*.

CRITICAL *days*, *ſymptoms*, &c. are certain days, and ſymptoms uſually ariſing in the courſe of acute diſeaſes, as fevers, ſmall-pox, &c. which indicate the patient's ſtate, and determine him either to recover, or grow worſe.

The word comes from κρινω, *judico*, *I judge*.

The criſes have been frequently obſerved to happen on the ſeventh, fourteenth, or twentieth day; whence thoſe are denominated *critical days*.

For the theory of *critical days*, it may be obſerved, that the concoction of any morbific matter, and the humour to be ſecerned, is nothing elſe but a change thereof into ſuch a due magnitude, or ſmallneſs, as it may be carried by the circulating blood along the canals, and excerned by veſſels deſtined for that purpoſe. But if the morbific matter cannot be reduced to ſuch a magnitude or ſmallneſs as may correſpond to the orifices of the ſecretory veſſels; then either an abſceſs or hæmorrhage will follow, if a criſis be begun; for which reaſon, abſceſſes, &c. are accounted leſs perfect criſes. But, that the morbific matter may be reduced to a due magnitude, or ſmallneſs, and its wiſhed-for diſcharge take place, there is required a conſiderable time, if the quantity of matter be large; that is, if the diſtemper be great and ſevere: and ſince there are a great many cauſes, and thoſe very conſtant, which may occaſion the blood, and offending humours therein, to be of a different fluidity in the inhabitants of different climates, it is impoſſible but that different ſpaces of time ſhould be required for the finiſhing concoction: which makes it impoſſible to determine the *critical* days in one climate, from what they are found to be in another.

The cauſes of real *critical* days, that is, ſuch on which happens the laſt concoction of the morbific matter, which is always attended with expulſion, are all thoſe things which occaſion the humours to become of ſuch a certain magnitude or minuteneſs, and of a greater or leſſer coheſion; but with any given power, bodies unequally large, or unequally cohering, cannot be concocted in an equal time: wherefore it is to be found by the obſervations made by all nations among themſelves, which are the uſual cauſes and conditions of thoſe diſeaſes, that require a certain number of days to finiſh ſuch a concoction in it.

CRITICISM, the art of judging concerning diſcourſe and writings. See JUDGMENT.

Some define *criticiſm*, more amply, the art of judging of a hiſtory, or a work of genius, with the various incidents there met with, their ſtyle, and authors.

On which footing, M. le Clerc ſeems to have given a defective idea of *criticiſm*, when he defines it ſimply the art of entering into the meaning of ancient authors, and of making a juſt diſcernment of their genuine works.

We may diſtinguiſh divers ſorts, or branches, of this art: as,

CRITICISM, *philoſophical*, or the art of judging of opinions and hypotheſes in philoſophy.

CRITICISM, *theological*, the art of judging of explications of doctrines of faith, &c.

CRITICISM, *political*, the art of judging of the means of governing, acquiring, and preſerving ſtates.

But the ordinary uſe of the word is reſtrained to

CRITICISM, *literary*, which, however, is of great extent, as it takes in the art of judging of facts; a branch of *criticiſm*, which regards not only hiſtory, but alſo the diſcernment of the real works of an author, the real author of a work, the genuine reading of a text, and the art of diſcovering ſuppoſititious monuments, charters, interpolated paſſages, &c.

The other parts of *literary criticiſm* are, the art of judging of works of genius, their excellencies and defects. We have alſo

CRITICISM, *grammatical*, or the art of interpreting and diſcovering the words and meanings of an author.

CRITICISM *of antiques*, which conſiſts in diſtinguiſhing genuine medals, and the different taſte and ſpirit found among them, according to the different people, the different country, and the different times wherein they were ſtruck; the diſtinguiſhing between what is caſt, and what ſtruck; what has been retouched, and repaired or added, from what is really antique; the genuine from the ſpurious, &c. and to decypher and explain them, &c.

CRITICISM, *ſacred*, in general, is that employed in eccleſiaſtical matters, the hiſtory of the church, the works of the fathers, councils, lives of the ſaints, &c. but more particularly what concerns the books of the Holy Scriptures, and the canon thereof.

Ariſtotle, if we believe Halicarnaſſeus, is the firſt inventor of the art of *criticiſm*. Ariſtarchus, Dionyſius Halicarnaſſeus himſelf, Varro, and Longinus, diſtinguiſhed themſelves therein in their days. Among the Chriſtians, Dionyſius Alexandrinus, Heſychius, Euſebius, St. Jerom, and Theodoret, were the greateſt maſters in this art. The decree of pope Gelaſius about the apocryphal books, required a good ſhare of *criticiſm*.

But the critical art fell with the other arts; and lay unknown till the time of Charlemagne, when it was reeſtabliſhed

eſtabliſhed under him and his ſons. The care which the religious Ciſtercians took to correct the manuſcripts of the Bible, ſhew that the rules of *criticiſm* were not entirely unknown in the eleventh century. The works of Johannes Sariſburienſis, Euſtathius, and Tzetzes, make it evident it was cultivated in the twelfth. The manuſcripts of the Bible, corrected by the Dominicans of Paris, and the doctors of the Sorbonne, in the thirteenth, ſhew it was ſubſiſting then. In the following ages, it was ſtill cultivated with more earneſtneſs; eſpecially in the ſixteenth, ſeventeenth, and eighteenth centuries, when all the world made it their ſtudy.

From the whole, it follows, that *criticiſm* does, indeed, ſuppoſe an uncommon ſtock of knowlege of the ſubject whereon it is employed: but that *criticiſm*, itſelf, is nothing elſe but good ſenſe perfected by grammar and logic.

CRIZZELLING, in the *Glaſs Trade*, a kind of roughneſs ariſing on the ſurface of ſome kinds of glaſs. This was the fault of a peculiar ſort of glaſs made in Oxfordſhire, and ſome other places, of black flints, a cryſtallized ſand, and a large quantity of nitre, tartar, and borax. The glaſs thus made is very beautiful, but, from the too great quantities of the ſalts in the mixture, is ſubject to *crizzel*; that is, the ſalts in the mixture, from their too great proportion, are ſubject, either from the adventitious nitre of the air from without, or from warm liquors put in them, to be either increaſed in quantity, or diſſolved, and thereby induce a ſcabrities, or roughneſs, irrecoverably clouding the tranſparence of the glaſs. This is what was called *crizzelling*; but by uſing an Italian white pebble, and abating the proportions of the ſalts, the manufacture is now carried on with advantage, and the glaſs made with theſe ſalts is whiter than the fineſt Venetian, and is ſubject to no faults. Plott's Oxfordſhire, p. 258.

CROCALLIS, in *Natural Hiſtory*, the name given by the ancients to a ſtone famous for its virtues againſt poiſons, and venomous bites. All the deſcription Pliny gives of it is, that it was of the ſize and ſhape of a cherry.

CROCARDS, an old name given by the Iriſh to a certain kind of money brought over into that kingdom from France, and other parts beyond the ſeas, and uttered there for pennies, though not really worth ſo much as a halfpenny. They were a ſmall ſort of coin, made of a mixture of copper, ſulphur, and a ſmall quantity of ſilver, and were called by ſeveral other names, as *mitres*, *lionines*, *roſaries*, and the like, from the figures they were impreſſed with. They were current in Ireland, and in ſome parts of England, a great many years; but were afterwards denied, and prohibited importation, both in England and Ireland, under the penalty of the forfeiture of life and effects. At this time, mints were ſet up in Dublin, for the coining of good money, and, in a few years, the whole quantity of the *crocards* was deſtroyed. See POLLARDS.

CROCEUS, in *Natural Hiſtory*, is ſaid to be an amphibious animal, which is neither fiſh nor bird, but both. All the ſummer it is a bird of a ſaffron colour, and flies through the mountains; but towards the end of autumn it returns to the ſea, and becomes a fiſh. It is only in winter that they catch it, when it is very good food.

CROCHES, among *Hunters*, the little buds about the top of a deer's horns.

CROCI, among *Botaniſts*, the apices, or ſmall knobs, on the tops of flowers.

CROCIA, a biſhop's or abbot's CROSIER, or paſtoral ſtaff.

CROCIAS *lapis*, in *Natural Hiſtory*, a name given by ſome of the old authors to a ſpecies of agate, of a yellow colour, but deeper than the cerachates, or wax-coloured agate, and approaching to what is called a ſaffron colour.

CROCINUM, a name given by the ancient phyſicians to a ſort of oil of ſaffron, which is thus deſcribed by Dioſcorides.

Eight drams of ſaffron are to be put into three pints of inſpiſſated oil, and they are to be ſtirred together ſeveral times in a day, for five days together; then the oil is to be ſeparated from the ſaffron, and a like quantity is to be added to the ſame ſaffron, and ſtirred about at times, for three days; then this oil is to be cleanſed off, and to it are to be added fifty ounces of powdered myrrh. Theſe having been well ſtirred together, are then to be ſet by for uſe.

Some uſed an oil, impregnated with aromatics, in the compoſition of the *crocinum*; but that was uſually eſteemed beſt, which ſmelt the moſt ſtrongly of ſaffron, or elſe of myrrh.

The *crocinum* was eſteemed heating and narcotic; whence it was frequently preſcribed by way of embrocation, or elſe held in the noſe in frenſies. It was alſo eſteemed uſeful as a ſuppurative, and to cleanſe old ulcers: it was much eſteemed alſo in hardneſſes, obſtructions, and other diſorders of the uterus, being uſed with wax, marrow, and double the quantity of oil; for a *glaucoma* it was alſo uſed with ſucceſs, when mixt with water, and the eyes anointed frequently with it.

CROCODILADES. See THISTLE.

CROCODILE, in *Zoology*, a ſpecies of lizard, with a two-edged tail, and triangular feet, the fore ones having five, and the hinder only four toes.

This animal is the largeſt of the LIZARD kind, growing to twenty-five feet in length, and about the thickneſs of a man's body; its noſe is like that of a hog; the opening of its mouth monſtrouſly large, reaching even to the ears, and the upper-jaw moving in the opening of it, gives it a very terrible aſpect. The teeth are large, white, and very numerous, and ſet by one another, like the teeth of a comb; there are two long teeth in the lower-jaw, which paſs into two holes in the upper. Herodotus affirms that the *crocodile* has no tongue; but he is obſerved to have a fleſhy ſubſtance like a tongue, that is fixed to the lower-jaw, which ſerves to turn his meat. The legs ſtand ſideways; and the feet are armed with extremely ſharp claws. The length of the tail is equal to that of the whole body; the ſkin of the belly is ſoft, and eaſily wounded, but that of the reſt of the body ſo hard as to be impenetrable to ſpears or darts, and is covered with ſtrong prickly ſcales. The colour is in ſome a duſky reddiſh yellow, but in moſt a diſagreeable brown, with a mixture of grey; and even thoſe which, when alive, had much yellowneſs, always acquire this duſky colour in dying.

It is a native of the torrid zone, frequenting ſalt-water rivers, where it lies concealed among the reeds or ruſhes, until it finds an opportunity to ſeize men or other animals, which it drags into the water; always taking this method of drowning them firſt, that it may afterward ſwallow them without reſiſtance; its general food, however, is fiſh. The Africans and Indians eat its fleſh, which is white, and has a kind of perfumed flavour.

Its eggs are about the ſize of a gooſe egg, and it lays fifty of theſe for one brood, burying them in the ſands, and leaving them for the ſun to hatch them. As ſoon as they are hatched, which takes twenty-five or thirty days, the parent takes care of the young, which run with them into the water. The *crocodile* is found in the great rivers, as the Nile, the Niger, and the Ganges, and in ſome other places. Ray's Syn. Quad. p. 261. Warm. Muſ. p. 815. Pococke's Deſcr. of the Eaſt, vol. i. p. 202, &c.

The *crocodile* was worſhipped by the Egyptians.

See an account of a peculiar ſpecies of *crocodile*, diſtinguiſhed by a narrow beak, reſembling the bill of a gooſander, and by a pouch under the belly, probably formed for receiving its young in times of danger, with a drawing by Mr. G. Edwards, in the Phil. Tranſ. vol. xlix. art. 95. p. 639.

CROCODILE, *foſſile*. One of the greateſt curioſities in the foſſile world, which the late ages have produced, is the ſkeleton of a large *crocodile*, almoſt entire, found at a great depth under ground, bedded in ſtone. This was in the poſſeſſion of Linkius, who wrote many pieces in natural hiſtory, and particularly an accurate deſcription of this curious foſſile. It was found in the ſide of a large mountain, in the midland part of Germany, and in a ſtratum of a black foſſile ſtone, ſomewhat like our common ſlate, but of a coarſer texture, the ſame with that in which the foſſile fiſh of many parts of the world are found. This ſkeleton had the back and ribs very plain, and was of a much deeper black than the reſt of the ſtone, as is alſo the caſe in the foſſile fiſhes, which are preſerved in this manner. The part of the ſtone where the head lay was not found, this being broken off juſt at the ſhoulders, but that irregularly, ſo that, in one place, a part of the back of the head was viſible in its natural form. The two ſhoulder-bones were very fair, and three of the feet were well preſerved; the legs were of their natural ſhape and ſize, and the feet preſerved, even to the extremities of the five toes of each.

CROCODILE, CROCODILUS, in *Rhetoric*, a captious and ſophiſtical kind of argumentation; contrived to ſeduce the unwary, and draw them ſpeciouſly into a ſnare.

It has its name, *crocodile*, from the following occaſion, invented by the poets. A poor woman, begging a *crocodile* that had caught her ſon walking by the river-ſide, to ſpare and reſtore him, was anſwered, that he would reſtore him, provided ſhe ſhould give a true anſwer to a queſtion he ſhould propoſe: the queſtion was, *Will I reſtore thy ſon, or not?* To this the poor woman, ſuſpecting a deceit, ſorrowfully anſwered, *Thou wilt not:* and demanded to have him reſtored, becauſe ſhe had anſwered truly. Thou lyeſt, ſays the *crocodile:* for if I reſtore him, thou haſt not anſwered truly: I cannot therefore reſtore him, without making thy anſwer falſe. Under this head may be reduced the propoſitions called *mentientes*, or *inſolubiles*; which deſtroy themſelves. Such is that of the Cretan poet: *Omnes ad unum Cretenſes ſemper mentiuntur: All the Cretans to a man, always lye.* Either, then, the poet lyes, when he aſſerts that the Cretans all lye; or the Cretans do not all lye.

CROCODILION, in *Botany*, a name given by ſome authors to the plant commonly called the ECHINOPUS, or *globe*-THISTLE.

CROCOMAGMA, in *Pharmacy*, a name given by ſome to troches compoſed of ſaffron, myrrh, red roſes, ſtarch, and gum Arabic: thus called from κροκος, *ſaffron*, and μαγμα, *a maſs of any thing*.

CROCOTTA, in *Natural Hiſtory*, a name given by the ancients to a very fierce and terrible animal, produced by copulation between the large hyæna and the lioneſs. See LEOCROCOTTA.

CROCUS, in *Botany*. For the characters, ſee SAFFRON.

The variety of the ſeveral ſpecies of *crocus* produced in the gardens of the curious, by raiſing them from well choſen ſeeds, is almoſt incredible.

They are all very hardy, and will increaſe exceedingly by the roots, if ſuffered to remain ſome years in the ground. They will grow in all ſoils and ſituations, and are great ornaments to a garden, as they flower when ſcarce any thing elſe is up. The fibres of theſe roots periſh when their leaves do, and they may, therefore, like all other roots of that kind, be taken up as ſoon as the leaves appear dead, and laid by, in a dry place, till September, at which time they muſt be planted again for the ſpring-flowering. They ſhould be planted in holes made with a dibble, about two inches deep, and at two inches diſtance from one another; the earth being raked over them, they ſhould remain covered about an inch deep with it. If the weather is mild, they will, in January, appear above ground, and in February they will be in full flower. The leaves are ſo ſhort when the flower appears, that it ſeems produced on a naked ſtalk, but as that decays they grow to a conſiderable length; theſe look but unſightly after the flower is gone, but they ſhould not be cut, for that greatly weakens the root for the next ſeaſon's flowering.

CROCUS, in *Chemiſtry*. The preparations of metals which are generally known by this name, as the *crocus Martis*, and the like, ſeem to have obtained it from their ſaffron-like colour. They are the calxes of metals, conſiſting of their fixed parts ſeparated from their ſulphureous; they are made either by the means of fire, or by the action of ſalts of various kinds; and are either naturally in a powder, or very eaſily reducible into one.

The general ſubjects of this ſort of proceſs are gold, ſilver, iron, and antimony, and there are many ways of making the proceſſes. The virtues aſcribed to the gold and ſilver *crocuſes* ſeem, in a great meaſure, imaginary: thoſe of antimony are far from being the beſt ſort of preparations of that metal; but thoſe of iron are, more than all others, uſeful in medicine. Hoffman, in his Acta Laboratorii, has many improvements on the common proceſſes for the making theſe preparations.

CROCUS *antimonii*, or *metallorum*, in *Pharmacy* and *Chemiſtry*, the name given, in the late London Diſpenſatory, to the preparation of antimony and nitre commonly known by the name of *crocus metallorum*. It is made of equal parts of antimony and nitre, powdered fine, and thrown gradually into a red-hot crucible, and, when thoroughly melted, poured out, and ſeparated from its ſcoriæ. This looks more yellow the longer it has been melted: it is but little uſed, except among horſes; but when intended for internal uſe among men, ſhould be procured faithfully prepared in this manner; for our chemiſts generally abate of the nitre to ſave charges, and render the medicine of a very different effect. Pemberton's Lond. Diſp. p. 230.

Waſhed *crocus* of antimony is made by boiling the *crocus* of antimony, reduced to a very fine powder, in water, ſtill changing the water, till it comes off inſipid. Of this is made the *vinum antimoniale*, called alſo VINUM *emeticum*, and *benedictum*.

The medicinal *crocus* of antimony conſiſts of eight ounces of antimony, and one ounce of nitre, pulverized, mixed, and deflagrated: the matter is then taken from the fire, and cooled and powdered for uſe. A doſe from eight to twenty grains will operate gently both as an emetic and purge. The milder *crocus* of antimony is prepared with two pounds of crude antimony, and one of nitre, much in the ſame manner as the former.

CROCUS *Indicus*, *Indian ſaffron*, in the *Materia Medica*, a name given by ſome authors to the *curcuma*, or *turmeric* root of the ſhops.

CROCUS *martis*, a preparation of iron; which is of two kinds, viz. *crocus martis aperiens*, and *crocus martis aſtringens*.

CROCUS *Martis aperiens*, *opening ſaffron of Mars*, is a preparation of iron plates, made by firſt waſhing them, then expoſing them to the dew, till they have contracted a ruſt; which ruſt is ſcraped off, and the plates expoſed for more.

Others prepare it by calcining iron filings with an equal weight of ſulphur. Others, by clapping a bar of iron, red, or rather white hot, between two rolls of brimſtone; in which caſe, the iron melts, and runs down into a veſſel of water below: which ſome call *Mars cum ſulphure præparatus*. Others have other preparations.

Crocus Martis aperiens is preſcribed in caſes of obſtructions, the doſe being from ten to thirty grains.

M. Lemery endeavours to ſhew, that iron taken in ſubſtance, is much more ſalutary and efficacious than when thus prepared; the proceſs tending to ſtrip it of its oily part, wherein its chief virtue reſides; leaving nothing behind but the mere ferruginous earthy part.

CROCUS *Martis aſtringens*, *binding ſaffron of iron*, is a preparation of iron filings; wherein they are deprived of their more ſaline parts by waſhing them five or ſix times in ſtrong vinegar, and calcining them five or ſix hours.

It is preſcribed in hæmorrhages, dyſenteries, and diarrhœas, the doſe being the ſame as in the former. The beſt way is to give it in a bolus, or pills, becauſe in liquid it ſinks to the bottom too ſuddenly to be taken without waſte.

Crocus Martis is a chemical preparation, uſed by the glaſs-makers, to give a red colour to glaſs. The glaſs-makers prepare this for themſelves, and have four ways of doing it. The firſt is this: take filings of iron; mix them with three parts of powdered brimſtone, and keep them in a melting-pot, in a furnace, to calcine, and burn off the ſulphur; let them ſtand four hours in this ſtate, then take them out, and, when cold, powder and ſift them, and put the powder into a crucible, which lute over, and ſet it in the leer of the furnace for fifteen days, or more; it will then be of a reddiſh purple, and muſt be kept for uſe.

The ſecond way of making this, is by ſprinkling filings of iron with ſtrong vinegar, and ſetting them in the ſun to dry; when dry, powder and ſift them, and wet them again with vinegar, and, when dry, powder them again. Repeat this eight times, and then powder the whole, and ſift it fine for uſe.

The third way is to uſe aqua fortis, inſtead of vinegar, in the ſame manner.

The fourth way, which is the beſt of all, is this: diſſolve filings of iron in aqua regia, and let the ſolution ſtand three days in a veſſel cloſe ſtopped, ſhaking it about at times; then evaporate the liquor gently, and there will remain a moſt valuable *crocus Martis*.

CROFT, CROFTUM, a little cloſe adjoining to a dwelling-houſe, either for paſture or tillage.

Poſſunt etiam dicti monachi de eiſdem mariſcis verſus occidentem jacentibus pro ſe, & hominibus ſuis, includere croftos, *ſive pratum juxta pontem, ſpecialiter, quantum illus placuerit.* Ingulf.

In ſome ancient deeds, *cruſta* occurs as the Latin word for a *croft*; but *cum toftis & croftis* is more frequent. *Croft* is tranſlated in Abbo Floriacenſis, by *prædium*, a *farm*.

CROISADE, CRUSADE, or CRUZADO, a *holy war*, or an expedition againſt infidels and heretics; particularly againſt the Turks, for the recovery of Paleſtine.

People anciently flocked on theſe *croiſades* out of devotion; the popes bulls, and the preaching of the prieſts of thoſe days, making it appear a point of conſcience. Hence ſeveral orders of knighthood took their riſe.

Many circumſtances contributed to give riſe to theſe expeditions. The deſire of viſiting a country which had been the ſcene of very important tranſactions, and in which the Son of God had accompliſhed the redemption of mankind, together with the idea of peculiar merit, acquired by a diſtant pilgrimage of this kind, and of its ſerving as a general expiation for almoſt every crime, had no ſmall influence on this occaſion. Beſides, an opinion prevailed, that the thouſand years mentioned by St. John, Rev. xx. 2, 3, 4. were accompliſhed, and that the end of the world approached; many thus hurried into the Holy Land, where they imagined that Chriſt would quickly appear to judge the world. Chriſtians alſo thought it reproachful, to ſuffer a country, which had been ſo ſignally diſtinguiſhed, and whence they derived the moſt valuable benefits, to be abandoned to the enemies of the Chriſtian name; and they thought it meritorious to avenge the calamities and injuries which its profeſſors had ſuffered under the Mahometan yoke. Moreover, pilgrims were encouraged in their reſort to Jeruſalem, whilſt Paleſtine continued ſubject to the caliphs; but when the Turks conquered Syria, about the middle of the eleventh century, they were expoſed to every kind of outrage from theſe barbarians, and returned with exaggerated accounts of the vexations they had endured. Accordingly, the firſt ſignal was given by Silveſter II. towards the cloſe of the tenth century, in an epiſtle wrote in the name of the church of Jeruſalem to the church univerſal throughout the world, in which all the European powers are intreated and exhorted to ſuccour and reſcue the Chriſtians in Paleſtine. This effort of zeal, however, produced no immediate effect. Gregory VII. in the beginning of the eleventh century, renewed the undertaking, and propoſed in perſon to invade the Holy Land. Though he was prevented from executing this deſign, the ſpirit of the people was inflamed; and Peter the Hermit, returning from a voyage which he had made through Paleſtine, A. D. 1093, complained of the extreme ſufferings of the Chriſtians, applied to Urban II. for ſuccour, and run from province to province with a crucifix in his hand, exciting princes and people to this holy war, and pretending a divine commiſſion for this purpoſe. At length, Urban II. finding a general ardour for the cauſe, aſſembled a grand and numerous council at Placentia, A. D. 1095, and warmly recommended this expedition. Soon after the propoſal was renewed with ſucceſs at the council of Clermont. In 1096, an army of 800,000 men ſet out for Conſtantinople, in ſeparate bodies, under the command of Peter the Hermit, Godfrey of Bouillon, and many other noble and illuſtrious leaders. Nor need we wonder at the multitude who flocked to the ſtandard of the croſs, when we conſider the natural operation of frantic zeal, and the numberleſs privileges which the cruſaders acquired; ſuch as exemptions from proſecutions for debt, from paying intereſt for money, and from taxes; the power of alienating their lands without conſent of their lord, the protection of St. Peter, the immunities of eccleſiaſtics, and the plenary remiſſion of their ſins. Du-Cange.

The firſt efforts of theſe adventurers were irreſiſtible, and they gained conſiderable advantages; but before the expiration of the thirteenth century, the Chriſtians were driven out of all their Aſiatic poſſeſſions; and the enterpriſe remains a ſingular monument of human folly. Nevertheleſs, many ſubſtantial benefits accrued from it in a political and commercial view, however injurious it was to individuals, and to the cauſe of religion in general. To theſe wild expeditions we owe the firſt gleams of light which tended to diſpel barbarity and ignorance. They were the means of introducing a more general and ſteady adminiſtration of juſtice, and of eſtabliſhing regal government in the ſeveral kingdoms of Europe, and of extending commerce. Robertſon's Hiſt. ch. V. p. 26, &c. Moſheim's Ecc. Hiſt. Eng. ed. 8vo. vol. ii. p. 189. 231, &c.

Thoſe who engaged to go on this ſervice, diſtinguiſhed themſelves by croſſes of different colours, worn on their cloaths; ordered, it is ſaid, by the council of Clermont; and were thence called *croiſes*, or croſs-bearers, of whom, contemporary authors tell us, there were ſix millions: the Engliſh wore them white; the French, red; the Flemiſh, green; the Germans, black; and the Italians, yellow.

The following are the principal *croiſades* for the conqueſt of the Holy Land: the firſt undertaken in 1095, at the council of Clermont; the ſecond in 1147, under Louis VII. and the pontificate of Eugenius III. at the inſtigation of Bernard, abbot of Clairval; the third in 1189, and 1190, by Frederic I. ſurnamed Barbaroſſa, emperor of Germany, Henry II. of England, and Phil. Auguſtus of France; the fourth in 1195, by pope Celeſtin III. and the emperor Henry VI. the fifth publiſhed in 1198, by order of Innocent III. wherein the French, Germans, and Venetians, engaged; the ſixth undertaken in the year 1217, under the pontificate of Honorius III. by the confederate arms of Italy and Germany, which ended in the rout of the Chriſtians; the ſeventh under Frederic II. emperor of Germany; who ſet out in the year 1228, and concluded a truce of ten years with the ſultan of Egypt in 1229, which was ſucceeded by inconſiderable and very unſucceſsful expeditions in 1239, under Theobald VI. king of Navarre; and in 1240, under Richard earl of Cornwall, brother to Henry III. of England; the eighth under Louis IX. of France, in conſequence of a vow which he had made in 1248; and the ninth, and laſt, renewed by the ſame valiant, but unfortunate monarch, who died of a peſtilential diſeaſe in the harbour of Tunis, in the year 1270. Theſe expeditions coſt Europe at leaſt two millions of its inhabitants, and an immenſe ſum of money.

The abbot Juſtiniani makes an order of knighthood of the croiſes, who ſerved in the *croiſades*.

Towards the middle of the twelfth century, there was alſo a *croiſade* of the Saxons, againſt the pagans of the north; wherein the archbiſhop of Magdeburg, the biſhops of Halberſtadt, Munſter, Merſburgh, Brandenburgh, &c. with ſeveral lay-lords, embarked. And towards the beginning of the ſame century, under the pontificate of Innocent, there was alſo a *croiſade* undertaken againſt the Albigenſes; who were become powerful in Languedoc, &c.

CROISES, or CROIZES, in our *Ancient Cuſtoms*, pilgrims bound for the Holy Land, or who had already been there; ſo called from a badge which they wore on their garments, repreſenting a croſs.

The word *croiſes* is alſo extended to the knights of St. John of Jeruſalem, created for the defence and protection of pilgrims; and all thoſe of the nobility, gentry, &c. who in the reigns of king Henry II. Richard I. Henry III. and Edward I. were *cruce ſignati*, i. e. dedicated themſelves to the wars, for the recovery of the Holy Land.

CROISIERS, CRUCIGERI, or *croſs-bearers*, a religious order, or congregation of regular canons, ſo called.

There are three orders which have, or do ſtill bear this name; one in Italy; another in the Low Countries; and a third in Bohemia.

The firſt pretend to be derived from St. Clet; and add, that St. Quiriacus the Jew, who ſhewed S. Helena the place of the true croſs, and was afterwards converted, reformed them. All we know for certain is, that they ſubſiſted in Italy before Alexander III. mounted the throne; for that pontiff, flying from Frederic Barbaroſſa, found an aſylum in the monaſteries of the *croiſiers*, which he afterwards, in 1169, took under his protection, giving them the rule of St. Auguſtine, &c.

They were confirmed by Pius V. but the diſcipline being much relaxed, they were ſuppreſſed in 1656, by Alexander VII.

Matt. Paris ſays, that the *croiſiers*, bearing ſtaffs with croſſes at the end, came into England in 1244, and preſented themſelves before a ſynod held by the biſhop of Rocheſter, demanding to be admitted. They were here called *crouched* friars.

Dodſworth and Dugdale mention two monaſteries of this order in England, the one at London, the other at Ryegate; the firſt founded in 1245, the latter in 1298; ſome add a third at Oxford, where they were received in 1349. M. Allemand ſays, there were fourteen monaſteries of *croſs-bearers* in England; adding, that they came from Italy; thoſe of the Low Countries diſowning them.

The *croiſiers* of the Low Countries and France were founded in 1211, by Theodore de Celles ſon of Boſon, who having ſerved in a croiſade in Paleſtine, in 1188, and there found ſome of the *croiſiers* inſtituted by St. Clet, conceived a deſign of inſtituting another congregation in his own country. This is certain, that Theodore, in his return from Paleſtine, engaged himſelf in the eccleſiaſtical ſtate; and went in quality of miſſionary to the croiſaide againſt the Albigenſes: and that at his return in 1211, the biſhop of Liege gave him the church of St. Thibault near Huy; where, with four companions, he laid the foundation of his order; which was confirmed by Innocent III. and Honorius III. Theodore ſent his religious to Tholouſe, to join thoſe of St. Dominic, and combat the Albigenſes; and the congregation multiplied in France. The popes have endeavoured to bring the *croiſiers* of Italy under thoſe of Flanders. The *croiſiers*, or *port croix with a ſtar*, in Bohemia, derive their origin from St. Quiriacus, and ſay they came from Paleſtine into Europe, where they embraced the rule of St. Auguſtine, and built monaſteries. They add, that St. Agnes of Bohemia, to diſtinguiſh them from other *croiſiers*, obtained of Innocent IV. to add a ſtar to their habit. But the ſtory of St. Quiriacus has no foundation; and it was Agnes herſelf, daughter of Primiſlaus king of Bohemia, who inſtituted the order at Prague, in 1234. They are very numerous; and have, now, two generals.

CROISSANTE', in *Heraldry*. *Croix croiſſanté* is a croſs creſcented; that is, having a creſcent, or half-moon, fixed on each end thereof.

CROM-LECHE, in *Britiſh Antiquity*, derived, according to the conjecture of Mr. Rowlands, from the Hebrew *carem-luach*, a devoted ſtone or altar, are huge, broad, flat ſtones, raiſed upon other ſtones ſet up on end for that purpoſe. They are common in Angleſey; and Mr. Rowlands ſuppoſes, that they are the remains of altars erected there by the firſt coloniſts. Mona Antiqua reſtaurata.

CRONICAL, in *Aſtronomy*. See ACRONICAL.

CRONIUS, in *Chronology*, the ancient name of the Athenian month HECATOMBÆON, which was the firſt of their year, and anſwered to the latter part of our June, and beginning of July.

There were feaſts called *cronienes*, celebrated at Athens in this month, in honour of Saturn, anſwering to the *Saturnalia* of the Romans.

CROOKEDNESS. See DISTORTION.

CROOTES, a ſubſtance found about the ore in the lead-mines, at Mendip, being a mealy, white, ſoft ſtone, matted with ore.

CROPPER, or *Dutch* CROPPER, in *Zoology*, the name of a particular ſpecies of pigeon, called the *columba gutturoſa Bataviæ*, by Moore. It is naturally thick, and has its name from its large crop, or bag of wind, which it carries under its beak, and can, at pleaſure, either raiſe or depreſs. Theſe are thick-bodied, and ſhort; their legs are alſo thick and ſhort, and are feathered down to the feet; the crop is large, and hangs low; the feathers on the thighs hang looſe; and their legs ſtand wide; they are gravel-eyed, and are generally very bad feeders.

There are of theſe pigeons of all colours, and thoſe who are careful of them, generally take them away from their proper parent, while young, and breed them under the females of other ſpecies.

CROSETTES, in *Architecture*, the returns in the corners of chambranles, or door-caſes, or window-frames; called alſo *ears*, *elbows*, *ancones*, *prothyrides*, &c.

CROSIER, or **CROZIER**, *ſhepherd's crook*, a ſymbol of paſtoral authority, conſiſting of a gold or ſilver ſtaff, crooked a-top, carried occaſionally before BISHOPS and ABBOTS, and held in the hand when they give ſolemn benediction. At one end it is crooked, at the other pointed; expreſſed in the verſe:

Curva trahit mites, pars pungit acuta rebelles.

The cuſtom of bearing a paſtoral ſtaff before biſhops is very ancient, as appears from the life of St. Cæſarea of Arles, who lived about the year 500. Among the Greeks, none but the patriarchs had a right to the *croſier*. The *croſiers* were at firſt no more than ſimple wooden ſtaves, in form of a T, uſed to reſt and lean upon: by degrees they were made longer; and at length arrived to the form we now ſee them of. *Tab.* III. *Heraldry*, *fig.* 122.

Regular abbots are allowed to officiate with a MITRE and a *croſier*.

CROSIER, in *Aſtronomy*, four ſtars, in form of a croſs; by help whereof, thoſe who ſail in the ſouthern hemiſphere find the antarctic pole.

CROSS, **CRUX**, a ſort of inſtrument, compoſed of two pieces of wood, traverſing and cutting each other, ordinarily at right angles.

Pezron derives the word *crux* from the Celtic *croug*, and *croas*; though, perhaps, *croug* and *croas* might with as much juſtice be derived from *crux*.

The *croſs* was uſed among the ancients as a puniſhment for malefactors and ſlaves; and was planted at ſeveral places, *in terrorem*, as our gallows, &c.

Sozomen obſerves, that it was Conſtantine who by law firſt aboliſhed the puniſhment of the *croſs*, which had obtained among the Romans till his time. It had alſo been in uſe among the Aſſyrians, Egyptians, Perſians, Carthaginians, and even the Greeks.

As to crucifixion, or the manner wherein the puniſhment of the *croſs* was effected, the critics, both ancient and modern, are exceedingly divided: the points in diſpute are, Whether the criminal was faſtened with three nails, or with four; whether the feet were immediately faſtened to the *croſs*, or whether they reſted on a little piece of wood, in manner of a ſtep, or reſt, called ϖηγμα; whether the *croſs* was planted in the earth before the perſon was nailed on, faſtening him afterwards by means of a ſcaffold raiſed to the height of the place where the feet were to be nailed; or whether he was nailed before the *croſs* was raiſed or planted, as the painters repreſent it: or laſtly, whether the patient was faſtened quite naked, or covered: queſtions that have all been occaſioned by the *crucifixion* of Jeſus Chriſt.

CROSSES were uſually in former times erected on the tops of houſes, by which tenants pretended to claim the privileges of the Templars Hoſpitallers, to defend themſelves againſt their rightful lords. This was condemned by the ſtatute Will. II. c. 37. It was uſual alſo, in thoſe days, to ſet up *croſſes* in places where the corpſe of any of the nobility reſted, as it was carried to be buried, that *a tranſeuntibus pro ejus animo deprecetur*.

Croſſes, &c. are forbid to be brought into England, by 13 Eliz. c. 2. on pain of a *præmunire*, &c.

CROSS, *Invention of the*, *inventio crucis*, an ancient feaſt, ſolemnized on the third of May, in memory of St. Helena's (the mother of Conſtantine) finding the true *croſs* of Chriſt deep in the ground, on mount Calvary; where ſhe erected a church for the preſervation of part of it: the reſt being brought to Rome, and repoſited in the church of the *Holy Croſs* of Jeruſalem. See FEAST.

Theodoret mentions the finding of three *croſſes*, that of Jeſus Chriſt, and thoſe of the two thieves; and that they diſtinguiſhed between them by means of a ſick woman, who was immediately healed by touching the true *croſs*.

The place is ſaid to have been pointed out to her by St. Quiriacus, then a Jew, afterwards converted and canonized.

CROSS, *Exaltation of the*, an ancient feaſt, held on the fourteenth of September, in memory of this, that Heraclitus reſtored to mount Calvary the true *croſs*, in 642, which had been carried off fourteen years before, by Coſroes king of Perſia, upon his taking Jeruſalem from the emperor Phocas.

The adoration of the *croſs* appears to have been practiſed in the ancient church, in as much as the heathens, particularly Julian, reproach the primitive Chriſtians with it. And we do not find that their apologiſts diſclaimed the charge. Mornay, indeed, aſſerted, that this had been done by St. Cyril, but could not ſupport his allegation at the conference of Fontainbleau. St. Helena is ſaid to have reduced the adoration of the *croſs* to its juſt principle, ſince ſhe adored in the wood, not the wood itſelf, which had been direct idolatry and heatheniſm, but him who had been nailed to this wood. With ſuch modifications ſome proteſtants have been induced to admit the adoration of the *croſs*. John Huſs allowed of the phraſe, provided it were expreſly added, that the adoration was relative to the perſon of Chriſt. But however Roman catholics may ſeem to triumph by virtue of ſuch diſtinction and mitigations, it is well known they have no great place in their own practice. Imbert, the good prior of Gaſcony, was ſeverely proſecuted in 1683, for telling the people, that in the ceremony of adoring the *croſs*, practiſed in that church on Good Friday, they were not to adore the wood, but Chriſt who was crucified on it: the curate of the pariſh told them the contrary: it was the wood! the wood! they were to adore. Imbert replied, it was Chriſt, not the wood: for which he was cited before the archbiſhop of Bourdeaux, ſuſpended from his functions, and even threatened with chains and perpetual impriſonment. It little availed him to cite the biſhop of Meaux's diſtinction; it was anſwered, that the church allowed it not.

CROSS-*bearer*, *port-croix*, *cruciger*, in the Romiſh *Church*, the chaplain of an archbiſhop, or a primate, who bears a *croſs* before him on ſolemn occaſions.

The pope has the *croſs* borne before him every where; a patriarch any where out of Rome; and primates, metropolitans, and thoſe who have a right to the pallium, throughout their reſpective juriſdictions.

Gregory XI. forbad all patriarchs and prelates to have it borne in preſence of cardinals. A prelate bears a ſingle *croſs*, a patriarch a double *croſs*, and the pope a triple one on their arms.

CROSS-*bearers* alſo denote certain officers in the INQUISITION, who make a vow before the inquiſitors, or their vicars, to defend the catholic faith, though with the loſs of fortune and life. Their buſineſs is to provide the inquiſitors with neceſſaries. They were formerly of great uſe; but in proceſs of time, ſome of their conſtitutions were changed, and they were called, of the penance of St. Dominic. Limborch's Hiſt. Inq. by Chandler, ch. x. See FAMILIARS, and INQUISITION.

CROSS, *pectoral*, is a *croſs* of gold or ſilver, or other precious materials, often enriched with diamonds, which the biſhops, archbiſhops, &c. and regular abbeſſes, wear hanging from the neck.

CROSS, *order of the*, or **CROISADE**, an order of ladies inſtituted in 1668, by the empreſs Eleonora de Gonzagua, wife of the emperor Leopold; on occaſion of the miraculous recovery of a little golden *croſs*, wherein were encloſed two pieces of the *true croſs*, out of the aſhes of part of the palace. It ſeems the fire had burnt the caſe wherein it was incloſed, and melted the cryſtal; yet the wood remain untouched.

CROSS, *Maids of the*, a community of young women inſtituted in 1265, at Roye, in Picardy, and ſince diſperſed to Paris, and other towns. They inſtruct young perſons of their own ſex; ſome take the three vows of poverty, chaſtity, and obedience; others retain their liberty. They are under the direction of a ſuperior.

CROSS, *judgment of the*, a cuſtom in France, at the beginning of the ninth century, of giving judgment in favour of one of two contending parties, who held his arms for the longeſt time lifted up to a *croſs*.

CROSS, in *Botany*, is uſed to expreſs the arrangement of the petala of certain flowers; called *plantæ flore cruciformi*. See PLANT, and FLOWER.

The flowers are not to have either more or leſs than four petala; and their calyx only to conſiſt of four pieces. The piſtil generally becomes a fruit called *ſiliqua*. See CRUCIFORM *flowers*.

CROSS, in *Coins*, a name given to the face, or right ſide, the other being called the pile, or reverſe. It has been a coma common error that the reverſe was meant by the *croſs*; becauſe at this time with us marked with figures diſpoſed in that form; but the ſtamping the head of the prince in theſe kingdoms, on the right ſide of the coin, was preceded by a general cuſtom of ſtriking on that part the figure of a *croſs*, while the other, called the pile, contained the arms, or ſome other device.

Cross, in *Dialling*. See Dial.

Cross, in *Heraldry*, is defined by Guillim, an ordinary compoſed of fourfold lines; whereof two are perpendicular, and the other two tranſverſe; for ſo we muſt conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the feſs-point of the eſcutcheon. See Ordinary.

The content of a *croſs* is not always the ſame: for when it is not charged, cantoned, nor accompanied, it has only the fifth part of the field; but if it be charged, it muſt contain the third part thereof.

This bearing was firſt beſtowed on ſuch as had performed, or at leaſt undertaken, ſome ſervice for Chriſt, and the Chriſtian profeſſion; and is held, by divers, the moſt honourable charge in all heraldry. What brought it into ſuch frequent uſe, was the ancient expeditions into the Holy Land; and the holy war pilgrims, after their pilgrimage, taking the *croſs* for their cognizance; and the enſign of that war being the *croſs*.

In thoſe wars, ſays Mackenzy, the Scots carried St. Andrew's *croſs*; the French a *croſs* argent; the Engliſh a *croſs* or; the Germans, ſable; the Italians, azure; the Spaniards, gules.

St. George's *croſs*, or the *red croſs*, in a field argent, is now the ſtandard of England; that ſaint being the reputed patron of this nation.

Guillim enumerates thirty-nine different ſorts of *croſſes* uſed in heraldry, the ſeveral names whereof here follow; the deſcriptions whereof are to be looked for under their proper articles. A *croſs* voided, a *croſs* wavy-voided, a *croſs* patée fimbriated, a *croſs* patée fitched on the foot, a *croſs* patée on three parts and fitched on the fourth, a *croſs* engrailed, a *croſs* patonée, a *croſs* flory, a *croſs* patonée voided, a *croſs* avelane, a *croſs* patée lambeaux, a *croſs* furchée, a *croſs* croſlet, a *croſs* croſlet fitchée at the point, a *croſs* bottonée, a *croſs* pommée, a *croſs* urdée, a *croſs* degraded fitchée, a *croſs* potent, a *croſs* potent fitched, a *croſs* calvary, a *croſs* croſlet ſet in degrees, a *croſs* patriarchal, a *croſs* anchored, a *croſs* molinée, a *croſs* clechée, a *croſs* flory or fleur-de-lys, a *croſs* double fitchée, a *croſs* a-ſeize points, a *croſs* milrinée, a *croſs* raguled, a *croſs* pointed voided, a *croſs* pall, a tau or St. Antony's *croſs*, a *croſs* voided and couped, a *croſs* couped pierced, a *croſs* molinée pierced lozenge ways, a *croſs* molinée quarter-pierced, a ſaltire or St. Andrew's *croſs*, which will be diſtinctly ſpoken of under that denomination; and ſo all the other may be found more particularly deſcribed under the names of their ſeveral differences.

Colombiere makes ſeventy-two diſtinct ſorts of *croſſes*, of which we ſhall only mention thoſe that differ from ſuch as have been mentioned above; as a *croſs* remply, which is only one *croſs* charged with another; a *croſs* party, that is, one half of one colour, and the other of another; a *croſs* quartered, that is, the oppoſite quarters of ſeveral colours; a *croſs* of five pieces, that is, of ſo many colours; a *croſs* mouſſue, and abaiſée; a *croſs* barbée; a *croſs* croiſſanante, or creſcented, that is, having a creſcent at each end; a *croſs* forked of three points; a *croſs* pometée of three pieces; a *croſs* reſſercelée; a *croſs* pointed; a *croſs* ankered, and fur-ankered; a *croſs* ankered with ſnakes heads; a *croſs* orled; a high *croſs*; a *croſs* rayonnant, or caſting out rays of glory; a *croſs* of Malta; a *croſs* of the Holy Ghoſt; a *croſs* forked like the ancient reſts for muſquets; a *croſs* with eight points; a *croſs* bourdonnée; a *croſs* cramponnée and tournée; a *croſs* cablée; a *croſs* inclining; a *croſs* pater noſtre, that is, made of beads; a *croſs* treſle; a *croſs* fleuronnée; a *croſs* vuidée, clechée, and pommetée; a *croſs* crenellée and baſtiéle; a *croſs* with four ſteps to every arm; a *croſs* rounded; a *croſs* and an half; a *croſs* eſtoilée, or ſtar-ways; a *croſs* corded; a *croſs* doubled of ſix pieces ſet together; a double *croſs* ſplit in pale; a long *croſs* cut in pieces and diſmembered; a *croſs* couped or cut through in feſſe, of the two contrary colours to the field; a chevron ſurmounted by an half *croſs*; four tails of ermine in a *croſs*, the tops of the ermines oppoſite to each other in the middle; four pieces of vair placed *croſs-ways*, and counter-pointing in the center; the *croſs* or ſword of St. James; *croſs* potence cramponnée on the dexter upper arm, and a potence about the middle of the ſhaft.

Theſe are the various *croſſes* we find in the aforeſaid authors; which ſome may think too many, as not being all uſed in England: but heraldry extends to all countries; and all terms uſed require to be explained.

Nor is it only in *croſſes* that the variety is ſo great; the like is found in many other bearings, and particularly in lions, and the parts of them; whereof the ſame Colombiere gives us no leſs than ninety-ſix varieties. Leigh mentions but forty-ſix ſeveral *croſſes*; Sylvanus Morgan, twenty-ſix; Upton, thirty; Johannes de Bado Aureo, twelve; and ſo others, whom it is needleſs to mention. Upton owns he dares not preſume to aſcertain all the various *croſſes* uſed in arms, for that they are at preſent almoſt innumerable: and therefore he only takes notice of ſuch as he had ſeen uſed in his own time.

Crosses, in *Mining*, are two nicks cut on the ſuperficies of the earth, thus +, which the miners make when they take the ground, to dig for ore. This *croſs* gives the miners three days liberty to make, and ſet on ſtones. As many of theſe *croſſes* as the miner makes, ſo many mears of ground he may have in the vein, if he ſet on ſtones within three days after the making his *croſs* or *croſſes*. But if he make but one *croſs*, and a ſtander-by makes the ſecond, and a ſtranger makes the third, every one is ſerved with the next mear, according as they have, firſt or laſt, ſooner or later, made their *croſs*, or *croſſes*, upon the ground.

Cross, in *Surveying*, is an inſtrument conſiſting of a braſs circle, divided into four equal parts, by two lines cutting each other in the center: at each extremity of either line is fixed a ſight, perpendicular over the lines; with holes below each ſlit, for the better diſcovery of diſtant objects. The *croſs* is mounted on a ſtaff, or ſtand, for uſe. Sometimes, inſtead of four ſights there are eight. The *ſurveying croſs* is but little known or uſed among us: abroad it is of more account. The manner of applying it is as follows.

Suppoſe the field ABCDE (*Tab. Surveying, fig.* 9.) required to be ſurveyed: plant poles at all the angles; meaſure the line AC, and the perpendiculars let fall from the angles to the line: take down the dimenſions of each. Now, to find the point F, plant poles at pleaſure in the line AC, and at the foot of the inſtrument in the ſame line, in ſuch manner, as that through two of the oppoſite ſights you may obſerve two of the ſtaves; and through the other two, the ſtaff E. If in this ſtation E be not viſible, remove the inſtrument backwards or forwards, till the lines AF, EF, make a right angle in F; by which means, the plot of the triangle AFE will be had. After the ſame manner is the point H found, where the perpendicular DH falls; whoſe length, together with that of HF, is meaſured, to have the plot of the trapezium EFHD.

Again, meaſure HC, making a right angle with HD, and the plot of the triangle DHC will be had. All that now remains, is to find the point G, where the perpendicular BG falls: which being found after the ſame manner as the reſt, we have the plot of the whole field A, B, C, D, E. The area whereof is had by adding the triangles and trapeziums together.

Cross-*bar ſhot*, in the *Military Art*, a round ſhot, or great bullet, with a bar of iron put through it, coming out at both ends ſix or eight inches. It is of good uſe in fight, for cutting and ſpoiling ropes, ſails, &c.

Cross *battery*, in *War*. See Battery.

Cross-*bill*, in *Zoology*, the Engliſh name of the loxia, a ſmall bird remarkable for its beak, which is hooked both ways, and has the points croſſing one another. It feeds on the kernels of fruits, and is very deſtructive in orchards.

In the Linnæan ſyſtem of *Zoology*, *loxia* is uſed for the name of a genus of birds of the *paſſeres* kind; the diſtinguiſhing characters of which are, that the tongue is plain, equal, and whole; the beak large, thick, and ſhort, and crooked and convex both ways.

Of this genus are the *coccothrauſtes*, *loxia*, or *croſs-bill*, &c. It is about the ſize of the green-finch, and much of the ſame ſhape. Its beak is very hard, thick, ſtrong, and black; and contrary to the cuſtom of nature, in all other birds, both parts of it are crooked, and that contrary ways: the upper chap being bent a point downwards, and the lower one hooked and brought upwards to one as ſharp, ſo that the ends ſtand acroſs. They do not always obſerve the ſame ſide of falling over; the upper one ſometimes lying on the right, ſometimes on the left ſide of the under. One would think this croſs ſtructure of the beak but a bad one for feeding with, yet the bird is very voracious; it feeds on ſeeds, which it picks up with great dexterity; in particular, it is fond of the kernels of the apple, and to get at them, ſplits an apple in two with one ſtroke of its oddly-faſhioned beak, by which it does infinite miſchief in orchards. It is common in Germany, Sweden, and ſome other countries, and ſometimes in autumn comes over to us in vaſt abundance, doing great miſchief to the orchards in the weſt of England. It ſings very ſweetly, and, as it is ſaid, only in winter. See *Tab. Birds*, N° 36.

Cross-*bill*, in *Chancery*, is an original bill, by which the defendant prays relief againſt the plaintiff.

Cross-*bows*. See Bows, and Archery.

Cross, inſtead of a ſignature to a deed, &c. is derived from the Saxon practice of affixing the ſign of the *croſs*, whether they could write or not.

Cross-*grained ſtuff*, in *Joinery*. Wood is ſaid to be *croſs-grained*, when a bough or branch has ſhot out of it: for the grain of the branch, ſhooting forward, runs athwart that of the trunk.

In wood well grown this defect is ſcarce perceivable, except in working; but in deal-boards theſe boughs make knots. If the bough grew up with the young trunk, inſtead of a knot is found a *curling in the ſtuff*; very ſenſible under the plane.

Cross-*jack*, in a ſhip, is a ſail extended on the lower-yard of the mizen-maſt, which is hence called the *croſs-jack-yard*. It is ſeldom uſed.

Cross *multiplication*, a method of multiplying feet and inches, by feet and inches, or the like; ſo called, becauſe the members are multiplied *croſs-wiſe*. See Multiplication.

Cross-*piece*, in *Ship-Building*, a rail of timber, extended over the windlaſs of a merchant-ſhip, from the knight-heads to the belfry. It is ſtuck full of wooden-pins, which are uſed to faſten the running-rigging as occaſion requires.

Cross-*ſtaff*, a mathematical inſtrument, otherwiſe called the fore-*ſtaff*.

Cross-*tining*, in *Huſbandry*, a method of harrowing land, conſiſting in drawing the harrow up the interval it went down before, and down that which it was drawn up.

Cross-*trees*, in a ſhip, *croſs* pieces of timber ſet on the head of the maſt, and bolted, and let into one another very ſtrongly. They are four in number, and are generally called *croſs-trees*, but, ſtrictly ſpeaking, only thoſe which go thwart ſhips, are called *croſs-trees*; the other, in the largeſt ſhips, are called treiſel-trees. Their uſe is to keep and bear the top-maſts up; for the foot of the top-maſt is always faſtened into them, ſo that they bear all the ſtreſs. They alſo bear the tops, and are neceſſary to all maſts which carry any other top, or flag-ſtaff, at the head. Manwayring.

Cross-*tree-yard* is a yard ſtanding ſquare, juſt under the mizen-top, and to it the mizen-top is faſtened below. See Cross-*jack*.

Cross, *Winter*, in *Botany*, *Eriſymum*. See *Hedge* Mustard.

Cross-*wort*, *Cruciata*, in *Botany*, the name of a genus of plants, the characters of which are theſe: that the flowers and fruit wholly agree with thoſe of the aparine, but the leaves grow in form of ſtars round the ſtalks, and are only four at a joint. This is a ſpecies of Valantia in the Linnæan ſyſtem.

The ſpecies of *croſs-wort* enumerated by Mr. Tournefort are nine. Tourn. Inſt. p. 115.

A decoction of this plant in wine has been recommended as a very excellent vulnerary and detergent. Camerarius tells us, that it is of great efficacy in attenuating and expectorating tough humours.

CROSSE, a name given by the people of Guinea, and ſome other parts of Africa, to a kind of fruit very common among them. It very much reſembles our common hazel-nut, but that the ſhell is not ſo hard. Phil. Tranſ. N° 108.

CROSSELET, *little croſs*, a diminutive *croſs*, uſed in *Heraldry*, where we frequently ſee the ſhield covered with *croſſelets*; alſo feſſes, or other honourable ordinaries, charged or accompanied with *croſſelets*.

Croſſes themſelves frequently terminate in *croſſelets*: as in *Tab*. II. *Heraldry*, *fig*. 54.

CROTALARIA, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the flower is of the butterfly-kind, the ſtandard large, heart-ſhaped, and pointed; the wings are oval, and half the length of the ſtandard; the keel is pointed, and as long as the wings. It hath ten ſtamina, which are united, and an oblong reflexed germen, which afterward becomes a ſhort turgid pod, with one cell, opening with two valves, and filled with kidney-ſhaped ſeeds. There are nine ſpecies, natives of the Eaſt and Weſt Indies.

CROTALOPHORUS *anguis*, in *Zoology*, the name uſed by the generality of authors for the *rattle*-snake.

Crotalophorus *anguis*, in *Zoology*, is alſo the name of a very remarkable ſpecies of ſerpent, more uſually known by the name of cobra *de capello*.

CROTALUM, an ancient kind of caſtagnetta, or muſical inſtrument, found on medals, in the hands of the prieſts of Cybele.

The *crotalum* differed from the *ſiſtrum*; though authors frequently confound the two. It conſiſted of two little braſs plates, or rods, which were ſhaken in the hand, and in ſtriking againſt each other made a noiſe. It was ſometimes alſo made of a reed ſplit lengthwiſe; one part whereof they ſtruck againſt the other: and as this made a noiſe ſomewhat like that of a crane's bill, they called that bird *crotaliſtria*, a player on the *crotala*: and Ariſtophanes calls a great talker a *crotalum*.

Clemens Alexandrinus attributes the invention to the Sicilians; and forbids the uſe thereof to the Chriſtians, becauſe of the indecent motions and geſtures that accompany it.

CROTALO, an inſtrument of military muſic, like that deſcribed in the preceding article. The Turks are the firſt, among the moderns, who introduced the uſe of it for their troops. It is now common in Flanders and Florence, and other territories on the continent. It has only one tone; but its effect in marking time may be diſtinctly heard through the noiſe of forty drums. This is the ſame inſtrument with the ancient cymbalum.

CROTALYSTRIÆ, in *Antiquity*, a kind of morice dancers, admitted to entertainments, in order to divert the company with their dancing, and playing on an inſtrument called crotalum, whence they had their name.

CROTAPHIC *artery* is uſed, by ſome medical writers, to denote the tendon of the muſcle called crotaphites, or *temporalis*.

CROTAPHITES, in *Anatomy*, a muſcle of the lower-jaw, ſerving to draw it downwards. Its fibres ſpring ſeverally from the bones of the forehead, the ſinciput, ſphenoides, and temporale; which meeting, and, as it were, centering under the *os jugale*, whence alſo this muſcle receives ſome fibres, proceed to the *proceſſus corone*, into which they are inſerted.

CROTAPHIUM, in *Medical Writers*, is uſed for a pain in the head. See Head-*ach*.

CROTCHES, *Croccia*, in *Sea-Language*, a name given to thoſe crooked timbers that are placed upon the keel, in the fore and hind-parts of a ſhip, upon which the frame of her hull grows narrower below, as it approaches the ſtem afore, and the ſtern-poſt abaft.

Crotches are alſo certain pieces of wood or iron, whoſe upper parts open into two horns, or arms, like a half-moon. They are fixed in different parts of the ſhip, according to the uſes for which they may be deſigned, which is uſually to ſupport the ſpare maſts, yards, &c.

CROTCHET, in *Muſic*, one of the notes, or characters of time, marked thus  equal to half a minim, and double a quaver.

It is not eaſy to conceive how this character comes by the name *crotchet*: the word is apparently borrowed from the French *crochet*, of *croc*, a *crook* or *hook*, uſed by them for what we call the *quaver*, or *half crotchet*; by reaſon of the additional ſtroke at bottom, which gives it an appearance of a crook.

A dot added to the *crotchet*, thus  increaſes its time by half; that is, makes it equal to a *crotchet* and an half, or to three quavers.

Crotchet, in *Printing*, denotes a ſort of line, ſometimes ſtrait, ſometimes waved, but always turned up at each extreme: ſerving to bind or link together ſeveral articles, that are to be read together, before you proceed to the ſubdiviſions, placed aſide of them with ſimilar or ſmaller *crotchets*; much uſed in genealogies, analytical tables, &c. for facilitating the diviſion and ſubdiviſion of any ſubject.

Crotchets are alſo uſed for two oppoſite characters, ſerving to incloſe what we call a *parentheſis*, or any other part of a diſcourſe, to be diſtinguiſhed from the reſt of the work; ſometimes in this [ ], and ſometimes in this ( ).

CROTON, in *Botany*, a genus of the *monoecia monadelphia* claſs, *baſtard ricinus*, or *tallow-tree*. Its characters are theſe: it hath male and female flowers on the ſame plant; the flowers have five petals, thoſe of the male being no larger than the leaves of the empalement; and they have five nectarious glands, which are fixed to the receptacle. They have ten or fifteen ſtamina, which are joined at their baſe. The female flowers have a roundiſh germen, with three reflexed ſtyles, which afterward become a roundiſh three-cornered capſule with three cells, each containing a ſingle ſeed. There are nine ſpecies, natives of the Weſt Indies, and ſouth of France.

CROUP, in *Medicine*, *ſuffocatio ſtridula*, is a diſeaſe to which children, chiefly under twelve years of age, are ſubject in cold and wet ſeaſons, and moſt commonly on the ſea-coaſt, and in low marſhy countries. It is a ſpecies of asthma or catarrh, attended with an inflammatory fever, and many violent ſymptoms. It is ſeated in the cavity of the wind-pipe, a little below the glottis downwards, and affects the mucus ſeparated there, which is ſo thickened, as to fill up the paſſage of the trachea. It often proceeds from catarrhs, occaſioned by the meaſles, hooping-cough, ſmall-pox, or cold damp weather. It is indicated by a frequent pulſe, quick and laborious breathing, which is performed with a peculiar kind of croaking noiſe; the voice is ſharp and ſhrill, and the face generally much fluſhed, though ſometimes of a livid colour. When a child is ſeized with the above ſymptoms, his feet ſhould be put into warm water; he ſhould be bled, and a laxative clyſter adminiſtered as ſoon as poſſible. He ſhould be made to breathe over the ſteams of warm water and vinegar; an emollient decoction and cataplaſms, or fomentations, may be applied round the neck; a bliſter-plaſter may be alſo applied to the neck, or ſhoulders. A mixture of ſyrup of althea, and balſamic ſyrup, an ounce each, with three ounces of pennyroyal water, may be given in the quantity of a table-ſpoonful frequently. Aſſa-fœtida has likewiſe been of ſervice. This diſorder is in ſome places called the chock, and the ſtuffing or riſing of the lights. Buchan's Domeſtic Med. ed. 5. p. 606. Home's Inquiry into the Nature and Cure of the *Croup*.

CROUP *of a horſe*, in the *Manege*, the extremity of the reins above the hips. It ſhould be large and round, ſo that the tops of the two haunch bones be not within view of each other. It ſhould have its compaſs from the haunch bones to the very dock, or onſet, of the tail; and ſhould be divided in two by a channel, or hollow, all along to the neck. A rocking *croup* is when a horſe's fore-quarters go right, but his *croup* ſwings from ſide to ſide; when ſuch a horſe trots, one of the haunch bones will fall, and the other riſe like the beams of a balance; a ſign that he will not be very vigorous.

CROUPADE, in the *Manege*, a leap, higher than the curvet, wherein the fore and hind-parts of the horſe keep an equal height; his legs being truſſed under his belly, without ſtretching them out, or ſhewing his ſhoes.

CROUPER, or CRUPPER. See CRUPPER.

CROUTE, *Sour-croute*, or KROUTE. As this preparation of CABBAGE has been found of ſovereign efficacy as a preſervative in long voyages from the ſea-ſcurvy, it may not be unacceptable to give a conciſe account of the proceſs for making it, according to the information communicated by an ingenious German gentleman.

The ſoundeſt and moſt ſolid cabbages are ſelected for this uſe, and cut very ſmall, commonly with an inſtrument made for this purpoſe; not unlike the plain which is uſed in this country for ſlicing cucumbers. A knife is uſed, when the preparation is made with greater nicety. The cabbage thus minced is put into a barrel in layers, hand high, and over each is ſtrewed a handful of ſalt and carraway ſeeds; in this manner it is rammed down with a rammer *ſtratum ſuper ſtratum*, till the barrel be full; when a cover is put over it, and preſſed down with a heavy weight. After ſtanding ſome time in this ſtate, it begins to ferment; and it is not till the fermentation has entirely ſubſided, that the head is fitted to it, and the barrel is finally ſhut up, and preſerved for uſe. There is not a drop of vinegar employed in this preparation. The Germans write this preparation in the following manner: *Sauer kraut*, or *ſaurer kohl*, that is, in their language, ſour herb, or ſour cabbage.

CROW, *Cornix*, in *Ornithology*. See CORVUS.

The carrion *crow*, *cornix*, or *corvus corone* of Linnæus, agrees in the form of its body with the RAVEN, and in its food, which is carrion, and other filth. It will alſo eat grain and inſects, and, like the raven, pick out the eyes of lambs juſt dropped. Ben Johnſon, in his Fox, act i. ſcene 2. calls it the *gor*, or *gore-crow*, and claſſes it with the vultur, kite, and raven, as birds of prey. Virgil ſays that its croaking foreboded rain:

Tum cornix *plena pluviam vocat improba voce.*

And it was thought to be a bird of bad omen, when ſeen on the left hand:

Sæpe ſiniſtra cava prædixit ab illice cornix.

England formerly abounded with *crows*; and in the reign of Henry VIII. an act was paſſed for their deſtruction.

CROW, *hooded*, *corvus cornix*, agrees in the ſhape of its bill with the ROOK, and reſembles it alſo in its manners, flying in flocks, and feeding on inſects. In England it is a bird of paſſage, viſits us in the beginning of winter, and leaves us with the woodcocks. It is common in Scotland, and is the only ſpecies of genuine *crow* in many parts of the Highlands, and in all the Hebrides, Orkneys, and Shetlands, where it continues the whole year. They have a ſhriller note than the common *crows*, and are much more miſchievous. The head, and under ſide of the neck and wings, are black, gloſſed over with a fine blue; the breaſt, belly, back, and upper part of the neck, are of a pale aſh colour; the irides hazel, the legs black, and the toes broad and flat, to enable them to walk without ſinking in marſhy and muddy ground.

CROW, in *Mechanics*, an iron lever, furniſhed with a ſharp point at one end, and two claws at the other. It has various uſes, in heaving or purchaſing great weights.

The name *crow*, or *raven*, *corvus*, was anciently given to ſeveral machines of war, uſed in the defence of places: one invented by Diades; another by the Tyrians, mentioned by Q. Curtius; another by Cn. Ovilius. Vitruvius calls the firſt the *demoliſhing crow*, *corvus demolitor*, and alſo *deprædator*: others call it the *crane*, *grus*. Polybius deſcribes another invented by C. Duillius uſed againſt the Carthaginian fleet.

They were all a kind of grappling-hooks; ſerving to drag things towards the engineer. That deſcribed by Q. Curtius was thrown out of a baliſta.

CROW-*berries*, in *Botany*, *Empetrum*. See *Berry-bearing* HEATH.

CROW'S-*bill*, an inſtrument uſed by ſurgeons, in their operations; eſpecially for drawing bullets and other foreign bodies out of wounds. It has its name from its figure.

CROW'S-*feet*, in the *Military Art*. See CALTROP.

CROW'S-*feet*, in a *Ship*, are ſmall ropes, or lines, ſometimes ſix, eight, or ten, reeved through the dead man's eye. They are uſed to ſuſpend the awnings; or to keep the top-ſails from fretting againſt the edges of the tops.

CROW-*foot*, *muſk-wood*. See ADOXA.

CROW'S-*foot*, in *Botany*. See RANUNCULUS.

CROW-*flowers*. See CAMPION.

CROW-*garlic*, a name given to a ſpecies of ONION.

CROW-*net*. See NET.

CROW, *ſcare*, in *Ornithology*, a ſpecies of the larus. See GULL.

CROW-*ſtaves*, in *Agriculture*, a name given to a part of a plough, ſignifying two upright pieces ſtanding perpendicularly, inſerted into the box of the plough, near the wheels, and each pierced with two rows of holes; by means of which they ſupport a tranſverſe piece, called the pillow of the plough, running acroſs them, and ſerving to raiſe or ſink the beam, by being pinned higher or lower, according as the ground is to be ploughed deeper or ſhallower. See PLOUGH.

CROWD, *to*, in *Sea Language*, is to carry an extraordinary force of ſail on a ſhip, in order to accelerate her courſe on ſome important occaſion.

CROWN, *Corona*, a mark of regal dignity; being an ornament worn on the head by kings and ſovereigns, as a ſymbol of their authority.

Gallot derives the word *corona*, whence *crown*, from the Latin *cornu*, *horn*; becauſe the ancient *crowns* were pointed in manner of horns; which were anciently, both by Jews and Gentiles, eſteemed as marks of power, ſtrength, authority, and empire. Hence, in the Holy Scripture, horns are uſed for the regal dignity: and accordingly, *horn* and *crown*, in the Hebrew, are expreſſed by the ſame word.

In the remoteſt antiquity, the *crown* was only given to gods. Pliny ſays, that Bacchus was the firſt who uſed it. Pherecydes, cited by Tertullian De Corona, ſays, Saturn. Diodorus aſcribes it to Jupiter, after his victory over the Titans. Q. Fabius Pictor attributes the invention to Janus; adding, that it was an ornament he uſed in ſacrificing. Leo the Egyptian ſays, it was Iſis who firſt wore a *crown*; and that it conſiſted of ears of corn, the uſe whereof ſhe firſt taught men.

In this, moſt authors agree, that the *crown*, originally, was rather a religious than a civil ornament; rather one of the pontificalia, than the regalia; that it only became common to kings, as the ancient kings were prieſts as well as princes; and that the modern princes are entitled to it, in their eccleſiaſtical capacity rather than their temporal. See KING, &c.

The firſt *crowns* were no more than a bandelet, or head-band, drawn round the head, and tied behind; as we ſtill ſee it repreſented on medals, around the heads o Jupiter, the Ptolemies, and the kings of Syria.

Afterwards they conſiſted of two bandelets; by degrees they took branches of trees of divers kinds: at length they added flowers; inſomuch that Tertullian, De Corona, aſſures us (from Claudius Saturninus, who had written expreſly on the ſubject) there was not any plant whereof *crowns* had not been made.

The woods and groves were ſearched, to find different *crowns* for the ſeveral deities: thus, on medals, we find Jupiter's *crown* of flowers, more frequently of laurel; Juno's of the vine; that of Bacchus, the vine with grapes, vine-leaves, and branches of ivy, with flowers and berries: thoſe of Caſtor, Pollux, and the river-gods, of bulruſhes; that of Apollo, ſometimes of laurel, ſometimes of ruſhes; that of Saturn, new figs; that of Hercules, poplar; that of Pan, pine or alder; that of Lucina, dittany; that of Horæ, the fruits proper to each ſeaſon; that of the Graces, olive-branches, as well as that of Minerva; that of Venus, roſes; of Ceres, ears of corn, as well as that of Iſis; that of the Lares, myrtle or roſemary, &c.

Crowns were not only uſed on the ſtatues and images of the gods, by the prieſts in ſacrificing, and by kings and emperors; but alſo on altars, temples, doors of houſes, ſacred veſſels, victims, ſhips, &c.

The *agonothetæ crowned* thoſe who were victors in the ſolemn games, warriors, &c.

Among the Romans, there were various kinds of *crowns*, diſtributed as rewards of military atchievements. The *oval crown* was the firſt, made of myrtle; and was beſtowed on generals who had been victorious over ſlaves or enemies unworthy of the Roman valour, and who were entitled to the honours of the leſſer triumph, called *ovation*. *Tab.* III. *Heraldry*, *fig.* 96.

The ſecond was the *naval* or *roſtral crown*, conſiſting of a circle of gold, raiſed with prows and poops of ſhips; given to the captain who firſt grappled, or the ſoldier who firſt jumped aboard an enemy's ſhip. *Fig.* 97.

The third called *vallaris*, or *caſtrenſis*, was alſo a circle of gold, raiſed with piles or palliſades; given to him who firſt leaped into the enemy's camp, or forced the palliſades. *Fig.* 98.

The fourth, called *mural crown*, was a circle of gold, indented or embattled; given to him who firſt mounted the wall of a place beſieged, and there lodged a ſtandard: this *crown* we alſo find given, on medals, to the particular genii and guardians of provinces and places. *Fig.* 99.

The fifth, the *civic crown*; made of a branch of green oak; given to him who had ſaved the life of a citizen in a battle or aſſault. This was conferred on Cicero for detecting Catiline's conſpiracy, and afterwards on Auguſtus Cæſar himſelf. *Fig.* 100.

The ſixth was the *triumphal crown*, made of branches of laurel, or bay-tree, given to a general who had gained a battle, or conquered a province. This was afterwards made of gold. *Fig.* 101.

The ſeventh the *corona obſidionalis*, or *graminea*, made of graſs or herbs found on the ground; given to generals who had delivered a Roman army beſieged by the enemy, and obliged him to decamp. *Fig.* 102.

The eighth was alſo a *crown* of laurel, given by the Greeks to their athletæ; and by the Romans, to thoſe who had negociated, or confirmed a peace with an enemy: this was the leaſt eſteemed. Beſides theſe, in antiquity, we meet with *radial crowns*, given to princes at their tranſlation, among the gods; whether before or after their death. *Fig.* 103. Caſaubon ſays, this ſort of *crown* was peculiar to deities; yet it is certain Nero took it in his life-time.

Athletic crowns were deſtined to crown victors at the public games.

From ſome paſſages in Euſebius Cæſarienſis, ſome authors conclude, that biſhops had likewiſe anciently their *crowns*.

The Roman emperors had four kinds of *crowns*, ſtill ſeen on medals, viz. a *crown* of laurel, a radiating *crown*, a *crown* adorned with pearls and precious ſtones; and the fourth a kind of bonnet, or cap, ſomething like the mortier.

The firſt was ordinarily that uſed from the time of Julius Cæſar: the right of bearing it was granted him by the ſenate; ſome ſay, on account of his baldneſs; and afterwards continued to his ſucceſſors. Juſtinian was the firſt who took that of the bonnet-kind.

The *papal* CROWN is compoſed of a cap or tiara, encloſed by three marquiſes coronets, having two pendants, like the biſhops mitres; and on its top a mound of gold: theſe three *crowns* repreſent the pretended triple capacity of the pope, viz. as high-prieſt, ſupreme judge, and ſole legiſlator of the Chriſtians. *Fig.* 104.

The *imperial* CROWN is a bonnet or tiara, voided at the top like a creſcent, with a circle of gold, adorned with precious ſtones and pearls, heightened with fleurs-de-lys, ſupporting a globe, with a croſs at the top. *Fig.* 105.

The *Engliſh* CROWN is adorned with four croſſes, in the manner of thoſe of Malta; between which are fleurs-de-lys. It is covered with four diadems, which meet at a little globe ſupporting a croſs. *Fig.* 106.

The *French* CROWN is a circle, enamelled, of eight fleurs-de-lys, encompaſſed with eight arched diadems; bearing a-top a double fleur-de-lys, which is the creſt of France. *Fig.* 107.

The *Spaniſh* CROWN is adorned with large indented leaves, covered with diadems; bordering on a globe, ſurmounted with a croſs. *Fig.* 108. Thoſe of Portugal, Poland, Denmark, and Sweden, are of the ſame form.

The *crowns* of moſt other kings are circles of gold, adorned with precious ſtones, and heightened up with large trefoils, and cloſed by four, ſix, or eight diadems, ſupporting a mound, ſurmounted with a croſs.

The great Turk bears over his arms a turband, enriched with pearls and diamonds, under two coronets, the firſt of which is made of pyramidal points, heightened up with large pearls, and the uppermoſt is ſurrounded with creſcents. *Fig.* 109.

The *Electoral* CROWN, or *coronet*, is a ſcarlet cap, turned up with ermine, and cloſed with a ſemi-circle of gold, all covered with pearls. On the top of it there is a globe with a croſs thereon. *Fig.* 110.

CROWNS, or *coronets*, *of Britiſh princes of the blood royal*. 1. The *crown* of the prince of Wales: this was formerly a circle of gold, ſet round with four croſſes-pattee, and as many fleurs-de-lys alternately; but now conſiſts of one arch, adorned with pearls; in the middle of which is a ball and croſs, and bordered with ermine, as in the royal diadem. *Fig.* 111. Beſides this, the prince of Wales has another diſtinguiſhing mark of honour, viz. a plume of three oſtrich feathers, with an ancient coronet of a prince of Wales, with this motto, *Ich dien*, i. e. *I ſerve*. This device was at firſt taken by Edward prince of Wales, commonly called the Black Prince, after the battle of Creſſy, where, having killed John king of Bohemia, he took from his head ſuch a plume, and put it on his own. *Fig.* 112. 2. That of the younger ſons and brothers of the king, conſiſts likewiſe of a circle of gold, bordered with ermine, and heightened with four croſſes and fleurs-de-lys alternately, but without any arch, or being ſurmounted with a globe and croſs on the top. *Fig.* 113. 3. That of the other princes of the blood conſiſts alternately of croſſes and leaves, like thoſe in the coronets of dukes, &c. *Fig.* 114. Thoſe of the princeſſes have the addition of ſtrawberry-leaves. *Fig.* 115.

CROWNS, or *coronets*, *of the Britiſh nobility*. 1. That of a duke is a circle of gold, bordered with ermine, and enriched with pearls and precious ſtones, and ſet round with eight large leaves of parſley, or ſtrawberry. *Fig.* 116. 2. That of a marquis is ſet round with four ſtrawberry-leaves, and as many pearls, on pyramidal points of equal height, alternately. *Fig.* 117. 3. An earl's has eight pyramidal points, with as many large pearls on the tops of them, placed alternately, with as many ſtrawberry-leaves, lower than the pearls. *Fig.* 118. 4. The viſcount has only pearls, without any limited number, placed on the circle itſelf, all round. *Fig.* 119. 5. A baron has only ſix pearls, ſet at equal diſtance, on the golden border of ermine; not raiſed, to diſtinguiſh him from the earl; and limited, to ſhew that he is inferior to the viſcount. *Fig.* 120.

The eldeſt ſons of peers, above the degree of a baron, uſe the CORONET appertaining to their father's ſecond title; and none of the younger ſons uſe *coronets*.

The *coronet* of a French earl is a circle of gold, with eighteen pearls ſet on the brim of it; that of a French viſcount an enamelled circle of gold, charged with four large pearls; and that of a French baron a circle of gold enamelled, and bound about with a double bracelet of pearls. All theſe are uſed on their coats of arms, and not worn on their head, as Britiſh noblemen and their ladies do at the king's coronation.

Ch. Paſchal has wrote expreſly de Coronis. Baudelot, in his Hiſtory of Ptolemy Auletes, has a number of curious obſervations on the ſame ſubject, that had eſcaped Paſchal. Du-Cange gives us a curious diſſertation on *crowns*; and Schmeizell, a German, a treatiſe of *royal crowns*, both ancient and modern.

CROWN, in *Architecture*, denotes the uppermoſt member of the corniche; called alſo CORONA and LARMIER.

CROWN, in *Aſtronomy*, is a name given to two conſtellations; the one called *ſeptentrionalis*, and the other *meridionalis*. See CORONA.

CROWN, in *Commerce*, is a general name for coins both foreign and domeſtic, of or near the value of five ſhillings ſterling.

In its limited ſenſe, *crown* is only applicable to that popular Engliſh coin which bears the name, and which is equivalent to ſixty Engliſh pence, or five ſhillings; or to ſix livres French money. But, in its extenſive ſenſe, it takes in ſeveral others; as the French ecu, which we call the French *crown*, ſtruck in 1641 for ſixty ſols, or three livres; alſo the patagon, dollar, ducatoon, rix-dollar, and piaſtre, or piece of eight.

CROWN, in an *Eccleſiaſtical Senſe*, is uſed for the clerical tonſure; which is the mark, or character, of the Romiſh eccleſiaſtics.

This is a little circle of hair, ſhaved off from the *crown* of the head; more or leſs broad, according to the quality of the orders received. That of a mere clerk is the ſmalleſt; that of prieſts and monks the largeſt.

The *clerical crown* was anciently a round liſt of hair, ſhaved off around the head, repreſenting a real *crown*: this is eaſily obſervable in ſeveral ancient ſtatues, &c. The religious of St. Dominic and St. Francis ſtill retain it.

CROWN, in *Geometry*, a plane ring included between two parallel or concentric peripheries, of unequal circles; generated by the motion of ſome part of a right line round a center, the moving part not being contiguous to the center.

The area of this is had, by multiplying its breadth by the length of a middle periphery, which is a mean proportional between the two peripheries that bound it.

Let D be the middle point of the breadth AB (*Tab.* II. *Analyſis, fig.* 39.); let CB $= a$, and CA $= r$. Let the circumference of the outer circle be c, and its area will be $\frac{ca}{2}$, and the area of the inner circle will be $\frac{cr^2}{2a}$, this quantity being a fourth proportional to a^2, r^2, and $\frac{ca}{2}$; then the difference of theſe two areas, or the area of the *crown*, will be $\frac{ca}{2} - \frac{cr^2}{2a} = \overline{a-r} \times \frac{c}{2} \times \frac{a+r}{a}$: but $a-r$ is equal to AB, the breadth of the *crown*, and $\frac{c}{2} \times \frac{a+r}{a}$ is the circumference of the circle, whoſe radius is CD; becauſe CD is an arithmetic mean between CA and CB, and therefore equal to $\frac{r+a}{2}$, and the circumferences of circles are as their radii, or $a : c :: \frac{r+a}{2} : \frac{c}{a} \times \frac{a+r}{2}$.

Crown, or **Coronet**, in *Heraldry*, is uſed for the repreſentation of that ornament, in the mantling of an armoury; to expreſs the dignity of the perſon who bears it. The *crown* here is of more antiquity even than the helmet; and it was uſed as a ſymbol of victory and triumph.

Crown, among *Jewellers*, the upper work of the roſe diamond, which all centers in the point at the top, and is bounded by the horizontal ribs.

Crowns, *pearled*, or *flowered*, thoſe with pearls, or leaves of ſmallage, parſley, &c. Such were anciently almoſt all *crowns*, even thoſe of ſovereign princes: though they were not uſed in their armours, till about two hundred years ago.

Crowns, *radiated*, or *pointed*, are thoſe of the ancient emperors, which had twelve points; repreſenting, as ſome will have it, the twelve months of the year.

Crown *Royal, order of*, an order of knighthood, which, ſome ſay, was inſtituted in 802; the knights of which bore a *crown* embroidered with gold, on a white robe. Others deny the exiſtence of ſuch an order.

Crown *of colours*, in *Meteorology*, certain coloured rings, which, like halos, appear about the body of the ſun and moon, but of the colours of the rainbow; and at a leſs diſtance than the common halos. Theſe *crowns* Sir Iſaac Newton ſhews to be made by the ſun's ſhining in a fair day, or the moon in a clear night, through a thin cloud of globules of water or hail, all of the ſame bigneſs; and according as theſe globules are bigger or leſs, the diameter of theſe *crowns* will be larger or ſmaller; and the more equal theſe globules are to each other, the more *crowns* of colours will appear; and the colours will be the more lively.

Crown, in *Muſic*, a REST marked by a reverſed C, with a point in the middle of it thus 𝄐

Crown, *clerk of the*. See CLERK.

Crown, *pleas of the*. See PLEA.

Crown, *officers of the*. See OFFICER.

Crown-*glaſs*, denotes the fineſt ſort of window-glaſs. See GLASS.

Crown-*grafting*. See ENGRAFTING.

Crown, *imperial*, in *Botany*. For the characters, ſee FRITILLARIA.

There are ſeveral diſtinct ſpecies of this plant preſerved in the gardens of the curious, all which make a very elegant appearance; there are alſo a great number of varieties which are propagated from the ſeeds of one or other of the ſpecies, in the ſame manner with thoſe of the TULIP.

When they are thus raiſed, the beſt time for tranſplanting their roots is in July or Auguſt, before they puſh forth new fibres; or they may be taken up out of the ground in June, after their green leaves are decayed, and kept till Auguſt, and then planted out into beds of rich earth, with ſome rotten dung buried deep in them. The moſt pleaſing method of planting them is at eight or ten feet diſtance, in the middle of long flower-beds: a hole of ſix inches deep ſhould be opened with a ſpade, and the root put into it, and the earth put in with the hand upon it, and all the ſtones picked out, and the lumps broke. They now require no farther care, but in February will ſhoot up, and grow ſo quick, if the weather be mild, as to flower in March. As this is uſually a windy ſeaſon, it is proper to plant ſtakes in the earth, to tye theſe plants to, to prevent their being blown down; and it is a good caution never to gather the flowers, which much weakens the roots; they ſhould, therefore, always be ſuffered to die upon the ſtalks. The roots ſhould be removed once in three years, and their off-ſets ſeparated, and planted in beds.

Crown *imperial ſhell*, in *Conchyliology*. See VOLUTA.

Crown-*office*, a court or office under the king's-bench, ſo called, becauſe the *crown* is more immediately concerned in what is therein tranſacted. See COURT *of King's-bench*.

Though none of the officers under the lord chief-juſtice of the king's-bench are employed in ſummoning a parliament; yet many of them have buſineſs in other matters, during the ſitting of the parliament: as in caſes of error, &c. but more eſpecially on trials of peers; wherein the clerk of the *crown* is chief manager. He has likewiſe, out of parliament, all indictments in the *crown*, informations, recognizances; and a multitude of other buſineſs runs through his hands, as the writings of all pleadings, declarations, and other proceedings upon records: but the executive part is left to his ſecondary or deputy.

Crown-*poſt*, in *Architecture*, a poſt which in ſome buildings ſtands upright in the middle, between two principal rafters; and from which there go ſtruts or braces to the middle of each rafter. It is otherwiſe called a *king's-piece*, or *joggle-piece*. See POST.

Crown-*ſcab*, in *Farriery*, a diſeaſe in horſes, conſiſting in an humour that breaks out round the coronet, of a ſharp itching nature, and attended with ſcurfineſs. The beſt remedy for this diſorder is a mixture of equal parts of marſhmallow ointment, and yellow baſilicon, ſpread on tow, and laid round the coronet.

Crown, *right of*, JUS CORONÆ, in *Britiſh Hiſtory*, denotes the right of ſucceſſion to the throne in theſe kingdoms. In this ſenſe the *crown*, according to judge Blackſtone, is by common law, and conſtitutional cuſtom, hereditary, in a manner peculiar to itſelf; ſo that the right of inheritance may from time to time be changed, or limited, by act of parliament. The ſucceſſion is ſuch, that the next heir of the crown takes poſſeſſion on the death or demiſe of the laſt proprietor; not by any *jure divino* title, but that kind of hereditary right which owes its origin ſolely to the founders of our conſtitution. The ſucceſſion likewiſe reſembles that of the heirs to landed eſtates, under particular exceptions: thus, the *crown* deſcends lineally to the iſſue of the reigning monarch, as from king John to Richard II. and to the firſt born of the male iſſue, as in the caſe of Edward V. who was preferred to Richard his younger brother, and Elizabeth his elder ſiſter; but on failure of the male line, it deſcends to the female iſſue: thus Mary I. ſucceeded Edward VI. and the line of Margaret queen of Scots, the daughter of Henry VII. inherited on failure of the deſcendants of Henry VIII. Among the females, the *crown* deſcends to the eldeſt daughter and her iſſue, and not, like common inheritances, to all the daughters at once: thus queen Mary, on her brother's death, was the ſole ſucceſſor, though her ſiſter Elizabeth was living. Moreover, the lineal deſcendants of any perſon deceaſed claim, as their anceſtor would have done, if he had been ſtill living. Thus, Richard II. ſucceeded his grandfather Edward III. in right of his father the Black Prince, to the excluſion of all his uncles. On failure of lineal deſcendants, the *crown* is veſted in the next collateral relations of the late king, if they are lineally deſcended from the blood royal, as in the caſe of Henry I. who ſucceeded to William II. John to Richard I. and James I. to Elizabeth, being all derived from the Conqueror, who was then the only regal ſtock: nor is there any exception, as in common deſcents, to collateral relations of the *half*-BLOOD. Thus Mary I. inherited after Edward VI. and Elizabeth after Mary, though born of Henry VIII. by different mothers.

However this hereditary right is by no means indefeaſible; becauſe the immediate heir has been, and may be excluded by the ſupreme legiſlative authority of this kingdom. Under this controul, the *crown* naturally deſcends either to the *hæres natus*, if the courſe of deſcent is unimpeached, or to the *hæres factus*, in conſequence of a particular ſettlement: becauſe the KING never dies, and there can be no *interregnum*.

Egbert, in the beginning of the ninth century, was the ſole monarch of this kingdom. From Egbert, to the death of Edmund Ironſide, through a ſucceſſion of fiſteen princes, the crown deſcended regularly, with very little deviation. In the three ſucceeding reigns, the ſucceſſion was ſuſpended by force; at length the Saxon line was reſtored in Edward the Confeſſor, who indeed was not the next heir, becauſe his brother Edmund Ironſide had a ſon living, then an outlaw in Hungary. On his deceaſe Harold II. uſurped the throne, though the right remained in Edgar Atheling, ſon of Edward the outlaw. At this time William the Norman invaded England, pretending a right to the *crown* from a grant of Edward the Confeſſor; and his conqueſt transferred the ſucceſſion of the *crown* to a new family. From the Conqueror it deſcended to his ſons William II. and Henry I. the eldeſt ſon Robert being kept out of poſſeſſion by his brethren. Henry was ſucceeded by Stephen of Blois, grandſon of William I. by his daughter Adelicia, his elder brother Theobald waving his claim, and Matilda or Maud, the daughter of Henry I. and the grand-daughter of Edward the outlaw, to whom the ſucceſſion properly belonged, being excluded by force. However, her ſon Henry II. as heir to the Conqueror, ſucceeded Stephen, though the proper heirs in the Saxon line were the ſons of Malcolm king of Scotland, by Margaret, the daughter of Edward the outlaw. From Henry II. the *crown* deſcended to his eldeſt ſon Richard I. and on his death was ſeized by his brother John, the youngeſt ſon of Henry, the right being veſted in his nephew Arthur. On the death of Arthur, and his ſiſter Eleanor, without iſſue, the *crown* properly deſcended to Henry III. the ſon of John, and from him, in an hereditary line of ſix generations, to Richard II. and this right of ſucceſſion was declared in parliament by ſtat. 25 Edw. III. When Richard reſigned the *crown*, the right reſulted to the iſſue of his grandfather Edward III. and particularly to the poſterity of Lionel duke of Clarence; but Henry duke of Lancaſter uſurped the *crown* under the title of Henry IV. pretending to be a ſucceſſor by right line of the blood royal. Parliament, by ſtat. 7 Henry IV. c. 2. ſettled the inheritance of the *crown* and kingdom in him and his heirs. He was regularly ſucceeded by his ſon and grandſon, Henry V. and VI. In the laſt of theſe reigns the houſe of York began to aſſert their dormant title, and eſtabliſhed it in the perſon of Edward IV. At his acceſſion, the diſtinction of a king *de jure*, and a king *de facto*, firſt occurs; and by ſtat. 1 Ed. IV. c. 1. the three Henries are ſtyled kings *in dede, and not of right.* This king was ſucceeded by his eldeſt ſon Edward V. who was depoſed by his unnatural uncle Richard III. under a pretence of baſtardy. During the tyrannical reign of Richard, Henry VII. earl of Richmond, aſſumed the regal dignity, and his poſſeſſion was eſtabliſhed by parliament in the firſt year of his reign. He afterwards married Elizabeth of York, the undoubted heireſs of the Conqueror, in whom the right of the *crown* was veſted. Henry VIII. ſucceeded by indiſputable hereditary right, and tranſmitted the *crown* to his three children in ſucceſſive order; and ſtat. 25 Hen. VIII. cap. 12. provides for the regular ſucceſſion in his deſcendants. This ſtatute was repealed by 28 Hen. VIII. c. 7. by which Elizabeth and Mary were baſtardized, after the king's divorce from Anne Boleyn. They were again legitimated, and the ſucceſſion reſtored by 35 Henry VIII. c. 1. The right both of Mary and Elizabeth is again expreſly recognized by parliament, after their reſpective acceſſion; and parliament explicitly aſſerts its right of directing the ſucceſſion of the *crown*, by ſtat. 13 Eliz. c. 1. On the death of queen Elizabeth, James VI. of Scotland, and I. of England, was the lineal deſcendant, from the alliance of Margaret, eldeſt daughter of Henry VII. by Elizabeth of York with James IV. of Scotland; and in him were united not only the claims of different competitors ſince the Conqueſt, but likewiſe the right of the Saxon monarchs, becauſe he was the direct lineal heir of Malcolm, who married Margaret, grand-daughter of Edmund Ironſide. Several inſtances have occurred, in this abſtract of the hiſtory of the deſcent of the *crown*, in which parliament has interpoſed to fix, direct, and limit the ſucceſſion; particularly, under Henry IV. Henry VII. Henry VIII. queen Mary, and queen Elizabeth; to which we may alſo add the ſtat. 1 Jac. I. c. 1. which recognizes the ſucceſſion as lawfully deſcending to king James.

The attempt to obtain a bill of EXCLUSION in the latter end of the reign of Charles II. evidently ſuppoſed that the *crown* was hereditary, and at the ſame time liable to the controul of parliament. This attempt proved ineffectual, and James II. ſucceeded.

However, in conſequence of his abdication in 1688, and the declared vacancy of the throne, the lords and commons, repreſenting all eſtates of the people of the realm, invited over William prince of Orange, and the princeſs Mary, eldeſt daughter of king James II. and declared them king and queen, during their lives, and the life of the ſurvivor of them; and ſettled the *crown* on the iſſue of queen Mary; and on failure of ſuch iſſue, on the princeſs Anne of Denmark, and her iſſue. Stat. 1 W. and M. c. 2.

By ſtat. 12 and 13 W. III. c. 2. the princeſs Sophia, youngeſt daughter of Elizabeth queen of Bohemia, who was the daughter of James I. and the heirs of her body, being proteſtants, and married to none but proteſtants, were declared next in ſucceſſion after king William, the princeſs Anne, and their iſſue; and it is enacted that they ſhould join in communion with the church of England, as by law eſtabliſhed. After the death of queen Anne, the *crown* deſcended to George I. eldeſt ſon of the princeſs Sophia; from him to George II. and laſt of all to our preſent ſovereign George III. Blackſtone's Commentaries, vol. i. chap. 3. See KING and PARLIAMENT.

CROWN-*wheel of a* WATCH, is the upper wheel next the balance, or that which drives the balance.

CROWN-*work*, in *Fortification*, is an out-work running into the field; deſigned to keep off the enemy, gain ſome hill, or advantageous poſt, and cover the other works of the place. See *Tab. Fortific. fig.* 21. *lit. ll.*

The *crown-work* conſiſts of two demi-baſtions at the extremes, and an entire baſtion in the middle, with curtins.

CROWN, the *American ſea-ſun*. See AMERICAN, &c.

CROWNED, in *Farriery*. A horſe is ſaid to be *crowned*, when by a fall, or other accident, the knee is ſo hurt, that the hair falls off, without growing again.

CROWNED *horn-work*, is a HORN-*work*, with a *crown-work* before it.

CROWNING, in *Architecture*, is underſtood, in the general, of any thing that terminates, or finiſhes a member or decoration.

Thus, a corniche, a pediment, a croteria, &c. are called *crownings*. Thus, alſo, the ABACUS is ſaid to *crown* the capital; and thus any member or moulding is ſaid to be *crowned*, when it has a fillet over it; and a niche is *crowned*, when it is covered with a capital.

CROWNING, in *Sea-Language*, denotes the finiſhing part of a knot made at the end of a rope. It is performed by interweaving the ends of the different ſtrands artfully amongſt each other, ſo as that they may not become looſened or untwiſted. They are uſeful in all kinds of ſtoppers.

CROWTH, or CRUTH, an inſtrument of muſic (ſee *Tab. Muſic, fig.* 3.) reſembling a violin, formerly in common uſe in the principality of Wales. It has ſix ſtrings, ſupported by a flat bridge, placed obliquely to the ſides, and is played on with a bow. A A repreſent the apertures for the hand; B B the ſtrings conducted under the end board; C C the pegs, and *d d* the ſound holes. The fifth and ſixth ſtrings are the uniſon and octave of G, the fourth and third the ſame of C, and the ſecond and firſt the ſame of D; ſo that the ſecond pair of ſtrings are a fourth, and the third a fifth to the firſt.

This inſtrument was not peculiar to Wales; ſince a figure of it has been lately diſcovered among the outſide ornaments of the abbey church of Melroſs in Scotland, built about the time of Edward II.

From the name *crowth* is derived *crowther*, a *crowder*, as a common fidler is now called. The uſe of this inſtrument is almoſt loſt. Hawkins's Hiſt. of Muſic, vol. ii. p. 273.

CROZIERED *abbots*. See ABBOT.

CRUCIAL *inciſion*, in *Chirurgery*, an inciſion, or cut, into ſome fleſhy parts, in form of a croſs.

CRUCIAN, in *Ichthyology*, the CYPRINUS *caraſſius* of Linnæus, is common in many of the fiſh-ponds about London, and other parts of the ſouth of England, though probably not a native fiſh. The meat of it is coarſe, and little eſteemed. For the characters, ſee CARASSIUS.

CRUCIANELLA, in *Botany*, a genus of the *tetrandria monogynia* claſs; *petty madder*. Its characters are theſe: the flower hath one petal, with a ſlender cylindrical tube, longer than the empalement, cut into four parts at the brim. It hath four ſtamina ſituated in the mouth of the tube. It has a compreſſed germen ſituated at the bottom of the tube, which afterward becomes two twin capſules, each containing one oblong ſeed. There are three ſpecies, natives of the ſouthern parts of Europe.

CRUCIBLE, in *Chemiſtry*, &c. a little veſſel, ordinarily of earth, ſometimes of iron, without any handle; wherein chemiſts, coiners, goldſmiths, glaziers, and other artificers, uſe to melt and calcine gold, ſilver, or other metals, whereon they work.

The word is formed from the French *creuſet*, which ſignifies the ſame. Du-Cange derives this further from *cruſelinum*; which, in the lower Latin, ſignifies a little drinking veſſel.

Earthen *crucibles* are made of potters clay, with ſtone potſherds pounded and ſifted: they are of various ſizes, but generally of the ſame form, which reſembles that of an inverted cone, or pyramid. Theſe are chiefly uſed in coinage, as being the only ones in which gold will melt kindly. Iron *crucibles* are in form of little buckets without handles, made of iron well ſorged and hammered: in theſe they melt ſilver, copper, &c.

There are earthen *crucibles* that hold from 800 to 24 or 2500 ounces; but thoſe ordinarily uſed are but of 800. The iron ones are larger; ſome holding 10,000 ounces: theſe are not taken off the furnaces when the plates are to be run, but the metal is laded out with an iron ladle. It is a rule, never to put as much metal in the *crucible* as it will hold.

The *crucibles* uſed by goldſmiths and founders, are like thoſe uſed in COINAGE; thoſe of chemiſts, &c. are of all ſizes, according to the quantity and quality of the metal to be put in them.

Theſe veſſels, ſo much uſed by aſſayers, &c. are beſt made of a pure and well-waſhed clay, with an admixture of the pureſt ſand, powder of flint, or the powder of other broken *crucibles*, which have already ſuſtained a great fire, and are very clear. They are formed in wooden, or braſs moulds, divided longitudinally into two parts, and to be disjoined or put together again at pleaſure: for this purpoſe alſo a broad iron ring is adapted to the outſide of the mould, in ſuch manner, that the two ſides are kept firmly together while this ring is on, and fall aſunder as ſoon as it is taken off. This mould, however, gives only the outer ſhape of the *crucible*; its cavity muſt be made by a peſtle, or other ſuch inſtrument.

When theſe veſſels are to be made, the ring is put upon the mould, and the whole ſet upon a ſtrong ſupport: then the cavity of the mould is to be filled with the matter very ſtiff; this is to be preſſed down firſt with the fingers, or with a ſtick, making a hollow in the middle, and leaving the edges of the matter above the ſides of the mould; then apply to this hollow the peſtle, rubbed over with the fat of bacon, and drive it in with ſeveral ſtrong ſtrokes of a mallet: then take away the peſtle, and, taking the ring from off the mould, the *crucible* is taken out perfect, and finiſhed, and is to be dried, and baked in a potter's kiln. See *Tab. of Chemiſtry*, Nº 25.

If, from the too great moiſture of the matter, when put into the mould, or from any inequalities or roughneſſes in the mould, the *crucible* will not readily ſeparate from its ſides, as ſoon as made, place the mould in a dry, warm place, for a few minutes, and the veſſel will, after that, come out eaſily.

In making theſe veſſels, a ſufficient quantity of the matter muſt always be put at once into the mould; for if you add to the matter once compreſſed, a new lump of the ſame, it will not cohere with the firſt. If the matter be put into the mould in ſmall maſſes, not moulded thoroughly together firſt by handling, theſe never cohere; but the veſſel, when finiſhed, will be full of chinks and pores, which, though not to be diſcovered either by the eye, or by the ſound of the veſſel when ſtruck, yet let the ſalts in fuſion paſs through them.

If theſe veſſels are not made with a large bottom, the concave mould muſt not be greaſed; for if it be, the veſſel comes out of it with the peſtle, and ſticks ſo firmly to it, as not to be got off without breaking. Cramer, Art of Aſſ. p. 66.

Others order a large piece of chalk to be cut into the form of a *crucible*, and boiled in linſeed-oil for twenty-four hours: this, when dry, they uſe as a *crucible*.

Mr. Scheffer ſays, that *crucibles* may be made much more durable and ſolid, by ſteeping them for a few days in linſeed-oil, and ſtrewing powdered borax on them before they are dried. Mem. Sued. 1752.

On the method of preparing *crucibles*, ſo as to ſtand ſulphureous mixtures, &c. ſee Lewis's Commercium P. Technic. p. 156.

Black lead *crucibles* are preferred for melting of GOLD, becauſe very ſmooth, and leſs apt to retain the particles of this coſtly metal; and alſo becauſe leſs liable to crack, ſo that they may be uſed for ſeveral fuſions, and with leſs precaution. Ibid. p. 67.

The beſt *crucibles* for ſuſtaining the action of violent fire, and of chemical ſolvents, are prepared of good baked clay; but as theſe are liable to be broken by a ſudden application of heat or cold, another ſort is made of a mixture of refractory clay, with two parts of ſand, of a middling fineneſs: and the addition of ſand makes the clay leaner, and prevents its cracking whilſt it dries, and likewiſe preſerves it from becoming too compact, by being baked. Theſe are better adapted to contain metals in fuſion, and leſs ſubject to break than thoſe made of pure clay. The beſt of this kind are brought from Heſſe in Germany. *Crucibles* that are deſigned for containing glaſs, and vitrifying matters for a long time in fuſion, ſhould have no mixture of ſand, flints, and vitrifiable earths, becauſe they are acted upon by the vitreous matters, and the *crucibles* are ſoon penetrated and melted. For this purpoſe the powder of baked clay ſhould be ſubſtituted in the room of ſand; and thus pots are prepared for glaſs-houſes, which will bear a violent and conſtant fire for ſeveral months. Of this kind are the *crucibles* which are made in France. Every laboratory, then, ſhould be furniſhed with *crucibles* of different kinds; Paris *crucibles* for a more gentle fire; thoſe of Heſſe for a more violent heat; and thoſe of baked clay for vitreſcent matters, and penetrating fluxes. Pott's Diſſertation on Chemical Veſſels. See POTTERY.

CRUCICOLÆ, q. d. *worſhippers of the croſs*, a deſignation given to the primitive Chriſtians, by the heathens.

CRUCIFIX, a croſs, whereon the body of Jeſus Chriſt is faſtened in effigy; much uſed by the Romaniſts in their churches, and other places, to recognize the paſſion of Jeſus Chriſt, and direct their prayers to.

There are ſome chapters wherein Jeſus Chriſt is the firſt canon, and the income of the canonry goes to the ſubſiſtence of the *crucifix*.

CRUCIFIXION, an ancient form of execution; by faſtening the criminal to an erected CROSS.

CRUCIFORM *flowers*. See FLOWER.

CRUCIFORM *hyperbola*. See CURVES.

CRUCIS *experimentum*. See EXPERIMENTUM.

CRUDE, ſomething that has not paſſed the fire, or has not had the degree of coction, i. e. of heat, requiſite to prepare it for eating, or ſome other uſe.

Crude, or raw ſilk, is that which has not been put in boiling water, to unwind it from off the cod; nor boiled in water and ſoap, to fit it for dying.

CRUDE *ſugar*. See SUGAR.

CRUDE *antimony*, is that which comes immediately from the mines, without any preparation, except once melting.

CRUDE *humours*, in *Medicine*, are thoſe which want that preparation and elaboration which they ordinarily receive from a thorough digeſtion.

The retainers to the doctrine of trituration hold, that the *crudity* of the humours only conſiſts in this; that they are not broken and comminuted ſo much as they ſhould be by the ordinary action of the ſtomach.

CRUDITY, ſometimes denotes that ſtate of a diſeaſe, wherein the morbific matter is of ſuch bulk, figure, coheſion, mobility, or inactivity, as creates or increaſes the DISEASE.

The *crudity* is diſcovered, 1. From the diſeaſe continuing its degree of ſtrength, or increaſing. 2. From a continual increaſe of ſymptoms. 3. From a diſorderly exerciſe of the functions. 4. But chiefly from a fault in the quantity or quality of the humours; both thoſe ſtill circulating, and thoſe ſecreted; as of ſweat, tears, mucus of the noſe, ſaliva, ſputum, the bile, urine, ichor, pus, blood, menſes, lochia, milk, aphthæ, &c.

That ſtate of the diſeaſe, wherein the *crude* matter is changed, and rendered leſs peccant, and laudable, is called *digeſtion*, *concoction*, or *maturation*.

CRUISE, from the German *kruiſs*, *a-croſs*, ſignifies to croſs to and fro, to ſail up and down within a certain ſpace of the ſea, called the *cruiſing* latitude, in queſt of veſſels, or fleets of an enemy, &c.

CRUISERS, in the *Navy*, are ſmall men of war, made uſe of to and fro in the Channel, and elſewhere, to ſecure our merchant-ſhips and veſſels, from the enemy's ſmall frigates and privateers. They are generally ſuch as ſail well, and are commonly well manned: and, indeed, the ſafety of the trade in the Channel, and up and down the ſoundings, and other places, abſolutely requires the conſtant keeping out of ſuch ſhips at ſea.

CRUMENA, from κρεμαω, *pendeo*, *I hang*, in *Zoology*, the name given by Cardan, and ſome others, to the purſe, or pouch, which the OPOSSUM has under its belly, and into which it receives the young in time of danger.

Scaliger, ſuppoſing there might be other animals, as well as the opoſſum, to which nature might have given this ſort of pouch, has erected a generical diſtinction, under the name of *animalia crumentata*; but the opoſſum is the only ſpecies yet known to belong to this genus. The only inſtance that naturaliſts ſeem to afford us of a like proviſion of nature for the care of the young, is what is related of ſome of the fiſh kind. Oppian, in his Halicutics, mentions this property of receiving the young into the body, in time of danger, to be in the dog-fiſh, and in the ſquatina, and ſome others; and Tyſon obſerves, that, in the anatomy of a female dog-fiſh, he ſaw two ſlits under the belly, cloſed up in their natural ſtate, but eaſily diſtenſible, ſo as to be capable of receiving the young fiſh; and that theſe went not into the womb, nor any other peculiar part, but only into the cavity of the abdomen.

The account given by Oppian is, that, in time of danger from a ſtorm, or from any fiſh of prey purſuing the young fry, they go into their parent's belly. If therefore, after this account of Tyſon's, any young fiſh ſhould ever be found looſe, in the cavity of the mother's belly, it will prove the truth of this paſſage in Oppian, which has been ſo much diſputed. Phil. Tranſ. Nº 239. p. 120.

CRUMENTATA, a term uſed by Julius Scaliger to expreſs ſuch animals as have a pouch, or bag, under their belly, into which young ones may be received in time of danger. See Opossum.

CRUOR, from κρυος, *cold*, according to Ainſworth, or perhaps from χροα, *colour*, a term uſed by anatomiſts for the red globules of the blood; in contradiſtinction to the limpid or ſerous part.

Some authors, as Dr. Keill and Dr. Woodward, ſuppoſe theſe globules replete with an elaſtic aura, or air; and on this principle account for ſome of the phænomena of the animal œconomy; particularly muſcular motion, &c. But Dr. Jurin has overturned that ſuppoſition.

Van Helmont uſes the word *cruor* for the blood in the veins; in contradiſtinction to the blood in the arteries, which he calls *ſanguis*. See Blood.

CRUPEZIA, in *Antiquity*, wooden ſhoes, or clogs, worn by the mesochori.

CRUPINA, in *Botany*, a name by which ſome authors call the *carduus ſtellatus*, or ſtar-thiſtle.

CRUPPER is uſed by ſome for the hind part of a horſe, comprehended between the place of the ſaddle and the tail.

The word is formed from the French *crouppe*, which ſignifies the ſame. It denotes alſo a thong of leather put under a horſe's tail, and fixed to the ſaddle, to prevent it from being thrown forward.

CRURA *clitoridis*, in *Anatomy*. Between the *corpora nervoſa* of the *clitoris*, runs a *ſeptum*, or membranous partition, from the glans to its divarication at the *os pubis*; dividing the *clitoris* into two parts, called the *crura* of the *clitoris*. See *Tab. Anatomy* (*Splanch.*) *fig.* 13. *lit. b b.*

Theſe are three times as long as the ordinary trunk of the *clitoris* itſelf.

Crura *of the medulla oblongata*, are two of the four roots whence the *medulla oblongata* ſprings, in the brain.

The *crura* are the larger roots; the two ſmaller are called *pedunculi*.

CRURÆUS, in *Anatomy*, a muſcle ariſing from the forepart of the thigh-bone, between the leſſer and great trochanter, and lying cloſe upon the bone, joins its tendon with three others, which all together make one broad tendon, that paſſes over the *patella*, and is inſerted into the little tuberoſity on the upper and fore-part of the *tibia*. Its uſe is to extend the leg. See *Tab. Anatomy* (*Myol.*) *fig.* 2. *n* 40.

It is called *cruræus*, as being faſtened to the thigh-bone in the ſame manner as the *brachiæus* to the arm.

CRURAL, in *Anatomy*, an epithet given to the large artery and vein of the thigh.

The *crural* artery ariſes from the iliac artery; or rather, it is the iliac itſelf, under another name; being called *crural*, from the place of its entrance into the thigh. See *Tab. Anatomy* (*Angeiol.*) *fig.* 1. *n.* 69.

It conveys blood through all the part, by means of a great number of branches diſſeminated through its ſubſtance.

The *crural* vein is the production of the external iliac vein, and is formed of ſix other veins, viz. the *great* and *little ſciatica*, the *muſculoſa*, the *poplitea*, the *ſural*, and the *ſaphena*.

Crural *nerves*. See Nerve.

CRUS, among *Anatomiſts*, denotes all that part of the body which reaches from the buttocks to the toes; and is divided into thigh, leg, and foot.

CRUSCA, an Italian term, ſignifying *bran*, or what remains of meal after the flour has been ſifted out. It is only in uſe among us to denote that celebrated academy called *Della Cruſca*, eſtabliſhed at Florence, for purifying and perfecting the Tuſcan language.

The academy took its name from its office, and the end propoſed by it; which is to refine the language, and, as it were, to ſeparate it from the bran. Accordingly, its device is a ſieve, and its motto, *Il piu bel fior ne coglie*; that is, *It gathers the fineſt flour thereof.*

In the hall or apartment where the academy meets, M. Monconis informs us, every thing bears alluſion to the name and device: the ſeats are in form of a baker's baſket; their backs like a ſhovel for moving of corn; the cuſhions of grey ſattin in form of ſacks, or wallets; and the branches where the lights are placed, likewiſe reſemble ſacks.

The vocabulary *Della Cruſca* is an excellent Italian dictionary, compoſed by this academy.

CRUSTA *lactea*, *Achor*, in *Surgery*, ſignifies a cruſt of ſcabby ulcers, apt to affect the faces of children. The cure of it depends principally on regulating the diet of the nurſe, and giving her gentle purges, and ſweetening powders; the infant ought alſo to take at times a few gentle doſes of phyſic; and, in the intervals, between the purges, to take powders of crude, or diaphoretic antimony, with flower of brimſtone, and crabs claws, and other of the teſtaceous powders. When this method has been purſued for ſome time, the parts may be anointed with cream, with a ſmall quantity of chalk, or ceruſe, mixed in it, or with a mixture of oil of eggs, with a ſmall quantity of oil of bricks. Ointments of mercury, or ſulphur, are very dangerous in the beginning of this diſorder, or to weakly infants; and when ſuch have been uſed by ignorant perſons, the beſt method to be taken is the endeavouring to throw out the humour again by ſudorifics. Heiſter's Surgery, p. 269.

Crusta *villoſa*, in *Anatomy*, the fourth tunic, or coat of the stomach.

On the inner ſurface of the coat are ſeen innumerable villi, or fibrillæ, riſing every where perpendicularly from it; which ſome will have to ſerve for nothing but a defenſative to the ſtomach, to preſerve it from acrimonious humours: but Dr. Drake rather takes them to be excretory ducts to the ſubjacent glands; which ſome authors would have to be that now exploded thing a parenchyma; but which are, indeed, the organs by which moſt of that humour which is diſcharged into the ſtomach, is ſeparated; and theſe villi the immediate channels through which it is conveyed.

CRUSTACEOUS *fiſh*, in *Natural Hiſtory*, are thoſe covered with ſhells, conſiſting of ſeveral pieces, or ſcales; as thoſe of crabs, lobſters, &c. See Squilla.

Theſe are uſually ſofter than the ſhells of the teſtaceous kind, which conſiſt of a ſingle piece, and uſually much thicker and ſtronger than the former; ſuch as thoſe of the oyſter, ſcallop, cockle, &c. See Testaceous *animals*.

Dr. Woodward obſerves, in his Natural Hiſtory, that of all the ſhells found in beds of all the different matters dug out of the earth, there are ſcarce any of the *cruſtaceous* kind: the reaſon he gives for it is, that theſe being much lighter than the reſt, muſt have floated on the ſurface at the time of the deluge, when all the ſtrata were formed; and there have corrupted and periſhed.

CRUSTULA, in *Medical Writers*, the ſame as *ecchymoma*, in the eye, being a deſcent of the blood from the arteries into the *tunica conjunctiva*, occaſioned by a wound, ſtroke, &c.

CRUX *herrings*. See Herring.

CRUYSHAGE, in *Zoology*, the name of a fiſh of the ſhark kind, ſomewhat approaching to that ſtrange fiſh the zygæna, but much leſs monſtrous, its head being only triangular, or ſomething like the figure of a heart, whence Willughby has named it *zygænæ affinis capite triangulo.* The eyes are very ſmall, and are placed, as in the zygæna, at the ſides of the head: the mouth is ſmall and triangular, and placed a vaſt way below the end of the noſe, and is furniſhed with three rows of very ſmall teeth.

CRUZADO, or Croisade, an expedition to the Holy Land.

Cruzado, or Crusade, in *Commerce*, is a Portugueſe coin, ſtruck under Alphonſus V. about the year 1457, at the time when pope Calixtus ſent thither the bull for a croiſade againſt the infidels. See Coin.

It had its name from a croſs, which it bears on one ſide; the arms of Portugal being on the other.

CRUZITA, in *Botany*, a genus of the *tetrandria digynia* claſs, with a four-leaved calyx, corolla, and a ſingle ſeed.

CRY. See Hue, Clamor, Haro, &c.

CRYMODES, from κρυος, *cold*, in *Medical Writers*, a cold, ſhivering fever, but often accompanied with an inflammation of the inner parts.

CRYPTA, a ſubterraneous cell, or vault; eſpecially under a church, for the interment of particular families, or perſons.

S. Ciampini, deſcribing the outſide of the Vatican, ſpeaks of the *cryptæ* of St. Andrew, St. Paul, &c.

The word is formed of κρυπτω, *abſcondo*, *I bide*; whence κρυπτη, *crypta.*

Vitruvius uſes the word *crypta* for a part of a building, anſwering nearly to our cellar; Juvenal, for a *cloaca.*

Hence, *crypto-porticus*, a ſubterraneous place, arched, or vaulted; uſed as an under-work, or paſſage, in old walls.

The ſame is alſo uſed for the decoration at the entry of a grotto.

Crypta is alſo uſed, by ſome of our ancient writers, for a chapel, or oratory, under-ground.

Cryptæ, in *Anatomy*, a name given by Ruyſch to glands ſituated on the back of the tongue, and to glands of the inteſtines.

CRYPTOGAMIA, in *Botany*, a claſs of plants whoſe flowers are either wholly inviſible, or ſcarce diſcernible by the eye.

The word is formed of κρυπτος, *hidden*, and γαμος, *marriage*. Theſe are a claſs of plants whoſe fructification is concealed, and under it are comprehended thoſe plants which either flower, as is generally ſuppoſed, within the fruit, or have the organs of their fructification ſo minute, as to eſcape our obſervation. This claſs comprehends four orders, viz. the *filices*, or ferns, the *muſci*, or *moſſes*, the *algæ*, or flags, and the *fungi*, or *muſhroom*. See *Tab.* I *of Botany, Cryptogamia*; and *Tab.* II. *Filices*, &c.

CRYPTOGRAPHY, the art of ſecret writing, or writing in CIPHER. See DECIPHERING.

The word is compounded of κρυπτω, *I hide*; and γραφω, *I deſcribe*.

CRYSTALS, in *Natural Hiſtory*, are defined to be hard, pellucid, and naturally colourleſs bodies, of regularly angular figures, compoſed of ſimple not filamentous plates, not flexile nor elaſtic, giving fire with ſteel, not fermenting in acid menſtrua, and calcining in a ſtrong fire. They poſſeſs the general properties of the earths called vitrifiable. Moſt of the coloured *cryſtals* are fuſible by a violent fire; and probably derive both their colour and fuſibility from metallic ſubſtances.

The word comes from κρυϛαλλος, *glacies*; formed of κρυος, *frigus*, and ϛελλω, *concreſco*; becauſe of its reſembling ice.

The ancients were but little acquainted with the nature of *cryſtal*. Pliny ſpeaks of it as hardened petrified water, which was the popular opinion of thoſe days; but experience has ſhewn us the contrary: for by a chemical analyſis, inſtead of reſolving into water, it yields nothing but a calx, earth, and ſalts.

For the places where it is found, Pliny adds, that he has ſeen it dug from off the higheſt and roughest rocks of the Alps; whence, doubtleſs, its name of *rock-cryſtal*. It is ſometimes alſo found in brooks and rivers, but not formed there; only waſhed down thither from the mountains by the violent rains.

Several mountains of Europe, and ſome of Aſia, produce *rock cryſtal*. If we may believe the French relation of Madagaſcar, that iſland yields more than all the world beſide.

Its perfection conſiſts in its luſtre, and tranſparency; that with ſtraws, duſt, clouds, &c. is little valued.

This claſs of bodies is arranged into three diſtinct *orders*, and under thoſe into nine *genera*.

Of the *firſt order*, are the perfect columnar *cryſtals*, with double pyramids, compoſed of eighteen planes, in an hexangular column, terminated by an hexangular pyramid at each end. See *Tab. Foſſils, Claſs* 3.

Of the *ſecond order*, are the perfect *cryſtals*, with double pyramids, and without a column. Theſe are compoſed either of twelve or of ſixteen planes, in two hexangular pyramids, joined cloſely baſe to baſe, without the intervention of any column.

Of the *third order*, are the imperfect *cryſtals*, with ſingle pyramids. Theſe are *cryſtals* of the common kind, and are compoſed either of twelve or of ten planes, in an hexangular or pentangular column, affixed irregularly at one end to ſome ſolid body, and terminated at the other by an hexangular or pentangular pyramid. There are ſeveral *genera* in each order.

Adding to theſe regular *genera* the accidental varieties of *cryſtals*, owing to the admixture of metalline particles, influencing their ſhape as well as colour; the three principal of which are thoſe impregnated with lead, iron, and tin; the firſt cubic, the ſecond rhomboidal, and the laſt quadrilateral pyramids, without columns; we have the whole ſeries of the figured *cryſtals*: the firſt of theſe are called *molybdia*, the ſecond *ſideria*, and the third *caſſiteria*. Beſide all theſe, *cryſtal* is alſo ſometimes found in a pebble-like form, which is an accidental variety, like thoſe in the cryſtallizations of ſalts, where many concretions entirely want their naturally angular form.

It is cut, or engraved, in the ſame manner, with the ſame inſtruments, and by the ſame workmen, as diamonds. See DIATRÆTA.

The origin and formation of *cryſtals*, as to the time and manner of them, deſerve a very nice enquiry, ſince many of the more compound foſſile bodies are principally compoſed of either *cryſtal*, or ſpar, a body in many things reſembling it; and the aſcertaining the great queſtion, whether it was all formed at one time, and that long ſince, or does continue to be formed at this day, will ſo far alſo aſcertain the time of the coaleſcence of thoſe other bodies, of which it is the baſis.

The original coaleſcence and formation of thoſe bodies of which ſpar is the baſis, we well know, may have been but of yeſterday, ſince we have evident proofs, that ſpar is concreting to this day, and that ſparry bodies are forming every moment. This is evident, from the ſparry STALACTITÆ in the arches of modern buildings, particularly in one ſo lately built as the new bridge at Weſtminſter, the roofs of the arches of which were filled with theſe ſpars within a year after the arches were built; and there are evident proofs, that ſpars are not made of matter endued from the ſtone, ſince brick arches equally abound with them; and the brick vault which ſupports part of the grand terrace at Windſor, has been ſo full of them, that there was not room to walk.

From theſe obſervations, as alſo thoſe of the ſparry incruſtations round vegetable, and other bodies in ſprings, and at the bottoms of our tea-kettles, which are all incruſted with it, we have evident proof, that ſparry bodies are formed to this day, but we have no ſuch clear evidence of the preſent growth of *cryſtal*.

The ſubject of enquiry, therefore, may be reduced to a narrow compaſs; and all that experiments have to determine is, 1. Whether *cryſtal* or ſpar are at this time found ſuſpended in water, in imperceptible particles, or whether they are not; and, 2. If they are thus ſuſpended, whether they are or are not capable of being raiſed in vapours.

The ſubſtance encruſting tea-kettles, &c. is found to be a genuine ſpar, with a greater or leſſer admixture of earth, and is wholly the ſame with the encruſtations on vegetables in ſprings, &c. Here therefore is a proof of ſpar and earth being ſuſpended in common water, but none of *cryſtal*. This was alone to be determined by repeated and cautious diſtillations. In diſtilling the water of the ſame ſpring, with different degrees of fire, a different quantity of matter was found left at the bottom of the veſſel. It appeared hence, that in a greater degree of heat, a great part of the matter had been raiſed in vapour, and the remainder, on trial, always proved to be only ſpar and earth. Here were therefore both the queſtions anſwered in the affirmative, in regard to ſpar, viz. that it is continually ſuſpended in water, and may be raiſed in vapour. The water of theſe diſtillations being returned into the cucurbit, and rediſtilled, leaves a ſecond ſediment in ſmall quantity, and of a whiter colour. This being examined according to the known laws of foſſils, proves to be part ſpar, and part *cryſtal*, an undiſſolved powder remaining from it, after pouring on aqua fortis to take up the ſpar; and this in all teſts appearing to be true and perfectly pure *cryſtal*. A third diſtillation of the ſame water, produced not the leaſt reſiduum. Hence therefore it is evident, that *cryſtal* as well as ſpar is continually ſuſpended in water, and may be raiſed in vapour, and ſeparated by no other agent than heat. And hence the concluſion is plain, that *cryſtalline* as well as ſparry bodies may be, and doubtleſs are, continually formed in the earth to this day. Hill's Hiſt. of Foſſils, p. 157.

Cryſtals are probably formed by the acceſſion of cryſtalline or ſaline particles, which are diffuſed through the whole globe, and mixed in ſome degree with moſt ſtrata: theſe particles being gradually carried along by the moiſture or vapours which ſoak through the pores, till they come to ſome cavity, where their progreſs is obſtructed, and they collect together in drops, and by their mutual attraction form cryſtalline bodies. By the acceſſion of more particles, their pores are diminiſhed, and they gradually increaſe in tranſparency; agreeably to the hypotheſis of Sir Iſaac Newton, that the tranſparency of bodies is occaſioned by the minuteneſs of their pores, and their opacity by the largeneſs of the pores. Phil. Tranſ. vol. lvii. p. 61.

Having thus from experiments gone through the hiſtory of what may be the origin of many of the *cryſtalline* bodies we daily meet with, it remains to ſay ſomething of their form.

The perfect regularity of the figures of *cryſtals*, cannot but be the effect of ſome fixed, permanent, and invariable cauſe; theſe being ever, unleſs altered by accidents, which rarely happen, the very ſame in the ſame genus.

Signior Lana, who had an opportunity in the Val-ſabbia, of ſeeing many of the perfect double pointed kinds, imagined, that they owed their origin to dews congealed by nitrous exhalations. Rohault imagines the figure of common *cryſtal* the effect of ſix drops of water thrown together.

Others are for its being formed of radiations; others, from all its parts being like the whole; and others from the mutual tendency of the parts of it toward the ſame center. But all theſe the laws of action in matter, and the ſtructure of *cryſtal* in the ſeveral ſpecies, eaſily ſhew to be erroneous.

Many think they have ſolved all difficulties, when they ſay, that *cryſtals* are ſalts; but we know no more of the true cauſe of the figure of ſalts, than we do of thoſe of *cryſtals*. And it is to be added, that if *cryſtals* are ſalts, then ſalts are ſomething elſe from what we have been taught to think they are, *cryſtals* by no means anſwering to the definitions given us of them by authors. As we yet know ſo little of the cauſes of the regular cryſtalizations of ſalts, why are we to ſuppoſe no other bodies but ſalts capable of ſuch cryſtalizations.

Henkel, a very accurate chemiſt, gives us a remarkable account of the formation of *cryſtal* out of human urine, which ſeems ſo ſtrange, that it would have been deſpiſed had it come from an author of leſs credit; and as it is, will require repeated experiments to convince the world there was no error in the caſe. He tells us, that he once filled a large round glaſs veſſel half way up, with the recent urine of a young lad, and tying a bladder over the mouth of the veſſel, he ſet it in a ſtove for four years together, never ſtirring it during that whole time. At the end of this time he found a number of ſmall white ſtones growing to the inſide of the glaſs; they were of the ſize of an oat-ſeed, of a priſmatic figure, and tolerably pellucid; they ſtuck ſo faſt to the ſides of the glaſs, as not to be waſhed off by the ſhaking about of the urine, and, when taken out, had no ſalt taſte, and were not ſoluble even in hot water. Act. Erudit. ann. 1720, p. 272.

When any piece of workmanſhip in *cryſtal* is become foul and dark, the method of recovering its luſtre without hurting its poliſh, is this: mix together ſix parts common water, and one part brandy; boil theſe over a briſk fire, and let the *cryſtal* be kept in it, in a boiling ſtate, a quarter of an hour; then take it out, and rub it carefully over, with a bruſh dipped in the ſame liquor; after this, it is not to be left to dry of itſelf, but to be wiped with a clean napkin, and its ſurface will by this means be perfectly cleaned, and rendered as bright as at firſt, without that injury to the points of the cutting, or to the ſurfaces of the planes or facets, which would naturally have been the conſequence of doing it by mere rubbing or wiping.

Natural *cryſtal* may be reduced, by calcination, into the ſtate of the bodies proper for making glaſs with alkaline ſalts, and makes a moſt fine and valuable FRITT. The method of doing it is this: calcine natural *cryſtal* in a crucible; when it is red-hot, throw it into cold water to quench it; repeat this eight times, covering the crucible, that no duſt or aſhes may get in and mix with the *cryſtal*; dry this calcined maſs, and reduce it to an impalpable powder; mix three pounds of this powder with two pounds of pure ſalts of polverine, or with a quarter of a pound of red lead, and with theſe make fritt, and with the proper quantity of manganeſe, or other tinging ſubſtance; waſh this often in cold water, and after a proper time, work it; it will yield a moſt beautiful GLASS.

Some have pretended to colour *cryſtals* by thus fuſing them, and imparting the various tinges to them, while in a melted ſtate. But as they cannot be fuſed by the heat of furnaces, without the medium of ſome fluxing body added to them, their texture and properties are ſo changed, or rather the glaſs produced by the compoſition is ſo different from the *cryſtal* itſelf, that there does not appear to be any advantage in employing rock *cryſtal* in ſuch a compoſition preferably to flints. Hand. Arts. vol. ii. p. 327.

Natural *cryſtal* may be coloured of ſeveral colours, without melting or running it into glaſs, in the following manner. Take a number of pieces of fine, clear, and pure *cryſtal*, of various ſizes, of white arſenic and yellow orpiment in powder, of each two ounces; ſal ammoniac one ounce; powder this alſo, and mix them well together; put this powder into a ſtrong crucible, and lay upon it the pieces of *cryſtal* in their natural ſtate, then cover this crucible with another, mouth to mouth; lute them well, and when the lute is dry, ſet them in coals, which kindle by little and little; and when they begin to fire, let them kindle of themſelves, and they will then ſmoak very much. Let this be done in a large chimney, taking care to avoid the fumes. When it fumes no more, let the fire go out of itſelf, and let all ſtand till cool; then unlute the crucibles, and take out the *cryſtals*; thoſe at top will be coloured to a fine yellow, with a deep and pale red, the colours of the common fine and balaſs ruby, with beautiful ſpots; and thoſe which are at the bottom upon the powder, will be of a watery colour, mottled like that of the viper. This *cryſtal* comes out ſo fair from this proceſs, that it may be cut as a gem; and though many are ſpoiled, yet, in making a large quantity, there are always ſome fair and perfect. Neri's Art of Glaſs. p. 117. See DOUBLETS, and OPAL.

Baptiſta Porta directs to colour *cryſtals* by keeping them immerſed for four or five hours in a melted mixture of ſulphur, crude antimony, orpiment, arſenic, and tutty. In theſe operations the *cryſtals* ſeem to imbibe ſome of the vapours of the metallic ſubſtances: though the method of giving colours to *cryſtals* by cementation ſeldom or ever fairly ſucceeds.

Crystals, *improper*, a term introduced into the world by Dr. Coppeler, in his Prodromus Cryſtallographiæ, to diſtinguiſh bodies which have the figure of *cryſtals*, but are not ſuch, from the proper or true genuine *cryſtals*.

Improper *cryſtals* are, according to this author, ſuch bodies, either ſtones, metals, or ſalts, as have any reſemblance to true *cryſtal*, either as to their multangular, regular, or irregular figure; or as to their pellucidity, or any other of their eſſential properties. As the number of theſe bodies is very extenſive, it was a work of great accuracy to arrange them into any ſort of order; but this is one of the principal attempts of the author. Among the firſt claſs of improper *cryſtals*, that is, ſuch as are ſtones, come all thoſe gems which have any determinate figure, as the diamond, emerald, amethyſt, and the like. To the ſecond belong all ſorts of regularly figured, metalline bodies, ſuch as *pyritæ* and marcaſites, as alſo thoſe ores of ſilver, where the native metal has aſſumed ſome regular form; as when this or any other metal ſhoots, in its natural bed, into the form of a tree or the like.

Under the third claſs of improper *cryſtals*, including the ſalts, come in all the chemical preparations of ſalt and ſaline bodies. The figure in this claſs is more determinate and accurate than in either of the former claſſes of bodies. See *Tab. Cryſtallization of Microſcopical Objects*.

We are happy enough to have at preſent much better arrangements of FOSSILS than this.

Crystal, *pebble*, a ſpecies of petridia. See PETRIDIA.

Crystal, *prepared*, a term among the makers of counterfeit gems, for a powder of natural *cryſtal*, made for their purpoſe. The manner of preparing it as follows: take the pureſt and cleareſt natural *cryſtal*, put it into a crucible covered at the top, ſet it among burning coals; let the *cryſtal* be made red-hot, then plunge it into a large veſſel of cold water. When the *cryſtal* is cold, put it into the fire again, heat it red-hot, and quench it again; and repeat this operation twelve times, carefully keeping aſhes or any other foulneſs out of the crucible. When the calcination is finiſhed, the *cryſtal* will be brittle and crumbly, powder it, and levigate it on a porphyry to an impalpable powder. This powder muſt be made perfectly fine, otherwiſe the gems made with it will be all foul and coarſe, and no braſs or copper veſſels muſt be uſed about the operation. If the *cryſtal* ſhould be powdered in a braſs or bell-metal mortar, there could be no gem but an emerald ever be made of it, from the quantity of copper it would take up in the powdering. When carefully prepared, it receives all the colours of the gems, by proper additions, and affords a maſs ſofter indeed, but not leſs bright and pellucid, or not leſs beautifully tinged than the fineſt of the oriental gems. Neri's Art of Glaſs, p. 125.

Crystal, *rock*, otherwiſe called *ſprig-cryſtal*, in *Natural Hiſtory*, a name given to the third order of *cryſtals* from their being affixed to a *rock*, or other ſolid body.

This kind of *cryſtal* is the moſt common of all others, and is what the generality of authors deſcribe under the name of *cryſtal of the ſhops*, being that kept for medicinal purpoſes.

The cleareſt, pureſt, and moſt tranſparent that can be had, ought to be choſen; and to prove its genuineneſs, it may be tried with aqua fortis, true *cryſtal* making no effervеſcence with that menſtruum.

Crystal, in *Medicine*, has many virtues attributed to it, being eſteemed an aſtringent and lithontriptic; hence it has been given in diarrhœas, the fluor albus, and in caſes of gravel in the kidneys. Its doſe is a ſcruple, or half a dram, being firſt reduced to a fine powder, by repeated calcinations, and extinctions in cold water.

Many are afraid of the uſe of theſe ſtony medicines, in nephritic caſes. The objection againſt ſpar will hold good againſt *cryſtal*; but there wants ſufficient proofs to determine this point. In general, however, SPAR is an alkali, which *cryſtal* is not.

Cryſtal has been recommended by ſome, as a dentrifice, and there is no doubt of its cleaning the teeth; but, like other hard bodies, it is apt to wear away their enamel, and thereby ſubject them to decay.

Crystal is alſo uſed for a factitious body, caſt in the glaſs-houſes; called alſo *cryſtal-glaſs*.

It is, in effect, glaſs; but carried, in the melting, and in the matter whereof it is compoſed, to a degree of perfection beyond the common glaſs. It is ſimilar in appearance to the whiteſt and moſt tranſparent natural *cryſtal*, though much leſs hard, and more fuſible.

The beſt artificial *cryſtals* are ſaid to be thoſe made at Moran, near Venice; called *Venice cryſtals*.

Crystals, in *Chemiſtry*, expreſs ſalts, or other matters, ſhot, or congealed, in manner of *cryſtal*. See Crystallization. Thus,

Crystal *of alum*, is alum purified, and reduced into *cryſtals*, in the ſame manner as tartar. In like manner are vitriol, nitre, and other ſalts, *cryſtallized*.

Cryſtals of alum are quadrangular, and brilliant, like diamonds; thoſe of nitre, white, and oblong; thoſe of vitriol, green, angular, and ſhining. See Salt.

Crystal, or **cream** *of tartar*, is tartar purified and diſſolved, and again coagulated in form of *cryſtals*.

To prepare it, they boil tartar in water, ſkim it, and ſtrain it; when cool, there are formed little white ſhining *cryſtals*, at the edges; as alſo a pellicle, or cream ſwimming a-top.

The cream and *cryſtals* were anciently ſuppoſed to be different; but are now found the ſame thing.

Cryſtal of tartar is eſteemed purgative, and aperitive; proper in hydropical and aſthmatical caſes, and in intermitting fevers.

Crystal *of tartar chalybeated*, is when it is impregnated with the moſt diſſoluble parts of iron.

Crystal *of tartar emetic*, is when it is charged with the ſulphureous parts of antimony, to render it vomitive.

Crystal *mineral*, called alſo *mineral anodyne*, and *ſal prunella*, is nitre detonated with ſulphur, thus: put a pound of nitre in a crucible, and ſet that in a furnace; and when the nitre is in fuſion, let it be detonated with a dram of ſulphur; in which it is to be agitated, whilſt in a fluid ſtate, that it may fix in the form of cakes, or tablets. After the flame is over, invert the crucible into a braſs or copper baſon.

This is eſteemed good againſt the ſquinancy, whence its name of *ſal prunella*; *pruna*, or *prunella*, expreſſing that diſeaſe. It is cooling, ſedative, aperitive, and diuretic.

Crystals *of ſilver*, or *luna*, denote ſilver, penetrated and reduced into the form of ſalts, by the ſtrong acid of ſpirit of nitre: or by a ſolution in a weaker acid, if the liquor be left to cool, and the water to evaporate. Theſe *cryſtals* are white, flattened like thin ſcales, and not very hard.

It is uſed for making eſchars, by applying it to any part: it is alſo of uſe internally, in dropſies, and diſeaſes of the brain; though its corroſive quality ſeems to render it unfit for this latter purpoſe.

Mr. Boyle commends it highly in this view; and propoſes a method of rendering it mild, which is not likely to prove effectual; and therefore its uſe in medicine is not yet eſtabliſhed. Macquer.

Crystals *of Mars*, called alſo *ſalt*, or *vitriol of Mars*, is iron reduced into a ſalt by an acid liquor; uſed in diſeaſes ariſing from obſtructions.

Crystals *of Venus*, or of *copper*, called alſo *vitriol of Venus*, is copper reduced into the form of vitriol by ſpirit of nitre, or by diſſolving verdegriſe in good diſtilled vinegar, till the acid be ſaturated; it is very cauſtic, and uſed to eat off proud fleſh. It is alſo uſed by painters, and manufacturers, and ſold under the name of *diſtilled* verdegrise. It is alſo called *radical* vinegar.

Crystal *of Iceland*, or *Iſland*, a tranſparent fiſſile ſtone, brought from Iceland, ſoft as talc, clear as rock-*cryſtal*, and without colour; famous among optic writers for its unuſual refractions.

It is there found in great abundance all over the country, but is particularly plentiful in a mountain, not far from the bay of Roezfiord, where the fineſt and moſt pellucid pieces are found on digging. The mountain lies in ſixty-five degrees latitude, and has its whole outſide made up of it; but, though this makes a very bright and glittering appearance, it is not ſo fine as that which lies at a little depth, and is met with on opening the ſurface. This is generally taken up out of the earth in maſſes a foot long, and its corners very frequently are terminated in theſe large maſſes, by a ſort of *cryſtals*, very different in figure and qualities from the reſt of the maſs. The ſtone itſelf is of a parallelopiped figure; but theſe excreſcences are either ſingle pyramids, affixed to columns, like common *cryſtal*, or double pyramids, with or without columns between. The ſtone itſelf is ſoft, theſe are hard, and cut glaſs; the ſtone calcines to lime in the fire, theſe run into glaſs; in ſhort the ſtone itſelf is true ſpar, and theſe are true *cryſtal*: beſide theſe, there ſometimes grows out of the ends of the larger maſſes a pure fine aſbeſtos This likewiſe is the caſe ſometimes in the ſpar found about Barege in France, and ſhews how nearly together the formation of bodies, wholly different from one another, may happen. The general figure of the ſtone is parallelopiped; or, as ſome expreſs it, rhomboide; and it retains this not only while whole, but alſo when broken to pieces. Every fragment it naturally falls into, though ever ſo ſmall, being truly of that ſhape. But it is remarkable, that in ſome places of this mountain, the ſame ſort of matter is found in form of triangular pyramids, all which have the ſame property of the double refraction with the parallelopipeds of the ſame ſubſtance; ſo that the original error of ſuppoſing its qualities owing to its ſhape, is refuted by this, as well as by the trials made with other pellucid bodies of the ſame figure, which do not ſhew this remarkable property. Phil. Tranſ. Nº 67.

The *Iceland cryſtal* is electrical, and when rubbed will draw up ſtraws, feathers, and other light ſubſtances, in the ſame manner that amber does.

The vaſt maſſes of white ſpar which are found in the lead-mines of Derbyſhire, though they are not externally of the parallelopiped figure of the *Iceland cryſtal*, nor have any thing of its brightneſs or tranſparence in the general lump; yet, when they are broken, they ſeparate into rhomboidal fragments, and ſome of theſe are found to be tolerably pellucid: all thoſe which are ſo have the property of the *Iceland cryſtal*; and being laid upon paper, where a black line is drawn, they all ſhew that line double in the ſame manner as the real *Iceland cryſtal* does.

Iceland cryſtal bears a red heat without loſing its tranſparency; and, in a very intenſe heat, calcines without fuſion: ſteeped a day or two in water, it loſes its natural poliſh.

It is very ſoft and eaſily ſcratched with the point of a pin; it will not give fire on being ſtruck againſt ſteel; and ferments, and is perfectly diſſolved in aqua fortis. It is found in Iceland, from whence it has its name; and in France, Germany, and many other places. In England, fragments of other ſpars are very often miſtaken for it, many of them having, in ſome degree, the ſame property.

It has none of the diſtinguiſhing characters of *cryſtal*, and is plainly a genus of ſpars, called, from their figure, *parallelopipedia*, which, as well as ſome other bodies of a different genus, have the ſame properties. Bartholine, Huygens, and Sir Iſaac Newton, have deſcribed the body at large, but have accounted it either a *cryſtal* or a talc; errors which could not have happened, had the criterions of foſſils been at that time fixed; ſince Sir Iſaac Newton has recorded its property of making an ebullition with aqua fortis, which alone muſt prove that it is neither talc nor *cryſtal*, both thoſe bodies being wholly unaffected by that menſtruum.

It is always found in form of an oblique parallelopiped, with ſix ſides, and is found of various ſizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much leſs bright than the pureſt *cryſtal*, and its planes are all tolerably ſmooth, though when nicely viewed, they are found to be waved with crooked lines made by the edges of imperfect plates. What appears very ſingular in the ſtructure of this body is, that all the ſurfaces are placed in the ſame manner, and conſequently it will ſplit off into thin plates, either horizontally or perpendicularly; but this is found, on a microſcopic examination, to be owing to the regularity of figure, ſmoothneſs of ſurface, and nice joining of the ſeveral ſmall parallelopiped concretions, of which the whole is compoſed, and to the ſame cauſe is probably owing its remarkable property in refraction. Hill. See Parallelopipedia.

The phænomena of this ſtone are very remarkable, were firſt ſuggeſted by Bartholin, and have been examined with great accuracy by M. Huygens, and Sir Iſaac Newton. 1. Whereas in other pellucid bodies there is only one refraction, in this there are two; ſo that objects viewed through it appear double.

2. Whereas in other tranſparent bodies, a ray falling perpendicularly on the ſurface, paſſes ſtrait through, without ſuffering any refraction; and an oblique ray is always divided: in *Iceland cryſtal*, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. One of theſe refractions is, according to the ordinary rule, the ſine of incidence out of air into *cryſtal*, being to the ſine of refraction as five to three; but the other is perfectly new. The like double refraction is alſo obſerved in *cryſtal of the rock*, though much leſs ſenſibly.

When an incident ray is thus divided, and each moiety arrives at the farther ſurface, that refracted in the firſt ſurface after the uſual manner, is refracted entirely after the uſual manner at the ſecond; and that refracted in the unuſual manner in the firſt, is entirely refracted after the like manner in the ſecond; ſo that each emerges out of the ſecond ſurface, parallel to the firſt incident ray. Again, if two pieces of this *cryſtal* be placed over each other, ſo that the ſurfaces of the one be parallel to the correſponding ones of the other; the rays refracted in the uſual manner in the firſt ſurface of the firſt, are refracted after the uſual manner in all the other ſurfaces; and the ſame uniformity appears in the rays refracted after the unuſual manner; and this in any inclination of the ſurfaces, provided their planes of perpendicular refraction be parallel.

From theſe phænomena Sir Iſaac Newton infers, that there is an original difference in the rays of light; by means whereof ſome are, here, conſtantly refracted after the uſual manner; and others in the unuſual manner. Were not the difference original, and did it ariſe from any new modifications impreſſed on the rays at their firſt refraction, it would be altered by new modifications in the three following ones; whereas, in fact, it ſuffers no alteration at all.

Again, he hence takes occaſion to ſuſpect, that the rays of light have ſeveral ſides, endued with ſeveral original properties: for it appears from the circumſtances, that theſe are not two ſorts of rays differing in their nature from each other, one conſtantly, and in all poſitions, refracted in the uſual, and the other in the unuſual manner; the difference in the experiment mentioned, being only in the poſition of the ſides of the rays, to the plane of perpendicular refraction. For one and the ſame ray is refracted ſometimes after the uſual, and ſometimes after the unuſual manner, according to the poſition of its ſides to the *cryſtal*: the refraction being alike in both, when the ſides of the rays are poſited the ſame way to both, but different, when different.

Every ray, therefore, may be conſidered as having four ſides, or quarters: two of which, oppoſite to each other, diſpoſe the ray to be refracted after the unuſual manner; and the other two in the uſual. Theſe diſpoſitions, being in the rays before their incidence on the ſecond, third, and fourth ſurfaces; and ſuffering no alterations, for what appears in their paſſage through them, muſt be original and connate.

Father Beccaria corrects the obſervations of Huygens and Newton concerning the refraction of rock or mountain *cryſtal*. The double refraction of the latter happens, when a ray paſſes through two ſides that are inclined to each other, and conſequently iſſues coloured; whereas that of the Iceland *cryſtal* is made by the paſſage of a ray through two parallel ſides, and therefore it iſſues colourleſs. He ſuggeſts, that there may be other ſubſtances, in which there is a manifold refraction. Graveſande had a priſm of Braſil pebble, which had a double refraction at each angle, but of a different kind from one another. Phil. Tranſ. vol. lii. part ii. p. 487, &c.

Mr. B. Martin prepared ſeveral priſms of Iceland *cryſtal*, which exhibited not only a double but a multiple refraction. A ſingle priſm produced a ſix-fold refraction; and by combining ſeveral priſms, a number of refractions was obtained equal to the product of thoſe of the ſingle priſms; i. e. a priſm which afforded two images applied to one of ſix, produced a priſm of twelve images, &c. He farther obſerves, with reſpect to Iceland *cryſtal*, that though the ſides of its plane of perpendicular refraction be parallel to one another, a beam of light tranſmitted through them will not be colourleſs; in which property it differs from all other known ſubſtances. See Martin's Eſſay on Iceland Cryſtal, or Prieſtley's Hiſt. of Viſion, period vii. § 8. p. 548, &c.

CRYSTALLI, among *Phyſicians*, denote puſtules diſperſed all over the body, white and tranſparent, and of the bigneſs of a lupine: much the ſame with what are otherwiſe called *phlyctanæ*.

CRYSTALLINE *humour* is a thick, compact humour of the eye, in form of a flattiſh convex lens, ſituate in the middle of the eye; ſerving to make that refraction of the rays of light, neceſſary to have them meet in the retina, and form an image thereon, whereby viſion may be performed.

The *cryſtalline* is ſet in the anterior part of the vitreous humour, like a diamond in its collet; and is retained there by a membrane which ſurrounds it; and which, for that reaſon, is called the *capſula of the cryſtalline*.—This membrane is ſometimes alſo called *cryſtalloides*; and by others, on account of its fineneſs, which reſembles that of a ſpider's web, *arachnoides*.

It is the configuration of the *cryſtalline* that occaſions perſons to be either *myopes*, or *preſbytæ*; i. e. to be either long, or ſhort-ſighted; a diſcovery firſt ſuggeſted, and proved by Maurolycus of Meſſina, in a treatiſe, De Lumine & Umbra, publiſhed in 1575. Bapt. Porta thought that this humour was the principal ſeat of viſion.

The *cryſtalline* being of two conſiſtences, outwardly like a jelly, but toward the center as hard as ſalt; hence ſome authors think, that its figure may be varied; which variation they ſuppoſe to be effected by the ligamentum ciliare. Hence, Dr. Grew, and others, aſcribe to the ciliary ligament a power of making the *cryſtalline* more convex, as well as of moving it to or from the retina: accordingly, by the laws of optics, ſomething of this kind is abſolutely neceſſary to diſtinct viſion: for, as the rays from diſtant objects diverge leſs than thoſe from nigh ones; either the *cryſtalline humour* muſt be capable of being made more convex, or more flat; or elſe there muſt be an elongation of the eye, or of the diſtance between that and the retina.

The *cryſtalline humour*, when dried, appears to conſiſt of a vaſt number of thin, ſpherical laminæ, or ſcales, lying over one another. Leewenhoek reckons there may be two thouſand of them in one *cryſtalline*; each of theſe, he ſays, he has diſcovered to conſiſt of a ſingle fibre, or fine thread, wound up in a ſtupendous manner, this way and that, ſo as to run ſeveral courſes, and meet in as many centers; and yet not interfere nor croſs in any place. Phil. Tranſ. Nº 165, and 293.

The veſſels of the *cryſtalline* humour of the eye are all the branches of an artery, which being ſent off from the artery which enters at the central part of the retina, paſſes through the vitreous humour, and when it reaches the *cryſtalline*, diſperſes its branches along the ſurface of the lens like radii, till they are exceeding minute, when they pierce into its ſubſtance. Med. Eſſ. Edinb. vol. i. p. 337.

M. Petit, the phyſician, has many minute obſervations and experiments on the colour, conſiſtence, meaſure, weight, &c. of the *cryſtalline humour* of the eye, and its *capſula* in different animals: but his obſervations are ſo numerous that we can only take notice of ſome of them. He obſerved, that in ſerpents and fiſhes the *cryſtalline* is nearly ſpherical, whereas in all other animals which he examined it was lenticular, the anterior ſurface being leſs convex than the poſterior.

This humour hardens with age, and is not ſo hard in men as in birds, quadrupeds, and fiſhes; its hardneſs increaſing in the order here expreſſed.

He alſo obſerves, that the *cryſtalline* changes colour with age, becoming gradually more and more tinged with yellow after the age of twenty-five years, in proportion to its hardneſs.

He ſhews, in confirmation of Leewenhoek's diſcovery, that the *cryſtalline* conſiſts of concentrical laminæ: he always found the capſula tranſparent, and denies any connection between this membrane and the *cryſtalline*, or that there are any veſſels going from the one to the other; but affirms that the *cryſtalline* is nouriſhed by abſorbing the lymph lodged between it and its capſula.

But Albinus diſcovered this to be a miſtake; and that, on the contrary, it is connected with the capſula by means of ſeveral veſſels, which, paſſing through ſmall perforations in the capſula, are inſerted at the extremities of it, and ſpread along the back part of it; and that it receives its nouriſhment by veſſels, which are the branches of the central artery paſſing through the vitreous humour, and divided into ſeveral branches in the back part of the capſula, and tranſmitted to the interior parts of the *cryſtalline*, by which it is alſo ſuſpended.

Dr. Porterfield has accounted for the greater central hardneſs of the *cryſtalline*; as the rays of light, which fall near its axis, and would conſequently be leſs refracted than thoſe that fall more obliquely nearer the extremities, have hereby their refraction increaſed, and are made to converge and meet with thoſe at the ſame point with thoſe that paſs through it nearer its edge.

When the *cryſtalline* or vitreous humours are fallen out of the eye, it is eaſy to conceive, that not only the ſight, but the figure of the eye, muſt be entirely deſtroyed; therefore, an accident of this kind muſt at firſt be dreſſed with compreſſes dipped in warm wine, or ſpirit of wine, and afterwards with ſome vulnerary balſam. But it ſometimes happens, when only the *tunica albuginea*, and ſclerotica, are ſlightly wounded, the cornea and uvea remaining unhurt, that the eye recovers itſelf: and though both the vitreous and *cryſtalline* humours fall out by the wound, yet they are renewed again by the efficacy of nature, and the office of ſight performed as well as before the injury happened. Heiſter.

The *cryſtalline* is the ſubject of the diſeaſe called a CATARACT, and the operation of COUCHING. See EYE.

CRYSTALLINE *heavens*, in the *Old Aſtronomy*, two orbs imagined between the *primum mobile* and the firmament, in the Ptolemaic ſyſtem, where the heavens were ſuppoſed ſolid, and only ſuſceptible of a ſingle motion.

King Alphonſus of Arragon is ſaid to have introduced the *cryſtallines*, to explain what they called the *motion of trepidation*, or *titubation*.

The firſt *cryſtalline*, according to Regiomontanus, &c. ſerves to account for the ſlow motion of the fixed ſtars; which makes them advance a degree in ſeventy years, according to the order of the ſigns, viz. from weſt to eaſt; which occaſions the preceſſion of the equinox.

The ſecond ſerves to account for the motion of libration, or trepidation; whereby the celeſtial ſphere librates from one pole towards another, occaſioning a difference in the ſun's greateſt declination.

But the moderns account for theſe motions in a much more natural and eaſy manner.

CRYSTALLINE *arſenic*. See ARSENIC.

CRYSTALLIZATION, in *Chemiſtry*, a kind of congelation befalling eſſential, fixed, and volatile ſalts: when, being ſet free from the greateſt part of their humidity, they are left to harden, dry, and ſhoot into cryſtals.

The term has been extended to denote any regular arrangement of the parts of a body which is capable of it, whether the aggregate maſſes be tranſparent or not. Opake ſtones, pyrites, and minerals, when regularly formed, are ſaid to be cryſtallized, as well as tranſparent ſtones and ſalts. Ice is a true *cryſtallization*, formed of long needle-like maſſes, flattened on one ſide, and joined together in ſuch a manner, that the ſmaller are inſerted into the ſides of the greater; making, as M. Mairan has obſerved, conſtantly the ſame angle, i. e. either 60°, or 120°. Melted metals, and other bodies, which become ſolid after fuſion, aſſume a regular arrangement, whenever they are cooled ſlowly enough for that purpoſe; and thus all kinds of earths, and metallic and mineral matters, whoſe integrant parts ſwim ſeparately in water, are *cryſtallized*, by ſlowly evaporating the watery fluid that ſeparates their parts, and allowing them to approximate and unite by the moſt ſuitable ſides, forming maſſes of a determinate figure. See CRYSTAL, *Rock*.

The ordinary method of *cryſtallization* is performed by diſſolving the ſaline body in water, filtering it, and letting it evaporate ſlowly, till a film appears at the top; and laſtly, letting it ſtand to ſhoot.

Cryſtallization may alſo be effected by the application of cold to the water ſuſpending the ſalt. As moſt ſalts are diſſolved more eaſily, and in greater quantity, by hot than cold water, it is plain, that if the water is ſuffered gradually to cool, the portion of ſalt, which was diſſolved merely by the heat of the water, will be collected and cryſtallized; and the cryſtals will be both larger, and more regular, as the water cools the more ſlowly. Another method of *cryſtallizing* ſalts, is by adding to a ſolution of ſalt, a ſubſtance which has no action on that ſalt, but which has a greater affinity with the water: and this will ſerve to take away from the ſalt a portion of water, which keeps it diſſolved. Spirit of wine will anſwer this purpoſe with regard to many ſalts.

This ſhooting is accounted for, on Sir Iſaac Newton's principles, from that attractive force which is in all bodies, and particularly in ſalt, by reaſon of its ſolidity: whereby, when the menſtruum or fluid, in which ſuch particles float, is ſated enough, or evaporated (which brings it to the ſame), ſo that the ſaline particles are within each other's attractive powers, and can draw one another more than they are drawn by the fluid, they will run into *cryſtals*.

This is peculiar to SALTS; that, let them be ever ſo much divided and reduced into minute particles, yet, when they are formed into *cryſtals*, they each of them re-aſſume their proper figures; ſo that one might as eaſily diveſt and deprive them of their ſaltneſs, as of their figure. See VEGETATION *of ſalts*.

Saline *cryſtals* retain part of the water with which they were united in ſolution; and to this they owe their form, tranſparency, and even the coheſion of their parts. This is called by chemiſts *the water of cryſtallization*; the quantity of it varies in different ſalts, being greater or leſs, as the acid in them is leſs or more firmly combined with its baſis. M. Baumè has diſcovered, that, when the *cryſtallization* is properly conducted, this water is perfectly pure, without the mixture of any ſubſtance foreign to the cryſtallized ſalt.

This being an immutable and perpetual law, by knowing the figure of the *cryſtals*, we may underſtand what the texture of the particles ought to be, which can form thoſe *cryſtals*: and, on the other hand, by knowing the texture of the particles, may be determined the figures of the *cryſtals*.

For ſince the figures of the moſt ſimple parts remain always the ſame; it is evident, that the figures they run into, when compounded and united, muſt be uniform and conſtant; and ſince the force of attraction may be ſtronger on one ſide of a particle, than on another, there will conſtantly be a greater accretion of ſalts upon thoſe ſides which attract more ſtrongly; from which it may eaſily be demonſtrated, that the figure of the leaſt particles is entirely different from that which appears in the CRYSTAL. See Macquer's Chem. Dict.

A great number of pigments or colours are obtainable by *cryſtallization* from metalline bodies; but theſe are ſubject to corrode and eat the canvas, &c. and are not capable of waſhing, by which ſome naturally corroſive colours are rendered mild and harmleſs. The blue and green vitriols, or *cryſtals* of copper, cannot be deprived of their aqueous, or ſaline parts, by a dry air, or by waſhing, without ſuffering extreme alterations, or being left in the form of a dry, groſs, terreſtrial matter, differently coloured from what they were before: and thus the fine green *cryſtals* of iron, being expoſed to the air, become white; and when well waſhed in water, loſe their greenneſs, and turn to a reddiſh, or yellow, ochreous earth; and if deprived of their ſaline and aqueous parts, by a ſtrong diſtillation, they leave behind a brown, or red caput mortuum, which being waſhed in water, affords not a green, but a brown-coloured pigment; and as this holds proportionably of other colours obtained by *cryſtallization*, there are little hopes of procuring durable pigments by this operation, which ſhall be of the ſame colour with themſelves, though, after waſhing, ſome other colours may be thus procured. Shaw's Lectures, p. 187.

CRYSTALLOIDES, the cryſtalline coat of the EYE; a fine membrane, immediately encompaſſing, and containing the cryſtalline humour; and ſuppoſed to ſerve, by conſtringing or dilating that humour, to vary the place of its focus.

Anatomiſts are divided about the reality of ſuch tunic, which is alſo, from its fine texture, called *aranea tunica*, or *arachnoides*.

CRYSTALLOMANCY, the art of divining, or foretelling, future events, by means of a mirror; wherein the things required are repreſented.

It is alſo called catoptromancy. The firſt from κρυϛαλλος, *congealed water*, or *cryſtal*; and the ſecond from κατοπτρον, *mirror*, and μαντεια, *divination*.

CRYSTALLUS *lapis*, a word uſed by ſome of the old authors, not in the expreſs ſenſe in which we now make it ſignify *rock cryſtal*, but as a general term for all pellucid ſtones. Some extend it even to the factitious, as well as the natural gems.

CRYSTINE, a ſilver coin in Sweden, equal to fourteen ſols and eleven deniers French. They have alſo demi-*cryſtines*.

CTENITA, or CTENOIDES, names ſometimes given to thoſe pectens, which have one of their ſhells very convex. See PECTEN.

CUANDA, in *Zoology*. See PORCUPINE.

CUB denotes a bear's whelp; a fox and martin of the firſt year are alſo called by this name.

CUBA, in *Mythology*, a goddeſs among the Romans, thus called from *cubo, I lie down*, who was invoked, in order to make children ſleep.

CUBATURE, or CUBATION, of a ſolid; the meaſuring of the ſpace comprehended in a ſolid; as a cone, pyramid, cylinder, &c. or finding the ſolid content thereof. The *cubature* regards the content of a ſolid, as the quadrature does the ſuperficies of a figure: ſo that the *cubature* of the ſphere turns on the ſame thing as the quadrature of the circle.

CUBBITTING, in *Farriery*, a vice of horſes, conſiſting in their catching hold of the manger, ſucking in the air, and ſwallowing it down in ſuch large quantities that they are ready to burſt. No method has yet been deviſed of curing this vice.

CUBBRIDGE-*heads*, in *Ship-Building*, is ſometimes uſed for the bulk-heads of the fore-caſtle, and the half deck: the firſt being called the *cubbridge-head before*; the other the *cubbridge-head abaft*.

CUBE, in *Geometry*, a regular or ſolid body, conſiſting of ſix ſquare and equal faces, or ſides; and its angles all right, and therefore equal.

The word comes from κυϐος, *teſſera, die*.

The *cube* is alſo called *hexaedron*, becauſe of its ſix ſides.

The *cube* is ſuppoſed to be generated by the motion of a ſquare plane, along a line equal to one of its ſides, and at right angles thereto: whence it follows, that the planes of all ſections, parallel to the baſe, are ſquares equal thereto; and, conſequently, to one another.

To deſcribe a rete, or net, whence any given cube *may be conſtructed, or wherewith it may be covered.* On the right line AB (*Tab. Geometry, fig.* 11.) ſet off the ſide of the *cube* four times; on A erect a perpendicular, AC, equal to the ſide of the *cube* AI, and complete the parallelogram ACDB: with the interval of the ſide of the *cube*, in the line CD, determine the points K, M, and O; laſtly, draw the right lines, IK, LM, NO, and BD; produce IK and LM, each way to E and F, and to G and H; till $EI=IK=KF$, and $GL=LM=MH$, and draw the right lines EG, FH.

To determine the ſurface and ſolidity of a cube. As the ſurface of a *cube* conſiſts of ſix equal ſquares, a ſide multiplied by itſelf, and the product by ſix, will give the ſuperficies; and the ſame product, again, multiplied by the ſide, the ſolidity.

Hence, if the ſide of a *cube* be 10, the ſolidity will be 1000; if that be 12, this will be 1728: wherefore the geometrical perch being ten feet, and the geometrical feet twelve digits, &c. the *cubic* perch is 1000 *cubic* feet, and a *cubic* foot 1728 *cubic* digits, &c.

Hence, alſo, *cubes* are in the triplicate ratio of their ſides; and are equal, if their ſides be ſo.

Cube, *duplication of a.* See Duplication.

Cube, *ſcenography of a.* See Scenography.

Cube, or Cubic *number*, in *Arithmetic*, is a number ariſing from the multiplication of a ſquare number by its root.

Thus, if the ſquare number four be multiplied by its root two, the factum eight is a *cube*, or *cubic number*; and the number two, with reſpect thereto, a *cube root.*

Hence, ſince, as unity is to the root, ſo is the root to the ſquare; and as unity is to the root, ſo is the ſquare to the *cube:* the root will, alſo, be to the ſquare, as the ſquare to the *cube:* that is, unity, the root, the ſquare, and the *cube*, are in continual proportion; and the *cube root* is the firſt of two numbers that are mean proportionals between unity and the *cube*.

Cubic *numbers, for the compoſition of.* Every *cubic* number of a binomial root is compoſed of the *cubic* numbers of the two parts of the factum, of thrice the ſquare of the firſt part into the ſecond, and of the factum of thrice the ſquare of the ſecond part into the firſt.

Demonſt. For a *cubic* number is produced by multiplying the ſquare by the root; but the ſquare of a binomial root is compoſed of the ſquares of the parts, and double the factum of one part into the other.

Wherefore, the *cubic* number is compoſed of the *cube* of the firſt part, of the triple factum of the ſquare of the firſt part into the ſecond, and of the triple factum of the ſquare of the ſecond part into the firſt.

An occular demonſtration of this we have in the following example, where multiplication alone is uſed. Suppoſe, v. gr. the root 24, or 20+4.

$$\begin{array}{lr}
\text{Here} & 24^2=20^2+2\times4\times20+4^2 \\
 & 20+4 \\
\hline
 & 4\times20^2+2\times4^2\times20+4^3 \\
 & 20^3+2\times4\times20^2+4^2\times20 \\
\hline
 & 24^3=20^3+3\times4\times20^2+3\times4^2\times20+4^3
\end{array}$$

$$\begin{array}{lr}
\text{Then} & 20^3=8000 \\
 & 3\times4\times20^2=4800 \\
 & 3\times4^2\times20=960 \\
 & 4^3=64 \\
\hline
 & 24^3=13824
\end{array}$$

Hence, as the part on the right-hand is placed among units, and that on the left among tens; the *cubic* number of the right-hand part muſt be put in the right-hand place; the factum of its triple ſquare into the left, in the ſecond place; and the factum of the triple ſquare of the left into the right, in the third: laſtly, the *cube* of the left-hand part falls in the fourth place.

If the root be a multinomial, two or more characters on the right muſt be eſteemed as one, that it may have the form of a binomial. It is obvious, that any *cube* is compoſed of the *cubes* of the ſeveral parts of the root, and of the factums of the triple ſquare of any of the left-hand characters into the next on the right; and alſo of the factums of the triple ſquare of the right-hand characters into all the left. Suppoſe, v. gr. the root 243; take 240 for one part of the root, three will be the other part; conſequently,

$$\begin{array}{r}
240^3=13824000 \\
3\times240^2\times3=518400 \\
3\times240\times3^2=6480 \\
3^3=27 \\
\hline
243^3=14348907
\end{array}$$

The places of the ſeveral factums are determined from what was obſerved above: for regard muſt here, too, be had to the ciphers to be added to the numbers multiplied by each other, if they be placed alone.

This compoſition of *cubic numbers* once well conceived, the extraction of *cubic* roots will be eaſy.

Cube *root*, or Cubic *root*, the origin of a *cubic number*; or a number by whoſe multiplication into itſelf, and again into the product, any given number is formed.

The *extraction of the cube root* is the ſame thing as the finding any number, v. gr. 2; by whoſe multiplication into itſelf twice continually, a given number, v. gr. 8, is produced: the proceſs whereof, ſee under the article Extraction.

CUBEBS, in *Pharmacy*, a fruit brought from the iſland of Java, in grains, or ſeeds, reſembling pepper, both in form and ſize; whence ſome call it *wild pepper.*

This is a ſmall round fruit or berry, rather leſs than pepper, with a dark brown wrinkled outſide, and whitiſh within, having a little ſhort ſtalk at one end; whence it has been called *piper caudatum*, or pepper with a tail. It is not near ſo hot and biting as pepper, but is of an aromatic ſmell and taſte.

Botanical writers differ as to their opinion of the growth of *cubebs*; ſome, as Mr. Ray, Dr. Plukenet, and others, believe that they grow on trees as big as apple-trees, in bunches like grapes; of which Dr. Plukenet gives a figure. Others, as Herman and Pomet, will have them to grow on a ſcandent plant like pepper.

Cubebs are heating and drying, ſtrengthen the ſtomach, expel wind, comfort the brain and nerves, and are particularly uſeful againſt the vertigo or giddineſs, with other diſorders of the head. Miller's Bot. Off.

They are recommended in a hoarſeneſs and loſs of voice, eſpecially when the tonſils are ſtuffed and obſtructed. The doſe is from ten to twenty-four grains in ſubſtance, to be chewed, or from a dram to a dram and a half in infuſion.

They are farther recommended in diſorders of the ſpleen, and in cold diſtemperatures of the uterus.

It is ſaid, the natives of the place boil it before they allow it to be exported, to prevent its being ſown in other countries.

CUBIC *equation.* See Equation.

For the conſtruction of cubic *equations, ſee* Construction.—*For their reſolution*, ſee Resolution.—*For their roots*, ſee Root, and Extraction.

Cubic *foot.* See Foot.

Cubic *hyperbola*, in *Conics*, one expreſſed by the equation $xy^2=a$, having two aſymptotes, and conſiſting of two hyperbolas, lying in the adjoining angles of the aſymptotes, and not in the oppoſite angles, like the *Apollonian hyperbola.* It is alſo called an *hyperboliſmus* of a *parabola.*

CUBICAL *parabolois*, a term uſed by ſome writers for a parabola of the higher kind; v. gr. where $a^2x=y^3$, &c. See Curve and Parabola.

CUBICLE. See Chamber.

CUBIDIA, in *Natural Hiſtory*, the name of a genus of ſpars. The word is derived from κυϐος, a *die*, and is given them from their being of the ſhape of a common die, or of a cubic figure. Theſe bodies owe this ſhape to an admixture of particles of lead, and there are only two known ſpecies of the genus. 1. A colourleſs cryſtalline one, with thin flakes, found in the lead mines of Yorkſhire, and ſome other parts of the kingdom. And, 2. A milky white one, with thicker cruſts. This is found in the lead-mines of Derbyſhire and Yorkſhire, but is uſually ſmall, and is not found plentifully.

CUBING *of a ſolid.* See Cubature, and Solid.

CUBIT, a long meaſure, uſed by the ancients, eſpecially the Hebrews; taken from the ordinary extent of a man's arm, between the elbow and the tip of the hand.

In the Scripture, we find *cubits* of two lengths; the one equal, according to Dr. Arbuthnot, to 1 foot 9 inches $\frac{888}{1000}$ of an inch, our meaſure; being the fourth part of the fathom, double the ſpan, and ſix times the palm: the other equal to 1 $\frac{824}{1000}$ foot, or the four hundredth part of a ſtadium. The Romans, too, had a *cubit*, equal to 1 Engliſh foot, 5 inches, $\frac{406}{1000}$ of an inch. F. Merſenne makes the Hebrew *cubit* 1 foot 4 digits and 5 lines, with regard to the foot of the Capitol. According to Hero, the geometrical *cubit* is 24 digits; and, according to Vitruvius, the foot is $\frac{2}{3}$ of the Roman *cubit*, i. e. 16 digits, or finger's-*breadths.*

CUBITÆUS *externus*, or *ulnarus*, in *Anatomy*, the firſt of the extenſor muſcles of the fingers; thus called, as being placed along the *cubitus*, externally.—It riſes from the external protuberance of the humerus, and, paſſing its tendon under the *ligamentum annulare*, is inſerted into the fourth bone of the metacarpus, that ſuſtains the little finger.

Cubitæus *internus*, the firſt of the flexors, placed along the *cubitus*, withinſide the arm. It riſes from the internal protuberance of the *humerus*, and part of the *ulna*; upon which it runs along till it paſſes under the *ligamentum annulare*, and is inſerted by a ſtrong and ſhort tendon into the fourth bone of the firſt order of the *carpus.*

CUBITI *biceps.* See Biceps.

Cubiti *brevis.* See Brevis.

Cubiti *longus.* See Longus.

CUBITUS, in *Anatomy*, a bone of the arm, reaching from the elbow to the wriſt; otherwiſe called *ulna*, or the *greater focile.* Some uſe the word for all that part of the arm between the elbow and the wriſt; including the *ulna*, or *cubitus*, properly ſo called, and the *radius.*

Cubitus, *fractured.* The lower part of the arm, which is called the *cubitus*, contains two bones, the *radius* and *ulna:* fractures of this part, therefore, ſometimes happen only to one, ſometimes to both theſe bones, and that ſometimes near their extremities, but oftener towards their middle: but, when they are both broke together, the bones are not only very eaſily diſtorted from each other, but they are not to be replaced without very great difficulty alſo: if one only ſhould, on the contrary, be broken, while the other remains whole, the fractured parts do not much recede out of their places, nor are they very difficult to reduce and retain; for the bone remaining ſound, is found, in this caſe, to be a better direction and ſupport than either ſplints, or bandages. When the fracture happens toward the lower head, near the pronator quadratus muſcle, the fractured part is ſtrongly drawn by that muſcle, and the intervening ligament that is extended between the radius and ulna, toward the ſound bone; and this makes it more difficult to replace. If the radius is to be replaced, whoſe fragment is contracted towards the ulna, an aſſiſtant muſt hold the arm, while the ſurgeon inclines the patient's hand towards the ulna, to draw back the contracted part of the radius. When this is done he muſt carefully reduce them by compreſſion on both ſides with his hands, ſo as to reſtore the compreſſed muſcle between the radius and ulna, and the fragments of the radius, to their proper places. The arm is then to be bound up with the proper bandage, and the limb muſt afterwards be placed in a ſort of caſe made of paſteboard, or light wood, to be ſuſpended in a ſling put about the neck.

In ſetting a fracture of the ulna, the whole method muſt be the ſame with this of the radius, except that in the extenſion, the hand muſt be bent toward the thumb, and radius, before the diſtorted part of the ulna can be compreſſed into its proper place. When both bones of the *cubitus* are broken, the method of cure is much the ſame with that uſed to each of them, when broken ſingly: but there is required more ſtrength and circumſpection, both in replacing them, and a great deal of caution in applying the bandage to retain them. Care muſt alſo be taken, that, while the arm continues in this caſe a great while, without motion, the mucilage of the joint does not harden, or the ligament become ſtiff, and the arm, or *cubitus*, be thereby rendered immoveable. To guard againſt this, it will be proper to unbind the arm once in two or three days, and to move it a little, carefully and gently, backwards and forwards; and ſometimes to foment it with warm water or oil; by which means its motion will be preſerved.

CUBITUS, *luxated*. The *cubitus* conſiſting of two bones, the ulna and radius is articulated by a ginglymus; and the connection of theſe bones is ſuch, that the ulna, or *cubitus*, as being the largeſt bone, and ſeated in the lower part of the arm, does of itſelf perform the whole flexion, and extenſion of the arm, yet it cannot perform thoſe motions without carrying the radius along with it; but, on the other hand, the radius may be turned along with the hand both inward and outward, without at all moving or bending the ulna, as when the pronation and ſupination of the hand are made thereby. Both theſe bones of the *cubitus* are ſo articulated with the lower head of the *os humeri*, that large protuberances are received into deep cavities, or grooves, and the whole inveſted and faſtened with exceeding ſtrong ligaments; ſo that, notwithſtanding the *cubitus* may be luxated in all four directions, outward or inward, backward or forward, yet it is but ſeldom that it ſuffers a perfect or entire diſlocation, unleſs the upper part of the ulna be broken, or the ligaments of the *cubitus* much weakened by ſome great external violence. The ſlighter, and more recent luxations of this kind are, the more eaſy is the reduction of them. Be the caſe better or worſe, however, the patient muſt be placed in a chair, and both parts of the limb, the humerus and the *cubitus*, muſt be extended in oppoſite or contrary directions, by two ſtrong aſſiſtants, till the muſcles are found pretty tight, with a free ſpace between the bones: then the luxated bone muſt be replaced, either with the ſurgeon's hands alone, or with the aſſiſtance of bandages, that the proceſſes may fall into their ſinuſes; and when that is done, the *cubitus* muſt be ſuddenly bent. But if the tendons and ligaments are ſo violently ſtrained that they can ſcarce perform their office, it will be proper to anoint them with emollient oils, ointments, and the fat of animals; or to apply emollient cataplaſms and fomentations. As ſoon as the reduction has been effected, the articulation muſt be bound up with a proper bandage, and the arm afterwards ſuſpended in a ſling hung about the neck. But care muſt be taken that the bandage is not kept on too long, nor the arm kept entirely without motion all the time, leſt the mucilage of the joint ſhould become inſpiſſated, and the articulation rendered, by that means, ſtiff, or the motion of the part be entirely loſt. To prevent this, it will be proper to undreſs the bandage every other day, and gently to bend, and extend the limb: afterwards compreſſes dipt in warm wine may be applied, and held on with the bandage. Heiſter's Surg. p. 164.

CUBO-CUBO-CUBUS. See CUBUS-CUBI.

CUBO-CUBUS, the term whereby Diophantus, Vieta, &c. diſtinguiſh the ſixth POWER; which the Arabs call *quadratum cubi*.

CUBOIDES, or *Os* CUBIFORME, in *Anatomy*, the ſeventh bone of the foot; ſo called, from its being in form of a *cube*, or die. See *Tab. Anat.* (*Oſteol.*) *fig.* 7. *lit. b b.* See alſo FOOT.

Some alſo call it *multiforme*: it is ſituated before the *os calcis*, on the ſide of the *os ſcaphoides*: it is a maſs with ſix ſides, all very unequal, and very irregular. The upper ſide is flat and rough, for the inſertion of the ligaments which connect it with the neighbouring bones: the lower ſide has an oblique eminence, and, immediately below that, a canal, or groove, which is alſo oblique: the eminence divides this ſide into two, and is a little cartilaginous on that ſide next the groove; the groove appears to be cartilaginous from a ligament which lines it, and both that, and the edge of the eminence, ſerve for the inſertion of an annular ligament, and for the paſſage of the tendon of the *peronæus longus*. The poſterior ſide is cartilaginous, broad, oblique, partly convex, and partly concave, anſwering to the anterior ſide of the *os calcis*. The anterior ſide is pretty broad, and is divided into two portions by a narrow prominent line, by which portions this bone is articulated with the third and fourth bones of the metatarſus. The inner ſide is the longeſt of all: it has a ſmall cartilaginous ſurface, by which it is articulated with one of the two *oſſa cuneiformia*; the reſt is rough, with ſeveral depreſſions, in which veſſels and glands are lodged. Behind the cartilaginous portion there is, in ſome ſubjects, another narrow ſurface, which is articulated with the neighbouring portion of the circumference of the *os ſcaphoides*. This articulation, when wanting, is ſupplied by ligaments. The outſide is the leaſt of all; it is irregular, ſhort, and narrow; and it has a notch which communicates with the groove, on the lower ſide. Winſlow's Anatomy, p. 99.

CUBROS *Gezira*. See GEZIRA *Cubros*.

CUBUS-CUBI, a name whereby the Arab writers, and thoſe who follow them, denominate the ninth POWER, or a number multiplied eight times by itſelf continually; which Diophantus, and after him Vieta, Oughtred, &c. call *cubo-cubo-cubus*.

CUCKING-STOOL, COKESTOOL, or CASTIGATORY, anciently called *tumbrel*, and *trebucket*; an engine for the puniſhment of ſcolds and unquiet women, by ducking them in the water.

Kitchen ſays, "Every one having a view of frank-pledge, "ought to have a pillory and a tumbrel." This machine was much in uſe, even among our Saxon anceſtors, who called it *ſcealding-ſtole*, or *ſcolding-ſtool*.

The puniſhment was anciently alſo inflicted on brewers, and bakers, tranſgreſſing the law; who were thereupon, in ſuch a ſtool or chair, to be ducked *in ſtercore*, ſome muddy or ſtinking-pond. This was anciently written *gaging-ſtool*; in Domeſday it is called *cathedra ſtercoris*.

CUCKOW, CUCKOO, *Cuculus*, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct genus of birds of the order of the *picæ*. The characters of this genus are, that the feet are climbing, having two toes before, and two behind; the bill is ſmooth, and a little arched; the tail whole, and compoſed but of ten feathers; the tongue ſhort and membranaceous, and terminated by hairs, and the noſtrils prominent.

The *cuckow* is a bird well known in England by the ſingularity of its note; its beak is long and ſtrait, only it is a little hooked at the end, of a blackiſh brown above, and of a yellowiſh white below; its mouth is yellow within, and the iris of its eyes of a hazel colour; its noſtrils round, open, and ſtanding out beyond the ſurface of the bill, by which mark alone it is to be diſtinguiſhed from all other birds; its throat, breaſt, and belly, are white, variegated with tranſverſe ſtreaks of brown; the feathers of its head are brown, with white edges, and its rump is grey; its back, neck, and wings, are of a browniſh hue; its long wing-feathers have white tips, and are variegated with black, brown, and white; and the tail-feathers are beautifully variegated with white. Its feet and legs are yellow; its food is caterpillars, and other inſects. Ray's Ornithol. p. 63.

It never builds itſelf a neſt, but ſeizes upon that of any other ſmall bird, and, deſtroying its eggs, leaves its own in its place. The water wag-tail, yellow-hammer, or a hedge-ſparrow, &c. is generally the nurſe of the young *cuckow*.

The ſtomach of this bird reaches almoſt to the vent; and on account of this formation, which diſables it from incubation, and not from want of affection, it probably leaves its young to be hatched by other birds.

Whether it hides in hollow trees, &c. during the winter, with us, or whether it leaves us for a warmer climate, is not certainly known. It is pretended that many have been found in hollow trees, but the truth of it has never been well atteſted. It is probably a bird of paſſage, appears early in the ſpring, and makes a ſhort ſtay with us. The continuance of the *cuckow's* ſong is ſaid to coincide with the ſeaſon of the mackarel's being in full roe, viz. from the middle of April to the end of June.

The note of this bird is a call to love, and peculiar to the male: from this its name is derived. The *cuckow* was admired for its delicacy as a food by the Romans, and is now eat in France and Italy.

The whole bird and its dung are uſed in medicine. The bird burnt whole is recommended for the gravel, pains and exceſſive humidity of the ſtomach. Rondel.

It is given with good ſucceſs alſo in the paroxyſms of fevers. The dung of the *cuckow* drank is ſaid to cure the bite of a mad dog.

CUCKOW-*flower*, or *Lady's-ſmock*. See CARDAMINE.

CUCKOW-*pint*, *Arum*. See WAKE-*Robin*.

CUCKOW-*ſpit*, a frothy ſubſtance found on ſeveral plants. See CICADULA.

CUCKSOO, the name of a common diſh among the Moors of Africa, made of flour, and prepared for ſeveral ways of dreſſing afterwards. They take fine wheat-flour, or, when, that is ſcarce, barley, millet, or Indian corn flour is made to ſerve: they firſt ſprinkle ſome water over the bottom of an unglazed earthen pan, and then ſhake ſome of this flour into it; they knead this together with their hands, and roll it backwards and forwards under their open palms; by this means they work it into grains like ſago, and then it is fit for uſe: when they have meat to ſtew, they do this in an earthen pot, and over the mouth of this they place a colander, in which is put a quantity of this granulated paſte; over this colander is fixed on a top or cover for the pot, and by this means as the meat ſtews, all the vapour that aſcends from it is received into the grains of *cuckſoo*; by that time the meat is done enough, the *cuckſoo* is ſo too; and opening the pot, they firſt take out this, which is ſoft, ſwelled, and tender, and piling it up in a diſh, they make a hollow in the top of the heap, in which they lay the meat, and then add their ſpices, which are better than thoſe of many neighbouring nations; the pooreſt uſing pepper, ginger, and ſaffron, the richer a great variety.

CUCUBALUS, in *Botany*. See *Berry-bearing* CHICKWEED.

CUCULARIA, in *Botany*. See FUMITORY.

CUCULLA, a cowl. See ABBOT, and COWL.

CUCULLARIS, in *Anatomy*, a muſcle of the ſcapula, ſo called from the reſemblance it is ſuppoſed to bear to a monk's cowl; and *trapezius*, from its reſemblance to a geometrical figure called a *trapezium*. See *Tab. Anat.* (*Myol.*) *fig.* 6. *n.* 9. *fig.* 2. *n.* 4. *fig.* 1. *n.* 18.

The fibres of this muſcle have various originations and actions; whence Dr. Drake thinks, it may be more properly called three, than one muſcle. The upper order of fibres, or muſcles, ſprings from the *os occipitis*; the ſecond from the ſpine of the vertebræ of the neck, and the third from the ſpines of the eight upper vertebræ of the thorax, or back; and are inſerted into the ſpine, acromium, and baſis of the ſcapula, and part of the clavicula.

From the different diſpoſitions of theſe fibres, the ſcapula is drawn different ways; the firſt pulling obliquely upwards, the laſt obliquely downwards, and the middle backwards: when they act all three together, they are ſaid to draw backwards only; i. e. the two extremes antagonizing, the middle one alone is at liberty to act.

CUCULLATE *flowers*, among *Botaniſts*, are ſuch as reſemble a *cucullus*, or monk's hood, or cowl. See FLOWER.

CUCULLUS was anciently a traveller's cap; called alſo *cowl*, *goul*, or *gula*: whence the name paſſed to the monks, among whom it ſignified their frock and cap, which were of one piece.

CUCULLUS, in *Conchyliology*, the name of a genus of ſhells, called by other authors cornet ſhells, or *volutæ*. See VOLUTA.

CUCULLUS *indicator*, a ſpecies of *cuckow* found in the interior parts of Africa, at a conſiderable diſtance from the Cape of Good Hope, and called by the Dutch ſettlers *honig-wyzer*, or *honey-guide*. It is of a ſmaller ſize than the common *cuckow*. It is famous for conducting thoſe who obſerve its motions, to the wild bee-hives, by a ſhrill note, ſounding *cherr*, *cherr*. This note is anſwered with a ſoft whiſtle, and repeated by the bird till the hive is found. Phil. Tranſ. vol. lxvii. part i. p. 43.

CUCUMBER, *Cucumis*, in *Botany*, a genus of the *monoecia ſyngeneſia* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant, which are are bell-ſhaped, of one petal, which adheres to the empalement, and is cut into five oval rough ſegments. The male flowers have three ſhort ſtamina, which are inſerted in the empalement: the female flowers have no ſtamina, but have three ſmall pointed filaments, without ſummits. The germen is ſituated under the flower, which afterward becomes an oblong fleſhy fruit with three cells, including many oval, flat, pointed ſeeds.

There are three ſpecies of this plant cultivated in gardens, the common kind, the white one, and the long green one. The firſt is what we bring to market in England; the ſecond is the common Dutch kind, and is greatly preferable to ours, as being much firmer, and having fewer ſeeds; and the third is better even than that, but it is raiſed with difficulty.

The common one, which is what our gardeners almoſt ſolely cultivate, is raiſed at three different ſeaſons of the year; the firſt is on hot-beds, under garden frames, for early fruit; the ſecond is under bell, or hand-glaſſes, which is for the middle crop; and the third is on the common ground, which is for a late crop, or to pickle.

The *cucumbers* which are ripe before April are unwholeſome, being raiſed wholly by the ferment of dung, not by the ſun's heat. Thoſe ripe in April are good fruit, and are raiſed in the following manner: toward Chriſtmas, or the beginning of January, a quantity of freſh horſe-dung muſt be procured, with the litter among it, and a ſmall proportion of ſea-coal aſhes ſhould be added to it. In four or five days the dung will begin to heat, at which time a little of it may be drawn flat on the outſide, and covered with two inches thickneſs of good earth: this muſt be covered with a bell-glaſs, and after two days, when the earth is warm, the ſeeds muſt be ſown on it, covered with a quarter of an inch of freſh earth, and the glaſs then ſet on again. The glaſs muſt be covered with a mat at nights, and, in four days, the young plants will appear; when theſe are ſeen, the reſt of the dung muſt be made up into a bed for one or more lights. This muſt be three feet thick, and beat cloſe together, and covered three inches deep with fine freſh earth; the frame muſt then be put on, and covered at night, or in bad weather with mats.

When the earth is hot enough, the plants from under the bell muſt be tranſplanted into it, and ſet at two inches diſtance. The glaſſes muſt be now and then a little raiſed to give air to the plants, and turned often, to prevent the wet from the ſteam of the dung from dropping down upon them. The plants muſt be watered at times, with water ſet on dung till as warm as the air in the frame: and as the young plants grow up, the ſtalks of them ſhould be earthed up, which will give them great additional ſtrength. If the bed is not hot enough, ſome freſh litter ſhould be laid round its ſides; and if too hot, ſome holes ſhould be bored into ſeveral parts of it with a ſtake, which will let out the heat; and when the bed is thus brought to a proper coolneſs, the holes are to be ſtopped up again with freſh dung. When theſe plants begin to ſhoot their third, or rough leaf, another bed muſt be prepared for them like the firſt, and when it is properly warm through the earth, the plants of the other bed muſt be taken up, and planted in this, in which there muſt be a hole in the middle of each light, of about a foot deep, and nine inches over, filled with light and fine freſh earth, laid hollow, in form of a baſon: in each of theſe holes there muſt be ſet four plants; theſe muſt be, for two or three days, ſhaded from the ſun, that they may take firm root, after which they muſt have all the ſun they can, and now and then a little freſh air, as the weather will permit. When the plants are four or five inches high, their ſtalks ſhould be gently pegged down toward the earth, in as different directions as may be from one another, and the branches afterwards produced, ſhould be treated in the ſame manner. In a month after this, the flowers will appear, and, ſoon after, the rudiments of the fruit. The glaſſes muſt now be carefully covered at nights, and in the day time they ſhould have gentle waterings, ſprinkling over the whole plants. Theſe will produce fruit till about Midſummer, at which time thoſe of the ſecond crop will come in to ſupply their place: theſe are to be raiſed in the ſame manner as the early crop, only they do not require ſo much care and trouble. This ſecond crop ſhould be ſowed in the middle, or towards the end of March. Miller.

The ſeaſon for ſowing the *cucumbers* for the laſt crop, and for pickling, is toward the latter end of May, when the weather is ſettled: theſe are ſown in holes dug to a little depth, and filled up with fine earth, in form of a baſon, eight or nine ſeeds in each hole. Theſe will come up in five or ſix days, and, till they are about a week old, are in great danger from the ſparrows; after this they require only watering now and then, and keeping clear from weeds. There ſhould be only five plants left at firſt in each hole, and when they are grown a little farther up, the worſt of theſe is to be pulled up, that there may finally remain only ſour. The plants of this crop will begin to produce fruit in July.

The Hiſtoria Plantarum, publiſhed under the name of Boerhaave, informs us, that if the branches of *cucumbers* are much trodden upon, the fruit will be bitter and emetic; and that a water diſtilled from *cucumbers* when full ripe, and beginning to putrify, purges ſmartly, in the quantity of a dram.

The *cucumber* is one of the four great coolers of the ſhops. It is almoſt an univerſal ingredient in emulſions, and is ſound of ſervice in fevers, and nephritic complaints.

Cucumber, *ſingle-ſeeded*, *Sicyos*, in *Botany*, a genus of the *monoecia ſyngeneſia* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers have a bell-ſhaped empalement of one leaf, with five indentures. The petal is bell-ſhaped, growing on the empalement; and they have each three ſtamina, which are united above, terminated by ſummits, joined in a head. The female flowers are like the male, and ſit upon the germen; they have no ſtamina, but the germen ſupports a cylindrical ſtyle, crowned by a thick three-pointed ſtigma. The germen becomes an oval fruit, ſet with briſtly hairs, having one cell, containing a ſingle ſeed of the ſame ſhape. There are three ſpecies, natives of North America, and the Weſt Indies.

Cucumber, *wild*, *Egyptian*, or *ſquirting*, in *Botany*. See *Male* Balsam *Apple*, and Elaterium.

Cucumber, *ſmall creeping*. See Melotheria.

Cucumber, *ſerpent*. See Trichosanthes.

CUCUMIS *capparis*, in the *Botanical Writings* of the Arabians, a name given by Avicenna, and others, to the plant which produced the fruit called bel. This fruit was like the capers in ſhape, and had a hard ſhell over its kernel, like that of a hazel-nut. Such is the deſcription they give of it, and of the fel and sel, two other fruits as like it in ſhape, and other reſpects, as in virtue.

CUCUPHA, an ancient form of medicine: being a cap, or cover ſor the head, with cephalic powders quilted in it; worn in many nervous diſtempers, and particularly ſuch as more immediately affect the head: as againſt catarrhs, defluxions, &c. It is now much out of uſe.

CUCURBIT, Cucurbita, in *Chemiſtry*, an earthen, or glaſs veſſel, called alſo *body*; of the figure of a gourd, or a pear; wherein are put the matters to be diſtilled.

It is ſometimes alſo made of tin, and ſometimes of braſs, tinned. When a diſtillation is to be made, they fit on to it a glaſs head with an aperture, and a neck proportional. Thus fitted, it is called an alembic.

CUCURBITACEOUS *plants*, a claſs of plants, ſo called from their reſemblance to the gourd, called by the Latins *cucurbita*, which is the head of this family.

Plants of the *cucurbitaceous* kind ſend out their branches every way; which are ſoft, and generally beſet with tendrils, by means whereof they cling to the bodies that are near them.

Their flowers are either ſterile, or fertile: the laſt knit, and yield fleſhy fruits of various figures; containing within them ſeveral flat ſeeds placed in three or four lodges, or even a greater number.

Theſe ſeeds have uſually a white ſweetiſh kernel; the greateſt part of them being of thoſe called *frigidæ majores*, or the greater cold ſeeds.

The pumpion, melon, &c. are of the *cucurbitaceous kind*.

CUCURBITINI *lumbrici*, are broad worms that breed in the inteſtines, like the ſeed of a gourd.

CUCURBITULA, in *Chirurgery*, a cupping-glass, or inſtrument, uſed in the operation of cupping.

CUCURI, in *Zoology*, the Braſilian name of a fiſh of the ſhark kind, but not miſchievous, called *caſſaon* by the Portugueſe.

It is about two feet and a half long. The head ends in an hyperbolic figure, and the mouth is placed far below its end; it has only one row of teeth, and thoſe very ſmall; its eyes are of the ſize of a large pea; its belly is of a ſilver white. Willughby.

CUCURUCU, in *Zoology*, the name of a ſerpent found in America, growing to ten or twelve feet long. It is very thick alſo in proportion to its length, and is of a yellowiſh colour, ſtrongly variegated with black ſpots, which are irregularly mixed among the yellow, and often have ſpots of yellow within them, and are plainly black. It is a very poiſonous ſpecies, and greatly dreaded by the natives; but its fleſh is a very rich food, and greatly eſteemed among them, when properly prepared. Ray.

CUD, ſometimes means the inſide of the throat in beaſts, and ſometimes the food that they keep there, and chew over again: from whence, to chew the *cud*, ſignifies to ponder, think, or ruminate upon a thing.

Cud *loſt*; cattle ſometimes loſe the *cud* by chance, ſometimes by ſickneſs, poverty, mourning, &c. to cure which, take four leaven of rye bread, and ſalt, and mixing it with human urine and barm, beat it in a mortar: then making a large ball or two thereof, put them down the beaſt's throat.

CUDDY, in a *Firſt-rate Man of War*, is a place lying between the captain lieutenant's cabin, and the quarter-deck; and divided into partitions, for the maſter, and other officers. See *Tab. Ship. fig.* 2. *lit. r.*

It denotes alſo a kind of cabbin near the ſtern of a lighter, or barge of burden.

CUDWEED, *Gnaphalium*, in *Botany*, the name of a genus of plants of the *ſyngeneſia polygamia ſuperflua* claſs. The characters of which are theſe: the flower is of the floſculous kind, and is compoſed of ſeveral floſcules, which are divided into many ſegments, and formed like a ſtar at the ends; theſe are placed upon the embryo fruit, and are contained in a general cup, which is of a ſcaly or ſquamoſe ſtructure, but is not at all bright or ſhining.

The ſpecies of *cudweed* enumerated by Mr. Tournefort, are eight. The common *cudweed* is deſiccative and aſtringent, and is of great efficacy in hæmorrhages of all kinds. In dyſenteries, and in floodings of the menſes, it has been known to do great cures. Some have recommended the diſtilled water of it in cancers, but this ſeems to have no very great foundation. A decoction of it in ſmall beer is a common medicine among country people for quinſies, and is ſaid ſometimes to have done remarkable cures in them.

Cudweed, *Baſtard*, *Micropus*, or *Gnaphaloides*, in *Botany*, a genus of the *ſyngeneſia polygamia neceſſaria* claſs. The characters are: it hath hermaphrodite and female flowers, included in the ſame double empalement; ten hermaphrodite flowers compoſe the diſk, which have one petal, are funnel-ſhaped, cut into five parts at the top, and have five ſhort briſtly ſtamina, terminated by cylindrical ſummits. In the ſame empalement are five female flowers in the circumference, which have each an oval germen, compreſſed, hid under the ſcales of the interior empalement, each having a ſtyle by their ſide, which is briſtly, turning towards the hermaphrodite flowers, crowned by ſlender acute-pointed ſtigmas, divided into two parts. The female flowers are ſucceeded by a ſingle oval ſeed; the hermaphrodite flowers are barren. Miller.

CUE, an *item*, or *innuendo*, given to the actors on the ſtage, what, or when, to ſpeak. See Prompter.

CUERPO. To *walk in cuerpo*, is a Spaniſh phraſe for going without a cloke; or without all the formalities of a full dreſs.

CUGNACUARANA, in *Zoology*, the name of an American beaſt of prey, uſually confounded with the tyger, and deſcribed by Marggrave as one of the three ſpecies of American tygers, the *jaguara* and *jaguarete* being the two others. Thoſe two animals are plainly rather of the leopard, or lynx, than of the tyger kind; and perhaps, this is as little of the tyger as they. It is a large and very fierce beaſt, of the ſhape of the jaguara, but of one ſimple colour, which is a very pale tawney, like the colour of ſome goats, but not ſo ſtrong. It is a little duſkier on the back than on the ſides, and there is a little white under the chin, and on the belly. Its hair is very ſhort. Ray.

CUGUACUETE, and Cuguacuapara, in *Zoology*, the Braſilian names of an animal of the caprea kind, ſeeming to be the male and female of the ſame ſpecies, and not diſtinct animals. The former has no horns, the latter has, and is probably the male; the horns are compoſed of three branches; they ſend out one near the inſertion, and from this they run up ſingle to the extremity, where they are bifid.

We have not ſeen the animal in England; but its horns, which are very ſingular in their ſhape, are preſerved in the muſeum of the Royal Society. This is the animal which Johnſon has figured under the name of the *capreolus marinus*. *Tab.* 33.

CUGUPUGUACU, in *Zoology*, a name by which many call the meros, a Braſilian fiſh of conſiderable ſize, and a very good taſte.

CUI *ante divortium*, in *Law*, a writ, which a woman divorced from her huſband hath, to recover lands or tenements from him to whom her huſband alienated them during marriage; becauſe during the marriage ſhe could not gainſay it.

Cui *in vita* is a writ of entry, which a widow hath againſt him to whom her huſband alienated her lands or tenements in his life-time; ſpecifying, that, during his life, ſhe could not withſtand it.

CUJETE, in *Botany*. See Calabash *Tree*.

CUIRASSE, a piece of defenſive armour, made of an iron plate well hammered; ſerving to cover the body, from the neck to the girdle, both before and behind.

Some derive the word, by corruption, from the Italian *cuore, heart*; becauſe it covers that part: others from the French *cuir*, or the Latin *corium, leather*; whence *coriaceous*: becauſe defenſive arms were originally made of leather.

The *cuiraſſe* was not brought into uſe till about the year 1300, though they were known both to the ancient Greeks and Romans in different forms.

Hence, *cuiraſſiers*, the cavalry armed with *cuiraſſes*.

The French have ſtill a regiment of *cuiraſſiers*; and a good part of the German cavalry are *cuiraſſed*: but the *cuiraſſe* is principally confined to general officers, and officers of the cavalry. Others bear only a plate of iron, which covers them before.

In the Roman calendar, we find the name of St. Dominic *the Cuiraſſed*; a title given a ſaint of the eleventh century, from his conſtant wearing of an iron *cuiraſſe*, by way of penance.

CUIRIRI, in *Zoology*, the name of a Braſilian bird of the ſtarling kind, very like the common ſtarling, and no way differing from the *pitanguaguacu*, but that it has a yellow ſpot upon its head.

Probably this is the male of the ſame ſpecies.

CUITPALLI, in *Natural Hiſtory*, the American name of a very beautifully variegated ſtone, found in New Spain, and ſome other places: its name expreſſes the painted ſtone. It is a ſpecies of jaſper of a beautiful green, variegated with very beautiful lines, and clouds of black, and is in ſome parts tranſparent.

CUL *de lamp*, a French term, properly ſignifying the bottom of a lamp. It is applied in architecture to ſeveral decorations, both of maſonry and joinery, uſed, in vaults and cielings, to finiſh the bottom of works, and wreathed ſomewhat in manner of a *teſtudo*; particularly a kind of pendentive in Gothic vaults.

Cul *de four*, a ſort of low, ſpherical VAULT, oven-like.

Cul de four of a niche, denotes the arched roof of a niche on a circular plan. See Mem. Acad. Scienc. an. 1719, p. 363.

CULCASIA, in *Botany*, a name given by ſome of the old writers to an Egyptian plant growing near the ſea-ſhores. It is by many ſuppoſed to have been the *colocaſia*, but improperly. The reſemblance of the name was the only thing that gave the idea of its being this plant; but the virtues attributed to it, and the uſes it was put to in the common affairs of life, ſhew that it was the *kali*, or *cali*, the plant of whoſe aſhes they made a ſalt uſeful in many arts, and ſtill the baſis of the glaſs and ſoap manufactures, and called by Avicenna *uſnen*.

CULCUL, a ſort of grain brought from Egypt to Conſtantinople, where it is much eſteemed, eſpecially when freſh. Authors are not agreed what plant it is produced from.

CULDEES, in *Church Hiſtory*, a deſignation given to the monks, or prieſts, in Scotland, in the firſt ages of Chriſtianity, whence the term paſſed into Ireland.

They were called *culdees*, quaſi *cultores dei*, from their great piety and devotion.

CULEUS, the name of a meaſure of liquids, the greateſt of all the meaſures among the Romans: it contained twenty amphoræ. Columella reckons the *culeus* of wine, at the vineyard, to be worth three hundred nummi, or ſeventy-five denarii, that is, according to Engliſh rate, a hundred and forty gallons three pints and an half, for two pounds eight ſhillings and five pence farthing, which is about a halfpenny the pint. Columella, lib. iii. cap. 3.

The *culeus* is, by others, deſcribed to contain 160 congii, or 960 ſextarii. We read of *dolia culearia*, and *ſeſquiculearia*, the latter of which muſt have been very large, being about 3$\frac{1}{7}$ hogſheads, and therefore larger than our pipes.

The word *culeus* is uſed alſo by ſome Roman authors for a leather ſack.

CULEX, in *Zoology*, the name of a genus of two-winged flies, comprehending the GNATS and HUMBLE-*bee* flies.

The diſtinguiſhing characteriſtic of this genus is, that their head is furniſhed with a ſiphon, or ſucker, very ſlender, oblong, and filiform.

CULINARY, an epithet frequently added to FIRE; determining it to be a common fire, excited in wood, coals, or other ordinary fuel: in contradiſtinction to ſolar fire, or that raiſed by the action of a burning-glaſs; alſo to central fire; to animal fire, &c.

The word is formed from the Latin *culina, kitchen*; this being the chief place of ſuch fires.

Culinary fire, according to Boerhaave, conſiſts of a portion of pure elementary, or ſolar fire, attracted by the oily, or ſulphureous parts of the fuel, with ſuch velocity, as that it moves the ſame, agitates and whirls them violently about, and by degrees breaks and attenuates them; renders them volatile, and diſperſes them in air.

The effect of air upon this fire is, to make, as it were, a vault around it, and, by that means, reſtrain and keep it in, determine it upon the ſulphur, and thus prevent its too haſty diſſipation.

CULLIAGE, or **Cullage**, a right uſurped by the ancient lords, and eſtabliſhed by a ſhameful cuſtom, which gave them the firſt night with their vaſſals brides.

The word is formed from the French *cul, podex*, the *breech*.

It is ſaid this right was eſtabliſhed by Evenus III. king of Scotland, and finally aboliſhed by Malcolm III. a compenſation being ſettled in its ſtead; as occaſioning frequent revolts of the vaſſals againſt their lords. See Marcheta.

CULLION, in *Botany*. See Orchis.

CULM, among *Botaniſts*, a term expreſſing the STALK of gramineous plants.

The *culmus*, and *culmen*, of the Latins, and the καλαμος of the Greeks, are what we call a ſtalk of corn or graſs. In graſſes and corns, the *culm* or ſtalk correſponds to the caudex or trunk in trees; and to the *calamus* in the cyperus and bulruſh: ſo that it generally denotes that part which reaches between the root and the ear, or panicle. Hence it appears in general what plants are of the culmiferous kind: but theſe are variouſly limited by the founders of different botanic ſyſtems, who have adopted them for conſtituting particular *genera* of plants.

CULMIFEROUS, in *Botany*, a term applied to ſuch plants as have a ſmooth-jointed ſtalk, uſually hollow; the ſtalk wrapped about, at each joint, with ſingle, narrow, ſharp-pointed leaves; and the ſeeds contained in chaffy huſks.

Culmiferous plants are divided by Ray into two kinds; thoſe with a *greater*, and thoſe with a *ſmaller* ſeed.

Thoſe with a larger ſeed are called *frumentaceous*, or *cereales*; and are again divided into *ſpicatæ*, as wheat, rye, ſpelt, barley, rice, peas, &c. and *paniculatæ* or *jubatæ*, as oats, ſcordium, milium, and maiſe.

CULMINATION, in *Aſtronomy*, the tranſit of a ſtar or planet over the meridian, or that point of its orbit wherein it is at its greateſt altitude.

Hence, a ſtar is ſaid to *culminate*, when it paſſes the meridian.

To find the culmination *of a ſtar, or the time wherein it paſſes the meridian.* On a meridian line AB (*Tab.* II. *Aſtronomy, fig.* 66.) ſtretch a thread, DC, perpendicularly; and from D to E another, DE, cutting the meridian obliquely, at any angle: the triangular thread, DCE, will cut the plane of the horizon in the meridian line, or at right angles; and conſequently will be in the plane of the meridian.

The eye, therefore, being ſo placed, as that the thread DE may cover the thread DC; wait till the ſtar be biſected by the triangle DCE; for then the eye and the ſtar will, together with the triangle DCE, be in the ſame plane: conſequently the ſtar is in the meridian.

To find the culmination of a ſtar by the globe, ſee Globe.

To find the time of a ſtar's culminating; its right aſcenſion, and the ſun's place in the ecliptic, being given.—From the ſun's place find his right aſcenſion; and from this ſubtract the right aſcenſion of the ſtar: the difference being converted into ſolar time, gives the time elapſed from mid-day to the time of the ſtar's *culmination*.

CULPABILIS. See Non *eſt culpabilis*.

CULPRIT, in *Law*, a term uſed by the clerk of the arraignments, when a perſon is indicted for a criminal matter.

After the indictment is read in court (which is the crown's charge againſt the priſoner at the bar), he is aſked if guilty, or not guilty? If he anſwers, *not guilty*, there is next a replication from the crown, by continuing the charge of guilt upon him; which is expreſſed by pronouncing the word *cul-prit*; *cul* being an abbreviation of the Latin word *culpa, guilt*, or *culpabilis, guilty*, and *prit* (now *pret*) the old French word for *ready*; or, as others rather think, the Latin *apparet, appears*.

From this formula, therefore, of the clerk of the arraignments, the priſoner is deemed guilty of the crime charged on him; and that the crown is ready to prove it upon him.

That this is the true explanation of the term, ſeems evident from the form of the entry of the record of the trial, when drawn at large.

CULTELLATION, a term which ſome authors uſe for the meaſuring of heights, and diſtances, by piecemeal: that is, by inſtruments which give us ſuch heights and diſtances by parts, and not all at one operation.

CULTIVATOR, in *Huſbandry*, the name given by foreigners to inſtruments uſed for ſtirring the earth, anſwering to our horſe-hoes.

CULTRARIUS. See Popæ.

CULTURE. See Agriculture, and Horticulture.

Culture *of hops*. See Hops.

CULVERIN, in *War*, a long ſlender piece of ordnance and artillery, ſerving to carry a ball to a great diſtance.

Menage derives the word from the Latin *colubrina*; others from *coluber*, *ſnake*; either on account of the length and ſlenderneſs of the piece, or of the ravages it makes.

Of theſe there are three kinds; viz. the *culverin extraordinary*, the *ordinary*, and the *leaſt ſized*.

The *culverin extraordinary* has 5½ inches bore; its length 32 calibers, or 13 feet; it weighs 4800 pound; its load is above 12 pound; carries a ſhot 5 inches ¼ diameter, weighing twenty pound weight.

The *ordinary culverin* is 12 feet long; carries a ball of 17 pound five ounces; caliber 5½ inches; its weight 4500 pound.

The *culverin* of the *leaſt ſize* has its diameter 5 inches; is 12 feet long; weighing about 4000 pounds; carries a ſhot 3 inches ¾ diameter, weighing 14 pounds 9 ounces. See Demi-Culverin.

CULVERTAIL, in *Ship-Building*, is uſed for a manner of letting one timber into another, ſo that they cannot ſlip aſunder. The faſtening of a ſhip's *carlings* into the beam is ſo performed. See Dove-tail.

CUMAMUS, in the *Materia Medica*, a name given by many of the ancients to cubebs.

CUMANDA *Guacu*, in *Botany*, a name for certain very large Indian kidney-beans, which roaſted, contuſed, and exhibited with an egg, are given for fluxes of the belly; boiled, made into a cataplaſm, and applied to the belly, they are ſaid to cure colic pains; and they are in this form applied to apoſtemations, with a view of reſolving them.

CUMELE, in *Botany*, the name by which the ancient Greek writers have deſcribed the *lupulus* or hop, with which we make our malt liquors bitter.

CUMELOBOTANE, in *Modern Greek Writers*, is alſo a name given to the *lupulus*, or plant, which produces the hops.

CUMIN, Cuminum, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbelliferous flower, the involucrum of which is longer than the umbel. The great umbel is uniform, the flowers have five unequal petals, whoſe borders are inflexed; and five ſingle ſtamina, with a large germen ſituated under the flower, ſupporting two ſmall ſtyles, which afterward becomes an oval ſtriated fruit, compoſed of two oval ſeeds, which are convex, and furrowed on one ſide, and plain on the other. We have but one ſpecies of this genus.

Miller derives *cumin* from κυειν, *to bring forth*, becauſe it is ſaid to be effectual in curing ſterility.

The ſeed of this plant is much like that of fennel; and grows abundantly in the iſle of Malta, where it is ſown and cultivated after the manner of corn.

The French frequently call it *anis aigre*, *ſharp* or *ſour anis*.

It is uſed with ſucceſs in vertigos, wind-colics, tympanies, &c. It is eſteemed excellent to retrieve the natural heat in ſtallions, bulls, &c. Pigeons are exceedingly fond of it; whence ſome make uſe of it to ſtock their dove-houſes; incorporating it with an earth naturally ſaline, or ſome other earth that has imbibed urine.

This ſeed, as well as the common aniſe, yields, by expreſſion, a kind of oil, eſteemed ſovereign in rheumatiſms; provided it be uſed with precaution, and in ſmall quantities.

Cumin, *baſtard*, or *wild*, *Cuminoides*, *Lagœcia*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath many flowers collected into a head, in one common empalement, compoſed of eight indented leaves. The flower conſiſts of five horned petals, at the bottom of which is ſituated a pointal, attended by five ſtamina: the pointal afterward becomes an oval ſeed, crowned with the empalement. There is only one known ſpecies of this plant, which is the *cuminum ſylveſtre*, or wild *cummin* of authors.

CUMPETES, in the *Materia Medica*, a name given by ſome of the Greek writers to the *carpeſia* of Galen and others. This was an aromatic drug, and was the younger ſhoots and tender twigs of an odoriferous tree, growing on ſome mountains in Pamphylia, which were collected in the ſpring, and, when dried. were uſed as a ſuccedaneum for the cinnamon. The word *cumpetes* often occurs in Myrepſus; but there is ſome doubt in the orthography, whether it be *cumpetes* or *cumpepes*; there ſeems moſt reaſon to believe the latter is the proper word. Charito mentions this drug in his antidotes, and the commentators uſually explain it by the word *carpeſia* or *carpaſus*, a name by which they underſtood, though improperly, the cubebs. The Greeks of the later ages, and the Latin writers who ſucceeded them, all fell into the ſame error, of calling the *carpeſia* the cubeb; though the accounts of the ancient Greeks are againſt it. Nay, Avicenna ſeems to have given into the ſame error; for he has tranſcribed into his chapter of cubebs what Galen ſays of the *carpeſia*.

CUN, or Cunning, at ſea. See Cond.

CUNEI, in *Natural Hiſtory*, a name given to thoſe *tellinæ*, which have one ſide of their ſhell much more extended than the other. See Muscle.

CUNEIFORM *leaf*, among *Botaniſts*. See Leaf.

CUNEIFORME *os*, in *Anatomy*. See Sphenoides.

Cuneiformia *oſſa* denote the fourth, fifth, and ſixth bones of the foot; thus called from their wedge-like ſhape, being large above, and narrow below. See *Tab. Anat.* (*Oſteol.*) *fig.* 7. *lit. c c. fig.* 3. *n.* 27. 27.

They lie all three aſide of one another, and are of different ſizes; their upper ſide convex, and their under hollow, by which means the muſcles and tendons in the bottom of the foot are not hurt in walking.

At one end they have each a ſinus, which receives the *os naviculare*; and at the other end they are joined each to one of the three inner bones of the *metatarſus*. See Winſlow's Anatomy, p. 83, and 100.

CUNETTE, or Cuvette, in *Fortification*, a deep trench, about three or four fathom wide, ſunk along the middle of a dry moat, to lade out the water; or to make the paſſage more difficult to the enemy.

CUNEUS, one of the *mechanical* powers; more uſually, by Engliſh writers, called the wedge.

Cuneus, among the Romans, a term often uſed to ſignify that part of the theatre where the ſpectators ſat, on account of its reſembling the figure of a wedge.

Cuneus, the wedge, was alſo a form of battle frequent among the Romans.

Cuneus, *parabolic*. See Parabolic *Cuneus*.

CUNICULUS, in *Zoology*, a genus of animals of the *lepus*, or hare-kind, called in Engliſh rabbit.

Cuniculus *Americanus*, in *Zoology*, a name given by ſome to the creature called tapeti, a ſmall ſpecies of rabbit.

Cuniculus *Braſilienſis*, a ſpecies of rabbit called aperea.

Cuniculus *Sibericus*, the name of the long-tailed Siberian rabbit, the fur of which is much valued. During the ſummer months many of them are beautifully variegated with oblique and tranſverſe ſtreaks of black and grey.

Cuniculus, in *Mining*, a term uſed by authors, in diſtinction from *puteus*, to expreſs the ſeveral ſorts of paſſages and cuts in theſe ſubterranean works. The *cuniculi* are thoſe direct paſſages in mines, where they walk on horizontally; but the *putei* are the perpendicular cuts or deſcents.

It is an obſervation with our miners, that the damps ſo much dreaded in all mines, happen generally in the horizontal cuts; but Dr. Brown, in his examination of the gold and ſilver mines in Hungary, obſerves, that they as often happen there in the *putei* or *ſchachts*, as in the *cuniculi* or *ſtollen*. Another obſervation as to damps with us is, that they are moſt frequent in clayey and ſoft places under ground; but in thoſe mines they are as frequent where the matter is hard ſtone; and one of the moſt miſchievous that had then lately happened, was in a place every way ſurrounded with ſtone ſo hard, that the tools of the miners could ſcarce work through it; and the deſcent had, in the very ſpot where the damp was, been made by means of gunpowder. In ſome of the *cuniculi* in theſe mines, there are damps that regularly return on certain occaſions; as if the lower end of the *cuniculus* be filled up with water, certain parts in going to it are always affected with damps, which will put out a lamp or candle the moment it enters them, and often do great miſchief to the miners in paſſing them. Phil. Tranſ. N° 48. See Damp.

CUNILA *bubula*, in *Botany*, a name by which Pliny, and ſome other authors, have called the wild marjoram or origanum.

Cunila, in *Botany*. See Iron-*wort*.

Cunila, in the Linnæan *Syſtem*, makes a diſtinct genus of the *diandria monogynia* claſs; with a ringent corolla; the upper-lip is erect and plane; there are two torn filaments, and the germen turns to four ſeeds.

CUNILAGO, in *Botany*, is uſed by ſome authors for the *coryza*.

CUNINA, in *Mythology*, a goddeſs who had the care of little children.

CUNNUS, the pudendum *muliebre*; or the anterior parts of the genitals of a woman, including the *labia pudendi*, and *mons Veneris*.

CUNOCEPHALI, in *Mythology*, from κυων, *dog*, and κεφαλη, *head*, a kind of baboons, or animals with heads like thoſe of dogs, which were wonderfully endowed and preſerved, with great veneration, by the Egyptians, in many of their temples. It is related, that, by their aſſiſtance, the Egyptians found out the particular periods of the ſun and moon; and that one half of the animal was often buried, while the other half ſurvived; and that they could read and write. This ſtrange hiſtory, Dr. Bryant imagines, relates to the prieſts of Egypt, ſtyled *caben*, to the novices in their temples, and to the examinations they were obliged to undergo, before they could be admitted to the prieſthood. The Egyptian colleges were ſituated upon rocks or hills, called *caph*, and from their conſecration to the ſun, *caph-el*; whence the Greeks deduced κεφαλη, and from *caben-caph-el* they formed κυνοκεφαλος. So that *caben-caph-el* was ſome royal ſeminary in Upper Egypt, whence they drafted novices to ſupply their colleges and temples. By this etymology, he explains the above hiſtory. The death of one part, while the other ſurvived, denoted the regular ſucceſſion of the Egyptian prieſthood. The *cunocephali* are alſo found in India, and other parts of the world. Theſe and the *acephali* were thus denominated from their place of reſidence, and from their worſhip. Bryant's Analyſis of Ancient Mythology, vol. i. p. 329, &c.

CUNODONTES, a people mentioned by Solinus and Iſidorus, and by them ſuppoſed to have the teeth of dogs. They were probably denominated, ſays Dr. Bryant, from the object of their worſhip, the deity *Chan-Adon*, which the Greeks expreſſed Κυνοδων, and thence called his votaries *Cunodontes*. Ibid. vol. i. p. 341.

CUNONIA, in *Botany*, a genus of the *decandria digynia* claſs, with a five-petalled corolla, a five-leaved calyx, a bilocular, acuminated, polyſpermous capſule, and ſtyles longer than the flower.

CUP, *Calyx*, a veſſel ſo called, of various forms and uſes. In the Ephem. German. we have a deſcription of a *cup* made of a common pepper-corn, by Oſwald Nerlinger; which holds one thouſand two hundred other ivory *cups*, each having its ſeveral handle, all gilt on the edges; with room for four hundred more.

CUPS, among *Herbaliſts*, are thoſe ſhort green huſks in which flowers grow; ſome being divided into two, three, four, five, or ſix leaves. See CALYX.

CUP-*fountain*. See FOUNTAIN.

CUP-*galls*, in *Natural Hiſtory*, a name given by authors to a very ſingular kind of galls found on the leaves of the oak, and ſome other trees. They are of the figure of a cup, or drinking-glaſs, without its foot, being regular cones, adhering by their point or apex to the leaf; and the top or broad part is hollowed a little way.

Beſide this ſpecies of gall, the oak leaves furniſh us with ſeveral others, ſome of which are oblong, ſome round, and others flatted; theſe are of various ſizes, and appear on the leaves at various ſeaſons of the year. They all contain the worm of ſome ſmall fly; and this creature paſſes all its changes in this its habitation, being ſometimes found in the worm, ſometimes in the nymph, and ſometimes in the fly ſtate, in the cavity of it. See *Tab. of Inſects*, Nº 25.

CUP-*ſhell*. See SHELL.

CUPA, among the *Ancients*, a kind of boats, uſed in laying bridges over rivers, being broad below, and narrow above.

CUPANIA, in *Botany*, a genus of the *monoecia monadelphia* claſs. The male of this genus hath a three-leaved calyx, a five-petalled corolla, and five ſtamina: the female hath a three-leaved calyx, three-petalled corolla, a ſtyle divided into three parts, a three-celled capſule, and a double ſeed.

CUPOLA, in *Architecture*, the ſame with DOME.

The word is Italian, formed of the barbarous Latin *cuppala*, otherwiſe called *thola*, and *fornix*.

CUPPEL, CUPEL, or COPPEL, among *Chemiſts*, a veſſel or utenſil, uſed in the trying and purifying of gold and ſilver; called alſo TEST. See COPPEL.

CUPPELLATION, in *Chemiſtry*. See COPELLING.

CUPPING, an operation in *Chirurgery*, for the diſcharge of blood, and other humours, by the ſkin.

It is performed by collecting the humours into a tumour under the *cutis*; and letting them out thence, by ſcarification; i. e. by ſeveral inciſions made with a ſcarificator.

The inſtruments uſed herein are the *cucurbitulæ*, or *cupping-glaſſes*, and *ſcarificator*: the deſcription of each whereof ſee under their proper head.

The uſe of *cupping*-glaſſes is very extenſive, comprehending almoſt the whole body: but their application is to be conſidered under two different circumſtances; for, they are either applied to the place firſt ſcarified with a knife, or to a whole ſkin. This latter is called dry, and the other ſanguinaceous or wet *cupping*.

Cupping is performed either *with*, or *without fire*.

Cupping with fire is the more uſual proceſs; and is commonly, among us, thus effected: the air in the cavity of the cucurbitula is heated, and ſo rarefied, by the application of the flame of a lamp, or the like; and the veſſel immediately applied to the part to be *cupped*.

Others, eſpecially the French, proceed thus: a piece of card is cut round, and a lamp, or four little wax candles, affixed to it: this is placed after the manner of a candleſtick on the part whereon the operation is to be performed, and covered with a cucurbitula or *cupping*-glaſs. After the included air has been well heated and rarefied with the flames of the candles, the glaſs is clapped cloſe to the ſkin; which is no ſooner touched, than the candles are extinguiſhed, and the tumor is raiſed.

In *cupping without fire*, inſtead of rarefying the air included in the *cupping*-glaſs by heat, it is done by a ſyringe applied to the neck of the *cupping*-glaſs, fitted with a braſs collar, cap, and valve: the *cupping*-glaſs being applied to the ſkin, and the SYRINGE wrought, part of the air is pumped out of the cucurbitula; and thus the tumor riſes, as in the former caſe.

The reaſon of the phenomenon is this: the air included in the *cupping*-glaſs being rarefied, a great part of the load which before preſſed the part, and kept it down, and which ſtill continues to preſs the reſt of the body, is taken off; upon which the air, known to be contained in the veſſels of the body, and mixed with the blood and juices, expands itſelf, and raiſes a tumor, carrying with it the fluids wherewith it is mingled.

The operation is performed on the back, and on the breaſts and thighs, to ſtop or promote the menſes: on the navel, for the colic. *Cupping* is alſo uſed for defluxions on the eyes, for venomous wounds, and buboes; on the head, for apoplexies, &c.

In dry *cupping*, before the application of the glaſs, a lighted candle or fire is to be conveyed into it, that the air being expelled by the heat, the glaſs may immediately be adapted to, and impreſſed upon the body, until it adheres firmly; an operation which the practitioners at bagnios perform with great dexterity.

The uſe of dry *cupping* is twofold; either to make a revulſion of the blood from ſome particular part affected, or elſe to cauſe a derivation of it into the affected part upon which the glaſs is applied. It is in the firſt ſenſe that Hippocrates orders a large *cupping*-glaſs to be applied under the breaſts of women, who have a too profuſe diſcharge of the menſes, intending thereby to cauſe a revulſion of the blood upwards from the *uterus*. And upon the ſame principle have hæmorrhages at the noſe been ſtopped by applying *cupping*-glaſſes to the legs and feet, particularly about the ankles and knees. Spitting of blood from the lungs has alſo been cured by the ſame method; and Scultetus gives a remarkable inſtance of a woman, who by the repeated application of ſix *cupping*-glaſſes, without ſcarification, to her thighs, was not only relieved of the troubleſome ſymptoms ariſing from an obſtruction of the menſes, but was alſo freed from the obſtruction itſelf.

Dry *cupping* is alſo uſed with ſucceſs to make a revulſion by applying the glaſſes to the temples, behind the ears, or to the neck and ſhoulders, for the removal of pains, vertigoes, and other diſorders of the head. They are alſo applied to the upper and lower limbs, to drive blood and ſpirits into them when they are paralytic; and laſtly, to remove the ſciatica, or other pains in the joints. The operation in theſe caſes is to be repeated till the part looks red, and becomes painful. Heiſter's Surgery, p. 308.

CUPPING-*glaſs*, *cucurbitula*, in *Chirurgery*, a glaſs veſſel, applied to certain parts of the body, to draw the blood, and other humors, from within, outwards; to be diſcharged through ſeveral inciſions made with a ſcarificator. See the preceding article.

The veſſel is of various dimenſions: ſometimes, inſtead of glaſs, it is made of wood, horn, braſs, ſilver, &c.

CUPRESSUS, in *Botany*. See CYPRESS.

CUPRUM. See COPPER.

CURA *avenacea*, a diet drink of OATS, much recommended by ſome authors in various diſtempers.

CURATAS. See CAZIC.

CURATE is properly a PARSON, or vicar of a pariſh, who hath the charge or CURE of the pariſhioners ſouls.

CURATE is now more generally uſed for a deputy, or ſubſtitute of the parſon; or one who officiates in the place of the incumbent, or beneficiary. And in caſe of plurality of livings, or where a clergyman is old and infirm, it is requiſite there ſhould be a *curate* to perform the cure of the church. He is to be licenſed and admitted by the biſhop of the dioceſe, or by an ordinary having epiſcopal juriſdiction: and when a *curate* hath the approbation of the biſhop, he uſually appoints the ſalary too; and in ſuch caſe, if he be not paid, the *curate* hath a proper remedy in the eccleſiaſtical court, by a ſequeſtration of the profits of the benefice: but if he hath no licence from the biſhop, he is put to his remedy at common law, where he muſt prove the agreement, &c. Rights of Clergy, 127. By ſtatute, where *curates* are licenſed by the biſhop, they are to be appointed by him a ſtipend not exceeding 50*l.* nor leſs than 20*l.* *per annum*, according to the value of the livings; to be paid by the rector or vicar: and the ſame may be done, on any complaint made. Stat. 12 Anne, c. 2.

There are perpetual *curates* as well as temporary, who are appointed where tythes are impropriate, and no vicarage endowed. Theſe are not removable, and the impropriators are obliged to find them, ſome whereof have certain portions of the tythes ſettled on them. Stat. 29 Car. II.

CURATELLA, in *Botany*, a genus of the *polyandria digynia* claſs; having a five-leaved calyx, four petals, two ſtyles, a bipartite capſule, with double-ſeeded cells.

CURATIVE *indication*, among *Phyſicians*, that which directs what is to be done for the cure of a diſeaſe. See Symptom, and Indication.

CURATOR, among the Romans, an officer under the emperors, who regulated the price of all kinds of merchandize and vendible commodities in the cities of the empire.

They had likewiſe the ſuperintendence of the cuſtoms and tributes; whence alſo they were called *logiſtæ*.

Curator, in *Civil Law*, a truſtee, or perſon nominated to take care of the affairs and intereſts of a perſon emancipated, or interdicted.

In countries where the Roman law prevails, between the age of fourteen and twenty-four years, minors have *curators* aſſigned them; till fourteen, they have tutors.

Curator *of an univerſity*, in the United Provinces, is an elective office, to which belongs the direction of the affairs of the univerſity; as, the adminiſtration of the revenues, the inſpection of the profeſſors, &c.

The *curators* are choſen by the ſtates of each province: the univerſity of Leyden has three; the burghermaſters of the city have a fourth.

CURB, in the *Manege*, a chain of iron faſtened to the upper part of the branches of a bridle, in the part called the eye, and running over the horſe's beard. Care ſhould be taken that it be neither too long nor too ſhort, and that the links be large and ſmooth.

Curb, in *Farriery*, is a hard and callous ſwelling on the hind part of the hock, attended with ſtiffneſs, and ſometimes with pain and lameneſs. See Spavin.

CURCAS, in *Botany*, a name given in Egypt to an eſculent root, approaching to the taſte and virtues of the *colocaſia*.

It is alſo a name uſed in Malabar, for a ſmall fruit of the ſhape and ſize of a hazel nut. Both theſe things have the credit of being great provocatives; and it is very probable, that the *curcas* of the Eaſt Indies may be the fruit called *bel* by Avicenna, and ſaid to poſſeſs the ſame famous virtues. Garcias has been led into a very great error by this ſimilarity of names and virtues, and ſuppoſes the *curcas* of Egypt the ſame with the *curcas* of the Eaſt Indies.

CURCULIO, in *Zoology*, the name of a genus of beetles, diſtinguiſhed by having their antennæ affixed to an elongated horny ſnout. See Scarabæus.

CURCUM, in the *Materia Medica of the Arabians*, the name of the large celandine; the roots of which, when dried, were uſed by the dyers of thoſe times as a yellow colour, and by the phyſicians as deobſtruents.

CURCUMA, *turmeric*. See Turmeric.

CURDLING, the coagulating or fixing of any fluid body; particularly milk.

Pauſanias ſays, that Ariſtæus ſon of Apollo, and Cyrene daughter of the river Peneus, were the firſt who found the ſecret of *curdling* milk.

At Florence they *curdle* their milk for the making of cheeſe with artichoke flowers; in lieu of the rennet uſed for the ſame purpoſe among us.

The Biſaltæ, a people of Macedonia, Rochfort obſerves, live wholly upon *curdled* milk, i. e. on curds. He adds, that curds are the whole food of the people of Upper Auvergne in France, and whey their only drink.

Women newly delivered are ſubject to have their milk *curdled*, converted into little grumæ, in their breaſts, which occaſions violent pains, with a ſhivering in the back.

It is owing to the want of being ſucked; whence the method of remedying, and preventing it, is apparent.

CURE, in *Medicine*. See Palliative *cure*.

Cure *of ſouls*, a benefice, the incumbent whereof has the charge and guidance of the ſouls of the people within a certain extent of ground, called a *pariſh*.

Such are a vicar, a rector, &c. in contradiſtinction to a prebend, a dean, a chantor, &c.

Cures, *ſine*. See Sine.

Cure, in *Falconry*, the ſame with casting.

CUREMA, in *Zoology*, the name of a fiſh of the mullet kind, but of a remarkable ſize, growing to two feet long, and having a very large moveable upper lip; the under one being ſmall, triangular in figure, and ſcarce viſible, being ſomething ſhorter than the upper. Its eyes are large, and its fins of a fine ſilvery white; in all other reſpects it reſembles the common mullet.

CURETES, in *Antiquity*, a ſort of prieſts, or people of the iſle of Crete; called alſo *corybantes*.

The name *curetes*, according to Strabo, was given them becauſe of their cutting off the hair before, to prevent the enemy's taking hold thereof: the word being Greek, κουρητες, of κουρα, *tonſure*, from κειρω, *tondo*. Others derive it from κουροτροφια, *the feeding* or *educating of a child*; becauſe they are ſaid to have educated Jupiter.

The *curetes* are ſaid to have been originally of mount Ida, in Phrygia; for which reaſon they were alſo called *Idæi Dactyli*. Ovid ſays, they had their origin from a huge ſhower of rain: Lucian and Diodorus Siculus repreſent them as very expert in caſting of darts; though other authors give them no weapons but bucklers and pikes: but all agree in furniſhing them with tabors and caſtanettas; and relate, that they uſed to dance much to the noiſe and claſhing thereof.

Some authors, however, give a different account of the *curetes*: according to Pezron, and others, the *curetes* were, in the times of Saturn, &c. and in the countries of Crete and Phrygia, what the druids and bards were afterwards among the Gauls, &c. i. e. they were prieſts who had the care of what related to religion, and the worſhip of the gods.

Hence, as in thoſe days it was ſuppoſed there was no communication with the gods but by divinations, auguries, and the operations of magic; the *curetes* paſſed for magicians and enchanters: to theſe they added the ſtudy of the ſtars, of nature, and poeſy; and ſo were philoſophers, aſtronomers, &c.

Such were the *curetes*, and after them the druids; with this difference, that the *curetes*, in the time of the Titans, went to the wars; for which reaſon they were armed, and were wonderfully dextrous in dancing, cap-à-pie, ſhaking their bucklers and javelins: from which action, Pezron conjectures, they took their name *curetes*; *curo*, in the Celtic, being the ſame with κουρω in the Greek; q. d. *I ſtrike* or *beat*.

According to Kircher, the *curetes* were what the *ſpirits* are among the Cabbaliſts, the *powers* in Dionyſius, the *dæmons* among the Platoniſts, and the *genii* among the Egyptians.

Voſſius, De Idololat. diſtinguiſhes three kinds of *curetes*; thoſe of Ætolia, thoſe of Phrygia, and thoſe of Crete, who were originally derived from the Phrygians.

The firſt, he ſays, took their name from κουρα, *tonſure*; becauſe, from the time of a combat wherein the enemy ſeized their long hair, they always kept it cut: thoſe of Phrygia and Crete, he ſuppoſes were ſo called from κουρος, *young man*; becauſe they were young; or becauſe they nurſed Jupiter when he was young.

CURFEU, q. d. *couvre-feu*, a ſignal of retreat, given in cities taken in war, &c. to advertiſe the inhabitants to go to bed, and not to ſtir out any more.

The *curfeu-bell*, wherewith the ſignal was anciently given, was ſometimes hung up as a puniſhment of ſedition. Paſquier ſays, it was called *carfou*, and *garefou*; as being intended to advertiſe the people to ſecure themſelves from the robbers and debauchees of the night.

The moſt ancient *curfeu* was that eſtabliſhed in England by William the Conqueror; who appointed, under ſevere penalties, that, at the ringing of a bell at eight o'clock in the evening, every one ſhould put out their lights, cover, or rake up their fires, and go to bed. Whence, to this day, where a bell is accuſtomed to be rung about bed-time, it is called *curfeu-bell*. It was aboliſhed by Henry I.

CURIA, in our *Ancient Cuſtoms*. It was uſual for the kings of England to ſummon the biſhops, peers, and great men of the kingdom, to ſome particular place, at the chief feſtivals in the year; and this aſſembly is called, by our hiſtorians, *curia*; becauſe they were conſulted about the weighty affairs of the nation: whence it was ſometimes alſo called *ſolemnis curia*, *generalis curia*, *Auguſtalis curia*, and *curia publica*, &c.

Curia *adviſare vult*, in *Law*, is a deliberation which the court ſometimes take, before they give judgment in a cauſe wherein there ſeems to be any point of difficulty.

Curiam, *accedas ad*. See Accedas.

Curiæ, *auxilium*. See Auxilium.

Curia *baronum*. See Court-*baron*.

Curia *claudenda*, is a writ that lies againſt him who ſhould fence and incloſe the ground, but refuſes or defers to do it.

CURIA *militum*, a court ſo called; anciently held at Cariſbrook caſtle, in the iſle of Wight.

Et idem dominus Willielmus de inſula facere debet ſectam ad curiam *domini caſtri de Cariſbroc, de tribus ſeptimanis in tres ſeptimanas, in* curia *quæ vocatur* curia militum.

CURIA, *rectus in.* See RECTUS.

CURIA, among the Romans, denoted a portion, or diviſion, of a tribe.

In the time of Romulus, a tribe conſiſted of ten *curiæ*, or a thouſand men; each *curia* being one hundred: that legiſlator made the firſt diviſion of his people into thirty *curiæ*.

Afterwards, *curia*, or *domus curialis*, became uſed for the place where each *curia* held its aſſemblies.

Hence, alſo, *curia* paſſed to the ſenate-houſe; and it is from hence the moderns come to uſe the word *curia*, COURT, for a place of juſtice, and for the judges, &c. there aſſembled.

Varro derives the word from *cura*, *care*, q. d. an aſſembly of people charged with the care of public affairs: others deduce it from the Greeks; maintaining, that at Athens they called κυρια the place where the magiſtrate held his aſſiſes, and the people uſed to aſſemble: κυρια, again, may come from κυρος, *authority*, *power*; becauſe it was here the laws were made.

CURIALITAS *Angliæ*. See COURTESY *of England*.

CURIASSIERS, in *War*, horſemen that wear armour. Theſe have ſometimes only breaſt-plates.

CURIATA *comitia*. See COMITIA *curiata*.

CURICACA, in *Zoology*, the name of a Braſilian bird, called *maſarino* by the Portugueſe. It is a very large bird, approaching to the ſize of a gooſe, but in ſhape reſembling the curlew. Its beak is ſix fingers breadth long; its head and neck are covered with white and yellow feathers; and its whole body is black, except that on the back, the head, and the lower part of the belly, it has a greyiſh caſt. It is much eſteemed at table. There is another ſpecies of it ſmaller than the former, not exceeding the ſize of a pullet. It is common about the rivers.

CURIMATA, in *Zoology*, a name by which ſome authors have called the LAVARETUS, a ſmall fiſh, of a ſort of middle nature, between truttaceous and the herring kind, and caught in the American and German lakes.

CURING, is uſed for the preſerving fiſh, fleſh, and other animal ſubſtances, by means of certain additions of things, to prevent putrefaction. One great method of doing this, is by ſmoking the bodies; that is, the making them imbibe a great quantity of vegetable fumes; for this is uſually done where wood is burnt. The reaſon of this ſort of preſervation is eaſily ſeen by the curious enquirer, ſince wherever wood, or any vegetable of the acid tribe is burnt, the acid particles go off with the ſmoke, and in this form penetrate into, and lodge themſelves in animal ſubſtances expoſed thereto; by which means this ſmoke acts upon them in the ſame manner that the fumes of ſpirit of nitre would do: and whether it be not a nitrous acid that tinges hams, herrings, &c. to a redneſs in the drying, is a ſubject worth enquiry. Shaw's Lectures, p. 152.

CURIO, the chief, and prieſt of a CURIA.

Romulus, upon dividing the people into *curiæ*, gave each diviſion a chief, who was to be prieſt of that *curia*, under the title of *curio*, and *flamen curialis*.

His buſineſs was to provide and officiate at the ſacrifices of the *curia*, which were called *curionia*; the *curia* furniſhing him with a ſum of money on that conſideration: which penſion or appointment was called *curionium*.

Each diviſion had the election of its *curio*; but all theſe particular *curios* were under the direction of a ſuperior, or general, called *curio maximus*; who was the head of the body, and elected by all the *curios*, aſſembled in the *comitia curialis*.

All theſe inſtitutions were introduced by Romulus, and confirmed by Numa, as Halicarnaſſeus relates it. Godwyn will have two *curios* in each *curia*.

CURIOSUS, an officer of the Roman empire, during the middle age, appointed to take care that no frauds and irregularities were committed; particularly no abuſes in what related to the poſts, the roads, &c. and to give intelligence to the court of what paſſed in the provinces. This made the *curioſi* people of importance; and put them in a condition of doing more harm than they prevented: on which account, Honorius caſhiered them, at leaſt in ſome parts of the empire, *anno* 415.

The *curioſi* came pretty near to what we call *controllers*: they had their name from *cura*, *care*; *quod curis agendis & evectionibus curſus publici inſpiciendis operam darent.*

CURIOSI *naturæ*, *academy of the*. See ACADEMY.

CURLEW, the Engliſh name of the ARQUATA or *numenius*.

Curlews frequent our coaſts in winter in large flocks, but retire to breed in ſummer on the more mountainous parts of the country. Their fleſh is rank and fiſhy, though ſome have highly commended it.

CURLEW, *ſtone*, a ſpecies of the CHARADRIUS. It is a migratory bird, appears in England about the middle of April, and retires in autumn. It is remarkable for a piercing ſhrill noiſe, which it begins in the evening: it breeds in rabbit-burrows, and alſo lays its eggs, which are two of a copper colour, among the ſtones on the bare ground. It feeds in the night on worms and caterpillars; and it is ſaid they will catch mice. Its fleſh is eſteemed very delicate food. In habit, make, and manners, this bird approaches near to the BUSTARD.

CURMI, a name given by the ancients to a ſort of malt liquor or ale. It was made of barley, and was drank by the people of many nations inſtead of wine, according to Dioſcorides's account. He accuſes it of cauſing pains in the head, generating bad juices, and diſordering the nervous ſyſtem. He alſo ſays, that in the weſtern part of Iberia, and in Britain, ſuch a ſort of liquor was in his time prepared from wheat inſtead of barley.

CURNOCK, a meaſure of corn, containing four buſhels, or half a quarter.

CURRANT-*tree*, *ribes*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower has a bellied empalement, cut at the top into five obtuſe concave ſegments: it has five ſmall, obtuſe, erect petals, growing to the border of the empalement; and five awl-ſhaped ſtamina inſerted in the empalement, terminated by incumbent compreſſed ſummits. A roundiſh germen is ſituated under the flower, ſupporting a bifid ſtyle, crowned by obtuſe ſtigmas; which afterward becomes a globular umbilicated fruit, with one cell, containing many roundiſh compreſſed ſeeds. There are four ſpecies. The *currant*-tree is ſaid to have been firſt brought from the iſle of Zant belonging to Venice, and planted in England in the year 1533.

The firſt ſort grows naturally in the northern parts of Europe, but has been long cultivated in the gardens, and greatly improved; ſo that at preſent there are the following varieties in the Engliſh gardens; viz. The common *currant* with ſmall red fruit, the ſame with white fruit, and another with pale fruit, which is commonly called the Champagne *currant*: but ſince the two ſorts of Dutch *currants* have been introduced, and become common in the gardens, the old red and white *currants* have been almoſt baniſhed. The ſecond ſort, called the ſweet alpine *currant*, is kept in a few gardens for the ſake of variety; but as the fruit is very ſmall, and has little flavour, it is not much cultivated. The third ſort, which is a black *currant*, grows naturally in Helvetia, Sweden, and other northern countries; and is ſometimes cultivated in gardens for its fruit, of which is made a rob very much eſteemed for ſore throats; from whence the fruit has been called ſquinancy berries, on account of their great uſe in quinſies. As this fruit has a ſtrong diſagreeable flavour, it is ſeldom admitted to the table. The fourth ſort grows naturally in Penſylvania; but the fruit does not merit cultivation.

The fruit of the red and white *currants*, are greatly eſteemed for the table, and are alſo very good in fevers: they are cooling and grateful to the ſtomach, quench thirſt, and are ſomewhat reſtringent. The jelly made with the juice of this fruit and ſugar, is very grateful in fevers, and is uſed as ſauce to the table. This fruit may be procured good much longer than moſt others, upon the plants, by planting them in different ſituations: for if they are planted againſt pales or walls expoſed to the ſouth, the fruit will ripen in June; and by planting ſome againſt north walls, if they are ſcreened from birds, and covered from the autumnal froſts, they may hang until November; and as the fruit is greatly uſed for tarts, it is very convenient to keep a ſucceſſion of them for ſo long a time.

The ſeveral ſpecies of *currants* are very eaſily propagated, by planting their cuttings any time from September to March, upon a ſpot of freſh earth, which muſt be carefully kept clear from weeds in the ſpring; and in the dry weather, the young plants muſt be frequently watered. When they have ſtood about two years in this place, they will be fit to tranſplant to the places where they are to remain; and this ſhould be done when the leaves are juſt decayed, that they may have time to be rooted before winter. If they are for ſtandards, they ſhould be planted in rows of ten feet diſtance from one another, and the trees in each row four feet from each other; but the much better way is to train them in eſpaliers, in which ſtate they take up much leſs room, and their fruit is much the finer. They ſhould be placed at eight feet diſtant in eſpaliers, and all their branches trained horizontally. They are to be allowed the ſame diſtance when ſet againſt walls or pales.

Currant-trees produce their fruit on the former year's wood, and alſo on ſmall ſnags that come out of the old wood. This may give a caution as to the manner in which they are to be pruned.

They will thrive in any ſoil, or ſituation; but this fruit is always beſt taſted when they grow in a dry ſoil, and an open ſpot of ground. Miller.

CURRANTS, in *Commerce*, a kind of little raiſins, or dried grapes of different colours, black, white, or red; brought from ſeveral places of the Archipelago, and among others, from the iſthmus of Corinth; whence their name, *currants*, q. d. *Corinths*.

They muſt be choſen new, ſmall, and in large maſſes; and care be taken, that the little Spaniſh *currants* be not foiſted in their room. When made up in bales, they may keep two or three years, without ſtirring, or giving them air. Their uſe is in ſeaſoning ſeveral viands, and in ſome medicinal compoſitions; where they ſerve in lieu of raiſins. Sir George Wheeler's account of theſe fruits, and the manner of preparing them, is very curious. The iſland of Zant, he obſerves, is the chief place whence *currants* are brought: the Morea, or the iſthmus of Corinth, which was anciently the principal plantation, and whence the Latins denominated them *uvæ Corinthiacæ*, now produces no more, as having been much neglected; the jealouſy of the Turks not allowing large veſſels to enter the gulph to take them off their hands.

They do not grow on buſhes, like our gooſeberries, though that be the common opinion, but on vines, like other grapes; except that the leaves are ſomewhat thicker, and the grapes ſomewhat ſmaller: they have no ſtone, and, in this country, are all red, or rather black.

They gather them in Auguſt, diſpoſe them in couches on the ground till they be dry, clean them, and lay them up in magazines, which the natives call *ſeraglios*; pouring them in at a hole, till the magazine be full. They cling ſo faſt together by their own weight, that they are forced to be dug out with iron inſtruments.

To barrel them for ſending abroad, they have people who greaſe their feet and legs, and tread them cloſe, that they may keep the better. They are ſold for about twelve crowns the thouſand weight; and pay as much cuſtom to the ſtate of Venice.

Zant produces enough yearly to load five or ſix veſſels; Cephalonia three or four; and the other iſlands one. The Engliſh have a factory at Zant; the Dutch two or three merchants, and the French one: the Engliſh conſuming more than ſix times the quantity that both France and Holland do together. Thoſe of Zant know but little of the uſe we make of them; being perſuaded they only ſerve in dyeing of cloth; and being entirely ignorant of the luxury of Chriſtmas pyes, and Engliſh puddings.

CURRANT, or **COURANT** *money*, good money, or that which paſſes in commerce from one to another. See COURANT.

CURRANT *accompts*. See BOOK.

CURRANT *coins*. See COIN.

CURRANT *price*. See PRICE.

CURRANT, *Curranto*, alſo denotes a ſort of running French dance; ſometimes, a muſical air in triple time. See COURANT.

CURRE, an Engliſh name for the fiſh called by authors *cuculus*, and by us more frequently named the *red* GURNARD.

CURRENCY. *Paper currency*, with reſpect to the Britiſh colonies in America.

On the firſt ſettlement of theſe colonies, an Engliſh crown was five ſhillings in denomination; but the trade there was chiefly carried on by exchanging one commodity for another, and with little or no ſilver or gold: ſugar, tobacco, and rice, ſerved as a medium for trade in ſome of the plantations.

As the American commerce flouriſhed, foreign ſpecie were introduced, and became a medium for trade; and bills of credit, commonly called paper credit, or paper *currency*, were remitted to ſome colonies by their governments, to be diſcharged by a tax or otherwiſe, at certain times to come, which added to their medium of trade and circulation, and anſwered the intention of theſe colonies while they kept within due bounds.

As the ſaid ſilver coin went by tale, and were not milled, they were clipped to ſuch a degree, that the exchange to England varied in proportion; and the paper *currency* alſo varied in value, and was depreciated in ſeveral of the colonies, occaſioned by their remitting more than their trade and property could bear, or from ſome other miſtaken conduct.

Now for the better regulating all money and exchange throughout his majeſty's colonies and plantations in America, it may be propoſed that there be an equal and fixed price for ſilver throughout all thoſe colonies; and that all contracts or bargains from ſome certain day to come, be made for ſuch money; and ſuch money to be accounted, received, taken, paid, ſued for, and recovered accordingly. And no recovery to be made for any money of different ſorts or denominations, that ſhall be contracted for after ſuch time, except for ſuch money and at ſuch prices as ſhall thus be ſettled. This will naturally be called ſterling money, proclamation money, or new money; and what is now current, be it what it will, will be called old *currency* or old money.

Notwithſtanding ſuch a regulation, there would ſtill be a ſmall exchange in the ſeveral plantations, in proportion to the riſk, charge, and other incidents attending the tranſporting money from one colony to another: but every one for the future may expect an equal value upon the repayment of the money he ſhall credit, lend, or trade for, without having the value of his property diminiſhed by any law or cuſtom while it is in other people's hands, which is the principal aim of the propoſition.

CURRENT, from *curro*, *I run*; in *Hydrography*, a ſtream or flux of water in any direction. The ſetting of the *current*, is that point of the compaſs towards which the waters run; the drift of a *current*, is the rate it runs an hour.

Currents, in the ſea, are either *natural* and *general*, as ariſing from the diurnal rotation of the earth on its axis; or *accidental* and *particular*, cauſed by the waters being driven againſt promontories, or into gulphs and ſtreights, where, wanting room to ſpread, they are driven back, and thus diſturb the ordinary flux of the ſea.

The *currents* are ſo violent under the equator, where the motion of the earth is the greateſt, that they carry veſſels very ſpeedily from Africa to America; but abſolutely prevent their return the ſame way: ſo that ſhips are forced to run as far as the fortieth degree of latitude, to find a paſſage into Europe.

In the Streights of Gibraltar, the *currents* almoſt conſtantly drive to the eaſtward, and carry ſhips into the Mediterranean: they are uſually, too, found to drive the ſame way in St. George's channel. The great violence and danger of the ſea in the Streights of Magellan, is attributed to two contrary *currents* ſetting in, one from the South, and the other from the North ſea.

CURRENTS, with reſpect to *Navigation*, may be defined, certain progreſſive motions of the water of the ſea, in ſeveral places; by which a ſhip may happen to be carried forward more ſwiftly, or retarded, in her courſe, according to the direction or ſetting of the *current*, in, with, or againſt, the courſe or way of the ſhip.

The buſineſs of *currents* making a conſiderable article in navigation; the way they ſet, together with their ſtrength, is to be carefully obſerved: this ſome do by the ripplings of the water, and by the driving of the froth along the ſhore, when in ſight of it; but the more uſual, as well as more accurate way, is thus: they firſt fix their boat, by throwing out a triangular piece of wood, with a piece of lead faſtened to it, and tied to the ſtem of the boat with a cord, and letting it ſink eighty or a hundred fathom; or ſometimes, by a kettle tied by the bowl, and ſunk, as the other. By either of theſe means, the boat is brought to ride as at anchor; which done, the log is caſt over, the glaſs turned, and as the log-line veers out, the drift of the log is ſet with the compaſs. See CALM.

This ſhews whether there be any *current*, or none; and if any, which way it ſets, and at what rate it drives: obſerving, however, to add ſomething to the drift, for the boat's drift; for though ſhe appear to ſtand ſtill, yet, in reality, ſhe is found to move. This addition, experience has thus determined: if the line ſhe ride by be ſixty fathom, a third part of the drift to be added; if eighty fathom, a fourth; if a hundred, a fifth.

If a ſhip ſail along the direction of a *current*, it is evident the velocity of the *current* muſt be added to that of the veſſel: if her courſe be directly againſt the *current*, it muſt be ſubtracted: if ſhe ſail athwart the *current*, her motion will be compounded with that of the *current*; and her velocity augmented, or retarded, according to the angle of her direction with that of the direction of the *current*; i. e. ſhe will proceed in the diagonal of the two lines of direction, and will deſcribe or paſs through that diagonal in the ſame time wherein ſhe would have deſcribed either of the ſides, by the ſeparate forces.

To determine a ſhip's courſe and diſtance, ſailing obliquely with, or againſt, a current. Suppoſe, v. gr. ſhe ſails N. E. 110 miles, in a *current* which ſets S. W. 30 miles in the ſame time: to ſolve the problem geometrically; ſet off four points from N towards E (*Tab. Navigation, fig.* 15.), and draw AC equal to 110 miles; from C draw CB, parallel to the line NNE, and equal to 30 miles: laſtly, draw AB, which will be the ſhip's true courſe and diſtance.

To find which trigonometrically. In the triangle A B C, there are given A C 110, B C 30, and the angle C 22° 30′; then, $AC+BC : AC-BC :: t, \frac{1}{2} A+B : t, \frac{1}{2} B-A$. That is, as the ſum of A C and B C, viz. 140, is to their difference 80 : : ſo is the tangent of 78° 45′ to the tangent of 70° 49′. Hence her true courſe appears to be N. E. 7° 56′ eaſterly. For her diſtance; as the ſine of the angle A, 7° 56′, is to the drift of the *current* B C, 30, ſo is the ſine of the angle at C 22° 30′, to the diſtance run, viz. 83 miles.

Currents, *Under*, are diſtinct from the upper or apparent, and in different places ſet or drive a contrary way. Dr. Thomas Smith, Phil. Tranſ. N° 158. or Abr. vol. ii. p. 288, 289, makes it highly probable; that in the Downs, in the Streights of Gibraltar, &c. there is an *under-current*, whereby as much water is carried out, as is brought in by the *upper-currents*.

This he argues from the offing between the north and ſouth Foreland, where it runs tide and half-tide, i. e. it is either ebb or flood in that part of the Downs three hours before it is ſo off at ſea: a certain ſign, that though the tide of flood runs aloft, yet the tide of ebb runs under-foot, i. e. cloſe by the ground; and ſo at the tide of ebb it will flow under-foot.

This he confirms by an experiment in the Baltic Sound, communicated to him by an able ſeaman preſent at the making it: being there, then, with one of the king's frigates, they went with their pinnace into the mid-ſtream, and were carried violently by the *current*. Soon after that, they ſunk a baſket with a large cannon-bullet, to a certain depth of water, which gave check to the boat's motion; and ſinking it ſtill lower and lower, the boat was driven a-head to the windward, againſt the *upper-current*; the *current* aloft not being above four or five fathom deep. He added, that the lower the baſket was let down, the ſtronger the *under-current* was found.

From this principle, it is eaſy to account for that continual in-draught of water out of the Atlantic into the Mediterranean, through the Streights of Gibraltar; a paſſage about twenty miles broad: yet, without any ſenſible riſing of the water along the coaſts of Barbary, &c. or any overflowing of the lands, which there lie very low.

Dr. Halley ſolves the *currents* ſetting in at the Streights without overflowing the banks, by the great evaporation; without ſuppoſing any *under-current*.

CURRICULUS, in our *Ancient Writers*, denotes the year, or courſe of a year.

Actum eſt hoc annorum dominicæ incarnationis quater quinquagenis & quinquies, quinis luſtris, & tribus curriculis; i. e. In the year 1028; for four times fifty makes two hundred, and five times two hundred makes one thouſand; five *luſtres* are twenty-five years, and three *curriculi* are three years.

CURRIED *hide*. See Hide.

CURRIERS are thoſe who dreſs and colour leather, after it comes from the tan-yard. If *curriers* do not curry leather that is ſent to them, within ſixteen days between Michaelmas and Lady-day, and in eight days at other times, they are liable to a forfeiture of 5 *l.* on conviction before a juſtice, to be levied by diſtreſs, &c. but ſubject to a mitigation. 12 Geo. II. c. 25.

CURRODREPANUS, formed of *currus*, *chariot*, and δρεπανον, *ſcythe* or *ſickle*; in *Antiquity*, a kind of chariot armed with ſcythes. The driver of theſe chariots was obliged to ride on one of the horſes, as there was no other ſeat for him; the uſual place for him being all armed with knives, as was likewiſe the hinder part of the chariot. There were no ſcythes pointing down to the earth, either from the beam or axle-tree; but theſe were fixed at the head of the axle-tree in ſuch a manner, as to be moveable by means of a rope, and thereby could be raiſed or let down, and drawn forward or let fall backward, by relaxing the rope.

CURRY-*comb*, an inſtrument full of ſmall teeth, uſed for currying horſes.

CURRYING is the art of dreſſing cow-hides, calves-ſkins, ſeal-ſkins, &c. principally for ſhoes: and this is done either upon the *fleſh* or the *grain*.

In dreſſing leather for ſhoes on the *fleſh*, the firſt operation is ſoaking the leather in water, until it be thoroughly wet; then the fleſh-ſide is ſhaved on a *beam*, about ſeven or eight inches broad, with a knife of a peculiar conſtruction, to a proper ſubſtance, according to the cuſtom of the country, and the uſes to which it is to be applied. This is one of the moſt curious and laborious operations in the whole myſtery of *currying*. The knife uſed for this purpoſe is of a rectangular form, with two handles, one at each end, and a double edge. They are manufactured at Cirenceſter, and compoſed of iron and ſteel: the edge is given to them by rubbing them on a flat ſtone of a ſharp gritty ſubſtance, till it comes to a kind of *wire*; this wire is taken off by a fine ſtone; and the edge is then turned to a kind of groove wire by a piece of ſteel, in form of a bodkin, which ſteel is uſed to renew the edge in the operation.

After the leather is properly ſhaved, it is thrown into the water again, and *ſcoured* upon a board or ſtone commonly appropriated to that uſe. *Scouring* is performed by rubbing the grain or hair-ſide with a piece of pumice-ſtone, or with ſome other ſtone of a good grit, not unlike in thickneſs and ſhape to the ſlate with which ſome houſes are covered. Theſe ſtones force out of the leather a white ſort of ſubſtance, called the *bloom*, produced by the oak-bark in tanning. The hide or ſkin is then conveyed to the ſhade or drying place, where the oily ſubſtances are applied, termed *ſtuffing* or *dubbing*: the oil uſed for this purpoſe is prepared by the oil leather-dreſſers, by boiling ſheep-ſkins or doe-ſkins in cod oil. This is put on both ſides of the leather, but in a greater and thicker quantity on the *fleſh*, than on the *grain* or hair-ſide.

Thus we have purſued the *currying* of leather in its wet ſtate, and through its firſt ſtage, commonly called *getting out*.

When it is thoroughly dry, an inſtrument with teeth on the under-ſide, called a *graining board*, is firſt applied to the fleſh-ſide, which is termed *graining*; then to the grain-ſide, called *bruiſing*: the whole of this operation is intended to ſoften the piece of leather, to which it is applied. *Whitening* or *paring* ſucceeds, which is performed with a fine edge on the knife already deſcribed, and uſed in taking off the greaſe from the fleſh. It is then *boarded up* or *grained* again, by applying the graining board, firſt to the grain, and then to the fleſh.

It is now fit for *waxing*, which begins with *colouring*. This is performed by rubbing with a bruſh dipped in a compoſition of oil and lamp-black on the fleſh, till it be thoroughly black: it is then *ſized*, called black ſizing, with a bruſh or ſpunge, dried, tallowed with a woollen cloth, and *ſlicked* upon the fleſh with a broad ſmooth piece of glaſs, ſized again with a ſpunge: and when dry, this ſort of leather, called *waxed* or *black on the fleſh*, is *curried*.

Currying leather on the hair or grain-ſide, termed *black on the grain*, is the ſame in the firſt operation with that dreſt on the *fleſh*, till it is ſcoured. Then the firſt black is applied to it, while wet; which black is a ſolution of copperas in fair water, or in the water in which the ſkins, as they come from the tanner, have been ſoaked: this is firſt put upon the grain, after it has been rubbed with a ſtone; then rubbed over with a bruſh dipped in ſtale urine; ſlicked out with an iron ſlicker, in order to make the grain come out as fine as poſſible; and then *ſtuffed*, in the manner already deſcribed among the firſt operations of *currying*: and when dry, it is *ſeaſoned*, i. e. rubbed over with a bruſh dipped in copperas water on the grain, till it be perfectly black; then ſlicked with a ſtone of a good grit, to take out the wrinkles and coarſe grain as much as poſſible: after this the grain is raiſed with a fine graining board, by turning the ſkin or piece of leather in various directions; and when a little dried, it is *bruiſed*, in order to ſoften it. When it is thoroughly dry, it is *whitened*, bruiſed again, and grained in two or three different ways; and when oiled upon the grain with a mixture of oil and tallow, it is finiſhed.

Bull and cow-hides are ſometimes *curried* for the uſe of ſadlers and collar-makers; but the principal operations are much the ſame as thoſe we have already deſcribed. It ſhould, however, be obſerved, that only a ſmall portion of fleſh is taken off from hides deſigned for theſe purpoſes. Hides for the roofs of coaches, &c. are ſhaved nearly as thin as ſhoe-hides, and blacked on the grain.

CURSED. See Accursed, and Corzned.

CURSITOR, an officer or clerk belonging to the court of chancery, who maketh out original writs.

Theſe are alſo called *clerks of the courſe*, and are twenty-four in number; making a corporation of themſelves. To each of them are allotted ſeveral ſhires; in which ſhires they make out ſuch original writs as are by the ſubject required.

CURSOR, a little ruler, or label of braſs, divided like a line of ſines, and ſliding in a groove, or notch, along the middle of another label, or ruler, repreſenting the horizon, and always at right angles to it. It is uſed in the analemma.

Cursor is alſo uſed for a point ſcrewed on the *beam*-compass; and which may be moved, or ſlidden along the beam thereof, for the ſtriking of greater or leſs circles.

CURTAILING, in the *Manege*, the docking, or cutting off a horſe's tail.

The practice of *curtailing* is no where in vogue ſo much as in England; it being a popular opinion, that the cutting off the tail renders the horſe's chine or back the ſtronger, and more able to bear burdens.

The amputation is uſually made between the fourth and fifth joints of the tail; a ligature being firſt tied tight about the place, to prevent the flux of blood; and the raw ſtump afterwards ſeared up with a hot iron, till the extremities of the veſſels be all ſtopped.

This abſurd and barbarous cuſtom is now in great meaſure out of faſhion; and horſes are allowed to enjoy the uſe, and retain the beauty of their tails, as given to them by nature.

CURTAIN, in *Fortification.* See Curtin.

Curtains, in a *Fire-ſhip*, are pieces of a coarſe canvaſs, about three quarters of a yard wide, and a yard long, thickened in a melted compoſition of pitch, ſulphur, roſin, tallow, and tar, and covered with ſaw-duſt on both ſides.

CURTATE *diſtance*, in *Aſtronomy*, the diſtance of a planet's place from the ſun, reduced to the ecliptic; or, the interval between the ſun, and that point where a perpendicular, let fall from the planet, meets with the ecliptic

CURTATION, in *Aſtronomy*, the interval between a planet's diſtance from the ſun, and the *curtate* diſtance.

From the preceding article, it is eaſy to find the *curtate* diſtance; whence the manner of conſtructing tables of *curtation* is obvious.

The quantity of inclination, reduction, and *curtation* of a planet, depending on the argument of the latitude, Kepler, in his Rudolphin Tables, reduces the tables of them all into one, under the title of Tabulæ Latitudinariæ.

CURTESY. See Courtesy.

CURTEYN, *Curtana*, a name given to king Edward the Confeſſor's ſword, which is the firſt ſword that is carried before the kings of England at their coronation.

It is ſaid, the point of it is broken, as an emblem of mercy.

CURTICONE, in *Geometry*, a cone whoſe top is cut off by a plane parallel to its baſis; called alſo TRUNCATED *cone*.

CURTILAGE, *Curtilagium*, in *Law*, a yard, backſide, or piece of ground, lying near a dwelling-houſe.

CURTILLA, in *Zoology*, a name given by ſome to the *corvus ſylvaticus* of Geſner.

CURTIN, Curtain, or Courtine, in *Fortification*, that part of a wall, or rampart, which is between two baſtions; or which joins the FLANKS thereof. See *Tab. Fortification, fig.* 21. *lit. q q.*

Du-Cange derives the word from the Latin *cortina*, *quaſi minor cortis*, a little county-court, incloſed with walls: he ſays, it was in imitation hereof, that they gave this name to the walls and parapets of cities, which incloſe them like courts: he adds, that the *curtains* of beds take their name from the ſame origin; that *cortis* was the name of the general's, or prince's tent; and that thoſe who guarded it were called *cortinarii* and *curtiſani*.

The *curtin* is uſually bordered with a parapet five feet high; behind which the ſoldiers ſtand to fire upon the covert-way, and into the moat.

Beſiegers ſeldom carry on their attacks againſt the *curtin*, becauſe it is the beſt flanked of any part.

Curtin, *angle of the*. See Angle.

Curtin, *complement of the*. See Complement.

CURVATAPINIMA, in *Zoology*, a name by which ſome authors call the fiſh more frequently named the BONITO.

CURVATOR *coccygis*, in *Anatomy*, a name given by Albinus to a muſcle of the coccyx diſcovered by himſelf, and not deſcribed by any other author. It is an oblong, thin, and ſmall muſcle, and for the moſt part tendinous. It ariſes with a double head, one from the inner, and the other from the lower and lateral part of the *os ſacrum*; and deſcending, terminates in three extremities. He calls it the *curvator coccygis*, from its office, which is the bending the coccyx; and ſays, that he found it in different ſtates, in three ſubjects: one very perfect and entire; in a ſecond, more imperfect and degenerating; and in the third, reſembling a ligament rather than a muſcle.

CURVATURE *of a line*, is its bending, or flexure; whereby it becomes a curve, of any peculiar form and properties.

Thus, the *curvature* of the circle is ſuch, as that all points of the periphery are equally diſtant from one point within, called the *center*.

The *curvatures* of different circles are to each other reciprocally as their radii.

The theory of the *curvature* of lines is of great uſe in geometry, in the phyſico-mathematical ſciences. Hence mathematicians have treated this ſubject fully. We ſhall here inſert as much of this doctrine as ſeems neceſſary to enable beginners to form a juſt notion of the ſubject, and refer thoſe who deſire a farther knowlege to Mr. Mac Laurin's Treatiſe of Fluxions, whom we have in this, as in many other articles, followed; becauſe he every where endeavours to avoid that air of paradox and myſtery, which has been more than once made a reproach to modern mathematicians.

Any two right lines applied to each other, perfectly coincide; and the rectitude of lines admits of no variety. Arches of equal circles applied upon each other, perfectly coincide likewiſe; and the *curvature* is uniform in all the parts of the ſame, or of equal circles. Arches of unequal circles cannot be applied upon each other ſo as to coincide; but when they touch each other, the arch of the greater circle is leſs inflected from the common tangent, and paſſes betwixt it and the arch of the leſſer circle, through the angle of contacts formed by them, and is therefore leſs curve. Any two arches of curve lines touch each other when the ſame right line is the tangent of both at the ſame point; but when they are applied upon each other in this manner, they never perfectly coincide, unleſs they be ſimilar arches of equal and ſimilar figures: and the *curvature* of lines admits of indefinite variety. As the *curvature* is uniform in a given circle, and may be varied at pleaſure in circles by increaſing or diminiſhing their diameters, their flexure or *curvature* will therefore ſerve for meaſuring that of other lines. Only one right line can be the tangent of a given arch of a curve at the ſame point; but an indefinite variety of circles may touch it there; and theſe have various degrees of more and leſs intimate contact with it. And as of all the right lines that can be drawn through a given point in the arch of a curve, that is the tangent which touches the arches ſo cloſely that no right line can be drawn between them; ſo of all the circles that touch a curve in any given point, that is ſaid to have the ſame *curvature* with it, which touches it ſo cloſely that no circle can be drawn through the point of contact between them, all other circles paſſing either within or without them both.

This circle is called the *circle of curvature*; its center, the *center of curvature*; and its ſemidiameter, the *ray* or *radius of curvature*, belonging to the point of contact. It is alſo called, eſpecially by foreign mathematicians, the *oſculatory circle*.

The arch of this circle cannot coincide with the arch of the curve, but it is ſufficient to denote it the circle of *curvature*, that no other can paſs between them; as the tangent of the arch of a curve cannot coincide with it, but is applied to it ſo that no right line can be drawn between them.

As in all figures, rectilinear ones excepted, the poſition of the tangent is continually varying; ſo the *curvature* is continually varying in all curvilinear figures, the circle only excepted.

As the curve is ſeparated from its tangent by its flexure or *curvature*, ſo it is ſeparated from the circle of *curvature* in conſequence of the increaſe or decreaſe of its *curvature*; and as its *curvature* is greater or leſs, according as it is more or leſs inflected from the tangent, ſo the variation of *curvature* is the greater or leſs, according as it is more or leſs ſeparated from the circle of *curvature*.

It is manifeſt, that there is but one circle of *curvature* belonging to an arch of a curve at the ſame point. For if there were two ſuch circles, any circle deſcribed between theſe through that point, would paſs between the curve and circle of *curvature*; againſt the ſuppoſition.

When any two curves touch each other in ſuch a manner that no circle can paſs between them, they muſt have the ſame *curvature*; for the circle that touches the one ſo cloſely that no circle can paſs between them, muſt touch the other in the ſame manner.

It appears from the demonſtration of geometricians, that circles may touch curve lines in this manner; that there may be indefinite degrees of more or leſs intimate contact between the curve and the circle of *curvature*; and that a conic ſection may be deſcribed that ſhall have the ſame *curvature* with a given line at a given point, and the ſame variation of *curvature*, or a contact of the ſame kind with the circle of *curvature*.

If we conceive the tangent of any propoſed curve to be a baſe, and that a new line be deſcribed, whoſe ordinate is a third proportional to the ordinate and baſe of the firſt; this new line will determine the chord of the circle of *curvature*, by its interſection with the ordinate at the point of contact; and by the tangent of the angle in which it cuts that circle, it will meaſure the variation of the *curvature*. The leſs this angle is, the cloſer is the contact of the curve and circle of *curvature*; and of this contact there may be indefinite degrees.

To give an example: let any curve EMH (*Tab.* II. *Analyſis*,

Analyſis, fig. 44.), and a circle ERB touch the right line ET on the ſame ſide at E; let any right line TK, parallel to the chord EB, meet the tangent in T, EMH in M, and a curve BKF that paſſes through B in K: then if the rectangle MTK be always equal to the ſquare of ET, the *curvature* of EMH at E will be the ſame as that of the circle ERB; and the contact EM and ER will always be the cloſer, the leſs the angle is that is contained at B by the curve BKF, and the circle of *curvature* BQE.

For it is demonſtrable from the elements of geometry (ſee Mac Laurin's Fluxions, art. 366.) that all the circles that can be deſcribed through E fall without both ER and EM, or within them both, and no circle whatever can paſs between them when the rectangle MTK is always equal to the ſquare of ET, and the curve in which K is always found, paſſes through B, and conſequently the circle ERB, and the curve EM, have the ſame *curvature* at E.

Now let E*m* (*fig.* 45.), any other curve touching ET in E, and *fk*B another curve paſſing through B meet TK in *m* and *k*, and let the rectangle *m*T*k* be likewiſe equal to the ſquare of ET; then will the *curvature* of E*m* at E be the ſame as that of the curve EM, as has been mentioned. But the rectangles *m*T*k*, MTK, RTQ being equal to each other, and their ſides therefore in a reciprocal proportion to each other, it is plain that if the arch B*k* paſs between BK the arch of the curve BKF, and BQ the arch of the circle BQE; the curve E*m* muſt paſs between EM the arch of the curve EMH, and ER the arch of the circle of *curvature* ERB: ſo that E*m* muſt have a cloſer contact with this circle than EM has with it; and the leſs the angle is that is formed by the curve FKB and the circle of *curvature* EQB at B, the cloſer is the contact at E of the curve EMH and the circle of *curvature* ERB. Thus the curve BKF, by its interſection with EB, determines the *curvature* of EM; and by the angle in which it cuts the circle of *curvature* it determines the degree of contact of EM and that circle, the angle BET and the right line ET being given.

Hence it follows, that the contact of the curve EMH, and the circle of *curvature*, is cloſeſt when the curve BK touches the arch BQ in B, the angle BET being given; but it is fartheſt from this, or is moſt open, when BK touches the right line EB in B.

Hence, alſo, there may be indefinite degrees of more and more intimate contact between a circle and a curve. The firſt degree is, when the ſame right line touches them both in the ſame point; and a contact of this ſort may take place betwixt any circle and any arch of a curve. The ſecond is when the curve EMH and circle ERB have the ſame *curvature*, and the tangents of the curve BKF and circle BQE interſect each other at B in any aſſignable angle. The contact of the curve EM and circle of *curvature* ER at E, is of the third degree, or order, and their oſculation is of the ſecond, when the curve BKF touches the circle BQE at B, but ſo as not to have the ſame *curvature* with it. The contact is of the fourth degree, or order, and their oſculation of the third, when the curve BKF has the ſame *curvature* with the circle BQE at B, but ſo as that their contact is only of the ſecond degree: and this gradation of more and more intimate contact, or of approximation towards coincidence, may be continued indefinitely, the contact of EM and ER at E being always of an order two degrees cloſer than that of BK and BQ at B. There is alſo an indefinite variety comprehended under each order: thus, when EM and ER have the ſame *curvature*, the angle formed by the tangents of BK and BQ admits of indefinite variety, and the contact of EM and ER is the cloſer, the leſs that angle is. And when that angle is of the ſame magnitude, the contact of EM and ER is the cloſer the greater the circle of *curvature* is. When BK and BQ touch at B, they may touch on the ſame or on different ſides of their common tangent; and the angle of contact KBQ may admit of the ſame variety with the angle of contact MER; but as there is ſeldom occaſion for conſidering thoſe higher degrees of more intimate contact of the curve EMH and circle of *curvature* ERB, Mr. Mac Laurin calls the contact or oſculation of the ſame kind, when the chord EB and angle BET being given, the angle contained by the tangents of BK and BQ is of the ſame magnitude.

When the *curvature* of EMH increaſes from E towards H, and conſequently correſponds to that of a circle gradually leſs and leſs, the arch EM falls within ER, the arch of the circle of *curvature*, and BK is within BQ. The contrary happens when the *curvature* of EM decreaſes from E towards H, and conſequently correſponds to that of a circle that is gradually greater and greater, the arch EM falls without ER, the arch of the circle of *curvature*, and BK is without BQ. And according as the *curvature* of EM varies more or leſs, it is more or leſs unlike to the uniform *curvature* of a circle; the arch of the curve EMH ſeparates more or leſs from the arch of the circle of *curvature* ERB, and the angle contained by the tangents of BKF and BQE at B, is greater or leſs. Thus the quality of *curvature*, as it is called by Sir Iſaac Newton, depends on the angle contained by the tangents of BK and BQ at B; and the meaſure of the inequability or variation of *curvature*, is as the tangent of this angle, the radius being given, and the angle BET being right.

The rays of *curvature* of ſimilar arches in ſimilar figures, are in the ſame ratio as any homologous lines of theſe figures; and the variation of *curvature* is the ſame. See Mac Laurin, lib. cit. ſect. 370.

When the propoſed curve EMH is a conic ſection, the new line BKF is alſo a conic ſection; and it is a right line when EMH is a parabola, to the axis of which the ordinates TK are parallel. BKF is alſo a right line when EMH is an hyperbola, to one aſymptote of which the ordinate TK is parallel.

When the ordinate EB, at the point of contact E, inſtead of meeting the new curve BK, is an aſymptote to it, the *curvature* of EM will be leſs than in any circle; and this is the caſe in which it is ſaid to be infinitely little, or that the radius of *curvature* is infinitely great. Of this kind is the *curvature* at the points of contrary flexure in lines of the third order.

When the curve BK paſſes through the point of contact E, the *curvature* is greater than in any circle, or the radius of *curvature* vaniſhes; and in this caſe the *curvature* is ſaid to be infinitely great. Of this kind is the *curvature* at the cuſpids of the lines of the third order.

As to the circles of *curvature* for lines of the third or higher orders, ſee lib. cit. art. 379, and art. 380, when the propoſed curve is mechanical.

As lines which paſs through the ſame point have the ſame tangent when the firſt fluxions of the ordinates are equal, ſo they have the ſame *curvature* when the ſecond fluxions of the ordinate are likewiſe equal; and half the chord of the circle of *curvature* that is intercepted between the points wherein it interſects the ordinate, is a third proportional to the right lines that meaſure the ſecond fluxion of the ordinate and firſt fluxion of the curve, the baſe being ſuppoſed to flow uniformly. When a ray revolving about a given point, and terminated by the curve, becomes perpendicular to it, the firſt fluxion of the radius vaniſhes; and if its ſecond fluxion vaniſhes at the ſame time, that point muſt be the center of *curvature*. The ſame may be ſaid, when the angular motion of the ray about that point is equal to the angular motion of the tangent of the curve; as the angular motion of the radius of a circle about its center is always equal to the angular motion of the tangent of the circle. Hence the various properties of the circle may ſuggeſt ſeveral theorems for determining the center of *curvature*.

See alſo art. 396 of the ſaid treatiſe, and the following, concerning the *curvature* of lines that are deſcribed by means of right lines revolving about given poles, or of angles that either revolve about ſuch poles, or are carried along fixed lines.

It is to be obſerved, that as when a right line interſects an arch of a curve in two points, if by varying the poſition of that line the two interſections unite in one point, it then becomes the tangent of the arch; ſo when a circle touches a curve in one point and interſects it in another, if, by varying the center, this interſection joins the point of contact, the circle then has the cloſeſt contact with the arch, and becomes the circle of *curvature*; but it ſtill continues to interſect the curve at the ſame point where it touches it, that is, where the ſame right line is their common tangent, unleſs another interſection join that point at the ſame time. In general, the circle of *curvature* interſects the curve at the point of oſculation, only, when the number of the ſucceſſive orders of fluxions of the radius of *curvature*, that vaniſhes at the term of time when this radius comes to the point of oſculation, is an even number.

It has been ſuppoſed by ſome, that two points of contact, or four interſections of the curve and circle of *curvature*, muſt join to form an oſculation. But Mr. James Bernoulli inſiſted juſtly, that the coalition of one point of contact and one interſection, or of three interſections, was ſufficient. In which caſe, and in general, when an odd number of interſections only join each other, the point where they coincide continues to be an interſection of the curve and circle of *curvature*, as well as a point of their mutual contact and oſculation. See Mac Laurin's Fluxions, art. 493.

From theſe principles the circle of *curvature* at any point of a conic ſection may be determined. Suppoſe EMH (*fig.*

(*fig.* 46.) to be any conic ſection, ET the tangent at E, HI a tangent parallel to EB (a chord of the circle of *curvature*) that meets ET in I, and let EMH meet EB in G. Take EB to EG, in the ſame ratio as the ſquare of EI is to the ſquare of HI; or, when the ſection has a center as in the ellipſis and hyperbola, as the ſquare of the ſemi-diameter O*a* parallel to ET, is to the ſquare of the ſemi-diameter OA parallel to EB; and a circle deſcribed upon the chord EB that touches ET, will be the circle of *curvature.*

When BET is a right angle, or EB is the diameter of the circle of *curvature*, EG will be the axis of the conic ſection, and EB will be the parameter of this axis; and when the point G where the conic ſection cuts EB, and B are on the ſame ſide of the point E, EMG will be an ellipſis, and EG the greater or leſſer axis, according as EG is greater or leſs than EB.

The propoſitions relating to the *curvature* of the conic ſections, commonly given by authors, follow without much difficulty from this conſtruction.

1. When the chord of *curvature* thus found paſſes through the center of the conic ſection, it will then be equal to the parameter of the diameter that paſſes through the point of contact.

2. The ſquare of the ſemi-diameter O*a*, is to the rectangle of half the tranſverſe and half the conjugate axis, as the ray of *curvature* CE is to O*a*. And therefore the cube of the ſemi-diameter O*a*, parallel to the tangent ET, is equal to the ſolid contained by the radius of *curvature* CE, and the rectangle of the two axes.

3. The perpendicular to either axis biſects the angle made by the chord of *curvature*, and the common tangent of the conic ſection and circle of *curvature.*

4. The chord of the circle of *curvature* that paſſes through the focus, the diameter conjugate to that which paſſes through the point of contact, and the tranſverſe axis of the figure, are in continued proportion.

5. When the ſection is an ellipſis, if the circle of *curvature* at E meet O*a* in *d*, the ſquare of E*d* will be equal to twice the ſquare of O*a*. Hence E*d* : O*a* :: √2 : 1. Which gives an eaſy method of determining the circle of *curvature* to any point E, when the ſemi-diameter O*a* is given in magnitude and poſition.

Several other properties of the circle of *curvature*, and methods of determining it when the ſection is given; or *vice verſa*, of determining the ſection when the circle of *curvature* is given, may be ſeen in Mr. Mac Laurin's Fluxions, art. 375.

CURVATURE, *variation of.* See VARIATION.

CURVATURE, *double*, is uſed for the *curvature* of a line, all the parts of which are not ſituated in the ſame plane.

CURUCUI, in *Zoology*, the name of an American bird of the wood-pecker kind, and very remarkably beautiful.

CURVE, in *Geometry*, a LINE whoſe ſeveral points tend ſeveral ways, or are poſited towards different quarters.

In this ſenſe, the word is uſed in oppoſition to a *ſtrait line*, whoſe ſeveral points are poſited towards the ſame quarter.

Hence, figures terminated with lines of the firſt ſort are called *curvilinear* figures; in oppoſition to thoſe terminated with the latter, called *rectilinear* figures.

The doctrine of *curves*, and of the figures and ſolids generated from them, conſtitute what we call the *higher geometry.*

In a *curve*, the line AD (*Tab. Geometry, fig.* 12.) biſecting the parallel lines MM, is called the *diameter:* if the lines be equidiſtant, and it cut them at right angles, it is called the *axis*; and the point A, whence the diameter is drawn, is called the *vertex.*

The equidiſtant lines, MM, are called *ordinates*, or *applicates*; and their halves, PM, *ſemiordinates.*

The portion of the diameter AP, between the vertex, or other fixed point, and an ordinate, is called the *abſciſſe.* And the concourſe of all the diameters, the *center.*

Modern geometers frequently conſider *curves* as compoſed of an infinite number of infinitely ſmall right lines; and it is often ſaid, that the ancients alſo conſidered *curves* as polygons of an infinite number of ſides. But it is certain, that this principle no where appears in their writings. We never find them reſolving any figure into infinitely ſmall elements. On the contrary, they ſeem to avoid ſuch ſuppoſitions, as if they judged them unfit to be received into geometry; though it was ſometimes obvious, that their demonſtrations might have been abridged, by admitting ſuch notions. They conſidered curvilinear areas as the limits of circumſcribed or inſcribed figures of a more ſimple kind, which approach to theſe limits; ſo that the difference between them may become leſs than any given quantity. The inſcribed and circumſcribed figures were always conceived to be of a magnitude and number that is aſſignable; and they demonſtrated the menſuration, or the proportions of the curvilinear limits themſelves, by arguments *ab abſurdo.*

But modern geometricians have abandoned the foundations of the ancients. It was thought unneceſſary to conceive the figures circumſcribed or inſcribed, in the curvilinear area, or ſolid, as being always aſſignable and finite; and the precautions of Archimedes and the ancients came to be conſidered as a check upon geometricians, ſerving only to retard their progreſs. Therefore, inſtead of aſſignable finite figures, indiviſible, or infinitely ſmall elements were ſubſtituted; and theſe being ſuppoſed infinite in number, their ſum was ſuppoſed to coincide with the curvilinear area or ſolid. See Maclaurin's Fluxions, in the Introd.

Curves are diſtinguiſhed into *algebraic*, frequently with Des Cartes called *geometrical*; and *tranſcendental*, called by the ſame Cartes, &c. *mechanical curves.*

CURVES, *Algebraical*, are thoſe wherein the relation of the abſciſſes AP, AP, AP, *fig.* 13. to the ſemiordinates MP, MP, MP, may be expreſſed by an algebraic equation.

Suppoſe, v. gr. in a circle, $AB=a$, $AP=x$, $PM=y$; then will $BP=a-x$; conſequently, as $PM^2=AP\times PB$, $y^2=ax-x^2$. Or, ſuppoſe $PC=x$, $AC=a$, $PM=y$; then will $MC^2-PC^2=PM^2$; that is, $a^2-x^2=y^2$.

Note. Thoſe are alſo called *algebraical curves*, which are of a determinate order; ſo, as that the equation always continues the ſame in the ſeveral points of the *curve.*

Moſt authors, after Des Cartes, call *algebraic curves geometrical* ones; as admitting none elſe into the conſtruction of problems; nor, conſequently, into geometry. But Sir Iſaac Newton, and after him Meſſ. Leibnitz, and Wolfius, are of another opinion; and think, that in the conſtruction of a problem, one *curve* is not to be preferred to another, for its being defined by a more ſimple equation, but for its being more eaſily deſcribed.

CURVE, *Tranſcendental*, is that which cannot be defined by an algebraic equation. See TRANSCENDENTAL *curve.*

Algebraic CURVES *of the ſame kind or order*, are thoſe whoſe equations riſe to the ſame dimenſion.

Geometrical lines being defined by the relation between the ordinates and abſciſſes (or, which is the ſame, by the number of points wherein they may be cut by a right line), are well diſtinguiſhed into two kinds, or orders: in which view, lines of the firſt order will be right lines; and thoſe of the ſecond, or quadratic order, will be *curves*, viz. the *conic ſections.*

Now, a *curve* of the firſt kind is the ſame with a line of the ſecond (a right line not being numbered among *curves*): and a *curve* of the ſecond kind is the ſame with a line of the third. Thus, *curves of the firſt kind*, are thoſe whoſe equations riſe to two dimenſions; if they riſe to three, the *curves* are *of the ſecond kind*; if to four, *of the third*, &c.

Thus, e. gr. the equation for a circle is, $y^2=ax-x^2$, or $a^2-x^2=y^2$. A circle, therefore, is a *curve* of the firſt kind.

Again, a *curve of the firſt kind*, is that defined by the equation $ax=y^2$; and a *curve of the ſecond kind*, that defined by the equation $a^2x=y^3$.

For the various *curves of the firſt kind*, and their properties, ſee CONIC *ſections.*

For *curves of the ſecond kind*, Sir Iſaac Newton has a diſtinct treatiſe, under the title of Enumeratio Linearum Tertii Ordinis, which was firſt printed at the end of Dr. Clarke's Latin tranſlation of Sir Iſaac's Optics; and ſince publiſhed more correctly by the late Mr. Jones in 1711, with the treatiſe of Quadratures, and other tracts of its illuſtrious author: ſince illuſtrated by Mr. Stirling, in his Lineæ Tertiæ Ordinis Neutonianæ. Oxon. 1717.

Curves of the ſecond and other higher kinds, he obſerves, have parts and properties ſimilar to thoſe of the firſt. Thus, as the conic ſections have diameters and axes; the lines cut or biſected by theſe, are called *ordinates*; and the interſection of the *curve* and diameter, the *vertex:* ſo, in *curves of the ſecond kind*, any two parallel right lines being drawn ſo as to meet the *curve* in three points; a right line cutting theſe parallels ſo, as that the ſum of the two parts between the ſecant and the *curve* on one ſide, is equal to the third part terminated by the *curve* on the other ſide, will cut, in the ſame manner, all other right lines parallel to theſe, and that meet the *curve* in three points, i. e. ſo, as that the ſum of the two parts on one ſide, will be ſtill equal to the third part on the other ſide.

Theſe three parts, therefore, thus equal, may be called *ordinates*, or *applicates*; the ſecant, the *diameter*; and where it cuts the ordinates at right angles, the *axis:* the interſection of the diameter and the *curve*, the *vertex*; and the concourſe of the two diameters, the *center*; and the concourſe of all the diameters, the *common* or *general center.*

Again, as an hyperbola of the firſt kind has two aſymptotes; that of the ſecond has three; that of the third, four, &c. and as the parts of any right line between the conic HYPERBOLA and its two aſymptotes are equal on either ſide; ſo, in hyperbolas of the ſecond kind, any right line cutting the *curve* and its three aſymptotes in three points; the ſum of the two parts of that right line, extended from any two aſymptotes, the ſame way, to two points of the *curve*, is equal to the third part, extended from the third ASYMPTOTE, the contrary way, to the third point of the *curve*.

Again, as in other conic ſections, not parabolical, the ſquare of an ordinate, i. e. the rectangle of the ordinates drawn to contrary parts of the diameter, is to the rectangle of the parts of the diameter terminated at the vertices of an ellipſis or hyperbola, as a given line, called the *latus rectum*, is to that part of the diameter which lies between the vertices, and called the *latus tranſverſum*: ſo, in *curves of the ſecond kind*, not parabolical, the parallelopiped under three ordinates, is to the parallelopiped under the parts of the diameter cut off at the ordinates and the three vertices of the figure, in a given ratio: wherein, if there be taken three right lines ſituate at the three parts of the diameter between the vertices of the figure, each to each; then thoſe three right lines may be called the *latera recta* of the figure, and the parts of the diameter between the vertices, the *latera tranſverſa.*

And, as in a conic parabola, which has only one vertex to one and the ſame diameter, the rectangle under the ordinates is equal to the rectangle under the part of the diameter cut off at the ordinates and vertex, and a given right line called the *latus rectum*: ſo, in *curves of the ſecond kind*, which have only two vertices to the ſame diameter, the parallelopiped under three ordinates is equal to the parallelopiped under two parts of the diameter cut off at the ordinates and the two vertices, and a given right line, which may therefore be called the *latus tranſverſum.*

Further, as in the conic ſections, where two parallels, terminated on each ſide by a *curve*, are cut by two parallels terminated on each ſide by a *curve*, the firſt by the third, and the ſecond by the fourth: the rectangle of the parts of the firſt is to the rectangle of the parts of the ſecond, as that of the ſecond is to that of the fourth: ſo, when four ſuch right lines occur in a *curve* of the ſecond kind, each in three points; the parallelopiped of the parts of the firſt will be to that of the parts of the ſecond, as that of the ſecond to the parts of the fourth.

Laſtly, the legs of *curves*, both of the *firſt*, *ſecond*, and *higher kinds*, are either of the parabolic or hyperbolic kind: an hyperbolic leg being that which approaches infinitely towards ſome aſymptote; a parabolic, that which has no aſymptote.

Theſe legs are beſt diſtinguiſhed by their tangents; for, if the point of contact go off to an infinite diſtance, the tangent of the hyperbolic leg will coincide with the aſymptote; and that of the parabolic leg, recede infinitely, and vaniſh. The aſymptote, therefore, of any leg, is found by ſeeking the tangent of that leg to a point infinitely diſtant; and the bearing of an infinite leg is found by ſeeking the poſition of a right line parallel to the tangent, when the point of contact is infinitely remote: for this line tends the ſame way towards which the infinite leg is directed.

Reduction of CURVES *of the ſecond kind.* Sir Iſaac Newton reduces all *curves of the ſecond kind* to four caſes of equations: in the firſt, the relation between the ordinate and abſciſs, making the abſciſs x, and the ordinate y, aſſumes this form, $xyy-ey=ax^3+bxx+cx+d$. In the ſecond caſe, the equation aſſumes this form, $xy=ax^3+bx^2+cx+d$. In the third caſe, the equation is $yy=ax^3+bx^2+cx+d$. In the fourth, the equation is of this form, $y=ax^3+bx^2+cx+d$. See Stirling's Lineæ, &c. p. 83, &c.

Enumeration of the CURVES *of the ſecond kind.* Under theſe four caſes, the ſame author brings a vaſt number of different forms of *curves*, to which he gives different names.

An hyperbola lying wholly within the angle of the aſymptotes, like a conic hyperbola, he calls an *inſcribed hyperbola*; that which cuts the aſymptotes, and contains the parts cut off within its own periphery, a *circumſcribed hyperbola*; that, one of whoſe infinite legs is inſcribed, the other circumſcribed, he calls *ambigenal*; that whoſe legs look toward each other, and are directed the ſame way, *converging*; that where they look contrary ways, *diverging*; that where they are convex different ways, *croſs-legged*; that applied to its aſymptote with a concave vertex, and diverging legs, *conchoidal*; that which cuts its aſymptote with contrary flexures, and is produced each way into contrary legs, *anguineous*, or *ſnake-like*; that which cuts its conjugate acroſs, *cruciform*; that which returning around cuts itſelf, *nodated*; that whoſe parts concur in the angle of contact, and there terminate, *cuſpidated*; that whoſe conjugate is oval, and infinitely ſmall, i. e. a point, *pointed*; that which from the impoſſibility of its two roots, is without either oval, node, cuſp, or point, *pure*: and in the ſame manner he denominates a parabola to be *converging*, *diverging*, *cruciform*, &c. Where the number of hyperbolic legs exceeds that of the conic hyperbola, he denominates the hyperbola *redundant.*

Now the various *curves* which he enumerates under theſe four caſes, are in number ſeventy-two; whereof nine are *redundant* hyperbolas, without diameters, having three aſymptotes including a triangle; the firſt conſiſting of three hyperbolas, one *inſcribed*, another *circumſcribed*, another *ambigenal*, with an *oval*; the ſecond, *nodated*; the third, *cuſpidated*; the fourth, *pointed*; the fifth and ſixth, *pure*; the ſeventh and eighth, *cruciform*; the laſt, *anguineal.* There are twelve *redundant* hyperbolas, having only one diameter: the firſt, *oval*; the ſecond, *nodated*; the third, *cuſpidated*; the fourth, *pointed*; the fifth, ſixth, ſeventh, and eighth, *pure*; the ninth and tenth, *cruciform*; the eleventh and twelfth, *conchoidal.* Mr. Stirling makes theſe fourteen. Two are *redundant* hyperbolas, with three diameters. Nine are *redundant* hyperbolas, with three aſymptotes converging to a common point; the firſt formed of the fifth and ſixth redundant parabolas, whoſe aſymptotes include a triangle; the ſecond, of the ſeventh and eighth; the third and fourth, of the ninth; the fifth is formed of the fifth and ſeventh of the redundant hyperbolas, with one diameter; the ſixth, of the ſixth and ſeventh; the ſeventh, of the eighth and ninth; the eighth, of the tenth and eleventh; the ninth, of the twelfth and thirteenth: all which converſions are effected, by diſtinguiſhing the triangle comprehended between the aſymptotes, till it vaniſh into a point.

Six are *defective* parabolas, having no diameters: the firſt, *oval*; the ſecond, *nodated*; the third, *cuſpidated*; the fourth, *pointed*; the fifth, *pure*, &c.

Seven are *defective* hyperbolas, having diameters: the firſt and ſecond, *conchoidal*, with an *oval*; the third, *nodated*; the fourth, *cuſpidated*, which is the ciſſoid of the ancients; the fifth and ſixth, *pointed*; the ſeventh, *pure.*

Seven are *parabolic* hyperbolas, having diameters: the firſt, *oval*; the ſecond, *nodated*; the third, *cuſpidated*; the fourth, *pointed*; the fifth, *pure*; the ſixth, *cruciform*; the ſeventh, *anguineous.*

Four are *parabolic* hyperbolas: four are *hyperboliſms* of the hyperbola: three, *hyperbolas* of the ellipſis: two, *hyperboliſms* of the parabola.

Six are *diverging* parabolas: one, a *trident*; the ſecond, *oval*; the third, *nodated*; the fourth, *pointed*; the fifth, *cuſpidated* (this is Neil's *parabola*, uſually called the *ſemicubic parabola*); the ſixth, *pure.*

Laſtly, one commonly called the *cubic parabola.*

Mr. Stirling and Mr. Stone have ſhewn this enumeration to be imperfect; and Mr. Murdoch has ſince found ſome new ſpecies. See his Geneſis Curvarum per Umbras.

Organical deſcription of CURVES. 1. If two angles, given in magnitude, P A D, P B D (*Tab. Geometry*, *fig.* 14.) revolve round poles given in poſition, A and B; and their legs, A P, B P, with their point of concourſe P, paſs over another right line: the other two legs A D, B D, with their point of concourſe D, will deſcribe a conic ſection paſſing through the poles A B; unleſs that line happen to paſs through either of the poles A or B; or unleſs the angles B A D and A B D vaniſh together; in which caſes, the point will deſcribe a right line.

2. Now, if the legs A P, B P, by their point of concourſe P, thus deſcribe a conic ſection paſſing through one of the poles, A; the other two, A D, B D, with their point of concourſe D, will deſcribe a *curve of the ſecond kind*, paſſing through the other pole B, and having a double point in the firſt pole A: unleſs the angles B A D, A B D, vaniſh together; in which caſe, the point D will deſcribe another conic ſection, paſſing through the pole A.

3. If the conic ſection, deſcribed by the point P, paſs through neither of the poles A, B; the point D will deſcribe a *curve of the ſecond or third kind*, having a double point: which double point will be found in the concourſe of the deſcribing legs A D, B D, when the two angles B A P, A B P, vaniſh together. The *curve* deſcribed will be of the *ſecond kind*, when the angles B A D, A B D, vaniſh together; otherwiſe of the *third kind*, having two other double points in the poles A and B.

With regard to *double points of the curves*: we have obſerved

ſerved, that *curves* of the ſecond kind may be cut by a right line in thoſe two points: now two of theſe ſometimes coincide, v. gr. when the right line paſſes through an infinitely ſmall oval, or through the concourſe of two parts of a *curve*, mutually cutting each other, and uniting in a cuſp. Sometimes all the right lines only cut the *curve* in one point; as in ordinates of the Carteſian and cubic parabola, &c. in which caſe, we muſt conceive the right line paſſing through two other points of the *curve*, placed, as it were, at an infinite diſtance: two of theſe coincident interſections, whether at a finite or infinite diſtance, make what we call a *double point.*

The theory of *curves* is a very conſiderable branch of the mathematical ſciences. Thoſe who are curious of advancing beyond the knowlege of the circle and the conic ſections, and to conſider geometrical *curves* of a higher nature, and in a general view, will do well to ſtudy Mr. Cramer's Introduction à l'Analyſe des Lignes Courbes Algebraiques, printed at Geneva, 4to. 1750, which the learned and ingenious author compoſed for the uſe of beginners. We have an elegant poſthumous work of Mr. Maclaurin, printed at the end of his Algebra, and entitled De Linearum Geometricarum Proprietatibus Generalibus. The ſame author, at a very early age, gave a remarkable ſpecimen of his genius and knowlege in his Geometria Organica, and carried theſe ſpeculations farther afterwards, as may be ſeen in the theorems he has given us in the Philoſophical Tranſactions. See Martyn's Abridg. vol. viii. p. 62, ſeq.

Curves may be organically deſcribed by the rotation of angles, in the manner mentioned above; but there is another general method of deſcribing *curves* by the rotation of rulers or ſtraight lines, inſtead of angles.

Thus, if inſtead of angles we uſe three rulers, D Q, C N, S P (*Tab.* II. *Analyſis, fig.* 47.), which are ſuppoſed to revolve about the poles D, C, S, and to cut one another always in three points, N, Q, and P; if any two of theſe interſections, as N and Q, be carried along the given ſtraight lines A E, E B, the third interſection P will deſcribe a conic ſection.

If you aſſume any number of poles whatſoever, and make rulers revolve about each of them, and all the interſections but one, be carried along given right lines, that one ſhall never deſcribe a line of a higher nature than a conic ſection. And if inſtead of rulers you ſubſtitute given angles which move on the ſame poles, the *curve* deſcribed will ſtill be no more than a conic ſection.

But by carrying one of the interſections neceſſary in the deſcription over a conic ſection, lines of higher orders may be deſcribed.

The Rev. Mr. Brakenridge has given us a general method of deſcribing *curves*, by the interſection of right lines moving about points in a given plane. See Phil. Tranſ. Nº 436. Martyn's Abridg. vol. viii. p. 58, ſeq. But the demonſtrations are not yet extant, excepting the particular caſes demonſtrated in his Exercitatio Geometrica de Curvarum Deſcriptione. Lond. 1733. 4to.

Curves may alſo be deſcribed by the projection, or ſhadows of other *curves*. Thus the projection, or ſhadow of the circle upon different planes, will form the reſt of the lines of the ſecond order, or conic ſections. This is evident, becauſe the rays of light proceeding from a point out of the plane of a circle, and falling upon the circumference of that circle form a cone, which being cut by the plane upon which the ſhadow of the circle is projected, the different conic ſections will be formed according to the poſition of the interſecting plane.

In like manner, the projections or ſhadows of lines of the third order, will form other lines of the third order; and projections or ſhadows of lines of the fourth order, will form lines of the fourth order, &c.

And as the circle, by the projection of its ſhadow, forms the conic ſections, ſo the five diverging parabolas among the lines of the third order, will, by their ſhadows, form and exhibit all the reſt of the lines of that order. See Newton, Enumerat. Lin. Terti. Ordin. publiſhed by Mr. Jones, 1711.

This hint of Sir Iſaac Newton has been lately purſued and illuſtrated with great elegance by Mr. Murdoch, in his treatiſe entitled Newtoni Geneſis Curvarum per Umbras, ſeu Perſpectivæ Univerſalis Elementa. Lond. 1746, 8vo.

By an accurate enumeration of theſe projections, Mr. Murdoch finds, that the number of ſpecies of the lines of the third order amount to ſeventy-eight in all.

Deſcription of CURVES *of the ſecond order, having double points.* Theſe are all deſcribed from ſeven given points, whereof one is the double point itſelf; thus, let there be given any ſeven points of the *curve* to be deſcribed; as, v. gr. A, B, C, D, E, F, G (*Tab. Geometry, fig.* 15.), whereof A is the double point: join the point A, and any other two points, v. gr. B and C; and let the angle C A B, of the triangle A B C, revolve about its vertex A; and another of the angles A B C, about its vertex B: and when the point of concourſe C, of the legs A C, B C, is ſucceſſively applied to the four other points D, E, F, G, let the concourſe of the remaining legs A B and B A fall on the four points P, Q, R, S.

Through thoſe four points, and the fifth A, deſcribe a conic ſection; and let the forementioned angles C A B, C B A, ſo revolve, as that the point of concourſe of the legs A B, B A, may paſs over that conic ſection; and the concourſe of the other legs A C, B C, will deſcribe the propoſed *curve.*

Uſe of theſe CURVES *in the conſtruction of equations.* The uſe of *curves* in geometry is, by means of the interſections thereof, to ſolve problems. See CONSTRUCTION.

Suppoſe, v. gr. an equation to be conſtructed of nine dimenſions, as $x^9+bx^7+cx^6+dx^5+ex^4+(m+f)x^3+gx^2+bx+k=o$; where *b*, *c*, *d*, &c. ſignify any given quantities affected with the ſigns + or −: aſſume the equation to a cubic parabola $x^3=y$; and the firſt equation, writing *y* for x^3, will come out $y^3+bxy^2+cy^2+dx^2y+exy+my+fx^3+gx^2+bx+k=o$; an equation to another *curve* of the ſecond kind, where *m* or *f* may be aſſumed or annulled at pleaſure: and by the deſcriptions and interſections of theſe *curves* will be given the roots of the equation to be conſtructed. It is ſufficient to deſcribe the cubic parabola once. If the equation to be conſtructed, by omitting the two laſt terms hx and *k*, be reduced to ſeven dimenſions; the other *curve*, by expunging *m*, will have the double point in the beginning of the abſciſs, and may be eaſily deſcribed as above: if it be reduced to ſix dimenſions, by omitting the three laſt terms, taking gx^2+bx+k; the other *curve*, by expunging *f*, will become a conic ſection: and if, by omitting the three laſt terms, the equation be reduced to three dimenſions, we ſhall fall on Dr. Wallis's conſtruction by the cubic parabola and right line.

CURVE *of a double curvature*, or CURVE *having a double curvature*, is uſed for a *curve*, all the parts of which do not lie in the ſame plane, that is, ſuch as cannot be deſcribed on the ſame plane.

The *curves* commonly treated of in geometry, are ſuppoſed to be deſcribed, or to have all their points placed in the ſame plane; but if a *curve* be ſuppoſed to be deſcribed on a *curve* ſurface, in ſuch a manner that all the points of that *curve* cannot lie or be ſituated in one and the ſame plane, then will the *curve* ſo deſcribed have a *double curvature.*

Monſieur Clairaut has publiſhed an ingenious treatiſe on *curves of a double curvature.* See his Recherches ſur les Courbes, à double Courbure, at Paris, 4to. 1731. Mr. Euler has alſo treated this ſubject in the Appendix to his Analyſis Infinitorum, vol. ii. p. 323.

CURVE, *rectification of a*, denotes the finding a right line equal to a *curve*. For the praxis hereof, ſee RECTIFICATION *of curves.*

CURVE, *inflection of a.* See INFLECTION.

CURVE, *quadrature of a*, the finding the area, or ſpace included, by a *curve*; or the aſſigning a ſquare equal to a curvilinear ſpace.

CURVES, *family of*, is an aſſemblage of ſeveral *curves* of different kinds, all defined by the ſame equation of an intermediate degree; but differently, according to the diverſity of their kind.

E. gr. Suppoſe an equation of an indeterminate degree, $a^{m-1}x=y^m$. If $m=2$, then will $ax=y^2$; if $m=3$, then will $a^2x=y^3$; if $m=4$, then $a^3x=y^4$, &c. all which *curves* are ſaid to be of the *ſame family*, or *tribe.*

The equations whereby the families of *curves* are defined, are not to be confounded with the tranſcendental ones: for though, with regard to the whole family, they be of an indeterminate degree; yet, with reſpect to each ſeveral *curve* of the family, they are determinate; whereas tranſcendent equations are of an indefinite degree, with reſpect to the ſame *curve.*

All algebraic *curves*, therefore, compoſe a certain family, conſiſting of innumerable others; each whereof comprehends infinite kinds. For ſince the equations whereby the *curves* are defined enter the facta, either of the powers of the abſciſſes and ſemiordinates into the given co-efficients, or of the powers of the abſciſſes into the powers of the ſemiordinates, or of the mere given quantities; and all equations may be equal to nothing (v. gr. if $ax=y^2$, then $ax-y^2=0$); the equation for all algebraic *curves* will be

$$\left.\begin{aligned} ay^m + bxy^{m-1} + nx^2y^{m-2}\ \&c. + fy^m \\ + fy^{m-1} + kxy^{m-2} \\ + qy^{m-2} \end{aligned}\right\} = 0.$$

CURVE, *cauſtic*, in the higher geometry, a curve formed by the concourſe, or coincidence of the rays of light reflected, or refracted from ſome other *curve.*

Every *curve* has its twofold cauſtic; accordingly, cauſtics are divided into *catacauſtics*, and *diacauſtics*; the one formed by reflection, the angle of reflection being equal to that of incidence, the other by refraction.

The geneſis of theſe *curves* may be thus conceived: let A B, A B, &c. *Tab.* II. *Analyſis*, *fig.* 48. repreſent an infinite number of incident rays, that lie all in one plane of incidence; it is evident, that after reflection or refraction, they will not belong to a ſingle point or focus, but cut one another in an infinite number of points: then, if a *curve* be ſuppoſed of ſuch a ſhape as to touch every one of the reflected or refracted rays B F, B F, &c. produced, if need be, in the points F, F, &c. the *curve* F F F is called a *cauſtic* by reflection or refraction, as the name is applied to reflected or refracted rays. It is plain, that if two tangents B F, B F interſect one another in G, and be ſuppoſed to approach one another till they coincide, the points of contact and of interſection will alſo coincide: and therefore the reflected or refracted ray touches the *cauſtic* in that point of the ray, where its interſection with the next ray vaniſhed, when they were ſuppoſed to coincide. And if two incident rays infinitely near to each other be conceived to revolve about their focus A, in the plane of incidence, the focus F or point of interſection of the reflected or refracted rays will deſcribe the *cauſtic* above defined; which is real or imaginary, as F is the focus of converging or diverging rays.

Or, a *cauſtic* by refraction, called a *diacauſtic*, may be ſuppoſed to be thus generated. Imagine an infinite number of rays, as B A, B M, B D, &c. (*Tab. Geom. fig.* 20.) iſſuing from the ſame luminous point, B, to be refracted from, or to the perpendicular M C, in the *curve* A M D; and ſo, as that C E, the ſines of the angles of incidence C M E be always to C G, the ſines of the refracted angles C M G, in a given ratio: then the curve line, which touches all the refracted rays, is called the *diacauſtic.*

M. Bouguer obſerves, that there are two *cauſtics* formed at the ſame time, by convex and concave ſurfaces; and that they occaſion two different images of objects ſeen by reflection from them. See his Traité d' Optique; or Prieſtley's Hiſt. of Viſion, p. 233. See alſo on this ſubject, Smith's Optics, p. 171—181.

Cauſtic curves have this remarkable property, that when the *curves* that produce them are geometrical, they are equal to known right lines.

Thus, the *cauſtic* formed by reflected rays from a quadrant of a circle, which came at firſt parallel to the diameter, is equal to three fourths of the diameter; which is a ſort of rectification of *curves* that preceded the invention of the new doctrine of infinites, on which moſt of our rectifications are built.

Cauſtic curves are uſually ſuppoſed to be the invention of M. Tſchirnhauſen; but it is only the name he invented. The firſt mention he made of them was in the year 1682, when he produced no inſtance but that of the cauſtic in a circle, which he might have learned from Dr. Barrow's Lectiones Opticæ, publiſhed in 1669. It would have been eaſy for him to have done the ſame for any *curve*, by the help of the radius of curvature publiſhed by Huygens in his Horologium Oſcillatorium, in 1673. It is certain this had been done by Sir Iſaac Newton as early as the year 1669, as appears from his Lectiones Opticæ, which were read that year at Cambridge, though not publiſhed till after his death, viz. in 1728. Act. Erud. Lipſ. ann. 1682. p. 364. Newt. Lect. Opt. ſect. 4. Preſ. Stat. Rep. Lett. tom. i. p. 50, ſeq.

Curve *reflectoire*, in *Optics*, ſo called becauſe it is the appearance of the plane bottom of a baſon covered with water to an eye perpendicularly over it. In this poſition the bottom of the baſon will appear to riſe upwards from the center outwards; but the curvature will be leſs and leſs, and at laſt the ſurface of the water will be an aſymptote to it. M. Mairan, who firſt conceived this idea from the phenomena of LIGHT, found alſo ſeveral kinds of theſe *curves*; and he gives a geometrical deduction of their properties, ſhewing their analogy to cauſtics by refraction. Ac. Par. 1740. H. 121. M. 1. Dr. Prieſtley's Hiſt. of Viſion, p. 752.

Curves *by the light*, or Courbes *a la lumiere*, in *Optics*, a name given to certain *curves* by M. Kurdwanowſki, a Poliſh gentleman. He obſerved that any line ſtraight or curved, expoſed to the action of a luminous point, received the light differently in its different parts, according to their diſtance from the light. Theſe different effects of the light upon each point of the line, may be repreſented by the ordinates of ſome *curve* which will vary preciſely with theſe effects. Dr. Prieſtley's Hiſt. of Viſion, p. 752.

Curve, *exponential*, is that defined by an exponential equation; that is, by an equation wherein is an exponential quantity, v. gr. x^x, a^x, &c.

The ſymptoms, properties, geneſes, &c. of particular *curves*, v. gr. the cycloid, conchoid, &c. ſee under their proper heads, Cycloid, Conchoid, &c.

Curve, *logarithmic.*

This *curve* was called *logarithmic* or *logiſtic* by Huygens: though others had conſidered it before him, none had named it. He has given us ſeveral curious properties relating to it, at the end of his Treatiſe of the Cauſe of Gravity, but without demonſtrations. Theſe have been ſince ſupplied by Guido Grandi. See Huyg. Oper. vol. ii. Amſtel. 1728.

Theſe properties are, 1. The ſpaces comprehended between two ordinates, are as the difference of thoſe ordinates. Thus, let AVD (*Tab.* II. *Analyſis*, *fig.* 50.) be a logarithmic, and its ordinates A B, V C, D Q; let the two laſt continued meet A K, a parallel to the aſymptote B O, in E and K, then will the ſpaces A B C V, A B Q D be to each other as E V to K D.

2. If A O be a tangent in A, interſecting C E and K Q in I, G; the ſpaces AVE, A D K will be to each other as VI and D G.

3. The ſpace A B Q D is to the infinite ſpace beyond Q D, and lying between the *curve* and its aſymptote, as K D to D Q.

The accurate author obſerves, that when he ſays the infinite ſpace has a certain proportion to a finite one, he means that this infinite, or indefinite ſpace, may approach ſo near to a given ſpace, having that certain proportion to another, that the difference may become leſs than any aſſigned quantity.

4. The ſub-tangent is conſtant.

5. This ſub-tangent may be found by approximation, and is to the portion of the aſymptote intercepted between ordinates in the ratio of 2 to 1, as 43429, &c. to 30103, or nearly as 13 to 9; that is, as the modulus of Briggs's ſyſtem, to the logarithm of 2. See Logarithm.

6. If there be three ordinates, as A D, G H, B F, *fig.* 51. and if from the extremity B of the leaſt, there be drawn a parallel to the aſymptote B K, cutting the other two ordinates in R, K; as alſo a tangent B Q, cutting them in N, Q; the trilinear ſpaces A B K, H B R will be to each other as the portions of the ordinates intercepted between the *curve* and the tangent, that is, as A Q, H N.

7. The infinite ſpace between the *curve* and its aſymptote, lying beyond any ordinate B F, is double of the triangle B F O, formed by that ordinate, the ſub-tangent and tangent. In which ſenſe this is to be underſtood. See above, N° 3.

8. The ſpace comprehended between two ordinates is equal to the rectangle under the ſub-tangent and the difference of the ordinates. Thus the ſpace A B F D is equal to the rectangle under F O, A K, or to B M X Y.

9. The ſolid formed by the revolution of the infinite ſpace lying beyond any ordinate about the aſymptote, is to a cone of the height of the ſub-tangent, with a baſe equal to the circle deſcribed with that ordinate as radius, as 3 to 2. Thus the ſolid formed by the revolution of the indefinite ſpace Z F B T, about F Z, is to the cone formed by the revolution of the triangle F B O, as 3 to 2.

10. The ſolid formed by the revolution of the ſame infinite ſpace about the ordinate F B, is ſextuple of the cone formed by the triangle F B O, revolving about F B.

11. The diſtance of the center of gravity of this infinite plain ſpace from the ordinate B F, is the length of the ſub-tangent F O.

12. The diſtance of this center from the aſymptote is one fourth of the ordinate.

13. The diſtance of the center of gravity of the firſt of the before mentioned ſolids, from its baſe, is one half of the ſub-tangent.

14. The diſtance of the center of gravity of the other ſolid, from its infinite baſe, is one eighth of its axis.

15. If there be two ſegments of an hyperbola, *fig.* 52. comprized between ordinates to one of its aſymptotes, and if the ordinates of the one be to each other, as the ordinates A D, H G of the logarithmic; and if the ordinates of the other be as B F to C E; then will the hyperbolic ſpaces be to each other, as D G to F E. And theſe hyperbolic ſpaces are to the parallelogram of the hyperbola, as the lines D G, F E are to the ſub-tangent F O. So that if this parallelogram be ſuppoſed equal to 0.4342944819, every hyperbolic ſpace com-

prized between two ordinates to one of the aſymptotes, will be to this parallelogram, as the logarithm of the ratio of the two ordinates, or the difference of the logarithms of the numbers expreſſing the proportions of thoſe ordinates, is to 0.4342944819; taking the logarithms of 10 figures beſides the characteriſtic.

We have mentioned one method of finding the ſubtangent of a given logarithmic from Huygens in N° 4. But this may be otherwiſe done thus: produce any ordinate C D, *fig.* 53. from C to E, ſo that the ratio of C E to C D be equal to the *ratio modularis*; and the right line E B drawn from E parallel to the aſymptote, and meeting the curve in B, will be equal to the ſub-tangent. The *ratio modularis* is 2.7182818, &c. to 1, or 1 to 0.3678794, &c. for which may be ſubſtituted the approximations 11 to 4, 87 to 32, &c. greater than the true, and 8 to 3, 19 to 7, 106 to 39, &c. leſs than the true ratio. See Cotes, Harm. Menſ. p. 7 and 16.

While the baſe O P increaſes uniformly, let the ordinate P *p*, *fig.* 54. increaſe or decreaſe proportionally, as mentioned under the head Logarithm; that is, let the velocity of *p* in the direction O *o*, be always as the ordinate P *p*; then will the point *p* deſcribe the *logarithmic curve*. The baſe O P is always the logarithm of the ordinate P *p*; and if the uniform motion of P be equal to the motion of *p* at *o* in the direction O *o*, then is the ordinate O *o* the modulus of this ſyſtem of logarithms; and the fluxion of any ordinate is to the fluxion of the baſe, as that ordinate is to O *o*.

By the general property of tangents, the fluxion of any ordinate is to the fluxion of the baſe, as that ordinate is to the ſub-tangent. Hence the ſub-tangent O T, or A T, will be equal to O *o*. The ſub-tangent will therefore be conſtant. In any other *logarithmic curve*, the ſub-tangent will always be equal to that ordinate, whoſe fluxion is equal to the fluxion of the baſe; that is, the modulus always expreſſes the ſub-tangent of the *logarithmic curve*. See Logarithm.

The ſub-tangent of the logarithmic expreſſing the modulus of that ſyſtem of logarithms, the ſub-tangent will be the logarithm of the *ratio modularis*, that is, of the ratio of two ordinates raiſed at the extremities of the ſub-tangent; and as the *ratio modularis* is the ſame in all ſyſtems of logarithms, ſo the ratio of the two ordinates placed at the extremities of their reſpective ſub-tangents, is the ſame in all *logarithmic curves* whatſoever.

When the *logarithmic curve* is ſuppoſed to be deſcribed, exponential quantities are eaſily determined by it. Let the ordinate A *a* be expreſſed by A; let O P be to O A as any quantity expreſſed by x is to 1: then the ordinate P *p* may be expreſſed by A^x, an exponential quantity of the firſt degree when x is variable. See Exponential.

To rectify the logarithmic Curve. Let it be required to find the length of the logarithmic arc E *e*, *fig.* 55. Draw the perpendiculars E L A, *e l a*, to the aſymptote; and having drawn the tangents E F, *e f*, take A L equal to the exceſs of the tangent above the ſub-tangent A F, and *a l* equal to the exceſs of the tangent *e f* above *a f*; then having drawn L M, *l m* parallel to the aſymptote, if the difference of the tangents E F—*e f*, be added to the difference of the parallels *l m*—L M, the aggregate will be equal to the arc E *e*. Cotes, Harm. Menſ. p. 23, 24.

Curves, *radial*, is a denomination given by ſome authors to *curves* of the ſpiral kind, whoſe ordinates, if they may be ſo called, do all terminate in the center of the including circle, and appear like ſo many radii of that circle; whence the name.

Curves, *regular*, are ſuch whoſe curvity proceeds continually in the ſame uniform geometrical manner. Such are the perimeters of the conic *ſection*, &c.

Such as have a point of inflection, or regreſſion, and which being continued to a certain point, turn themſelves a contrary way, are called *irregular curves*. Such are the conchoid, and the ſolid parabola, which has a ſquare for its parameter. See Flexion and Retrogression.

Curve, *characteriſtic triangle of a*, in the higher geometry, is a rectilinear right-angled triangle, whoſe hypothenuſe makes a part of the *curve*, not ſenſibly different from a right line. It is ſo called, becauſe curve lines are uſed to be diſtinguiſhed hereby.

Suppoſe, e. gr. the ſemiordinate *p m* (*Tab. Analyſis, fig.* 7.) infinitely near another P M; then will P *p* be the differential of the abſciſs: and letting fall a perpendicular, M R = P *p*, R *m* will be the differential of the ſemiordinate. Draw, therefore, a tangent T M; and the infinitely ſmall arch M *m* will not differ from a right line: conſequently M *m* R is a rectilinear right-angled triangle, and conſtitutes the characteriſtic triangle of that *curve*.

CURVET, in the *Manege*. See Corvet.

CURVICAUDA, in *Natural Hiſtory*, the name of a ſpecies of bee-fly, very common in England, and very troubleſome to horſes, commonly known by the name of the wringle-tail.

CURVILINEAR, or Curvilineal *figures*, in *Geometry*, are ſpaces bounded by crooked lines; as the circle, ellipſis, ſpherical triangle, &c.

Curvilinear *angle*, and *ſuperficies*. See Angle, and Superficies.

CURVIROSTRA, in *Ornithology*, a ſpecies of loxia.

Curvirostra *foſſilis*, in *Natural Hiſtory*, the name of a ſpecies of foſſile ſhell, found very frequently in the ſtone quarries of Northamptonſhire, and the neighbouring counties. It is a ſpecies of cockle, and is diſtinguiſhed by its beak not ſtanding in the middle, but always inclining to one or the other ſide. The ſhell is ſometimes found remaining entire, and in its native ſtate and condition, but more frequently there is ſtony matter depoſited in its place.

CURULE *chair*, *ſella* Curulis, in *Antiquity*, a high ivory chair, wherein certain of the Roman magiſtrates had a right to ſit.

The *curule* magiſtrates were, the ædiles, prætors, cenſors, and conſuls.

The ſenators, who had borne theſe charges, were carried to the ſenate on *curule chairs*, as alſo thoſe who triumphed: the chair being fitted into a kind of chariot, *currus*; whence the origin of the word *curulis*.

The *curule chair* is uſed, on medals, to expreſs a *curule* magiſtracy: when traverſed by a haſta, it is the ſymbol of Juno, and ſerves to expreſs the conſervation of princeſſes.

Curule *ſtatues*. See Statue.

CURURU, in *Botany*, a name uſed by Plumier in the ſame ſenſe with the *ſeriana* of the ſame author, in its generical characters, and called by Linnæus paulinia.

CURURUCA, in *Zoology*, the name of an American freſh water fiſh, of an oblong, and not flatted, body. It grows to a foot and a half in length; its mouth is very large. It is eaten in the Braſils.

CUSCASOW, the name of a Mooriſh diſh eaten in Egypt. It is made of flour tempered with water, rolled in the hands into ſmall pieces, and then put into a colander, over a boiling pot, ſtopped cloſe round; ſo that it is dreſſed with the ſteam; and when it is done enough, they put butter to it.

CUSCUTA. See Dodder.

CUSHION, *Ladies*, in *Botany*. See Saxifrage.

Cushion, *Sea*, *Statice*. See Thrift.

Cushion, *a rubber*, in *Electricity*. See Electrical *machine*.

Cushion, in *Engraving*, is a bag of leather filled with ſand, commonly about nine inches ſquare, and three or four thick, uſed for ſupporting the plate to be engraved.

Cushion, in *Gilding*, is made of leather, faſtened to a ſquare board, from fourteen inches ſquare to ten, with a handle. The vacuity between the leather and board is ſtuffed with fine tow or wool, ſo that the outer ſurface may be flat and even. It is uſed for receiving the leaves of gold from the paper, in order to its being cut into proper ſize and figures.

CUSI, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a very ſmall and very beautiful ſpecies of parrot.

CUSP, *cuſpis*, properly denotes the point of a ſpear, or ſword; but is uſed in *Aſtronomy* to expreſs the points, or horns, of the moon, or any other luminary.

Cusp, in *Aſtrology*, is uſed for the firſt point of each of the twelve houſes, in a figure, or ſcheme, of the heavens. See House.

CUSPIDATED, in *Botany*, is when the leaves of a flower end in a cuſp, or point, reſembling that of a ſpear.

Cuspidated *hyperbola*, &c. See Curve.

CUSTARD *apple*. See *Cuſtard* Apple.

CUSTODE *admittendo*, and Custode *amovendo*, are writs for the admitting, or removing, of guardians.

Custodes *libertatis Angliæ authoritate parliamenti*, was the ſtyle, or title, in which writs, and other judicial proceedings, did run in the time from the death of Charles I. till Oliver was declared protector, &c.

CUSTODIA. See Recto *de cuſtodia terræ & hæredis*.

Hærede deliberando alii qui habet Custodiam *terræ*. See Hærede.

CUSTOM is uſed to denote the manners, ceremonies, or ways of living of a people, which in time have turned into habit, and by uſage obtained the force of laws.

In this ſenſe, *cuſtom* implies things that were at firſt voluntary, but are become neceſſary by uſe.

Custom, *Conſuetudo*, in *Law*, is a law not written, eſtabliſhed by long uſage, and the conſent of our anceſtors. No law can oblige a people without their conſent: ſo wherever they conſent and uſe a certain rule or method as a law, ſuch rule, &c. gives it the power of a law; and if it is univerſal, then it is common law; if particular to this or that place, then it is *cuſtom*. 3 Salk. 112. And as to the riſe of *cuſtoms*, when a reaſonable act once done, was found to be good, and beneficial to the people, then did they uſe it often; and by frequent repetition of the act, it became a *cuſtom*; which being continued without interruption time out of mind, it obtained the force of a law, to bind the particular places, perſons, and things concerned therein. Thus a *cuſtom* had beginning, and grew to perfection: and a good *cuſtom* muſt be grounded on antiquity, continuance, certainty, and reaſon; antiquity, for that it hath been time out of memory, or threeſcore years, as limited by the ſtatute; and time out of mind, is where no man then living hath heard or known any proof to the contrary. It is ſufficient, if two or more witneſſes depoſe, they heard their fathers ſay the ſame of their time. If it be matter of record, the continuance of one hundred years is ſufficient.

The effect of a *cuſtom*, thus circumſtantiated, is, that in popular ſtates, and limited monarchies, it ſerves to interpret the written laws: for in abſolute monarchies, it is the king alone who has the power of interpreting laws. Hence, the word *cuſtom* is ſtill retained, and ſerves to expreſs the particular rights, and municipal laws, eſtabliſhed by uſage in particular provinces, &c. after they are reduced into written laws.

In this ſenſe, moſt of the common law of England is *lex non ſcripta*; being originally no more than the *cuſtoms* of our forefathers.

Lex non ſcripta, in this ſenſe, is uſed in oppoſition to *ſtatutes*, or *acts of parliament*; which commence laws at once.

Cowel diſtinguiſhes *cuſtom* from *preſcription*, in that the former is more general, and relates to ſeveral perſons; whereas the latter is uſually confined to this or that man. Five years time, too, are ordinarily ſufficient for preſcription; whereas, for *cuſtom*, there are required a hundred.

Cuſtoms are real things, and are included within their limits, or territories: they are either *local*, i. e. reſtrained to this or that place; or *general*.

The *cuſtom* of Paris ſerves as a rule for all the other places of France, where they have no proviſions contrary to it.

The Romans were governed by *cuſtoms*, or unwritten laws, after the expulſion of their kings.

Custom *of London*. The principal local *cuſtoms* of this city are the following: if a citizen and freeman dies, his goods and chattels ſhall be divided into three parts; the wife ſhall have one part, the executors another, to diſcharge legacies, &c. and the children unprovided for the other third part. If he has no wife, half of his perſonal eſtate goes to his children, and the other moiety is at his own diſpoſal: if he has a wife and no children, half belongs to her. By ſtat. 11 Geo. I. c. 18. the above *cuſtom* takes place only when a freeman dies inteſtate; but he is impowered by will to diſpoſe of his perſonal eſtate as he pleaſes. A woman in London, that uſes a trade, without her huſband, is chargeable without him, as a *feme ſole* merchant; and if condemned, may be put in priſon till ſhe pay the debt; and her bail are liable, if ſhe abſents herſelf, and the huſband ſhall not be charged. It is the *cuſtom* of the city of London, that a perſon educated in one trade may ſet up in another. And if a debtor be a fugitive, he may be arreſted before the day to find better ſecurity. Every tenant at will of a houſe above 40*s. per ann.* in the city, ought to give and receive half a year's warning on leaving it. Any *cuſtoms* are tried by writ to the lord mayor and aldermen, who certify whether there be ſuch a *cuſtom* as is pleaded by their recorder: and the *cuſtoms* of London are taken notice of in the courts at Weſtminſter.

Custom *of Merchants*, denotes certain rules of judging in relation to contracts, bills, &c. eſtabliſhed by the uſual proceeding of merchants.

Custom, *Dower by*. See DOWER.

Custom, *Suit*. See SUIT.

Customs, in *Commerce*, the dues, duties, or tolls, paid by merchants to the king, for carrying out, and bringing in, of merchandizes.

Some have imagined that they are called *cuſtoms*, becauſe they were the inheritance of the king by immemorial uſage and the common law, and not granted him by any ſtatute; but Sir Edward Coke has clearly ſhewn, that the king's firſt claim to them was by grant of parliament 3 Edw. I. and this is expreſly acknowleged by ſtat. 25 Edw. I. c. 7. with reſpect to the *cuſtoms* on exported wools, ſkins, and leather, which were called the ſtaple commodities of the kingdom; and theſe *cuſtoms* were formerly denominated the hereditary *cuſtoms* of the crown. They were alſo called *cuſtuma antiqua ſive magna*, in contradiſtinction to *cuſtuma parva & nova*, being an impoſt of three pence in the pound paid by merchant ſtrangers on all commodities imported and exported. This was called the alien's duty, and firſt granted in the 31ſt year of Edward I.

There is another hereditary duty pertaining to the crown, called the PRISAGE or BUTLERAGE of wines, conſiderably older than the *cuſtoms*; to which we may add other *cuſtoms* payable on exports and imports, and diſtinguiſhable into SUBSIDIES, impoſed by parliament on the fore-mentioned ſtaple commodities, TONNAGE, POUNDAGE, and other impoſts.

It was enacted, anno 6 Edw. III. that no new *cuſtom* could be levied, nor old ones increaſed, but by authority of parliament; which was afterwards confirmed by 16 Car. I. c. 8.

By the term *cuſtoms*, as it is now underſtood, we mean ſuch duty or ſubſidy as is paid by the merchant at the quay, on all imported as well as exported commodities, by authority of parliament; unleſs where particular reſtrictions and allowances are ſpecified. The duty of tonnage and poundage was granted to Charles II. for his life, and to his two immediate ſucceſſors; but now by three ſeveral ſtatutes, 9 Ann. c. 6. 1 Geo. I. c. 12. and 3 Geo. I. c. 7. it is made perpetual, and mortgaged for the debt of the public. The *cuſtoms* impoſed by parliament are chiefly contained in two BOOKS *of rates*; to which many ſubſequent additions have been made. Aliens pay a larger proportion than natural ſubjects. Blackſt. Com. vol. i. p. 313, &c. See DUTY, and NATURALIZATION.

The amount of the *cuſtoms* in England, being the medium of the payments into the exchequer, for three years ending in 1773, as ſtated by Dr. Price, a late writer on finance, is 2,528,275*l.* and the expence of collecting, being the average of 1771 and 1772, bounties included, 15 *per cent.* of the groſs produce, excluſive of drawbacks and over-entries, or 468,703*l.* and that of the *cuſtoms* in Scotland eſtimated in the ſame manner, is 68,369*l.*

In caſe goods and merchandiſe are brought to a port, and part of the goods are ſold there, but never landed, they muſt pay the *cuſtoms*. Ships outward bound, and coming from beyond ſea, having goods and merchandiſe on board, are to be entered at the *cuſtom*-houſe, and the *cuſtoms* paid or agreed for, under penalties and forfeiture of the goods; one moiety to the king, and another to the ſeiſor, &c. 13 and 14 Car. II. Officers of the *cuſtoms* may ſearch ſhips; and having writ of aſſiſtance, ſearch houſes. By other ſtatutes, foreign goods, taken in at ſea by any coaſting veſſel, ſhall be forfeited, and treble value: and for prevention of clandeſtine running of goods, if any foreign brandy, &c. is imported in veſſels under forty tons, the importer ſhall forfeit the veſſel and brandy. Run goods concealed or offered for ſale, are liable to forfeiture and treble value. 8 and 11 Geo. I. When three perſons are aſſembled and armed with fire-arms, &c. to be aſſiſting in running goods, they ſhall be adjudged guilty of felony. And two or more found in company within five miles of the ſea-coaſt, with any horſes, carts, &c. on which are put above ſix pounds of tea, or five gallons of brandy, or other foreign goods of 30*l.* value, landed without entry, and not having permits, who ſhall carry any offenſive weapons, &c. or aſſault any officer of the *cuſtoms*, ſhall be deemed runners of goods, treated as felons, and the goods ſhall be ſeized and forfeited. If any perſon offers any tea, brandy, &c. to ſale, without a permit, the perſons to whom it is offered may ſeize and carry it to the next warehouſe belonging to the *cuſtoms* or exciſe, and be entitled to a third part of the produce on condemnation. And perſons offering any bribe to officers of the *cuſtoms* to connive at the running of goods, are liable to a forfeiture of 50*l.* obſtructing ſuch officers in entering and ſearching ſhips, incurs a forfeiture of 100*l.* and if the officers are wounded or beaten on board any ſhip, the offenders incur the penalty of tranſportation, &c. 9 Geo. II. See DRAWBACK, and EXCISE.

CUSTOM-HOUSE, an office eſtabliſhed on the frontiers of a ſtate, or in ſome chief city, or port, for the receipt of the cuſtoms and duties of importation and exportation, impoſed on merchandiſes, by the authority of the ſovereign, and regulated by tariffs, or books of rates.

There are ſeveral *cuſtom-houſes* in the ſeveral ports of England: the moſt conſiderable is that of London. It is under the direction of nine commiſſioners appointed by patent; who have the charge and management of all the cuſtoms (the petty farms alone excepted) in all the ports of England.

Other officers are, a ſecretary, ſolicitor, receiver-general, comptroller of the iſſues and payments of the receiver-general, comptroller-general, inſpector of the out-port collectors accompts, inſpector-general of the exports and imports, regiſter-general of all ſhips of Great Britain, ſurveyor-general, ſurveyor of the out-ports, regiſter of the ſeizures, &c. all holding their places by patents: with other inferior officers, appointed by warrant from the board of treaſury. Theſe officers ſhall have no ſhips of their own, nor uſe merchandiſe, factorage, &c. under penalty of 40*l.* They are alſo prohibited to trade in any exciſable liquor, on pain of 50*l.* and forfeiture of office: for taking a bribe they ſhall forfeit 100*l.* and 500*l.* for making colluſive ſeizures.

CUSTOMARY *tenants*, **CUSTUMARII**, or *tenentes per conſuetudinem*, are ſuch tenants as hold by the cuſtom of the manor as their ſpecial evidence.

Theſe were anciently bondmen, or thoſe that held *tenura bondagii. Et omnes illi qui tenuerint in bondagii tenura, ſolebant vocari* cuſtumarii. MS. de Conſuetud. Man. de Sutton Colfield, de anno 3 Edw. II.

CUSTOS *brevium*, the name of an office belonging to the court of common pleas, executed by four perſons, and a deputy, who receive and keep all the writs, and put them upon files, every return by itſelf; and at the end of each term receive of the prothonotaries all the records of the *niſi prius*, called the *poſtea*.

The writs are firſt brought in, by the clerks of aſſiſe of every county, to the prothonotary who entered the iſſue in that matter, to enter judgment. Four days after the return, the prothonotary enters the verdict, and judgment thereupon, into the rolls of the court; and then delivers them over to the *cuſtos brevium*.

The *cuſtos brevium* alſo makes entry of writs of covenant, and concords on fines; and makes copies and exemplifications of all writs and records in his office, and of all fines levied: the fines, when engroſſed, are divided between the *cuſtos brevium* and chirographer; the former keeping the writ of covenant and the note, the latter the concord and foot of the fine.

In the court of king's bench there is likewiſe a *cuſtos brevium & rotulorum*, who files ſuch writs as are there uſed to be filed, and all warrants of attorney; and tranſcribes or makes out records of *niſi prius*, &c.

CUSTOS *placitorum coronæ*, in our *Ancient Writers of Law*, ſeems to be the ſame with him we now call *cuſtos rotulorum*, which is mentioned in the writ *de odio & atia*.

CUSTOS *rotulorum*, he who has the cuſtody of the rolls, or records, of the ſeſſions of peace; and, ſome ſay, of the commiſſions of peace itſelf; appointed by a writing ſigned by the king's hand.

He is always a juſtice of peace, and quorum, in the county where he hath his office; and by his office appears to be rather a miniſter than a judge: becauſe the commiſſion of the peace, by expreſs words, lays this ſpecial charge upon him; *Quod ad dies & loca prædicta, brevia, præcepta, proceſſus, & indictamenta prædicta coram te & dictis ſociis tuis venire facias.* It is his province to appoint the clerk of the peace.

CUSTOS *ſpiritualium*, he who exerciſes ſpiritual or eccleſiaſtical juriſdiction in any dioceſe, during the vacancy of the ſee.

This, by the canon law, belongs to the dean and chapter; but, in England, to the archbiſhop of the province, by preſcription: though divers deans and chapters do challenge it, by ancient charters, from kings of this land.

CUSTOS *temporalium*, the perſon to whoſe cuſtody a vacant ſee was committed by the king, as ſupreme lord; who, as a ſteward of the goods and profits, was to give an account to the eſcheator, and he into the exchequer.

His truſt continued till the vacancy was ſupplied by a ſucceſſor, who obtained the king's writ *de reſtitutione temporalium*; which was commonly after conſecration, but ſometimes before.

CUT *a feather*, in *Sea Language*, is when a well-bowed ſhip ſo ſwiftly preſſes the water, that it foams, or froths. To *cut the ſail*, is to unfurl it, and let it fall down.

CUT-*baſtion*. See BASTION.

CUT-*purſe*, in *Law*; if any perſon *clam & ſecrete*, and without the knowlege of another, cut his purſe or pick his pocket, and ſteal from thence above the value of twelve pence, it is felony excluded clergy. 8 Eliz. 3 Inſt. 68.

Cut-purſes or *ſaccularii* were more ſeverely puniſhed than common thieves, by the Roman and Athenian laws.

CUT-*roof*. See ROOF.

CUT-*water*, the ſharp part of the head of a ſhip below the beak. It is ſo called becauſe it cuts or divides the water before it comes to the bow, that it may not come too ſuddenly to the breadth of the SHIP, which would retard her.

CUTAMBULI, a name given by the old writers on medicine to certain worms bred under the ſkin, and cauſing by their creeping a very uneaſy ſenſation. Afterwards the ſame word was uſed to expreſs certain uneaſy itchings cauſed by a ſcorbutic habit, and reſembling the crawling of worms.

CUTANEOUS, ſomething that concerns the *cutis*, or ſkin; whether in the way of diſtemper, or remedy.

Thus, we ſay, *cutaneous* eruptions; the itch is a *cutaneous* diſeaſe.

CUTANEOUS *eruptions*, in infants. See INFANT.

CUTHBERT *duck*, in *Zoology*. See DUCK.

CUTICULA, **CUTICLE**, in *Anatomy*, a thin, pellucid membrane, void of ſenſe; ſerving as a cover to the *cutis*, or ſkin. See *Tab. Anat.* (*Myol.*) *fig.* 9.

The *cuticula* is that firſt, and outermoſt covering of the body, called alſo *epidermis*, but more commonly the *ſcarf ſkin*; or that ſoft tegument which riſes in a bliſter upon a burn, or the application of a cautery.

It ſticks cloſe to the ſurface of the *cutis*, or true ſkin, to which it is alſo tied by the veſſels that feed it; though theſe are ſo ſmall as not to be ſeen.

When examined by a microſcope, it appears to conſiſt of ſeveral lays of exceeding ſmall ſcales, which cover one another, more or leſs, according to its different thickneſs, in the ſeveral parts of the body; and in the lips, where the ſcales appear plaineſt becauſe the ſkin is thinneſt, they do little more than barely touch.

Theſe ſcales are either the excretory ducts of the glands of the *cutis*, as is the caſe apparently in fiſhes; or elſe the glands have their tubes, opening between the ſcales. See MILIARY *gland*.

Leuwenhoeck reckons, that in one *cuticular* ſcale there may be 500 excretory ducts; and that a grain of ſand will cover 250 ſcales: ſo that one grain of ſand will cover 1,250,000 pores, or orifices, through which we daily perſpire.

Yet, notwithſtanding the exceeding poroſity of the *cuticula*, it obſtructs a great part of the ſerous humours, which would otherwiſe be evacuated by the glands of the *cutis*; as is evident, from that plentiful diſcharge conſequent on the application of a bliſter, or other accident, whereby the *cuticula* is removed, and the *cutis* bared.

The ſcales are often glued together by the groſſer parts of our inſenſible tranſpiration hardening upon them by the heat of the body, which carries off the more volatile particles; and in this is ſuppoſed to conſiſt that indiſpoſition we popularly call a COLD.

The humour which is thenceforward ſeparated by the glands of the ſkin, being pent in between the ſcales, cauſes frequent itching; and where the matter has been long pent up, ſmall pimples, and other foulneſſes: for removing of which, nature directs to thoſe wholeſome remedies of frequent rubbing, waſhing, or bathing.

Some imagine the *cuticle* to be formed from the groſſer parts of the excrementitious ſerous humour, eliminated through the pores of the *cutis*, and condenſed on the ſurface; like the pellicle which appears, upon evaporation, on the ſurface of the ſerum of the blood: but Leuwenhoeck, with more probability, takes it to be from an expanſion of the excretory ducts of the glands of the ſkin.

Its uſe is to defend the nerves of the *cutis*, which are the origin of the ſenſe of feeling, from the injuries of rough and hard bodies, as well as the air: for either of thoſe would make too exquiſite and painful an impreſſion on the naked nerves; or the air would dry them, ſo as that they would be leſs ſuſceptible of the nicer touches of pleaſure.

Riolanus, and ſeveral others, maintain that the *cuticula* of women has no pores: Molinette argues the contrary from their ſweating; but maintains, alſo, that this is true of dogs and cats, who never ſweat, how much ſoever fatigued.

CUTICULAR *glove*, in the Phil. Tranſ. denotes a ſeparation of the *cuticle* from the *cutis*, from the wriſt to the finger-ends, &c. in the form of gloves, occaſioned by a ſingular kind of fever. See the caſe and hiſtory related, ibid. vol. lix. Nº 38. an. 1769.

CUTICULARES *carunculæ*. See CARUNCULÆ *cuticulares*.

CUTIS, in *Anatomy*, the *ſkin*; a reticular plexus, or body of veſſels, immediately under the cuticle, or ſcarf ſkin. See *Tab. Anat.* (*Myol.*) *fig.* 8.

The veſicles of the *cutis* contain a mucous liquor; from the tincture of which, Malpighi, and others, take the colour of the ſkin to be derived; founded on this, that the *cutis*, as well as *cuticle* of blacks, is white, and the blood red, &c. and that the only thing they have peculiar in this part, is the colour of this liquor.

The *cutis* conſiſts of fibres of its own; or, according to Steno, is formed out of the productions of the tendons of the ſubjacent parts: which terminate in an infinite number of pyramidal papillæ, interwoven with innumerable nervous fibres, and other veſſels, forming what we call a PARENCHYMA. It is by means of theſe papillæ that the *cutis* becomes the organ of feeling.

Dr. Hunter ſays, that when the ſkin is once deſtroyed, it is never regenerated, and that the cicatrix is hardened fleſh.

The *cutis* is generally connected to the ſubjacent parts by the *membrana adipoſa*, and its proper veſſels, the veins, arteries, nerves, &c. Its uſe is to wrap up and cover the whole body; to be a general emunctory for the matter of perſpiration; and to be the organ of feeling.

The diſeaſes of the *cuticula* and *cutis* are, the itch, leproſy, ſmall-pox, meaſles, ſcarlet fever, and eryſipelatous inflammations.

CUTTER, in *Sea Language*, denotes a ſmall veſſel commonly navigated in the Engliſh channel, furniſhed with one maſt, and rigged as a ſloop. Many of theſe are uſed in an illicit trade; and others employed, under the direction of the admiralty or cuſtom-houſe, by government, to ſeize them.

CUTTER is alſo the name of a ſmall boat belonging to ſhips of war. It is broader, deeper, and ſhorter than the BARGE or PINNACE; fitter for ſailing; and uſually employed in carrying ſtores, proviſions, &c. to and from the ſhip. CLINCHER-work is uſed in the ſtructure of theſe boats.

CUTTER *of the tallies*, an officer of the exchequer, who provides wood for the tallies, and cuts the ſum paid upon them. See TALLY.

CUTTING, a term uſed in various ſenſes, and various arts; in the general, it implies a diviſion or ſeparation.

CUTTING is particularly uſed in *Heraldry*, where the ſhield is divided into two equal parts, from right to left, parallel to the horizon, or in the feſſe-way.

The word is alſo applied to the honourable ordinaries, and even to animals, and moveables, when they are divided equally the ſame way; ſo, however, as that one moiety is colour, the other metal. The ordinaries are ſaid to be *cut*, *couped*, when they do not come full to the extremities of the ſhield.

CUTTING, in *Chirurgery*, denotes the operation of extracting the STONE out of the bladder by ſection. See LITHOTOMY.

CUTTING-*glaſs*, in *Chirurgery*. See CUPPING-*glaſs*.

CUTTING, in *Coinage*. When the laminæ, or plates of the metal, be it gold, ſilver, or copper, are brought to the thickneſs of the ſpecies to be coined, pieces are *cut* out, of the thickneſs, and nearly of the weight, of the intended coin; which are now called *planchets*, till the king's image hath been ſtamped on them.

The inſtrument wherewith they *cut*, conſiſts of two pieces of ſteel, very ſharp, and placed over one another; the lower a little hollow, repreſenting a mortar, the other a peſtle. The metal put between the two, is *cut* out in the manner deſcribed under COINAGE.

Note. Medallions, where the relievo is to be great, are not *cut*, but caſt, or moulded.

CUTTING, in the *Manege*, is when the horſe's feet *interfere*; or when with the ſhoe of one foot he beats off the ſkin from the paſtern joint of another foot.

This is more frequent in the hind feet than the fore: the cauſes are either wearineſs, weakneſs in the reins, not knowing how to go, or ill ſhoeing.

CUTTING, in *Painting*, the laying one ſtrong lively colour over another, without any ſhade or ſoftening. The *cutting* of colours has always a diſagreeable effect.

CUTTING *in wood*, a particular kind of ſculpture, or engraving; denominated from the matter wherein it is employed.

It is uſed for various purpoſes; as, for figured letters, head and tail-pieces of books; and even for ſchemes, and other figures, to ſave the expences of engraving on copper: and for prints, and ſtamps for paper, callicoes, linens, &c.

The invention of *cutting in wood*, as well as that in copper, is aſcribed to a goldſmith of Florence; but it is to Albert Durer, and Lucas, they are both indebted for their perfection. See ENGRAVING, and PRINTING.

One Hugo de Carpi invented a manner of *cutting in wood*, by means whereof, the prints appeared as if painted in clair-obſcure. In order to this, he made three kinds of ſtamps for the ſame deſign; which were drawn, after one another, through the preſs for the ſame print: they were ſo conducted, as that one ſerved for the grand lights, a ſecond for the demi-teints, and a third for the outlines and the deep ſhadows.

The art of *cutting in wood*, was certainly carried to a very great pitch above two hundred years ago; and might even vie, for beauty and juſtneſs, with that of engraving in copper. At preſent it is in a low condition, as having been long neglected, and the application of artiſts wholly employed on copper, as the more eaſy and promiſing province: not but that wooden *cuts* have the advantage of thoſe in copper on many accounts; chiefly for figures and devices in books; as being printed at the ſame time, and in the ſame preſs, as the letters: whereas, for the other, there is required a particular impreſſion. In the repreſentation of plants and flowers, and in deſigns for paper-hangings, where the outline only is wanted to be printed, in a bold full manner, this method will be found cheaper and more effectual than the uſe of copper-plates.

The *cutters in wood* begin with preparing a plank or block, of the ſize and thickneſs required, and very even and ſmooth on the ſide to be *cut*: for this, they uſually take beech, pear-tree, or box; though the latter is the beſt, as being the cloſeſt, and leaſt liable to be worm-eaten. The wood being cut into a proper form and ſize, ſhould be planed as even and truly as poſſible: it is then fit to receive the drawing or chalking of the deſign to be engraved. But the effect may be made more apparent, and the ink, if any be uſed in drawing, be prevented from running, by ſpreading thinly on the ſurface of the wood, white lead tempered with water, by grinding with a bruſh pencil, and afterwards rubbing it well with a fine linen rag, whilſt it is wet; and when it is dry, bruſhing off any looſe or powdery part with a ſoft pencil.

On this block they draw their deſign with a pen, or pencil, juſt as they would have it printed. Thoſe who cannot draw their own deſign, as there are many who cannot, make uſe of a deſign furniſhed them by another; faſtening it upon the block with paſte made of flour and water, with a little vinegar, or gum tragacanth; the ſtrokes or lines turned towards the wood.

When the paper is dry, they waſh it gently over with a ſponge dipped in water; which done, they take off the paper by little and little, ſtill rubbing it a little firſt, with the tip of the finger; till at length there be nothing left on the block, but the ſtrokes of ink that form the deſign, which mark out ſo much of the block as is to be ſpared, or left ſtanding. Figures are ſometimes cut out of prints, by taking away all the white part or blank paper, and cemented with gum-water to the ſurface of the wood.

The reſt they *cut* off, and take away very curiouſly with the points of very ſharp knives, or little chiſſels, or gravers, according to the bigneſs or delicacy of the work; for they need no other inſtruments.

It differs from engraving in copper, becauſe in the former, the impreſſion comes from the prominent parts, or ſtrokes left uncut; whereas in the latter, it comes from the channels cut in the metal.

The manner of printing with wooden prints is much more expeditious and eaſy than that of copper-plate: becauſe they require only to be dipt in the printing-ink, and impreſſed on the object in the ſame manner and with the ſame apparatus as the letter-printing is managed; and for purpoſes that do not require great correctneſs, the impreſſion is made by the hand only, a proper handle being fixed to the middle of the print, by which it is firſt dipped in the ink, ſpread by means of a bruſh, on a block of proportionable ſize covered with leather; and then lifted up inſtantly, and dropped with ſome little force on the paper, which is to receive the impreſſion. Handmaid to the Arts, vol. ii. p. 222.

CUTTINGS, or *ſlips*, in *Gardening*, the branches or ſprigs of trees, or plants, cut or ſlipped off to ſet again; which is done in any moiſt fine earth.

The beſt ſeaſon is from Auguſt to April; but care is to be taken, when it is done, the ſap be not too much in the top, leſt the cut die before that part in the earth have root enough to ſupport it: nor yet muſt it be too dry, or ſcanty; the ſap in the branches aſſiſting it to take root.

In providing the *cuttings*, ſuch branches as have joints, knots or burrs, are to be cut off two or three inches beneath them, and the leaves to be ſtripped off ſo far as they are ſet in the earth. Small top-branches, of two or three years growth, are fitteſt for this operation.

CUTTING-*teeth*, in *Anatomy*. See TEETH.

CUTTLE-*fiſh*, *Sepia*, in *Zoology*, the name of a genus of ſea-inſects of the *gymnarthria* kind, called alſo the INK-*fiſh*.

The body of the *ſepia* is of an oblong figure, and depreſſed; it is furniſhed with ten tentacula, two of which are longer than the others, and are pedunculated. It is often ſix inches in length, and three and a half in diameter.

It is ſupported by an oblong, light, and ſpongy ſubſtance, of a friable texture, and lined with a light fungous pith. This is uſed by the ſilver-ſmiths, and as a dentrifice under the name of *os ſepium*, *os ſepiæ*, or *cuttle-fiſh* bone.

This animal, when it is in danger of being taken, is ſaid to emit a black liquor like INK, out of its mouth in conſiderable quantities, whereby the water being obſcured, it finds an opportunity of eſcaping; and from this property it has got the name of the *ink-fiſh*. It is not wholly a ſtranger to our ſeas, as appears from its bone being found on our ſhores.

CUTTLE-*fiſh bone*, *Sepiæ os*, or *teſta*, is a white, ſpongy, teſtaceous ſubſtance, growing on the back of the *cuttle-fiſh*, and ſeeming almoſt to be calcined by the ſun.

It is rough and abſterſive, and chiefly uſed in medicine as a dentrifice. It is hard on one ſide, but ſoft on the other, ſo as to receive neat impreſſions from medals, and to ſerve as a mould for the caſting of metals, which thus take the figure of the original. It is likewiſe uſed for poliſhing or cleanſing ſilver. See Lewis's Com. P. T. p. 333, & ſeq.

CUTTOFOE, in *Botany*, a name given by the people of Guinea to a plant which they eſteem greatly for its medicinal virtues. They boil it in water, and give the decoction in all caſes of the colic, in which it proves a cure. It is a ſpecies of the *anonis*, or reſt-harrow, and is common to Africa, and the Weſt Indies, Sir Hans Sloane having very well figured, and deſcribed it, under the name of *anonis non ſpinoſa minor glabra procumbens flore luteo*, the yellow-flowered, ſmall, procumbent, ſmooth *anonis*, without thorns.

It is found in vaſt abundance on the banks of the Rio Cobre, near the city of St. Jago de la Vega, or Spaniſh Town. Phil. Tranſ. N° 232.

CUTTS, flat-bottomed boats, built low and commodiouſly, uſed in the channel for tranſporting horſes. Stow, Annal. p. 412.

CUVETTE. See CUNETTE.

CUURDO, in *Botany*, is, with ſome authors, the name of the cinnamon-tree.

CYAMEA, in *Natural Hiſtory*, the name by which the ancients call the black flinty eagle-ſtone. Pliny deſcribes its blackiſh colour, and ſays, that when broken, there was found within it another ſtone of the bigneſs of a horſe-bean. This is what rattles in it when ſhaken.

CYANELLA, in *Botany*, a genus of the *hexandria monogynia* claſs. The corolla conſiſts of ſix petals. The fruit is a roundiſh triſulcated capſule, conſiſting of three valves, and containing three cells: the ſeeds are numerous and oblong.

CYANEUS, in *Zoology*. See COLUBER.

CYANUS, in *Botany*. See BLUE-*bottle*, and CENTAURY.

CYANUS, in the *Natural Hiſtory of the Ancients*, is uſed to expreſs two different ſubſtances. The one, the *lapis lazuli*; the other, the *lapis armenus*, a ſubſtance uſed by the painters in its native ſtate, and very improperly called a ſtone, being a mere earth, and being truly to copper, what yellow ochre is to iron.

CYATHUS, from χωειν, *to pour out*, in *Antiquity*, a liquid meaſure among the Romans, being the twelfth part of the SEXTARIUS. It only held as much as a man could eaſily drink at one draught, and was divided into twelve parts, called UNCIÆ.

CYBÆA, in *Antiquity*, a kind of ſhip uſed in commerce, of a roundiſh form.

CYBELE, in *Mythology*, a heathen goddeſs; the daughter of heaven and earth, wife of Saturn, and mother of the gods. She was adored under the names of Ops, Rhea, Veſta, the Good Goddeſs, Dyndimene, Berecynthia, &c. and was called *Cybele* from Mount Cybelus in Phrygia. She is repreſented in a chariot drawn by lions, her garments flowered, a key in her hand, and a turret on her head.

CYBELICUM *marmor*, a name given by the ancients to a ſpecies of marble, dug in a mountain of that name in Phrygia. It was of an extremely bright white, with broad veins of a bluiſh black.

CYBOMANTIA, a ſpecies of divination performed by lots.

CYCAS, in *Botany*, a genus of the *cryptogamia ferns*.

CYCEON, from κοκαειν, *to mix*; a name given by the *Ancient Poets* and *Phyſicians*, to a mixture of meal and water, and ſometimes of other ingredients. Theſe conſtituted the two kinds of *cyceon*; the coarſer being of the water and meal alone; the richer and more delicate compoſed of wine, honey, flour, water, and cheeſe. Homer, in the eleventh Iliad, talks of *cyceon* made with cheeſe and the meal of barley, mixed with wine, but without any mention either of honey or water; and Ovid, deſcribing the draught of *cyceon* given by the old woman of Athens to Ceres, mentions only flour and water. Dioſcorides underſtood the word in both theſe ſenſes; but extolled it moſt in the coarſe and ſimple kind: he ſays, when prepared with water alone, it refrigerates and nouriſhes greatly.

CYCINNIS, a Grecian dance, ſo called from the name of its inventor, one of the ſatyrs belonging to Bacchus. Its conſiſted of a combination of grave and gay movements.

CYCLAMEN, in *Botany*. See SOW-*bread*.

CYCLAS, in our *Old Writers*, a long garment, cloſe upwards, and open, or large below. Matt. Paris, ſpeaking of the citizens of London, tells us they were *cericis veſtimentis ornati*, cycladibus *auri textis circundati*. Anno 1236.

CYCLE, from κυκλοω, *I revolve*, in *Chronology*, a certain PERIOD, or ſeries of numbers proceedingly orderly from firſt to laſt, and recurring again from laſt to firſt, ſucceſſively, and without interruption.

The origin of *cycles* was thus: the apparent revolution of the ſun round the earth, has been divided, arbitrarily, into twenty-four hours; the baſis or foundation of all our menſuration of time. Civil uſe knows none but hours; or rather multiples of hours, as days, and years. But neither the annual motion of the ſun, nor that of the other heavenly bodies, can be meaſured exactly, and without any remainder, by hours, or their multiples. That of the ſun, v. gr. is three hundred and ſixty-five days, five hours, forty-nine minutes, nearly; that of the moon, twenty-nine days, twelve hours, forty-four minutes.

Hence, to ſwallow up theſe fractions in whole numbers, and yet in numbers which only expreſs days and years, *cycles* have been invented: which, comprehending ſeveral revolutions of the ſame body, replace it, after a certain number of years, in the ſame points of the heaven whence it firſt departed; or, which is the ſame thing, in the ſame place of the civil calendar.

Such is the famous *cycle* of 19 years, called alſo the

CYCLE *of the moon*, or *lunar* CYCLE, a period of 19 ſolar years; equivalent to 19 lunar years, and ſeven intercalary months, which was thought to contain exactly 6940 days, or 235 ſynodical months; in which time the new and full moons are ſuppoſed to return to the ſame day of the Julian year. See CALIPPIC.

This is alſo called the *Metonic period*, from its inventor Meton, the Athenian; and the *golden number*. Though, in propriety, the golden number is rather the particular number which ſhews the year of the lunar *cycle*, which any given year is in. This *cycle* of the moon only holds true for 310.7 years: for, though the new moons do return to the ſame day after 19 years; yet not to the ſame time of the day, but near an hour and a half ſooner; which error, in 310.7 years, amounts to an entire day.

Yet thoſe employed in reforming the calendar went on a ſuppoſition of the lunations returning preciſely from 19 years to 19 years, for ever.

The uſe of this *cycle*, in the ancient calendar, is to ſhew the new moon of each year, and the time of Eaſter.

In the new one, it only ſerves to find the EPACTS; which ſhew, in either calendar, that the new moon falls eleven days too late.

As the orientals began the uſe of this *cycle* at the time of the council of Nice in 325, they aſſumed, for the firſt year of the *cycle*, the paſchal new moon to fall on the thirteenth of March: on which foot the lunar *cycle* three fell on the firſt of January, in the third year.

The occidentals, on the contrary, put the number one to the firſt of January, which occaſioned a conſiderable difference in the time of Eaſter: hence, Dionyſius Exiguus, upon framing a new calendar, perſuaded the Chriſtians of the Weſt to ſalve the difference, and come into the practice of the church of Alexandria.—*To find the year of the lunar* CYCLE, is to find the golden number. See GOLDEN-*number*.

CYCLE *of indiction* is a ſeries of fifteen years, returning conſtantly around, like the other *cycles*; and commencing from the third year before Chriſt. See INDICTION.

CYCLE *of the ſun*, or *ſolar* CYCLE, a revolution of 28 years; beginning with 1, and ending with 28; which elapſed, the Dominical or Sunday-letters, and thoſe that expreſs the other feaſts, &c. return into their former place, and proceed in the ſame order as before. The days of the month return again to the ſame days of the week; the ſun's place to the ſame ſigns and degrees of the ecliptic on the ſame months and days, ſo as not to differ one degree in a hundred years; and the leap-years begin the ſame courſe with reſpect to the days of the week on which the days of the month fall.

It is called *ſolar cycle*, not with regard to the ſun's courſe, which has nothing to do herein; but from Sunday, anciently called *dies ſolis*, *the day of the ſun:* in regard the DOMINICAL letter is principally ſought for from this revolution.

The reformation of the calendar under pope Gregory occaſioned a conſiderable alteration of this *cycle*: in the Gregorian calendar, the *ſolar cycle* is not conſtant and perpetual; becauſe every fourth ſecular year is common; whereas, in the Julian, it is biſſextile. The epocha, or beginning of the *ſolar-cycle*, both Julian and Gregorian, is the ninth year before Chriſt.

To find the cycle *of the ſun for any given year*: add nine to the number given, and divide the ſum by 28; the number remaining will be the number of the *cycle*, and the quotient the number of revolutions ſince Chriſt.

If there be no remainder, it will be the twenty-eighth, or laſt year of the *cycle*.

CYCLE *of the Sun in* Julian *Years*.

1	GF	5	BA	9	DC	13	FE	17	AG	21	CB	25	ED
2	E	6	G	10	B	14	D	18	F	22	A	26	C
3	D	7	F	11	A	15	C	19	E	23	G	27	B
4	C	8	E	12	G	16	B	20	D	24	F	28	A

CYCLE *of the Sun from the* Gregorian *Year* 1700, *to the Year* 1800.

1	DC	5	FE	9	AG	13	CB	17	ED	21	GF	25	BA
2	B	6	D	10	F	14	A	18	C	22	E	26	G
3	A	7	C	11	E	15	G	19	B	23	D	27	F
4	G	3	B	12	D	16	F	20	A	24	C	28	E

CYCLE, it may be obſerved, is not only applied in general to all the numbers that compoſe the ſeries; but to each number in particular: thus we compute, that the ordinary epocha from the birth of Jeſus Chriſt had the *ſolar cycle* 10; the *lunar cycle*, or the golden number, 2; the Dominical letter B; and the *cycle of indiction* 4.

CYCLE, *great Paſchal*, is another name for the *Victorian*, or *Dionyſian* PERIOD.

CYCLISCUS (from κυκλος, *circulus*) an inſtrument in form of a half-moon; uſed by the ſurgeons to ſcrape the ſkull, in fractures of that part.

CYCLOID, in *Geometry*, one of the mechanical, or, as others term them, tranſcendental curves; called alſo the *trochoid*.

CYCLOID, *the geneſis of the*, may be conceived by imagining a nail in the circumference of a wheel: the line which the nail deſcribes in the air, while the wheel revolves on a right line, is the *cycloid*. Hence it is called *trochoides*, from τροχος, a *wheel*.

It is deſcribed by the motion of a point C (*Tab. Geometry*, *fig.* 16.) in the periphery of a circle CDH, while the circle makes a revolution along the right line AB. This line is called the baſe; the line EF biſecting it at right angles in F is called the axis; and the point E the vertex of the *cycloid*. The circle by which it is deſcribed is called the generating circle. Hence we may eaſily deduce and demonſtrate the properties of this curve. The right line AB is equal to the periphery of the generating circle CDH, and AF equal to the ſemi-periphery: and in any ſituation of this circle, the right line AD is equal to the arc CD, and therefore the arc $CH = DF = IK = CG$; but CH is equal to the arc EG; therefore $CG =$ arc EG, and the ordinate CK equal to the ſum of the arc EG, and its right ſine GK.

Again, a line CH parallel to the chord EG, is a tangent to the *cycloid* in C. Let an ordinate ck be drawn very near CK, as in the figure; let Cu and Gn be parallel to the axis, and meet it in u and n; and from O, the center of the circle EGF, draw the radius OG. Since $ck = Eg + gk$, cu will be $= Gg + gn$. Let the ordinate ck approach to CK, and at length coincide with it, as Gg and Gn vaniſh, the triangles Ggn and GOK become ſimilar; becauſe the arc Gg in this evaneſcent ſtate coincides with its tangent, the angle OGg is a right angle $= nGK$; and therefore $gGn = OGK$: whence $Gg : gn :: OG : OK$, and $Gg + gn : gn :: OG + OK\ (= FK) : OK$. But $Gn : gn :: GK : OK$, therefore $Gg + gn : Gn :: FK : GK :: GK : EK$; and conſequently $cu : Cu :: GK : EK$; and ſuppoſing the chord Cc to be drawn, the triangles Cuc, EKG will be ſimilar, becauſe they have equal right angles, and the ſides about thoſe angles proportional; and therefore the chord Cc, as the points C and c coincide, becomes parallel to EG, ſince the angles on the ſame ſide of the croſſing line are equal: therefore the tangent of the *cycloid* at C is parallel to the chord EG.

Farther, the arc of the *cycloid* EL is double of the chord EM of the correſponding arc of the generating circle EMF.

Let KL and kS be two very near ordinates of the *cycloid*, meeting the generating circle in M and Q; produce the chord till it meets the ordinate kS in P; let Qo be perpendicular from Q on MP, and draw the lines EN and MN touching the circle in E and M. The triangles ENM and PQM are ſimilar, becauſe of the equal right angles, and the equal vertical angles, QM being indefinitely ſmall, and coinciding with the tangent; and $EN = NM$ as tangents to the ſame circle meeting in N; therefore $PQ = QM$, and Qo biſects the baſe of the iſoſceles triangle, and conſequently $MP = 2Mo$; but LS, being an indefinitely ſmall part of the curve, and coincident with the tangent, is parallel to MP, the chord produced, and equal to it; therefore $LS = 2Mo$. But as LS is the increment of the curve generated in the ſame time in which the chord EM increaſes by MO, ſince EQ ſuppoſed to be drawn is equal to Eo, when Q and M coincide: conſequently the curve increaſes twice as faſt as the chord, and as they begin to increaſe together, the arc of the *cycloid* EL will be always double of the chord EM. Hence it appears that the ſemi-*cycloid* ELB is equal to twice the diameter of the generating circle, EF; and the whole *cycloid* $= 4EF$.

Again, let ER be parallel to the baſe AB, and CR parallel to the axis of the *cycloid*; the ſpace ECR, bounded by the arc of the *cycloid* EC, and the lines ER and RC, will be equal to the circular area EGK. Draw cr parallel to CR; ſince $cu : Cu :: GK : EK$, as we have already proved, $EK \times cu = GK \times Cu$; and therefore $CR \times Rr = GK \times Kk$, and the little ſpace $CRrc = GKkg$: conſequently the areas ECR, EGK increaſe by equal increments; and as they begin to flow together, they muſt be equal. Whence it follows, making AT perpendicular to the baſe at A, that the ſpace ETACE is equal to the ſemicircular area EGF: and conſequently, that the area ECAFE, or ſemi-*cycloidal* ſpace is equal to three times the area of the generating ſemicircle EGF; becauſe AF is equal to the ſemiperiphery, and therefore EFAT being a rectangle under the diameter and ſemiperiphery, is equal to four times the ſemicircle EGF. Thus it appears, that the whole *cycloidal* ſpace is triple the area of the generating circle.

This property of the *cycloid* might likewiſe be eaſily proved, by ſuppoſing a line $\alpha\beta$ to be drawn at a diſtance below the center equal to that of CK above it: let it interſect the generating circle EGE in γ; then $\alpha\gamma + CG = E\gamma$ or $(FG) + EG =$ the ſemiperiphery EGF: and thus the ſum of every pair of lines drawn in the ſame manner will be EGF; and the number of them would be as OE; therefore the part of the *cycloidal* ſpace ECAFGE, ſuppoſed to be formed by theſe lines, would be equal to $OE \times EGF =$ to the area of the generating circle; then, adding to each the ſemicircular area, and the ſemi-*cycloidal* ſpace ECAFE, will appear to be equal to three times the ſemicircular area, &c.

Laſtly, if the line EA be drawn, the area intercepted between the *cycloid* ECA, and this line will be equal to the ſemicircle EGF; for the area $ECAFE = 3EGF$, and the triangle $EAF = AF \times \frac{1}{2} EF =$ the rectangle of the ſemicircle and radius $= 2EGF$; therefore their difference, the area ECAE, is equal to EGF.

The *cycloid* is reputed a modern curve, and its invention aſcribed, by ſome, to Merſenne; by others, to Galileo; but Dr. Wallis ſhews it of an older ſtanding, and to have been knowh to Bovillus about the year 1500, and even conſidered by cardinal Cuſanus much earlier, viz. before the year 1451. Phil. Tranſ. abr. vol. i. p. 116.

Mr. Huygens has demonſtrated, that from whatever point, or height, a heavy body, oſcillating on a fixed center (v. g. a pendulum), begins to deſcend; while it continues to move in a *cycloid*, the times of its falls, or oſcillations, will be equal to each other. This property M. Fontenelle ſtates thus: the nature of the *cycloid* is ſuch, that if a body, which deſcribes it, fall from a greater height, and by that means acquire a certain augmentation of velocity, as in Galileo's theory, the greater *cycloidal* arch which it deſcribes, takes up preciſely that exceſs of velocity: ſo that the body does not deſcribe it either ſooner for its being accelerated, or later for having a greater ſpace to move: and hence ariſes an equality in time, notwithſtanding the inequality of arches.

This is eaſily demonſtrated; ſince the force by which the motion of the pendulum is accelerated in any point M (*Tab.* III. *Mechanics*, *fig.* 33.) of the *cycloid*, is as the arc of the *cycloid* VM, that remains to be deſcribed. The force of gravity, ſuppoſed to be invariable, acting in the direction of the diameter DV, may be repreſented by DV; and it may be reſolved into the two forces DQ and VQ; the firſt of which, in a direction parallel to the ſtring ſuſpending the pendulum CM, ſerves only to ſtretch the ſtring, and does not contribute to accelerate the motion of the pendulum: it is only that part of the force of gravity repreſented by the chord VQ, which accelerates the motion of it along the curve Mm, and is altogether employed to produce that effect, ſince the direction VQ is parallel to the tangent of the *cycloid* at M. But $VM = 2VQ$; therefore the force that accelerates the pendulum at M is as the arc of the curve VM;

and it is a well known theorem in mechanics, that, when the accelerating forces are as the ſpaces to be deſcribed, thoſe ſpaces will be deſcribed in equal times. It appears from the foregoing demonſtration, that the part of the gravity, which the ſtring ſuſtains in any point M is to the whole weight of the pendulum, as the chord DQ to the diameter.

It is alſo demonſtrated by writers on this ſubject, that the time of a complete oſcillation in the *cycloid* is to the time in which a body would fall through its axis, as the circumference of a circle to its diameter (Prop. 25 Horol. Oſcill. and Keil's Introd. Lect. xv. prop. 46). whence we may eaſily infer, that the vibrations in unequal arcs are performed in equal times.

The *cycloid* is a line of the ſwifteſt deſcent; and ſome have imagined that a ray of light paſſing through the ATMOSPHERE deſcribes this curve. See farther on this ſubject, Phil. Tranſ. abr. vol i. p. 462, &c. vol. iv. p. 351, &c. Maclaurin's Fluxions, art. 405—408. Account of Newton's Phil Diſc. p. 209, &c. Cotes's Opera Miſc. p. 80. Stirling. Linæ tertii Ordinis. Appendix.

On this foundation it is, that the pendulum clock is built: on the ſubject whereof, the ſame M. Huygens has written a large volume, under the title of Horologium Oſcillatorium. See PENDULUM, and OSCILLATION.

CYCLOIDAL *ſpace*, the ſpace contained between the *cycloid*, and its ſubtenſe.

CYCLOMETRY, from κυκλος, *circle*, and μετρω, *I meaſure* the art of meaſuring cycles, or circles.

CYCLOPÆDIA, from κυκλος and παιδια, *inſtruction*, the circle, or compaſs of arts and ſciences; more ordinarily called *encyclopædia*.

The word *cyclopædia* is not of claſſical authority, though frequent enough among modern writers, to have got into ſeveral of our dictionaries. Some have cenſured us for having called the preſent work by this name; not conſidering, that names and titles of books, engines, inſtruments, &c. are in a great meaſure arbitrary; and that authors make no ſcruple even of coining new words on ſuch occaſions when there are no old ones to their mind. Thus it is Dr. Hook calls his fine book of microſcopical obſervations, Micographia; Wolfius his book on the air, Aerometria; Drake his book of anatomy, Anthropologia, &c. all of them words of modern, if not of their own fabric; and on no better authority ſtand the names of half our later inventions, as *microſcope*, *teleſcope*, *barometer*, *thermometer*, *micrometer*, &c. But it is ſuggeſted the word *cyclopædia* is ambiguous, and may denote the *ſcience of a circle*, as well as the *circle of ſciences*: we anſwer, that as cuſtom, the only ſovereign rule of language, has determined the word to the latter ſenſe, it is no more chargeable with ambiguity than a thouſand other words of received uſe; no more, for inſtance, than *micrometer*, which might either denote a *little meaſure*, or a *meaſure of little things*.

CYCLOPES, from κυκλος, and ωψ, *eye*, in *Mythology*, a people who were ſaid to inhabit the iſland of Sicily, in the primitive times, together with the Leſtrigones. According to Heſiod they were the ſons of heaven and earth; but of Neptune and Amphitrite, according to Euripides and Lucian. They were called *Cyclopes* from their being deſcribed with but one eye, placed in the middle of their forehead, and were of gigantic ſtature: they were ſaid to be the companions of Vulcan. They are repreſented as a people lawleſs, ſavage, and delighting in human fleſh; which character aroſe from the cruel cuſtom of ſacrificing ſtrangers, whom fortune brought upon their coaſt. It is related that Apollo killed the principal among them for having ſorged the thunderbolts which Jupiter hurled againſt his ſon Æſculapius. The adventures of Polyphemus with Ulyſſes and Galatea are well known.

The explanation of this allegory has been repreſented to be man in a ſtate of uncultivated nature; unſkilled in the laws of civil ſociety, and living in a ſtate of brutal force, having but one ſenſe, which was ſight. Him Ulyſſes overcame by ſuperior knowlege and experience.

The *Cyclopes*, according to Dr. Bryant, were a tribe of the ancient Amonians, who ſettled in many parts of Greece. They were famous for architecture; and the idea of this people was borrowed from the lofty towers which they erected. As theſe buildings were often light-houſes, and had, in their upper ſtory, one round caſement, by which they afforded light in the night, the Greeks made this circumſtance a characteriſtic of the people. They ſuppoſed this aperture to have been an eye, which was fiery and glaring, and placed in the middle of their foreheads. The *Cyclopian* deity was Ouranus, and the *Cyclopians* were his prieſts and votaries. Ouranus was often called Cæl, or Cælus, and worſhipped under the name of a ſerpent, Ops, or Opis. Hence the temple of the deity might have been called Cu-Cæl-Ops, *Domus Cæli Pythonis*; whence Κυκλωψ, and the prieſts and people *Cucelopians*. Analyſis of Ant. Mythol. vol. i. p. 491, &c.

CYCLOPTERUS, in *Ichthyology*, the name of a genus of the branchioſtegous fiſhes, the characters of which are theſe: the branchioſtege membrane on each ſide contains ſix ſmall and cylindric bones. The body is of an oblong, globoſe figure; the belly-fins unite at their extremities, ſo as to form one circular fin, of the ſhape of a funnel; the fins are ſix in number. We at preſent know only one ſpecies, which is the LUMP-*fiſh*, or ſea-owl.

The name is formed of κυκλος, a *circle*, and πτερον, a *fin*; and expreſſes that this fiſh has ſomething circular in its fins, thoſe of the belly being concreted into this form. See *Tab. of Fiſhes*, N° 32.

This is a genus of the *nantes amphibia*, in the Linnæan ſyſtem.

CYDER, a briſk, tart, cool liquor, prepared from apples. The apples ſhould remain on the tree, till they are quite ripe; and this is a circumſtance of great importance with reſpect to the quality of the *cyder*. They ſhould be gathered by the hand in dry weather, and the drieſt part of the day, that they may be guarded both from bruiſes and moiſture. They ſhould then be ſorted, according to their various degrees of maturity; and laid in ſeparate heaps to ſweat and meliorate: ſweating, however, ſeems to be neceſſary only for apples, that are not quite ripe; though ſome recommend it as proper for all apples. The duration of the time of ſweating is beſt determined by the ſmell of the fruit; different kinds require different lengths of time, viz. from eight or ten days to ſix weeks. The harſher the apple is, the more time it needs; they ſhould be well wiped before they are uſed; the rotten part, if any, ſhould be thoroughly pared off, and the ſtalk taken out.

CYDER, *manner of making*. The fruit is firſt ground in a mill, or pounded in a trough, and the juice ſqueezed out of the pomice in a preſs; then it is ſtrained through a ſieve, or other filtre, and tunned up; the veſſel is not to be full. It is better to put the *cyder* into tubs or vats during the firſt fermentation, than to tun it immediately from the preſs. The curious in the manufacture of it have a large veſſel in the ſhape of an inverted cone, with a part cut off near the vertex, holding from five to twenty hogſheads, in which they ferment it. In this veſſel the heavier lees ſubſide, and the lighter forms a cruſt at the ſurface, by the breaking and ſinking of which they judge when it is fit for racking; and it is drawn off by a tap near the bottom. For two or three days it is to be ſtopped looſely, then quite cloſed with clay; a ſmall vent-hole ſhould be left open for ſeveral days, or looſely ſtopped up with a peg, till the wild ſpirit of the liquor be ſpent; afterwards both the vent-hole and bung may be cloſed. Henceforward, a ſmall quantity is to be drawn out every day for ſome weeks, till ſuch time as it be ſuppoſed pretty clear: then it is pierced, to ſee how fine it is; the ſummer fruit after a month; the gennet-moil after the firſt froſts; the redſtreak not till after January; and the other winter fruits about the ſame time.

If it be now not found fine enough, it ſtands a month longer; and if after this it be defective, it is racked off like wine, ſo as to keep out the air.

Some, inſtead of racking, fine it with iſinglaſs, ſteeped in white wine, and diſſolved over the fire; this they boil in a quantity of the liquor to be fined, and then mix it with the reſt: and others, inſtead of diſſolving the iſinglaſs over the fire, let it ſteep in the white wine for about a month, in which time it diſſolves into a jelly of itſelf; a quantity of this is mixed with ſome of the liquor, and the whole beat to a froth; then mingled, together with ſome broom, with the reſt. The liquor once fine, it is drawn out, or bottled off, as occaſion requires.

Some recommend frequent racking, and other means, for renewing and increaſing the fermentation; but this ſhould be regulated according to the ſtrength or weakneſs of the *cyder*.

When the *cyder* has done fermenting, two or three handfuls of wheat-bran, thrown into each veſſel, will thicken the head or cream of the liquor, and make it keep better; and the *cyder* is much improved by putting into each hogſhead about three quarts of good wheat, firſt boiled and hulled. Dead or flat *cyder* may be revived by grinding a ſmall parcel of apples, and putting them into the caſk, to renew the fermentation. This *cyder*, however, ſhould be drawn off in a few days; otherwiſe the muſt will corrupt the whole maſs.

Flat *cyder* in bottles may alſo be remedied, by adding a ſpoonful or two of new muſt to each bottle, and ſtopping it again. Tart or ſouriſh *cyder* may be amended and preſerved by adding wheat to it, in the proportion of about a gallon to a hogſhead; and a greater degree of acidity may be corrected by egg-ſhells, powdered alabaſter, &c. Ginger is uſed for accelerating the maturation of *cyder*, helping its fermentation, preſerving it, and correcting its flatulence.

It is obſerved, that a mixture of fruits is of great advantage to *cyder*; the worſt apples, mixed together, making as good *cyder* as the beſt make alone: always obſerving, however, that they be of equal ripeneſs.

The beſt mixture, according to Mr. Worlidge, is that of redſtreaks with golden-rennets: bitter apples ſpoil the *cyder*, but the juice of them, and of crabs, yield as good ſpirits as the beſt apples, when fermented: neither the ſour nor bitter taſte ariſing with the ſpirit upon diſtillation.

The ſtire, under-leaf, fox-whelp, and golden-pippin, have not yet been found to do ſo well in mixtures, as each of them does by itſelf.

If the apples be pounded in a ſtone mortar, which is the cuſtom of ſome, the kernels and ſtalks are bruiſed with them, which gives the liquor an ill ſavour.

The beſt *cyder* of all the kinds is that made from the redſtreak apple, grafted upon the gennet-moil ſtock. Theſe two ſorts of apple-trees always agree very well, and the ſtalks ſcarce ever canker, as the crab-ſtalks uſually do, when this apple-tree is grafted upon them. The fruit of the redſtreak, on the ſtock here recommended, is always larger and milder, and, when ripe, is a very good eating apple, and the *cyder* made from it is mellower, and has not the over-roughneſs and auſterity that has, which is made from the ſame apple on the crab-ſtock; the apples alſo need leſs mellowing, in order to their making into *cyder*, the ſtalk, in a great degree, meliorating the fruit; for as an apple grafted on a crab becomes better by obtaining an acrimony and quickneſs from the fruit, ſo a crab, and the redſtreak apple, as it is called, which is in itſelf no other, obtains ſoftneſs, mellowneſs, and bigneſs, by being grafted on a good apple. Phil. Tranſ. N° 70.

It might be a great improvement to many eſtates, to cultivate, on the grounds not fit for corn, the proper ſorts of apples for *cyder*. It is a marketable commodity at all times, and coſts no fuel to brew it; and the labour is but once in the year. The greater quantities of *cyder* are made together, the better it uſually ſucceeds, but the veſſels ſhould alſo be large in which it is kept. In this caſe it will not only keep many years, but will improve all the time. Phil. Tranſ. N° 134.

Hugh Stafford, Eſq. a Devonſhire gentleman, publiſhed, about 1753, a pamphlet in 4to. on *cyder-making*, which may afford ſome inſtruction and entertainment to thoſe who cultivate apples, and make *cyder*.

By ſix ſeveral acts, for every hogſhead of *cyder* and PERRY made in Great Britain, and ſold by retail, there ſhall be paid by the retailer the ſum of 6*s*. and 8*d*. and by 12 Ann. ſtat. 1. 4*s*. more to be paid by the firſt buyer or retailer; and by 1 Geo. III. cap. 3. 4*s*. more over and above all other duties payable for *cyder* and perry ſold by retail; and by 6 Geo. III. cap. 14. 6*s*. more; and for every hogſhead conſigned to an agent or factor 16*s*. and 8*d*. By 10 Geo. III. cap. 2. it is declared, that *cyder* and perry made in Great-Britain ſhall in no caſe whatever be chargeable with more than 16*s*. and 8*d*. a hogſhead.

CYDER, *Pippin*. This is a ſort of *cyder* which, in many places, might be made in great quantities, where the redſtreak *cyder* apple will not thrive: the harſhneſs that is apt to be in this ſort of *cyder*, is the only objection to its value, it being of a good body, and otherwiſe, in all reſpects, commendable: the great reaſon of this harſhneſs is the light foulneſs; or, as the *cyder* people expreſs it, the flying lee that always is in this ſort. But it is eaſy, by watching a proper time, to draw off the liquor from this into other veſſels, or to ſtrain it through a cloth: in either caſe, much of the lee will be left out, and the *cyder* loſe its harſhneſs. Phil. Tranſ. N° 70.

CYDER *ſpirit*, a ſpirituous liquor drawn from *cyder* by diſtillation, in the ſame manner as brandy from wine. The particular flavour of this ſpirit is not the moſt agreeable, but it may, with care, be diveſted wholly of it, and rendered a perfectly pure and inſipid ſpirit, upon rectification. The traders in ſpirituous liquors are well enough acquainted with the value of ſuch a ſpirit as this: they can give it the flavours of ſome other kinds, and ſell it under their names, or mix it in large proportion with the foreign brandy, rum, and arrack, in the ſale, without danger of a diſcovery of the cheat.

CYDER *Vinegar*. See VINEGAR.

CYDERKIN, *Purre*, or *Perkin*, is a liquor made of the murk, or groſs matter remaining after the *cyder* is preſſed out. For this purpoſe, the murk is put in a large vat, with a proper quantity of boiled water, which has ſtood till it be cold again: if half the quantity of water be uſed that there was of *cyder*, it will be good; if the quantities be equal, the *cyderkin* will be ſmall. The whole is left to infuſe forty-eight hours, and then well preſſed: what is ſqueezed out by the preſs, is immediately tunned up and ſtopped; it is fit to drink in a few days.

It clarifies of itſelf, and ſerves in families inſtead of ſmall beer. It will keep, if boiled after preſſure, with a convenient quantity of hops.

CYDONIA. See QUINCE.

CYDONITES *Vinum*. See VINUM.

CYGNUS, or CYCNUS, *Gallina*, the SWAN; in *Aſtronomy*, a CONSTELLATION of the northern hemiſphere, between Lyra and Cepheus.

The ſtars in the conſtellation *Cygnus*, in Ptolemy's Catalogue, are 19; in Tycho's, 18; in Hevelius's 47; in the Britannic Catalogue, 81. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

CYGNUS, in *Ornithology*. See SWAN.

CYGNUS *cucullatus*, the *hooded ſwan*, a name very improperly given by ſome authors to the DODO, a very large bird, rather approaching to the caſſowary kind, but not ſo long legged, or long necked. Ray.

CYLINDER, in *Geometry*, a ſolid body, contained under three ſurfaces; ſuppoſed to be generated by the rotation of a parallelogram, as CBEF (*Tab. Geometry*, *fig.* 17.) about one of its ſides, CF.

If the generating parallelogram be rectangular, as CBEF, the *cylinder* it produces will be a *right cylinder*, i. e. a *cylinder* whoſe axis is perpendicular to its baſe.

If the parallelogram be a *rhombus*, or *rhomboides*, the *cylinder* will be *oblique*, or *ſcalenous*.

The ſurface of a *right cylinder*, excluſive of its baſes, is demonſtrated to be equal to a rectangle contained under the periphery, and the altitude of the *cylinder*.

The periphery, therefore, of the baſe, and thence the baſe itſelf, being found, and multiplied by two, and the product added to the rectangle of the height, and periphery of the *cylinder*, the ſum will be the area or ſuperficies of the *cylinder*: multiply this by the area of the baſe; and the product will be the ſolidity of the *cylinder*.

For it is demonſtrated, that a circle is equal to a triangle, whoſe baſe is equal to the periphery, and height, to the radius; and alſo, that a *cylinder* is equal to a triangular priſm, having the ſame baſe and altitude with itſelf: its ſolidity, therefore, muſt be had by multiplying the ſuperficies into the baſe.

Again, ſince a cone may be eſteemed an infinite-angular pyramid, and a *cylinder* an infinite-angular priſm; a cone is one third part of a *cylinder*, upon an equal baſe, and of the ſame height.

Further, a *cylinder* is to a ſphere of the ſame baſe and altitude as 3 to 2.

Laſtly, it is demonſtrated in mechanics, that the ſolidity of a *cylinder* is the factum of the generating rectangle ABCD, (*Tab. Mechanics*, *fig.* 28.) into the periphery of the circle deſcribed by the radius EG, which is ſubduple of EF, or the ſemidiameter of the *cylinder*. See CENTRO-BARYC *method*.

CYLINDERS, *for the ratio of*. As all *cylinders*, cones, &c. are in a ratio compoſed of their baſes and altitudes: hence, if their baſes be equal, they will be in the ratio of their heights; if their altitudes be equal, in the ratio of their baſes.

Hence, alſo, the baſes of *cylinders* and cones being circles; and circles being in a duplicate ratio of their diameters; all *cylinders* and cones are in a ratio compounded of the direct ratio of the altitude, and the duplicate one of their diameters: and, if they be equally high, as the ſquares of the diameters.

Hence, again, if in *cylinders*, the altitude be equal to the diameter of the baſes, they will be in a triplicate ratio of the diameters of the baſe. All *cylinders*, cones, &c. are in a triplicate ratio of their homologous ſides; as alſo of their altitudes.

Again, equal *cylinders*, cones, &c. reciprocate their baſes and altitudes. See CONE, &c.

Laſtly, a *cylinder*, whoſe altitude is equal to the diameter of the baſe, is to the cube of its diameter, as 785 to 1000.

To find a circle equal to the ſurface of a given CYLINDER, we have this theorem: the ſurface of a *cylinder* is equal to a circle, whoſe radius is a mean proportional between the diameter and height of the *cylinder*.

The diameter of a ſphere, and altitude of a CYLINDER *equal thereto, being given, to find the diameter of the* cylinder: the theorem is, the ſquare of the diameter of the ſphere is to the ſquare of the diameter of the *cylinder* equal to it, nearly, as triple the altitude of the *cylinder* to duple the diameter of the ſphere. See SPHERE.

To find a rete, *or cage, whence a* cylinder *may be formed, or wherewith any* cylinder *may be covered.* With the diameter of the baſe deſcribe two circles; find their peripheries: and, upon a line equal to the altitude of the *cylinder*, form a rectangle, whoſe other dimenſion is equal to the found periphery. Thus may the *cylinder* required be formed, or covered.

When the *cylinder* is oblique, the eſtimate of its ſuperficies depends upon the rectification of the ellipſe; for a plane cutting the *cylinder* at right angles to the axis will produce an ellipſe, and the ſuperficies will be equal to the product of this elliptic periphery by the ſide of the *cylinder*.

CYLINDER, *reſiſtance of a*. See RESISTANCE.

CYLINDER, *ſcenography of a*. See SCENOGRAPHY.

CYLINDER *charge*, in *Gunnery*, is that part of a great gun which is poſſeſſed by the powder and ball.

CYLINDER *concave*, in *Gunnery*, is all the chace, or hollow length, of a piece of ordnance.

CYLINDER *vacant*, in *Gunnery*, is that part of the hollow that remains empty, after the gun is charged. See CANNON.

CYLINDER, *rolling*, in *Mechanics*, a *cylinder* which rolls up an inclined plane.

The phænomena of the *rolling cylinder* may be eaſily accounted for from what we have obſerved under center of gravity.

For let ABED (*Tab.* III. *Mechanics*, *fig.* 34.) repreſent the ſection of a *cylinder* of wood, biaſſed on one ſide by a cylindrical piece of lead as B, which will bring the center of gravity out of the center of magnitude C to ſome point G between C and B. Let FH be an inclined plane, whoſe baſe is FL. It is evident the *cylinder* laid upon the plane will no where reſt but there, where a perpendicular to the horizon FL paſſes through the center of gravity G, and that point of the plane E, in which the *cylinder* touches it; and this, in all angles of inclination of the plane leſs than that whoſe ſine is equal to CG, the radius being CD, will be in two ſituations ABED, and *abed:* becauſe when the *cylinder* moves, the center of gravity deſcribing a circle round the center of magnitude C, this circle will meet the perpendicular in two points G and *g*, in each of which the center of gravity being ſuppoſed, the *cylinder* will reſt. Therefore the *cylinder* moves from E to *e* by the deſcent of the center of gravity from G to *g*, in the arch of the cycloid G*hg*.

If the *cylinder* ABED, *fig.* 35. inſiſting on the horizontal line EL, in the point E, has the center of gravity G in the horizontal diameter DB, it will gravitate in the perpendicular G*e:* if therefore the plane FH touch the *cylinder* in the point *e*, it is evident the *cylinder* cannot either aſcend or deſcend on ſuch a plane. Becauſe G in any ſituation between *e* and H, or *e* and F, will gravitate to the left or right from the point in which the *cylinder* touches the plane; and ſo will in either caſe bring it back to the point *e*. And as the angle EC*e* is equal to HFL, it follows, that a *cylinder* cannot aſcend on a plane whoſe inclination is greater than that angle.

CYLINDRICAL *Column*, *Compaſſes*, *Mirrours*, *Wax-Candles*. See the ſeveral ſubſtantives.

CYLINDROID, in *Geometry*, a ſolid body, approaching the figure of a *cylinder*; but differing from it in ſome reſpect, e. gr. as having its baſes elliptical, but parallel, and equal.

The word comes from κυλινδρος, *cylinder*; and ειδος, *form*.

CYLINDROID, *hyperbolic*. See HYPERBOLIC.

CYLINDRUS, in *Conchyliology*, the name of a genus of ſhell-fiſh, of which there are many very elegant and precious ſpecies. This genus is more generally, at preſent, called *rhombus*, though this is very improper, the word *cylindrus* very aptly expreſſing the ſhape of the ſhell, which is cylindric and oblong, and the *rhombus*, which ſignifies that figure we call a lozenge, not being at all expreſſive of it.

The characters of this genus are theſe: it is an univalve ſhell, of an oblong cylindric figure, with an oblong mouth, and oftentimes having the clavicle ſeparated from the body by a circle: the columella is, in ſome ſpecies, ſmooth, in others, rough. The moſt obvious character of this genus, without having recourſe to the mouth, is, its having in all the ſpecies, both ends of the ſhell nearly of the ſame ſize, the tail part being always, however, ſomewhat ſmaller than the head. The head is not ſeparated from the body by an elevated rib, as in the volutæ, but follows the ſhape of the body, though ſometimes it is ſeparated by a dentated furrow; and in ſome, though very few ſpecies, by a rib, or riſing circle. This is a very puzzling circumſtance in the diſtinction of the ſhell, bringing it to a near alliance with the volutæ: but, in this caſe, the point of the ſhell muſt be regarded, which in the *cylindrus* is always obtuſe, but in the voluta always pointed. See *Tab. of Foſſils, Claſs* 9. and *Tab. of Shells*, Nº 12.

Among the ſpecies of this family of ſhells, there are found two very remarkable diſtinctions; the one is in the ſpecies juſt mentioned, which has a rib near the head; the other is in the olive *cylindrus*, the two extremities of which are nearly equal, but the middle very conſiderably ſwelled.

The family of the *cylindri* are very numerous. See farther Hiſt. Nat. Eclair. p. 284. See LIMAX.

CYLISTICI, in *Antiquity*, a deſignation given to the *pancratiaſtæ*; becauſe when the weaker found himſelf ſore preſſed by his adverſary, he fell down, and fought, rolling on the ground. See PANCRATIUM.

The word is formed from κυλιω, *to roll*, or *tumble*.

CYLLOSIS, the ſame with CYLLUM.

CYLLUM, from κυλλος, *lame*, in *Medical Writers*, is uſed to ſignify a leg put out of joint outwardly; alſo one that is lame and crooked.

CYMA, in *Botany*, a term ſignifying the tender ſprout of any plant, eſpecially of the cabbage kind.

CYMA, in *Architecture*. See CIMA, and CYMATIUM.

CYMATITES, in *Natural Hiſtory*, a name given by ſome writers to a ſpecies of ASTROITES, the lineations of which are indented, and repreſent waves.

CYMATIUM, CIMATIUM, or CIMA, in *Architecture*, a member, or moulding of the corniche, whoſe profile is waved; i. e. concave at top, and convex at bottom; frequently alſo called *doucine*, *gorge*, or *gula recta*; eſpecially by the French: by the Italians *goletta*, i. e. *parva gula*; but more uſually *cymatium*, among us; being the laſt, or uppermoſt member of the corniche. See *Tab. Architecture*, *fig.* 8.

Some write the word *ſimaiſe*, from *ſimus*, *camus*, *flat-noſed*; but this etymology is improbable: the beauty of the moulding conſiſting in its having its projecture equal to its height. M. Felibien therefore rejects this origin; contending, that the moulding is not ſo denominated from its being the uppermoſt member of the corniche, but, according to the ſentiment of Vitruvius, from its being waved, from the Greek κυματιον, *undula*, of κυμα, *wave*. This is certain, that Vitruvius ſometimes uſes the word *unda* for *cymatium*; and ſometimes *lyſis*, i. e. *ſolution*, *ſeparation*; becauſe, corniches, where the *cymaiſes* are found, ſeparate one piece of architecture from another; as the pedeſtal from the column, and the frieze from the corniche. But it muſt be obſerved, that he does not confine *cymatium* to the corniche, but uſes it for any ſimilar moulding, wherever he meets with it; in which he differs from the more accurate among the moderns.

Felibien makes two kinds of *cymatiums*; the one *right*, the other *inverted*: in the firſt, that part which projects the fartheſt is concave, and is otherwiſe called *gula recta*, and DOUCINE. In the other, the part that projects fartheſt is convex, called *gula inverſa*, or TALON.

Our architects do not uſe to give the name *cymatium* to theſe mouldings, except when found on the tops of corniches; but the workmen apply the name indifferently, wherever they find them. Palladio diſtinguiſhes the *cymatium* of the *corniche* by the name *intavolata*.

CYMATIUM, *Tuſcan*, conſiſts of an ovolo, or quarter-round. Philander makes two Doric *cymatiums*, whereof this is one: Baldus calls this the Leſbian *aſtragal*.

CYMATIUM, *Doric*, is a cavetto; or a cavity leſs than a ſemicircle, having its projecture ſubduple its height. See *Tab. Architecture*, *fig.* 25. Nº 6.

CYMATIUM, *Leſbian*, according to Vitruvius, is what we otherwiſe call *talon*; viz. a concavo-convex member, having its projecture ſubduple its height.

CYMBAL, a muſical inſtrument, uſed among the ancients; called by the Greeks κυμϐαλον, and by the Latins *cymbalum*.

Sylburgius derives the word from three ſeveral roots, viz. from κυφος, *crooked*; from κυπελλον, *cup*; and from φωνη, *voice*. Iſidore derives it from *cum*, and *ballematica*, an immodeſt dance uſed to accompany this inſtrument. The real etymology appears to be from κυμϐος, *cavity*.

The *cymbal* was of braſs, like our kettle-drums; and, as ſome think, reſembling them in their form, but ſmaller, and applied to a different uſe.

Caſſiodorus and Iſidore call it *acetabulum*, the name of a cup or cavity of a bone wherein another is articulated; and Xenophon compares it to a horſe's hoof: whence it muſt have been hollow; which appears, too, from the figure of ſeveral other things denominated from it; as a baſin, caldron, goblet, caſque; and even a ſhoe, ſuch as thoſe of Empedocles, which were of braſs.

In reality, the ancient *cymbals* appear to have been very different from our kettle-drums, and their uſe of another kind: to their exterior cavity was faſtened a handle; whence Pliny compares them to the upper part of the thigh, *coxendicibus*; and Rabanus to phials.

They were ſtruck againſt one another, in cadence, and made a very acute ſound. Their invention was attributed to Cybele; whence their uſe in feaſts and ſacrifices: ſetting aſide this occaſion, they were ſeldom uſed but by diſſolute and effeminate people. M. Lampe, who has written expreſly on the ſubject, attributes the invention to the Curetes, or inhabitants of mount Ida, in Crete: it is certain theſe, as well as the Corybantes, or guards of the kings of Crete, and thoſe of Rhodes, and Samothracia, were reputed to excel in the muſic of the *cymbal*. See CORYBANTES.

The *cymbals* of Bacchus were two ſmall braſs veſſels, ſomewhat in the form of a ſhield, which being ſtruck together by the hands, gave a ſound. The well known ſtatue of the dancing fawn has one of theſe in each hand.

The Jews, too, had their *cymbals*, which they called צלצלים, or תצלתים; or, at leaſt, inſtruments, which the Greek, Latin, and Engliſh tranſlators, render *cymbals*; for as to their matter, form, &c. the critics are wholly in the dark.

The modern *cymbal* is a mean inſtrument, chiefly in uſe among vagrants, gypſies, &c. It conſiſts of ſteel wire, in a triangular form, whereon are paſſed five rings, which are touched and ſhifted along the triangle with an iron rod held in the left hand, while it is ſupported in the right by a ring, to give it the freer motion. Durandus ſays, that the monks uſed the word *cymbal* for the cloiſter-bell, uſed to call them to the refectory. See BELL.

CYMATIUS *ſtorax*. See STORAX.

CYMBARIA, in *Botany*, the name of a genus of plants, of the *didynamia angioſpermia* claſs, the characters of which are theſe: the perianthium is erect, and divided into ſeveral ſegments; two of them, which ſtand oppoſite to one another, are larger and broader than the reſt; the other ten are very narrow: this cup does not fall with the flower. The flower is monopetalous, and its tube is oblong and inflated; the mouth is open; the upper lip is reflex, obtuſe, and divided into two ſegments; the lower one is obtuſe alſo, and is divided into three. The ſtamina are four filaments, of the length of the tube; the antheræ are bifid, and prominent; the germen of the piſtil is oval; the ſtyle is capillary, and of the length of the ſtamina, and the top of it is bent; the ſtigma is obtuſe. The fruit is an oval capſule, compoſed of two valves, and having only one cell; this is ſquare, and contains a number of ſmooth angular ſeeds.

CYMBIFORME *Os*, in *Anatomy*. See NAVICULARE *Os*.

CYMBIUM, in *Natural Hiſtory*, a name given by many authors to a kind of ſea-ſhell, commonly called the GONDOLA *ſhell*. It is of the genus of the *concha globoſa*, or *dolium*, and there are ſeveral ſpecies of it.

CYMENE, in *Botany*, a name given by the ancient Greeks to a plant with which they uſed to dye woollen things yellow, and with which the women uſed alſo to tinge the hair yellow. The *cymene* of the Greeks is evidently the ſame plant with the *lutum* or *lutea herba* of the Latins; and this is deſcribed to have leaves like the *linum*, or flax, and flowers like the *geniſta*, or broom. It is plain from this, that the *lutum* of the Romans was the plant we call *geniſtella tinctoria*, or dyer's weed, ſtill uſed to dye yellow, and which anſwers to all the characters of the Roman deſcription.

CYMINALIS, in *Botany*, a name uſed by ſome authors for the *gentian*, the plant whoſe root is the fine bitter drug of that name.

CYNAPIUM, in *Botany*, a name uſed by authors for the leſſer *hemlock*, or *fool's parſley*.

CYNANCHE, and LYCNANCHE, in *Medical Writers*, an inflammation of the inner muſcles of the larynx, accompanied with a difficulty of breathing, and a continual fever, ſo called, becauſe it is frequently incident to dogs and wolves.

CYNANCHUM, in *Botany*. See *Baſtard* DOG'*s-Bane*.

CYNANTHEMIS, in *Botany*, a name given by ſome authors to the COTULA *fœtida*, or ſtinking mayweed. Ger. Emac. Ind. 2.

CYNANTHROPIA, from κυων, *dog*, and ανθρωπος, *man*, a term uſed for madneſs given by a dog, wherein the patient avoids light, or any thing bright, fears water, and trembles at the ſight and remembrance of it. It proceeds uſually from a poiſonous bite, or the like, of ſome mad creature, as a dog, a wolf, &c.

CYNARA, in *Botany*, a name generally eſteemed ſynonymous with the word *cinara*, but erroneouſly; the *cinara* being properly the ARTICHOKE, and *cynara* the chardoon, or ſome other thiſtle nearly allied to the artichoke kind, of which the ancient Greeks eat the young and blanched ſtalks, as we do the chardoons.

CYNEBOTE, the ſame with CENEGILD.

CYNEGETICS, from κυνηγος, *huntſman*, of κυων, *dog*, and αγω, *I lead out*, books treating of the art of hunting. Gratius Faliſcus has written a *Cynegetica* with applauſe.

CYNICS, a ſect of ancient philoſophers, who valued themſelves on their contempt of every thing, eſpecially riches and ſtate, arts and ſciences; all excepting morality.

The founder of this ſect is ſaid to have been Antiſthenes, a diſciple of Socrates; who, after his maſter's death, quitting the Pyreum, retired to Cynoſarges, a kind of academy not far from the gates of Athens.

Hence, ſome will have it, came the name κυνικος, *cynicus*, viz. from *cynoſarges*. But others, with more probability, derive it from κυων, *dog*, becauſe of their ſeverity and importunity in reprehending vice. Thus, Ariſtotle obſerves, οι δε κυνικοι, &c. *the* Cynics *were ſo called from their free way of rebuking*, &c. Hence, Diogenes the *Cynic* ſaid of himſelf, *I bite the evil*; and Antiſthenes himſelf was called απλως κυων, *an ingenious and ſincere dog:* it being the diſtinguiſhing character of the *Cynics* to attack and bark at the ill, and to defend and fawn on the good.

Arrian very much extols the *Cynical* genius: "A *Cynic* " (ſays he) is a meſſenger ſent from Jupiter to overlook " human affairs; a public doctor, and tutor of man" kind; who inſtructs and chaſtiſes at the ſame time; " an Æſculapius; a lord and king, adorned with a ſcep" tre and diadem, who governs the people; and this " voluntarily, without trembling, without guards, &c. " but by a good conſcience." The ground of this encomium may be owing, in ſome meaſure, to the affinity between the *Stoics* and *Cynics:* the chief difference between them conſiſted in this, that the former were more modeſt and reſerved than the latter; who were ſaid to have baniſhed all ſhame, and were able to practiſe any obſcenity without bluſhing.

Hence, Laertius obſerves of Diogenes, that he did every thing openly, whether it belonged to Ceres or to Venus: though the ſame Laertius adds, that he did it in imitation of the chorididaſcali, i. e. he only ran to an exceſs of impudence, to put others out of conceit with it.

CYNIC *Period*. See *Ægyptian* YEAR.

CYNIC *ſpaſm*, *ſpaſmus* CYNICUS, a ſort of convulſion, whereby the patient is brought to imitate the geſtures, ſnarlings, howlings, &c. of a dog. See SPASM.

Dr. Freind, in the Philoſophical Tranſactions, gives us an account of a very extraordinary *ſpaſmus* of this kind, wherewith two families, at Blackthorn in Oxfordſhire, were ſeized.

The novelty of the thing drew abundance of viſitors to the village, and among the reſt Dr. Willis; who, a good while before he reached the place, heard a terrible noiſe of barking and howling: upon his entering the houſe, he was immediately ſaluted by five girls, bawling, and anſwering each other by turns, with violent motions of the head. In their face there was no convulſion ſeen, beſide *cynic* diſtortions, and oſcillations of the mouth: their pulſe was pretty regular; their noiſe was rather like that of the howling, than of the barking of dogs; though its returns were more frequent, with deep ſighings between.

The *ſpaſmus* had ſeized them all equally: whereof the youngeſt was but ſix, and the eldeſt fifteen years of age: at intervals they had their reaſon and ſenſes entire; but not long, before one of them, returning to her yelling, ſet on the reſt: till at length, all fainting, they fell like epileptics on a bed laid in the middle of the room to receive them.

A little while they would lie quietly and decently together; but upon a new orgaſm of the ſpirits, they began to beat and bruiſe each other. Two of the youngeſt awaked while the doctor ſtayed, and left their ſiſters on the bed: but the *ſpaſmus* ſoon had hold on them again.

In July, 1700, Dr. Freind himſelf viſited another family, in the ſame village; where one boy and three girls had been ſeized ten weeks, without any apparent preceding cauſe. A girl had had it firſt; and the reſt, as the mother informed him, were ſo ſtruck with their ſiſter's diſorder, that they too were ſeized. At his arrival, they were all at play, very briſkly, and unconcernedly, before the doors; at length the eldeſt girl, about fourteen years of age, was ſeized as uſual.

The only ſymptom of its approach, was a ſwelling of the ſtomach; which riſing gradually up the throat, ſet the muſcles of the larynx and the head upon their uſual convulſions: this riſing was a certain ſymptom of an approaching paroxyſm in them all; and if they endeavoured to ſtop it, it burſt out with the greater violence, and held the longer.

The noiſe they made was inceſſant, and diſagreeable; yet not ſo much like the barking or howling of dogs, as had been given out, as a quaint kind of a ſong, conſiſting of three notes, or tones, repeated twice over; and cloſed by deep ſighs, &c. accompanied with extraordinary geſtures and nutations of the head.

This diſeaſe the doctor takes to be natural; and to riſe from the common cauſe of all convulſions, viz. from the animal ſpirits growing unruly in the nerves, and driving the muſcles into various contractions, according to the circumſtances of the indiſpoſition.

CYNIPS, in *Zoology*, a genus of four-winged inſects of the *hymenoptera* order, without a proboſcis, and with a ſpiral ſting, moſt commonly concealed.

CYNOCEPHALUS, from κυων, *dog*, and κεφαλη, *head*, in *Zoology*, the name of one of the genera of monkeys which have a long noſe, and reſemble a dog about the head. Theſe have all tails, ſome longer, ſome ſhorter, and are what we call in Engliſh *baboons*. There are ſeveral ſpecies of theſe, ſome of which are very large.

CYNOCRAMBE, in *Botany*, *Theligonum*. See *Dog's* CABBAGE.

CYNOCTONON. See ACONITE.

CYNODESMUS, or CYNODESMION, among *Anatomiſts*, the band, or ligament, which ties the prepuce of the yard to the nut or glans.

CYNOGLOSSUM, from κυων, *dog*, and γλωσσα, *tongue*, in *Botany*. See HOUNDS-TONGUE.

CYNOGLOSSI *radix*, *hound's-tongue root*, in the *Materia Medica*, is emollient, anodyne, and narcotic; it is alſo gently aſtringent, and is eſteemed a good medicine in catarrhs, diarrhœas, dyſenteries, and hæmorrhages of all kinds; alſo in the fluor albus, and gonorrhœa.

CYNOGLOSSUS, in *Zoology*, the name of a fiſh common in the Mediterranean ſea, and brought to market at Rome, Venice, and elſewhere. It much reſembles the ſoal-fiſh, but is a worſe fiſh for the table.

CYNOGLOSSOIDES. See BORRAGE.

CYNOGLUCOS, from κυων, *dog*, and λυκος, *wolf*, in *Natural Hiſtory*, a name given by the ancient writers to a creature which had the ſhape partly of a dog, and partly of a wolf, and was generated, according to their accounts, by a mixture of thoſe two ſpecies of animals in copulation, as the LEOCROCOTTA was, between the hyæna and lioneſs.

CYNOMITRA, in *Botany*, a genus of the *decandria monogynia* claſs of plants; the cup of which is four-leaved, and the fruit a fleſhy, lunated pod, containing a ſingle ſeed.

CYNOMORIUM, from κυων, *dog*, and μορον, *fruit*, in *Botany*, a name given by Micheli, and continued by Linnæus, to a genus of plants of the *monoecia monandria* claſs; the characters of which are theſe: it produces ſeparate male and female flowers, but they ſtand almoſt cloſe to one another, in the ſame amentum or ear. In the male flowers the general cup is an erect amentum, imbricated on every ſide, and compoſed of oblong, erect, truncated ſquammæ, each containing one flower, and formed narrow at the bottom, and gibbous on one ſide, and hollow on the other; there are no petals, and in the midſt there ariſes, by way of a ſtamen, one firm and ſtrait filament, longer than the cup, and crowned with a double apex. In the female flowers the common amentum is the ſame as in the male, but they have no other cup than is formed by the leaves of the plant. The germen of the piſtil is globoſe; the ſtyle is ſingle, erect, firm, and of the length of the cup; the ſtigma is obtuſe; the ſeed is ſingle and naked.

CYNOMUIA, the *dog-fly*, as the Greek term imports, in *Zoology*. See DOG-*fly*.

CYNOPHONTIS, in *Antiquity*, a feſtival obſerved in the dog-days at Argos, and ſo called απο της κυνας φονειν, i. e. from killing dogs; becauſe it was uſual on this day to kill all the dogs they met with.

CYNOREXY, or CYNODES OREXIS, an immoderate appetite to the degree of a diſeaſe; called alſo *fames canina*, and BULIMY.

CYNORRHODON, in *Botany*, the *dog-roſe*, as the Greek term ſignifies; the common wild briar, or wild white roſe, ſo common in our hedges.

CYNOSBATOS, from κυνων and βατος, *buſh*, in *Botany*, a word uſed as the name of different ſhrubs by different authors. It is now generally uſed as the name of the wild, or *dog-roſe*; but ſome authors have applied it to the common bramble; others to the *oxycanthus*, and others to the CAPER-*buſh*.

The fruit of the *wild roſe* is the *hip*, uſed in conſerve, and ſaid to be good in diſorders of the breaſt, &c.

CYNOSPASTOS, in *Botany*, a name uſed by ſome authors for the *garden piony*.

CYNOSURA, in *Aſtronomy*, a denomination given by the Greeks to URSA *minor*, or the little bear.

The word is formed of κυνοσουρα, q. d. the *dog's tail*.

This is the conſtellation next our pole, conſiſting of ſeven ſtars; four whereof are diſpoſed like the four wheels of a chariot; and three lengthwiſe, repreſenting the beam: whence ſome give it the name of the *chariot*, or Charles's *wain:* a name now more commonly given to the ſeven principal ſtars forming the ſame kind of figure in the Great Bear.

From theſe ſeven ſtars it is the pole takes its name, *Septentrionalis*; and the reſt of the hemiſphere, as far as the line, *Septemtriones.*

CYNOSURUS, *dog's-tail*, in *Botany*, a kind of graſs called *criſtata* by Scheuchzer, and other authors; but in the Linnæan ſyſtem of botany by this name. See Dog's *Tail*.

CYNTHIUS, and Cynthia, in *Mythology*, ſurnames of Apollo and Diana, derived from Cynthia, the name of a mountain in the middle of the iſland of Delos.

CYNOZOLOS, in *Botany*, a name given by ſome of the old Greek writers, and, from them, copied by Pliny, and the Latins, to expreſs the black *chamæleon thiſtle*, a poiſonous plant, which it was very neceſſary to diſtinguiſh perfectly from the plant called the white *chamæleon thiſtle*, which was a ſafe and eſculent plant.

CYON, or Cion, a graft, ſprig, or ſucker.

CYPERUS, in *Botany*, a genus of plants of the *triandria monogynia* claſs; the characters of which are, that the cup is an imbricated ſpike, the ſeveral ſcales of which are ſomewhat bent, of an oval figure, and boat-like form; and ſerve to keep the flowers ſeparate. It has no petals; the ſtamina are three extremely ſhort filaments; and the antheræ are oblong and furrowed; the germen of the piſtillum is extremely ſmall; the ſtyle is thread-like, and very long; the ſtigmata are three, and of a capillary form; it has properly no fruit but a ſingle, three-cornered, pointed, and naked ſeed. See *Tab.* V. *of Botany*, *Claſs* 15. Phil. Tranſ. vol. xlix. part ii. p. 808.

Cyperus *root*, in the *Materia Medica*, the name of a root uſed in medicine, of which there are two kinds, the long and the round; the long *cyperus* is of our own growth; the round, when genuine, we have from the Eaſt Indies, but what is uſually ſold is the root of a baſtard kind, common about our own ditches, and called by authors, by way of diſtinction from the Indian kind, *cyperus rotundus noſtras.*

The Indian round *cyperus* is a knobbed root, full of ſmall ſpecks and tubercles, brown on the outſide, and greyiſh within, of a ſlightly ſweet ſmell, and of an acrid taſte. The long *cyperus* is an oblong root, covered with a great number of fibres, not eaſily broke, of a duſky brown without, and a pale bright grey within, of an acrid taſte, and very agreeable ſmell, when freſh and good. The plants which produce them both, grow in watery places, and have leaves and flowers in ſome meaſure reſembling the water-graſſes, which, from their reſemblance to theſe, are called *cyperus* graſſes. They are poſſeſſed of the ſame virtues, cure ill-ſcented breaths, are good in nephritic diſorders, in colics, and in diſorders of the womb. They are taken in powder, or decoction.

The roots of *cyperus* are attenuants, and deobſtruents, promote urine, and the menſes, are good ſtomachics, and ſerviceable in the firſt ſtages of the dropſy.

CYPHER. See Cipher.

CYPHI, a term in the *Arabian Pharmacy*, ſignifying a kind of cordial perfume.

Mithridates gave the appellation *cyphi* to the troches wherewith the Egyptian prieſts uſed to ſweeten their gods, to make them grant what they requeſted. He uſed the ſame in the compoſition of mithridate, on account of their efficacy againſt poiſons, defluxions, &c. The *cyphi* are compoſed of raiſins, or dried grapes, turpentine, myrrh, bdellium, ſpica nardi, caſſia lignea, aſpalathum, ſaffron, &c. tempered into a maſs with honey and a little wine.

CYPHOMA, Cyphos, and Cyphosis, in *Medical Writers*, an incurvation of the ſpine, forming a crookedneſs of the back.

CYPHON, in *Antiquity*, a kind of puniſhment uſed by the Athenians; it was a collar made of wood, ſo called, becauſe it conſtrained the criminal, who had this puniſhment inflicted on him, to bow down his head.

CYPHONISM, Cyphonismus, from κυφων, which has various ſignifications, derived from κυφος, *crooked*, a kind of torture, or puniſhment, in uſe among the ancients.

The learned are at a loſs to determine what it was: ſome will have it to be that mentioned by St. Jerom, in his Life of Paul the Hermit, chap. 2. which conſiſted in ſmearing the body over with honey; and thus expoſing the party, with his hands tied, to the warm ſun, to invite the flies and other vermin to perſecute him.

CYPRÆA, in *Zoology*, a genus of ſnail-ſhells of an oval contorted figure, and with a longitudinal aperture, comprehending a great variety of ſpecies.

CYPRESS, *Cupreſſus*, in *Botany*, a genus of the *monoecia monadelphia* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers are formed into oval catkins, in which the flowers are placed thinly: they have no petals nor ſtamina, but have four ſummits, which adhere to the bottom of the ſcales. The female flowers are formed in a roundiſh cone, each containing eight or ten flowers: the germen is ſcarcely viſible, but afterward becomes a globular cone, opening in angular target-ſhaped ſcales, under which are ſituated angular ſeeds. There are ſix ſpecies. See *Tab.* V. *of Botany*, *Claſs* 19.

All the ſpecies of *cypreſs* are propagated from ſeeds: theſe ſhould be ſown early in the ſpring, on a bed of warm, dry, ſandy earth, which ſhould be levelled very ſmooth. If the weather prove warm and dry, it will be proper to water the bed, taking care not to waſh the ſeeds out of the ground: in about a month's time, the plants will appear above ground, which ought to be kept free from weeds. After remaining two years in this bed, they may be tranſplanted into a nurſery: the beſt ſeaſon for removing them is in April, on a cloudy day that ſeems to threaten rain; and, in taking them out of the ſeed-bed, the roots ſhould be preſerved entire, with a ball of earth to each plant. When they have been three or four years in the nurſery, they may be planted out for good; and, if deſigned for timber, the diſtance of eighteen or twenty feet ſhould be allowed every way around them. They muſt be well watered at firſt to ſettle the earth to their roots, which ought to be frequently repeated, if the weather proves dry.

The *cypreſs* tree, though found in moſt of our old gardens, is, at preſent, leſs regarded than it really deſerves. It adds a conſiderable beauty to wilderneſſes, or clumps of evergreens. But, beſides this, it ought to be cultivated on account of its valuable wood.

This tree is alſo recommended by many for purifying the air, and relieving weak lungs. On this account the ancient phyſicians of the eaſtern countries uſed to ſend their patients with weak lungs to the iſland of Candia, which then abounded with theſe trees. Miller.

The wood is very compact, and heavy; and its ſmell as agreeable as that of ſaunders. It ſcarce ever rots, decays, or is worm-eaten, any more than cedar, or ebony: for which reaſon, the ancients uſed it to make the ſtatues of their gods.

It is good for making cheſts, muſical inſtruments, and other utenſils. It never cleaves, and is extremely hard and durable; its bitter juice reſiſting worms and putrefaction. Thus we are told, that the gates of St. Peter's church at Rome, made of *cypreſs* wood, had laſted from the time of Conſtantine, eleven hundred years, as freſh as new, when pope Eugenius IV. ordered gates of braſs in their ſtead.

Some will have it, that the wood, gophir, of which Noah's ark was made, was *cypreſs*; which Plato preferred to braſs itſelf, for writing his laws on.

The coffins in which, according to Thucydides, the Athenians buried their heroes, were of this wood, as are alſo many of the Egyptian mummy cheſts. See on the *cyprus* of the ancients, Phil. Tranſ. vol. xlv. p. 564, &c.

Cypreſs nut is a very powerful aſtringent and balſamic. In diarrhœas, and dyſenteries, there is ſcarce any ſimple medicine preferable to it. It is ſaid to be a good febrifuge; but at preſent is little regarded in the ſhops.

Cypress, *ſummer*, a name uſed by ſome for the *chenopodium* of authors. See Goose-*foot*.

CYPRIANUS, in *Ichthyology*, the name given by Ariſtotle to the carp. He has alſo called it cyprinus; and Athenæus, Oppian, and many other writers, uſe indiſferently the one or the other of the words.

CYPRINE, in *Mythology*, a ſurname of Venus, becauſe the iſland of Cyprus was conſecrated to her.

CYPRINUS, in the *Artedian Ichthyology*, the name of a very extenſive genus of fiſhes, comprehending what have been before eſteemed many different genera; the characters are theſe: the branchioſtege membrane on each ſide contains three bones; the whole mouth is ſmooth and toothleſs, but low down in the jaws there are two hard and ſerrated bones, which ſerve as teeth, and over againſt theſe there is one ſoft oval bone to anſwer them. The air bladder is as it were tied with a thread in the middle, and ſo divided into two parts. The fiſh is of the malacopterygious kind, and the two jaws are uſually of the ſame length, but ſometimes the lower one is ſomewhat longer than the upper. Artedi enumerates nineteen ſpecies. Gen. Piſc. 3.

Of this genus are the barbel, bleak, bream, carp, chub, gudgeon, roach, and tench; which ſee under their ſeveral articles.

In the Linnæan ſyſtem this is a genus of the *abdominal* fiſhes.

Cyprinus *latus*, the broad *carp*, in *Zoology*, a name given by many authors to the common bream.

CYPRIPEDIUM, in *Botany*. See Lady's *ſlipper*.

CYPRIUS *lapis*, a kind of adamant brought from Cyprus, with which the ancients uſed to perforate other gems.

CYPRUS, an order of knights, called alſo knights of *Silence*, and knights of *the Sword*; inſtituted by Guy de Luſignan, king of Cyprus, in 1192.

The deſign of the inſtitution was, to oppoſe the inroads and irruptions of the infidels in that iſland: accordingly, their motto was *ſecuritas regni*.

CYPRUS *bird*, in *Zoology*, a common name for the *atricapilla*, or *black cap*, a very ſmall bird, well known in England, and much more plentiful in the iſland of Cyprus, where it is eſteemed a very delicate bird at table.

CYPRUS *vitriol*. See VITRIOL.

CYPRUS *wood*, in the *Materia Medica*, a name given by ſome authors to the *roſe-wood*, becauſe much of it is brought from the iſland of Cyprus.

CYRBASIA, Κυρϐασια, among the Greeks, a kind of caps with high tops, in form of a cone, which were worn by the prieſts.

CYRENAICI, a ſect of ancient philoſophers; ſo called from their chief, Ariſtippus of Cyrene, a diſciple of Socrates. See SOCRATIC.

Their leading tenet was, that man is born for pleaſure; and that virtue is only ſo far laudable, as it conduces thereto. By pleaſure, they meant, not only a privation of pain, and a tranquillity of mind, like what Epicurus taught; but an aſſemblage of all the poſitive pleaſures both of the mind and the ſenſes, eſpecially the laſt. See EPICUREAN.

Cicero makes frequent mention of Ariſtippus's ſchool; and ſpeaks of it as yielding debauchees.

Three diſciples of Ariſtippus, after his death, divided the ſect into three branches; under which diviſion it languiſhed and ſunk: the firſt called the *Hegeſiac* ſchool; the ſecond the *Annicerian*, and the third the *Theodoran*; from the names of their authors.

CYRILLA, in *Botany*, a genus of the *pentandria monogynia* claſs, with an acute petal inſerted in the receptacle; a double-celled capſule, and a bifid, permanent ſtyle.

CYROCEPHALUS, in *Botany*, the name given by ſome authors to the *antirrhinum*, the *calves ſnout*, or SNAP-*dragon*.

CYRTOMA, a bunch or curvity of the back. See GIBBOUS.

CYST, in *Surgery*, the bag, or membrane, in which an encyſted tumor of the ſteatomatous, atheromatous, or ſarcomatous kind, is included. In extirpating theſe tumors, if, by neglect, or accident, the *cyſt*, or any conſiderable part of it be left behind, the tumor will not fail to return. Indeed, if the tumor be a ſchirrhus, the contents are hard enough to make a clear extirpation of it, notwithſtanding its including coats be wounded: but when the matter of the tumor is ſoft, or fluid, by its eſcaping the tumor will become flaccid; ſo that it will be hardly poſſible to make a clear extirpation of the *cyſt*, without leaving ſome fragments of it behind, which muſt, in that caſe, be brought away afterwards by ſuppuratives, digeſtives, and a proper treatment; and when the ſinus is, by this means, cleared, the wound may be ſafely healed, without any danger of the return of the complaint. Heiſter's Surgery, p. 237.

CYST-HEPATIC *duct*, a canal, by which the *porus bilarius* diſcharges a part of its bile into the gall-bladder.

It was firſt deſcribed by Dr. Gliſſon, and long afterwards pretended to be diſcovered by M. Perrault. See *Tab. Anatomy* (*Splanch.*) *fig.* 5. *lit. c c.*

Verheyen, from the courſe of the bile, inverts the name, and more properly calls it *hepaticyſticus*.

CYSTIC, an epithet given to two arteries, and two veins opening into the gall-bladder. See *Tab. Anatomy* (*Angeiol.*) *fig.* 1. *n.* 34.

The *cyſtic arteries*, *cyſticæ gemellæ*, are two branches from the cœliac, beſtowed on the gall-bladder, and bringing blood to the ſame. The *cyſtic veins* return the remains of this blood into the *vena porta*.

CYSTICS, denote medicines againſt diſtempers of the bladder. See STONE, LITHONTRIPTIC, &c.

CYSTICAPNOS, in *Botany*. See FUMITORY.

CYSTICUS *ductus*, or *meatus*, a biliary duct, about the bigneſs of a gooſe's quill; joined to the *meatus hepaticus*, at about two inches diſtance from the gall-bladder; the two together forming the *ductus communis*. See *Tab. Anatomy* (*Splanch.*) *fig.* 1. *lit. d. fig.* 5. *lit. g g.*

CYSTIS, in *Botany*, a name by which many authors have called the *alkekengi*, or *winter cherry*. It had this name *cyſtis* from the remarkable character of its fruit being contained in a ſkinny bladder, or bag. It was generally, however, called *halicacabum*.

CYSTIS, the ſame with *veſica*, or BLADDER.

The word is κυϛις, which ſignifies the ſame.

CYSTIS *cholédocha*, the ſame with *felliculus*, or VESICULA *fellis*.

CYTHARA. See CITHARA.

CYTHEREA, in *Mythology*, the ſurname of Venus, ſo called from Cythera, at preſent Cerigo, an iſland oppoſite to Crete, where ſhe had a temple, eſteemed the moſt ancient in Greece, and on the ſhores of which ſhe was believed to be borne by the Zephyrs, ſurrounded by the Loves, the Tritons, and Nereides, reclining in a languiſhing poſture, in a ſea-ſhell. They give the name of *Cytheriades* to the Graces which attended her on the ſhore without quitting her, except on thoſe occaſions, when ſhe rather choſe to be waited on by the Pleaſures.

CYTHINON, in *Botany*, a name given by the ancient Greeks to the yellow wood, called alſo *thapſum* and *chryſoxylon*, a wood uſed in dying cloths, &c. See CYMENE. It was alſo called *Scythicum lignum*, Scythian wood, from the country whence it was brought; and from this laſt name it is eaſy to deduce the name *cythinon*. The old Greeks often wrote *cythinon* for *ſcythicon*, and the leaving out the initial *ſ*, which was a common practice among them, reduces this word to *cythinon*. Familiar inſtances of this practice occur to us in the words *milax* for *ſmilax*, *maragdus* for *ſmaragdus*, &c.

CYTINUS, in *Botany*, a genus of the *gynandria dodecandria* claſs; the calyx is parted into four ſegments; there is no corolla; with ſixteen ſeſſile antheræ, and an eight-celled berry, incloſing many ſeeds.

CYTISO *Geniſta*. See BROOM-*tree*.

CYTISUS. See *Shrub* TREFOIL.

CYZICENS, CYZICENA, among the ancient Greeks, were a ſort of magnificent banqueting-houſes, always looking towards the north, and uſually opening upon gardens.

They had their name from Cyzicus, a city very conſiderable for the grandeur of its buildings; ſituate in an iſland of Myſia, bearing the ſame name. Theſe *cyzicens* were among the Greeks what the *triclinia* and *cœnacula* were among the Romans.

CYZICUM *marmor*, a ſpecies of marble ſo called by the ancients from the great uſe made of it by a ſtatuary called Cyzicus. It was white, with fine narrow veins of black, and was called alſo PROCONNESIUM *marmor*.

CZAR, a title of honour, aſſumed by the grand-dukes, or, as they are now ſtyled, emperors of Ruſſia.

The natives pronounce it *tzar*, or *zaar*; and this, by corruption, from Cæſar, emperor; from ſome fancied relation to the Roman emperors; on account of which, they alſo bear the eagle as a ſymbol of their empire.

The firſt, who bore the title of *czar*, was Baſil, ſon of Baſilides, who freed his country from its ſubjection to the Tartars, about the year 1470.

M. Sperlingius, in his diſſertation on the majeſty of the name *konning*, obſerves, that the Ruſſian princes never bore the name *czar*, till their people had embraced the Greek faith: before that time, he ſays, they were called *konger*, KING.

When the *czar* Peter I. required his imperial title to be acknowleged by the court of Vienna, there was great difficulty made about it: but the *czar* ſhewing them by his embaſſador an original letter of Maximilian I. to the *czar* John Baſilowitz, the count Sinſendorff, grand chancellor of the court of Vienna, cauſed the archives of the houſe of Auſtria to be ſearched for the original of that letter; but no ſuch letter was found: however, the hand-writing of the ſecretary, and the ſignature of Maximilian, being known and acknowleged, the title of emperor was allowed to Peter and his ſucceſſors, which they continue to enjoy. This anecdote, M. l'abbé Langlet acknowleges to have received from count Sinſendorff himſelf, in 1722. Encycl.

CZEMER, in *Medicine*, a name given by the people of Hungary, and ſome of the neighbouring nations, to a very troubleſome diſtemperature of the wriſts, and lower part of the arms, to which the people of this part of the world are very ſubject. It conſiſts of a tumor not hard, but very painful to the touch. The general method of cure is, by giving firſt a ſtrong emetic, and then confining the patient to his bed, and to the uſe of ſudorifics, which in ſome days carry it off. Phil. Tranſ. N° 243.

END OF THE FIRST VOLUME.
